- **Show Patches:** This checkbox lets you show or hide the onscreen outline of every patch in the Viewer.
- **Hide During Interaction:** Hides the onscreen outline of every patch in the Viewer while you’re moving a patch; this makes it easier to see the effect of moving the patch on the image, without the outline getting in the way.

**Patch Type**

There are three methods you can use to attempt to fix the contents of a selected patch. When drawing new patches, the currently selected Patch Type will determine what the next patch will be. When you’ve selected an existing patch, changing the Patch Type will change how that patch works.

- **Spatial:** Automatically fills the interior of the selected patch with pixels drawn from the surroundings of the patch, using the Fill Method. This works well for small blemishes, but for large blemishes a pattern might be discernible, which gives away the effect.
- **Clone:** Clone mode copies part of the image to fill a shape or patch placed over the thing you want to remove. In this mode, clicking and dragging to place a Rect or Ellipse over an imperfection is followed by a second click to place the sample region you want to clone. Clicking once to place a Patch will be followed by a second click to place the sample region. Selecting an existing shape or patch and choosing Clone lets you click on the shape to position the clone region. The sample region is indicated by a dotted shape that’s connected to the original shape.
- **Blend Clone:** Operates similarly to Clone mode, except the copied part of the image that fills the Rect, Ellipse, or Patch is blended with the image to integrate it more softly.
- **Fill Method:** When using the Spatial Patch Type, the fill method determines how the blemish in the image is repaired.
  - **Grid:** Samples the pixels surrounding the Rect, Ellipse, or Patch, and blurs them inward both horizontally and vertically. Extremely effective for tiny blemishes. For larger blemishes, a grid-like pattern may emerge.
  - **Horizontal:** Samples the pixels to the left and right of the Rect, Ellipse, or Patch, and blurs them inward.
— **Vertical**: Samples the pixels to the top and bottom of the Rect, Ellipse, or Patch, and blurs them inward.
— **Patchy**: Samples pixels from all around the Rect, Ellipse, or Patch, and expands and blurs them together to create a soft, non-uniform region with which to repair the blemish. Doesn’t have the patterning of the grid methods of fill, but produces an extremely smooth result.
— **Smooth**: Simply uses a gaussian blur to repair the blemish.

### Patch Options

These options let you customize the effect of a patch filling over a blemish.

— **Mute**: Lets you turn a particular patch on or off via keyframing. Useful for blemishes that only show up for a few pixels of a shot.
— **Variability**: (Spatial patches only) Raising this parameter lets you make the Fill Method less uniform.
— **Soft Edges**: Lets you soften the edges of the patch.
— **Size Adjust**: Lets you change the size of a patch after its creation.

### Advanced Controls

These controls let you customize the UI of this effect.

— **Clone Sticks to Mouse**: When enabled, drawing or placing a Rect, Ellipse, or Patch in Clone or Blend Clone mode immediately switches to positioning the sample region, making it faster to use.
— **New Patches Stay Selected**: When enabled, patches stay selected after you draw them, in preparation for further customization.
— **UI Line Thickness**: Lets you choose how thick the on-screen outlines should be.
— **Patches Stick to**: This parameter lets you deal with fixing dead pixels or blemishes on clips that have been stabilized.
  — **Source**: Patches you place stay put, unless you apply motion stabilization to the shot, in which case the patches are transformed along with the image so they remain “stuck” to the feature in the source clip they’re fixing.
  — **Scene**: If you’re eliminating a blemish on a moving subject, you can use the FX Tracker to track the thing you’re fixing, so the patch follows along with it.
— **Output Mode**: This lets you see different representations of the patched effect you’re creating. There are four options.
  — **Patched Result**: The final result, with each patch repairing the blemish it’s covering.
  — **Patch Locations**: Shows a key where each placed patch is white against black.
  — **Differences**: Shows the difference of each patch against the original image.
  — **Difference Magnitude**: Shows a more pronounced Differences representation.
Deband (Studio Version Only)

Low bit-depth media that has areas with shallow gradients of color, such as a sky or a wall, often exhibit color banding, seen as visible stripes, because there aren’t enough color values to smoothly represent the gradation from light blue to darker blue in the sky.

An example of banding in the sky of an image

This filter is designed to isolate the edges of color banding and minimize them by dithering pixels from either side to soften the transition. This filter works best when applied to regions of the image that have been isolated with a secondary qualifier or window, otherwise you risk all edges within your image being dithered and thus softened (although this can be an interesting stylistic effect).

Minimizing banding using the Deband filter

Deband Parameters

Deband controls include:

— Edge Threshold: Adjusts how well-defined an edge needs to be in order to be affected by this filter; lowering this excludes fainter edges, while raising this includes them.
— Radius: Lowers or raises the intensity of dithering in areas that will be affected.
— Post Refine: Narrows (by lowering) or widens (by raising) the areas affected by dithering.
— Display Edge: A checkbox that shows you a black and white high-contrast preview of which edges are being detected for dithering, which can help you fine-tune your results.
Deflicker (Studio Version Only)

Introduced in DaVinci Resolve 15, this plug-in replaces the previous Timelapse Deflicker filter, and solves a far broader variety of problems in a much more automatic way. The new Deflicker plug-in handles such diverse issues as flickering exposure in timelapse clips, flickering fluorescent lighting, flickering in archival film sources, and in certain subtle cases even the “rolling bars” found on video screens shot with cameras having mismatched shutter speeds. Two key aspects to this filter are that it only targets rapid, temporally unstable variations in lightness, and that it’s able to target only the areas of an image where flickering appears, leaving all other parts of the image untouched. As a result, this plug-in can often repair problems once considered “unfixable.”

![Original image with flicker, Result setting Deflicker to Fluoro Light, (clip courtesy Redline Films)](image)

Main Parameters

By default, the top section of this plug-in exposes a single control, which in many cases may be all you need.

— **Deflicker Setting pop-up menu:** The top two options, Timelapse and Fluoro Light, are presets that effectively eliminate two different categories of flickering artifacts. If neither of these presets is quite as effective as you’d hoped, a third option, Advanced Controls, opens up the Isolate Flicker controls at the heart of this plug-in to let you tailor it further to your needs.

Isolate Flicker

Hidden by default, these controls only appear when you set Deflicker Setting to Advanced Controls, and let you choose how to detect motion in the scene so that flickering may be correctly addressed relative to the motion of subjects and items within the frame where it appears.

— **Mo.Est. Type:** Picks the method DaVinci Resolve uses to analyze the image to detect motion. Despite the names of the available options, which options will work best is highly scene dependent. The default, Faster, is less processor intensive, but less accurate, however this can be an advantage and actually do a better job with high detail images that would confuse the Better option. Choosing Better is more accurate, but more processor intensive, and Better will try harder to match fine details which can sometimes cause problems. None lets you disable motion analysis altogether, which can work well (and will be considerably faster) in situations where there’s no motion in the scene at all. The default is Better.

— **Frames Either Side:** Specifies the number of frames to analyze to determine what’s in motion. Higher values are not always better; the best setting is, again, scene dependent. The default is 3.
— **Motion Range:** Three settings, Small, Medium, and Large, let you choose the speed of the motion in the frame that should be detected.

— **Gang Luma Chroma:** Lets you choose whether to gang the Luma and Chroma Threshold sliders or not.

— **Luma Threshold:** Determines the threshold above which changes in luma will not be considered flicker. The range is 0–100, 0 deflickers nothing, 100 applies deflickering to everything.
  The default is 100.

— **Chroma Threshold:** Determines the threshold above which changes in chroma will not be considered flicker. The range is 0–100, 0 deflickers nothing, 100 applies deflickering to everything.
  The default is 100.

— **Motion Threshold:** Defines the threshold above which motion will not be considered flicker.

### Speed Optimization Options

Closed by default, opening this control group reveals two controls:

— **Reduced-Detail Motion checkbox:** On by default, reduces the amount of detail that’s analyzed to detect flicker. In many cases, this setting makes no visible difference but increases processing speed. Disable this setting if your clip has fine detail that is being smoothed too aggressively.

— **Limit Analysis Area checkbox:** Turning this on reveals controls over a sample box that you can use to limit deflickering to a specific region of the image. This option is useful when:
  a. Only one part of the image is flickering, so focusing on just that area speeds the operation considerably, or
  b. Part of the image is being smoothed too much by deflickering that’s fixing another part of the image very well.

### Restore Original Detail After Deflicker

Closed by default, opening this control group reveals two controls:

— **Detail to Restore slider:** Lets you quickly isolate grain, fine detail, and sharp edges that should not be affected by the deflicker operation, preserving those fine details exactly.

— **Show Detail Restored checkbox:** Turning this checkbox on lets you see the edges that are detected and used by the Detail to Restore slider, to help you tune this operation.

### Output

The Output pop-up menu lets you choose what Deflicker outputs, with options to help you troubleshoot problem clips. Here are the available options:

— **Deflickered Result:** The final, repaired result. This is the default setting.

— **Detected Flicker:** This option shows you a mask that highlights the parts of the image that are being detected as having flickering, to help you evaluate whether the correct parts of the image are being targeted. This mask can be very subtle, however.

— **Magnified Flicker:** This options shows you an exaggerated version of the Detected Flicker mask, to make it easier to see what the Deflicker plug-in is doing.
Dust Buster (Studio Version Only)

This plug-in is also designed to eliminate dust, dirt, and other imperfections and artifacts from clips, but it does so only with user guidance, for clips where the Automatic Dirt Removal plug-in yields unsatisfactory results. This guidance consists of moving through the clip frame-by-frame and drawing boxes around imperfections you want to eliminate. Once you’ve drawn a box, the offending imperfection is auto-magically eliminated in the most seamless way possible. This works well for dirt and dust, but it also works for really big stains and blotches, as seen below.

(Left) Drawing a box around dirt in the original image, (Right) Result in the Dust Buster plug-in

In many respects, the Dust Buster is similar to the Dead Pixel Fixer, however the Dust Buster effect is designed to repair transient bits of dust and dirt that only last for a frame or two, whereas the Dead Pixel Fixer is designed to work on blemishes that are fixed in place for the duration of a clip.

General

These top level controls let you choose how to draw patches with which to repair temporally unstable dust and dirt in the frame, whether or not to show their on-screen controls, and how.

— **Navigation Controls:** Four buttons let you jump to frames on which you’ve drawn patches.
   - There are four buttons:
     - **First Modified Frame:** Jumps the playhead to the first frame of that clip with a patch.
     - **Last Modified Frame:** Jumps the playhead to the last frame of that clip with a patch.
     - **Next Modified Frame:** Jumps the playhead to the next frame forward with a patch.
     - **Last Modified Frame:** Jumps the playhead to the last frame back with a patch.

— **Patch Style:** There are three different kinds of patches you can draw to deal with different kinds of blemishes in the frame.
   - **Draw Rect:** Click and drag to place a rectangular patch of any size from one corner to the opposite corner. Once drawn, you can click on any edge of the overlay and drag to reposition it.
   - **Draw Ellipse:** Click and drag to place an elliptical patch of any size from one corner to the opposite corner. Once drawn, you can click on any edge of the overlay and drag to reposition it.
   - **Place Patch:** Lets you place small patches specifically for tiny details such as dead pixels. When you choose this option, a New Patch Size slider appears that lets you adjust the size of the patches you’re about to place prior to placing them. Once drawn, you can click on the edge of any patch and drag to reposition it.
— **New Patch Size**: (only when Place Patch is selected) Lets you choose how large of a patch to place using the Place Patch tool.

— **Show Patches**: This checkbox lets you show or hide the onscreen outline of every patch in the Viewer.

— **Hide During Interaction**: Hides the onscreen outline of every patch in the Viewer while you’re moving a patch; this makes it easier to see the effect of moving the patch on the image, without the outline getting in the way.

### Patch Type

There are six methods you can use to attempt to fix the contents of a selected patch. When drawing new patches, the currently selected Patch Type will determine what the next patch will be. When you’ve selected an existing patch, changing the Patch Type will change how that patch works.

— **Auto**: The default method. Once you’ve drawn a bounding box, the two frames prior to and the two frames after the current clip will be analyzed and compared to the current image. The best of these 5 frames will be sampled to remove the imperfection in the current frame. Images two frames away are prioritized since that will avoid the appearance of frozen grain, but only if they’re a suitable match to the content of the current frame.

— **+/- 1 Frame**: In this mode, if you draw a bounding box from left to right, the next frame will be drawn upon to remove the imperfection. If you draw a bounding box from right to left, the previous frame will be used.

— **+/- 2 Frames**: If you draw a bounding box from left to right, the image two frames forward will be drawn upon to remove the imperfection. If you draw a bounding box from right to left, the image two frames back will be used.

— **Spatial**: Automatically fills the interior of the selected patch with pixels drawn from the surroundings of the patch, using the Fill Method. This works well for small blemishes, but for large blemishes a pattern might be discernible, which gives away the effect.

— **Clone**: Clone mode copies part of the image to fill a shape or patch placed over the thing you want to remove. In this mode, clicking and dragging to place a Rect or Ellipse over an imperfection is followed by a second click to place the sample region you want to clone. Clicking once to place a Patch will be followed by a second click to place the sample region. Selecting an existing shape or patch and choosing Clone lets you click on the shape to position the clone region. The sample region is indicated by a dotted shape that’s connected to the original shape.

— **Blend Clone**: Operates similarly to Clone mode, except the copied part of the image that fills the Rect, Ellipse, or Patch is blended with the image to integrate it more softly.

— **Fill Method**: When using the Spatial Patch Type, the fill method determines how the blemish in the image is repaired.

  — **Grid**: Samples the pixels surrounding the Rect, Ellipse, or Patch, and blurs them inward both horizontally and vertically. Extremely effective for tiny blemishes. For larger blemishes, a grid-like pattern may emerge.

  — **Horizontal**: Samples the pixels to the left and right of the Rect, Ellipse, or Patch, and blurs them inward.

  — **Vertical**: Samples the pixels to the top and bottom of the Rect, Ellipse, or Patch, and blurs them inward.
— **Patchy**: Samples pixels from all around the Rect, Ellipse, or Patch, and expands and blurs them together to create a soft, non-uniform region with which to repair the blemish. Doesn’t have the patterning of the grid methods of fill, but produces an extremely smooth result.

— **Smooth**: Simply uses a gaussian blur to repair the blemish.

**Patch Options**

These options let you customize the effect of a patch filling over a blemish.

— **Mute**: Lets you turn a particular patch on or off via keyframing. Useful for blemishes that only show up for a few pixels of a shot.

— **Variability**: (Spatial patches only) Raising this parameter lets you make the Fill Method less uniform.

— **Soft Edges**: Lets you soften the edges of the patch.

— **Size Adjust**: Lets you change the size of a patch after its creation.

**Advanced Controls**

These controls let you customize the UI of this effect.

— **Clone Sticks to Mouse**: When enabled, drawing or placing a Rect, Ellipse, or Patch in Clone or Blend Clone mode immediately switches to positioning the sample region, making it faster to use.

— **New Patches Stay Selected**: When enabled, patches stay selected after you draw them, in preparation for further customization.

— **UI Line Thickness**: Lets you choose how thick the on-screen outlines should be.

— **Output Mode**: This lets you see different representations of the patched effect you’re creating. There are four options.

— **Patched Result**: The final result, with each patch repairing the blemish it’s covering.

— **Patch Locations**: Shows a key where each placed patch is white against black.

— **Differences**: Shows the difference of each patch against the original image.

— **Difference Magnitude**: Shows a more pronounced Differences representation.

**Frame Replacer** *(Studio Version Only)*

The Frame Replacer allows you to reuse or blend adjacent frames together to help remove any corrupt frames or artifacts that show up for the duration of just a single frame. It’s useful for fixing problems like a damaged film frame or a video frame that has pixelated digital breakup.

— **Replace This Frame**: Checking this box selects the specific frame in the clip that you want to replace. This will also automatically apply a keyframe at the appropriate location in the clip.

— **Replacement Method**: Allows you to choose the method by which the new frame is created.

— **From Previous**: Replaces the selected frame with the one immediately before it, effectively duplicating the frame.

— **From Next**: Replaces the selected frame with the one immediately after it, effectively duplicating the frame.
— **Blend Prev/Next:** Replaces the selected frame with a blend of the frames immediately before and after it.
— **Optical Flow:** Replaces the selected frame using DaVinci Resolve’s optical flow technology with a blend of the frames before and after it.

## Noise Reduction (Studio Version Only)

Based on the Noise Reduction controls in the Color page, the Resolve FX Noise Reduction is divided into two types of GPU-accelerated noise reduction designed to subdue noise in problematic clips. Both methods of noise reduction can be used separately or together, in varying amounts depending on the needs of the particular material you’re working on.

### Temporal NR Controls

The Temporal NR controls analyze images across multiple frames to isolate noise from detail. Motion estimation settings let you exclude moving subjects from this operation to prevent unwanted motion artifacts.

— **Frames Either Side:** The number of frames on either side of the current frame that you want averaged to separate detail from the noise. You can choose between 0 and 5 frames. 0 applies no frame averaging; higher values apply more frame averaging, at the expense of being significantly more computationally intensive. A higher frame setting may yield a better analysis, but may also yield unwanted artifacts if there are fast-moving images in the frame. A value of 1 may yield better results for fast-moving images. If you need to use higher frame values, but see artifacts, you can also try adjusting the Motion Threshold to fix the issue.

— **Motion Est. Type:** Picks the method DaVinci Resolve uses to detect motion in the image. The default, Faster, is less processor intensive, but less accurate. Choosing Better can effectively exclude motion more accurately, but is more processor intensive. None lets you disable motion estimation altogether, resulting in the application of Temporal NR to the entire image.

— **Motion Range:** Three settings, Small, Medium, and Large, let you set the speed of motion that Motion Estimation should expect to exclude. A Small setting assumes slow-moving subjects with little or no motion blur, allowing Temporal NR to affect more of the image at a given Motion Threshold setting. A Large setting assumes fast motion with blur occupying a larger area of the image, which excludes more of the image from Temporal NR at the same Motion Threshold setting. Choose the setting that gives you the best compromise between reducing noise and the introduction of motion artifacts when adjusting the Motion Threshold parameter.

### Temporal Threshold Controls

The Temporal Threshold parameters allow you to control which image characteristics get more or less noise reduction.

— **Luma Threshold:** Lets you determine how much or how little Temporal NR to apply to the luma component of the image. The range is 0–100, where 0 applies no noise reduction at all, and 100 is the maximum amount. Too high a setting may eliminate fine detail from the image.
— **Chroma Threshold**: Determines how much Temporal NR is applied to the chroma component of the image. The range is 0–100, where 0 applies no noise reduction at all, and 100 is the maximum amount. Too high a setting may eliminate fine color detail from the image. However, you may find you can raise the Chroma Threshold higher than the Luma Threshold with less noticeable artifacting.

— **Gang Luma Chroma**: Ordinarily, the Luma and Chroma Threshold parameters are ganged together so that adjusting one adjusts both. However, disabling this checkbox ungangs these parameters, allowing you to adjust different noise reduction amounts to each component of the image, depending on where the noise happens to be worst.

— **Motion**: Defines the threshold separating which moving pixels are in motion (above this threshold) versus which moving pixels are static (below this threshold). Using Motion Estimation, Temporal NR is not applied to regions of the image that fall above this threshold, to prevent motion artifacts by not applying frame-averaging to parts of the image that are in motion. Lower values omit more of the image from Temporal NR by considering more subtle movements. Higher values apply Temporal NR to more of the image by requiring faster motion for exclusion. You can choose between 0 and 100, where 0 applies Temporal NR to no pixels, and 100 applies Temporal NR to all pixels. The default value is 50, which is a suitable compromise for many clips. Be aware that if you set too high a Motion Threshold, you may see artifacts in moving parts of the image.

— **Blend**: Lets you dissolve between the image as it’s being affected by the Temporal NR parameters (at 0.0) and the image with no noise reduction (100.0). This parameter lets you easily split the difference when using aggressive temporal noise reduction.

### Spatial NR Controls

The Spatial NR controls let you smooth out regions of high-frequency noise throughout the image, while attempting to avoid softening by preserving detail. It’s effective for reducing noise that Temporal NR can’t.

— **Mode**: The Mode drop-down menu lets you switch Spatial NR between three different algorithms. All three modes of operation use the same controls, so you can switch between modes using the same settings to compare your results.

— **Faster**: Uses a computationally lightweight method of noise reduction that’s good at lower settings, but may produce artifacts when applied at higher values.

— **Better**: Switches the Spatial NR controls to use a higher quality algorithm that produces greatly superior results to Faster, at the expense of being more processor intensive to render and not allowing you to decouple the Luma and Chroma Threshold sliders for individual adjustments to each color component.

— **Enhanced**: Does a significantly better job preserving image sharpness and detail when raising the Spatial Threshold sliders to eliminate noise. This improvement is particularly apparent when the Spatial Threshold sliders are raised to high values (what constitutes “high” varies with the image you’re working on). At lower values, the improvement may be more subtle when compared to the “Better” mode, which is less processor intensive than the computationally expensive “Enhanced” setting. Additionally, “Enhanced” lets you decouple the Luma and Chroma threshold sliders so you can add different noise reduction amounts to each color component, as the image requires.
— **Radius**: Options include Large, Medium, and Small. A smaller radius offers greater real-time performance and can provide good quality when using low Luma and Chroma Threshold values. However, you may see more aliasing in regions of detail when using low NR Threshold values. Setting Radius to be progressively larger results in higher quality within areas of greater visual detail at high Luma and Chroma Threshold values, at the expense of slower performance. An NR Radius of Medium should provide suitable quality for most images when using medium NR Threshold settings. As with many operations, there’s an adjustable tradeoff between quality and speed.

**Spatial Threshold Controls**

The Spatial Threshold parameters allow you to control which image characteristics get more or less noise reduction.

— **Luma**: Lets you determine how much or how little noise reduction to apply to the luma component of the image. The range is 0–100, where 0 applies no noise reduction at all, and 100 is the maximum amount. Too high a setting may eliminate fine detail from the image.

— **Chroma**: Lets you determine how much or how little noise reduction to apply to the chroma component of the image by smoothing out regions of high-frequency noise while attempting to preserve the sharpness of significant edge details. The range is 0–100, where 0 applies no noise reduction at all, and 100 is the maximum amount. Too high a setting may eliminate fine color detail from the image. However, you may find you can raise the Chroma Threshold higher than the Luma Threshold with less noticeable artifacting.

— **Gang Luma Chroma**: Ordinarily, the Luma and Chroma Threshold parameters are ganged together so that adjusting one adjusts both. However, you can ungang these parameters to adjust different amounts of noise reduction to each component of the image. For example, if an image softens too much at a certain level of noise reduction, but you find more color speckling than luma noise, you can lower the Luma Threshold to preserve detail while raising the Chroma Threshold to eliminate color noise.

— **Blend**: Lets you dissolve between the image as it’s being affected by the Spatial NR parameters (at 0.0) and the image with no noise reduction (100.0). This parameter lets you easily split the difference when using aggressive spatial noise reduction.

**Global Blend**

— **Blend**: Lets you dissolve between the image with no noise reduction (1.0) and the image with both Spatial NR and Temporal NR at their current settings (0.0).

**Using Noise Reduction**

The following procedure suggests a method of using the Noise Reduction (NR) parameters to achieve a controlled result.
Applying noise reduction to an image:

1. Enable Temporal NR by choosing 1 to 5 frames from the Number of Frames pop-up menu. Keep in mind that more frames dramatically increase the render time of this effect, while it may or may not significantly improve the result, depending on your material.

2. Choose options from the Motion Est. Type and Motion Range drop-down menus corresponding to how much motion is in the image. If there’s a lot of motion, you may need to choose Better and Large. If there’s not very much motion, lesser settings may suffice.

3. With Luma and Chroma Threshold linked, slowly raise either parameter until you just start to see a reduction in noise within nonmoving areas. Then make smaller adjustments to determine the maximum amount you can add without creating artifacts or overly softening detail.

4. If there’s obviously more chroma than luma noise in the image, you can disable Luma/Chroma linking at a satisfactory level of luma noise reduction, and then raise the Chroma Threshold to address color speckling in the picture.

5. Suppose you’re not satisfied with the tradeoff between the maximum possible threshold of noise reduction and the prevention of motion artifacts. In that case, you may want to adjust the Motion Threshold setting, lowering it to omit more of the motion from the noise reduction operation, or raising it to include more motion. If you’re still not satisfied, you can also try better Motion Est. Type and Motion Range settings.

   Keep in mind that the strength of Temporal NR is to reduce noise in unmoving parts of the image. When you’ve achieved the best tradeoff between noise reduction in the still areas and avoidance of motion artifacts in the moving areas of the image, it’s time to turn to Spatial NR to further eliminate noise throughout the rest of the picture.

6. Enable Spatial NR by raising either the Luma or Chroma Threshold parameters, which are linked by default, until you strike a suitable balance between the reduction of noise and an unwanted increase in image softness.

7. It’s recommended to choose the Enhanced option from the Spatial NR mode pop-up, as it will yield the best possible results. However, this can be processor-intensive, so if you need better real-time performance, you can switch the mode to Faster and compare results.

8. If there’s obviously more chroma than luma noise in the image, you can disable Luma/Chroma linking at a satisfactory level of luma noise reduction, and then raise the Chroma Threshold to apply more aggressive Spatial NR to address color speckling in the picture.

9. If you’ve had to use a high Spatial NR Luma or Chroma Threshold setting to reduce noise visibly, and areas of detail look a bit chunky or aliased, you can choose a larger setting from the Radius pop-up menu to enable a more detailed analysis of the scene.

   This will result in higher visual quality, but larger NR Radius settings are more processor-intensive and may reduce real-time performance if you don’t have adequate GPU resources available to your system.

10. If you’ve found suitable noise reduction settings, but the result is too aggressive and makes the image appear too processed, you can try raising the Spatial NR and/or Temporal NR Blend parameters to fade between the noise reduction added by each set of controls, and the image as it was before you added noise reduction.
Try Applying Temporal NR First, then Applying Spatial NR

Because Temporal NR analyzes multiple frames for its noise isolation, it tends to be better at preserving detail accurately in regions of the image where there’s little motion. If you try applying Temporal NR first and get a successful result, even if only in part of the image, you may reduce how much Spatial NR you have to apply, thus improving the overall quality of your final result.

Keep in mind that while Temporal NR does a great job in unmoving parts of an image but is less effective when dealing with subjects in motion, Spatial NR can reduce noise everywhere in the frame falling below its threshold, even when there’s motion. Ultimately, a combination of the two is almost always going to be a winning combination.

Spatial NR Radius, How Large Should You Go?

Larger NR Radius settings can dramatically improve the quality of high-detail regions in shots where you’re using aggressive Spatial noise reduction, but it’s not necessary to always jump to the large Radius setting, which provides the highest precision. In many cases, when evaluating an image that you’re applying noise reduction to, you may not be able to perceive the additional quality. You’ll waste processing time on an unnecessary level of correction.

It’s a good idea to evaluate the full-frame image on a large enough display to see the noise you’re working on within the viewing context of the intended audience. Zooming really far into a clip while applying noise reduction may encourage you to use higher quality settings than are necessary because an excessively enlarged detail of an image lets you see subtle changes that you wouldn’t notice at actual size.

Object Removal (Studio Version Only)

A Revival category plug-in that’s best used in the Color page, Object Removal uses the DaVinci Neural Engine to attempt to remove an object in the frame as automatically as possible. This plug-in works best when removing a moving object that passes over a temporally stable background, or dirt on the lens of a shot where the camera is in motion. Smaller objects get better results than larger objects, but your results really depend on the footage. Here’s a simple procedure that shows how to do this.

To remove a moving object from a clip:

1. In this example, a drone is flying through a long shot that’s being simultaneously recorded. We’ll remove the drone using a window to identify the feature to be removed using the Object Removal plug-in.

   ![The original shot with a drone that needs to be removed](image)
In simple cases, it’s often easiest to apply the Object Removal effect to a Corrector node, so you can use a window or qualifier within that node to isolate the feature you want to remove. That’s what we’ll do in this example.

2 Use the Window palette to draw a window around the object that needs to be removed. You’ll get the best results using windows or masks that hug the feature being removed fairly closely.

3 Track or keyframe the window to move with the feature you’re removing. Again, you’ll get better results the closer your window hugs the object being removed, and it’s good to have some softness at the edge of this window.

![Object that needs to be removed is isolated with a window](image1.jpg)

4 Drag and drop the Object Removal plug-in onto the node in which you’ve just isolated the feature to be removed.

5 The “Use OFX Alpha” option will be activated automatically in the node’s contextual menu to enable the Object Removal plug-in to use whatever key has been created within that node to do its work.

6 Click the Scene Analysis button, and wait for the analysis to finish. If the object you’re removing is moving but the camera is locked, you can turn on the “Assume No Motion” checkbox to improve your results in this case.

   If your footage is ideal for object removal, the object will disappear once analysis is complete, replaced by a seamless background derived from detail found on neighboring frames.

![The result after object removal analysis is complete](image2.jpg)

The Object Removal plug-in is highly footage dependent, and you won’t always get this good a result this easily. Problems with the result are shown via gray, either gray fringing or solid gray filling the
replacement window. Gray shows you where the current settings are failing to find background content with which to fill in the patch you’re removing. If this happens, there are two things you can try.

— If you notice while playing through the analyzed result that the object removal mask has gray fringing on some frames, you can try adjusting the “Search Range” slider, which is the distance, in frames, from the current frame that the Object Removal plug-in is searching for replacement image detail. For example, if the Search Range is 20, it searches +/-20 frames from the current location, or 40 frames total. The allowance of 10 frames means we look at every 4th frame. You will generally get the best results for the smallest range that gives an acceptable result.

— If you’re noticing that the object removal mask is filled entirely with gray on some frames, this means that background fill couldn’t be easily generated for those frames. In this case, you can try clicking the “Build Clean Plate” button, which takes a “best guess” approach to generating a background with which to fill the frame and integrates this with frames that could be successfully filled in.

— If the patch is successfully filled, but the result isn’t blending well with the background, you can try changing the Blend mode. The default is Linear, which is a simple cloning operation, but you can also choose Adaptive Blend, which can provide better results except in certain situations where the edges of the replacement patch have a different color or brightness than the background.

— The Scene Mode drop-down menu provides different methods of analyzing the scene, for improving the analysis of how the area that needs to be replaced moves, to best determine how to fill the hole left by the object being removed. Background analyzes the entire image except for the object region. Boundary analyzes the boundary area surrounding the object region. Object is for analyzing an object that moves with the background, like a sticker that’s on a window while the camera moves.

**Patch Replacer (Studio Version Only)**

The Patch Replacer is a quick fix when you need to “paint out” an unwanted feature from the image. For those of you who’ve been using windows and Node Sizing to do small digital paint jobs, this plug-in offers more options and a streamlined workflow.

On adding the plug-in, an onscreen control consisting of two patches appears, with an arrow connecting them indicating which patch is being copied into the other. The patch to the left is the “source” patch, used to sample part of the image, and the patch to the right is the “target” patch, used to cover up the unwanted feature using pixels from the source patch.

To use the Patch Replacer, simply drag the target patch over the feature you want to obscure, resize it to fit using the corner controls (the source patch is automatically resized to match), and then drag the source patch to an area of the image that can convincingly be used to fill the target patch.

(Left) Original image, (Right) Removing the thermostat with the Patch Replacer
The source and target patches can be motion tracked using the FX tracker, so this tool is effective even if the subject or camera is moving.

**Main Controls**

The Fill-in Method pop-up menu is arguably the most important, as it defines what method to use to fill the destination patch with whatever is in the source patch. The rest of the primary controls work differently depending on which Fill-in method you choose.

— **Clone**: Simply copies the source patch into the target patch. When Clone is selected, the Replacement Detail slider (which defaults to 1) lets you fade out the source patch, while Region Shape lets you choose a different kind of shape to use, and Blur Shape Edges lets you feather the edge of this operation, to more convincingly blend the source with the target area.

— **Adaptive Blend**: A much more sophisticated method of obscuring the target area using pixels from the source patch, and in many cases will yield better results more quickly than cloning. The source patch is copied into the target patch in such a way as to combine the source detail with the lighting found inside of the target area, creating in most instances a fast, seamless match. The Keep Original Detail checkbox, when turned on, merges detail from the source and target patches to create a composite, rather than a fill. The Blur Shape Edges slider works a bit differently with Adaptive Blend selected, but the idea is the same, feathering the effect from the outside in to obscure instances where there’s a noticeable border around the target area.

— **Fast Mask**: Eliminates the source patch, doing instead a quick neighboring pixel blend that works well with small patches but can betray a grid pattern on larger patches. Region Shape and Blur Shape Edges are both adjustable.

**Patch Positions**

Source X and Y, Target X and Y, and Target Width and Height are provided as explicit controls both for numeric adjustment, should that be necessary, and also to allow for keyframing in case you need to change the position and/or size of the source and fill patches over time.

Keep in mind that the source and target patches can be motion tracked using the FX tracker, although two checkboxes, Source Follows Track and Target Follows Track, let you disable FX tracker match moving when necessary.

The Align Source to Target button moves the source patch directly over the target patch, allowing you to quickly reset and iterate the location of the source patch.

**Onscreen Controls**

The Control Visibility pop-up menu lets you choose whether the source and target onscreen controls are visible as you work. Show (the default) leaves all onscreen controls visible all the time. Auto Hide hides all onscreen controls whenever you’re dragging one, letting you see the image as you adjust it without having these controls in the way. Hide makes all onscreen controls invisible, so you can see a clean version of the image with the effect, however you can still edit the effect if you remember where the controls are.
Chapter 160

Resolve FX Sharpen

These plug-ins offer a newer and more detailed method of sharpening specific details in images than the sharpen operation found in the Blur palette. Three different plug-ins offer different ways of using the same fundamental algorithm to perform different tasks.

Contents

- **Sharpen** *(Studio Version Only)* 3349

  - Detail Levels 3349
  - Chroma 3349
- **Sharpen Edges** *(Studio Version Only)* 3350
  - Main Controls 3350
  - Edge Detection Controls 3350
- **Soften and Sharpen** *(Studio Version Only)* 3351
  - Main Controls 3351
  - Adjust Small Skin Texture Granularity 3351
Sharpen (Studio Version Only)

The Sharpen filter functions by separating the image into four levels of detail, the underlying structure, the fine scale details, the medium scale details, and the large scale details, each of which encompasses differently sized structures that comprise the overall image. In this way, the Sharpen filter lets you apply different amounts of sharpening to each of the fine, medium, and large structures of the image, giving you enormous control over how these different structures of image detail are affected.

Main Controls

Controls the overall sharpening effect.

— Sharpen Amount: The primary global control that lets you add sharpening to the image. To refine the result, use the controls in Detail Levels to choose how much sharpness to apply to each size of structure this plug-in can operate upon. 1.800 is the default value. 0 is no sharpening, 5.000 is maximum sharpening.

Detail Levels

Lets you customize the sharpen effect in a variety of highly specific ways.

— Fine Detail Size: This slider adjusts the threshold of what is considered to be a fine detail, although this also alters which image structures are affected by the Medium and Large Details sliders as well. Lowering this slider omits larger structures of the image from sharpening. The default is 0.050.

— Fine Detail: At its default setting, the Fine Details slider governs the sharpness of extremely fine detail such as skin pores and strands of hair, or small speckles on textured surfaces. Lower settings apply less sharpening to these structures, while higher settings apply more sharpening.

— Medium Details: This slider governs the sharpness of coarser detail such as freckles, wrinkles, clusters of hair, and surface details with greater edge definition. Lower settings apply less sharpening to these structures, while higher settings apply more sharpening.

— Large Details: This slider governs the sharpness of the largest details in the image, such as eyelids, the shadows at the edges of lips and noses, and the edges where hair meets the face, and the most contrasty edge details throughout the image. Lower settings apply less sharpening to these structures, while higher settings apply more sharpening.

Chroma

A special purpose control that you want to handle with care.

— Sharpen Chroma: Selectively sharpens the chroma of the image while leaving the luma (Y) alone.
Sharpen Edges (Studio Version Only)

A variation of the Sharpen filter that’s streamlined for detecting edges to create a key used to limit sharpening to the selected edge details of an image. This is a good filter to use when attempting to make mildly soft-focus clips less objectionable.

Main Controls

Controls the overall sharpening effect accomplished with this plug-in.

— **Sharpen Amount**: The primary global control for adding sharpening to the edges detected by this filter.
— **Sharpen Radius**: Controls the granularity of the detail that’s added using Sharpen Amount.

Edge Detection Controls

These controls let you customize the sharpen effect in very specific ways.

— **Display Edges**: This checkbox lets you see a grayscale preview of the edges that are being detected for sharpening while you use the other controls in this group. If you turn this checkbox on, you can see precisely the effect that the four other controls in this section have on the key that determines which parts of the image are sharpened.
— **Pre Denoise**: Smooths the matte to remove individual pixels of noise. Reducing Pre Denoise lets you minimize edges from the key that you don’t want to sharpen and soften edges that are jagged because of excessive noise. Raising Pre Denoise adds more edges to the sharpening operation and strengthens the edges that are already there.
— **Edge Detect Threshold**: Lets you adjust how strong edge detail needs to be in order to be included in the key. Reducing this parameter includes more edges in the operation, while raising it excludes edges from the operation.
— **Edge Mask Strength**: Lets you increase the intensity of the edges in the key. Reducing Edge Mask Strength diminishes the edges and reduces the intensity of sharpening in those areas. Raising Edge Mask Strength intensifies the edges and adds more of the image within the region of each detected edge to the sharpening operation.
— **Edge Blur**: Lets you control the softness of the edges in the key. Reducing Edge Blur sharpens the key and narrows the edges that are affected by sharpening. Increasing Edge Blur softens the key and potentially includes a wider area of image detail in the sharpening operation.
**Soften and Sharpen** *(Studio Version Only)*

A variation of the Sharpen filter that’s streamlined for letting you both smooth some details and add sharpness to other details of the image based on the size of the structures. It can be used with any image for which you want to smooth some features while sharpening others, but this is an operation that’s often used for minimizing unwanted blemishes, wrinkles, or scarring when used within a window or qualifier that’s isolating the skin.

The advantage of using Soften and Sharpen is that you can use the Small Texture slider to leave a bit of natural skin detail intact, such as pores and other small naturalistic details, while you use the Medium and Large Texture controls to smooth out unwanted details in whatever proportion gives you a naturalistic result.

**TIP:** The best way to achieve a more natural result is to leave Small Texture at 0 or just above, while reducing Medium Texture just enough to minimize whatever details merit minimizing and reducing Large Texture by somewhat less to minimize larger blemishes, while leaving overall face detail intact. This is the logic behind the default values of Small 0.000, Medium –0.800, and Large –0.300.

**Main Controls**

Each of the Small, Medium, and Large Texture sliders can be moved into both negative and positive values. A value of 0 means no change is made to the corresponding details of the image. Negative values remove the corresponding details from the image, eventually leaving only the underlying smooth structure of the image at –1.000. Positive values add sharpness to the corresponding details of the image, to a maximum value of 1.000.

— **Small Texture:** Affects extremely fine detail such as skin pores and strands of hair.
— **Medium Texture:** Impacts coarser detail such as freckles, wrinkles, and clusters of hair.
— **Large Texture:** Affects the largest details in the image such as eyelids, eyebrows, the edges of lips and noses, and the edges where hair meets the face.

**TIP:** What’s identifiable as a small, medium, or large structure depends in large part on how the subject of the shot is framed. These structures differ depending on whether you’re grading a subject in a long shot (where they appear small) versus a subject in closeup (where they appear large).

**Adjust Small Skin Texture Granularity**

This control lets you adjust the distinction between the Small and Medium/Large texture controls in the previous group of controls.

— **Small Texture Size:** Defines the threshold that differentiates Small Textures from Medium and Large Textures, to help you fine-tune the Small Texture that you want to preserve. Raising this value includes more of the image as small details, while lowering this value excludes more of the image from small details.
Chapter 161

Resolve FX Stylize

The plug-ins found in this category all enable different ways of creating artistic modifications to the image.

Watercolor (Studio Version Only) 3364
Abstraction (Studio Version Only)

A deceptively powerful filter that lets you create a wide range of cartoon-like renders by simplifying an image into adjustable pools of similar color with optional outlines.

Main Controls

These controls create the foundation of this effect.

- **Pre Blur**: Simplifies the image by blurring unwanted details prior to this filter taking effect.
- **Abstraction Strength and Iterate Abstraction**: These parameters work together to then smooth the image, creating pools of simplified color within the details of the image.
  - **Abstraction Strength**: Must be higher than 0 for the Iteration No. parameter to have an effect. Higher Abstraction Strength simplifies image detail even more by averaging adjacent regions of color together.
  - **Iterate Abstraction**: Reduces the amount of small detail in the image even further by “widening” adjacent areas of similar color to blend together as one.

Quantization Controls

These controls simplify the pools of color even more aggressively by quantizing the bit depth used to stylize the image. The result is an even sharper flattening of each region of color.

- **Quantization**: A checkbox turns this function on.
- **Steps**: Raising this parameter lets you subdivide each region of color into a greater number of separate regions.
- **Softness**: Lets you blur the border between each level of color.

Draw Edge Controls

Adds an edge to the regions of color created by this effect.

- **Draw Edge**: Enables edge drawing.
- **Edge Strength**: Raising this value results in thicker and better-defined edges.
- **Edge Detection Threshold**: Raising this value restricts edges to only the boldest edge details in the picture.

Blanking Fill

This plug-in is specifically designed to quickly fill black frame blanking with a stylized image derived from the clip itself, to make blanking less intrusive for viewers in documentaries and news segments. In the following example, the Blanking Fill plug-in is used to add image to the left and right of “pillarboxed” standard definition 4:3 video that appears within a High Definition or Ultra High Definition 16:9 aspect ratio.
A variety of controls let you easily customize this effect to suit your own purposes.

**Source**

These controls let you transform the clip in different ways, which also affects how that clip is used to fill the blanking area.

- **Zoom**: Zooms the clip while keeping it within the native domain of definition. Good for quickly cropping unwanted pixels around the edges so they’re hidden and aren’t used for blanking fill.
- **Gang Left/Right Sliders**: On by default, locks both sliders together so moving one moves the other by a mirrored amount.
- **Crop Left and Right**: Crops both the left and right edges of the image and increases the area at the sides with blanking fill.
- **Gang Top/Bottom Sliders**: On by default, locks both sliders together so moving one moves the other by a mirrored amount.
- **Crop Top and Bottom**: Crops both the top and bottom edges of the image and increases the vertical area with blanking fill.

**Fill Extent**

These controls let you choose how the current duplicate of the image is stretched to fill the blanking area.

- **Zoom Mode**: There are three options:
  - **Stretch to Timeline**: Automatically warps the image to stretch it to fit the full frame. Keeps features in the blanking fill area level with where they appear in the original image.
  - **Zoom to Timeline**: Automatically zooms into the image to fit the full frame. Results in the clip looking “inset” from the blanking fill image.
  - **Manual**: Reveals Expand and Aspect sliders that let you manually choose how much to zoom and stretch the image to fit the blanking fill area.

- **Warp Top Layer**: lets you use onscreen controls to choose a section of the edge of an image to stretch out to fill blanking in the frame. In this mode, there are two sets of onscreen controls you can use to customize the result:
  - A set of outer handles let you choose how far out to warp the edges of the image to fill whatever blanking there is. These default to the project frame size.
A set of inner handles lets you choose how much of the image you want to stretch out. These default to the current title safe boundary. If you customize these, choosing too narrow an edge results in a more extreme warping and stretching effect, while choosing a wider edge to stretch looks more natural, but affects more of the frame.

— **Expand:** (Only appears when Zoom Mode is set to Manual) Zooms the image.
— **Aspect:** (Only appears when Zoom Mode is set to Manual) Stretches the image.

(Left) The original 4:3 image edited into a 16:9 timeline with black pillar boxing to the left and right as a result, (Right) The image with Blanking Fill set to Warp Top Layer, stretching the left and right edges to fill the blanking area

### Fill Appearance

These controls let you change the look of the image being used to fill the blanking area.

— **Blend Edges:** Lets you feather the edges where the original image meets the blanking fill area.
— **Blur Background:** Lets you choose how much or how little to blur the image that fills the blanking fill area.
— **Fade Amount:** Lets you fade or tint the blanking fill area. At 0, there’s no fade applied. At 1.000, the blanking area is filled with a solid color defined by the Fade Color control.
— **Fade Color:** A color picker/eyedropper combination that lets you choose a color with which to fade, tint, or fill the blanking fill area.

### Drop Shadow

These controls let you add a drop shadow to “lift” the foreground image against the blanking fill image.

— **Shadow Strength:** Lets you choose how solid the drop shadow appears.
— **Drop Angle:** Lets you choose the angle the drop shadow appears at. At 0 the drop shadow is centered.
— **Drop Distance:** Offsets the drop shadow farther in the direction of the Drop Angle
— **Blur:** Softens the drop shadow.
— **Color:** Tints the drop shadow.
Drop Shadow

Lets you add a simple drop shadow to any clip, using that clip’s native or generated alpha channel to create the shape of the shadow.

— **Shadow Strength**: Lets you choose how solid the drop shadow appears.
— **Drop Angle**: Lets you choose the angle the drop shadow appears at. At 0 the drop shadow is centered.
— **Drop Distance**: Offsets the drop shadow farther in the direction of the Drop Angle
— **Blur**: Softens the drop shadow.
— **Color**: Tints the drop shadow.

Edge Detect

An edge detection effect with options for customizing which edges create outlines.

— **Mode**: Lets you choose between RGB and Grayscale edges. RGB is the default.
— **Edge color**: (only enabled if Mode is set to Grayscale) Lets you colorize the edge outlines that are generated.
— **Threshold**: Determines the lightness level that’s used for edge creation.
— **Smooth**: Lets you soften these edges.
— **Brightness**: Lets you adjust edge intensity.
— **Denoise Type**: Can be switched between Soften and Sharpen, to preprocess the image.
— **Denoise Strength**: Raise this slider to emphasize dominant outlines and de-emphasize weak ones.
— **Edge Mask Overlay**: This checkbox lets you superimpose the edges created with this filter over the RGB image via a multiply operation.

Emboss

An emboss effect with several options to create different kinds of outline and emboss effects.

— **Emboss Style**: This pop-up lets you choose from among Relief, Emboss Over, Sobel, and Laplacian types of embossing.
— **Power**: Lets you adjust how pronounced the emboss effect is.
— **Angle**: Lets you choose the apparent angle at which the emboss effect is rendered.

Channels

Three checkboxes let you choose to use the Red, Green, and Blue channels to create this effect.
**Halation** (Studio Version Only)

An effect that mimics the subtle light scatters, reflections, and analog blooms of light reflecting back through the dye layers of motion picture film. This usually presents itself as a fine red/orange tinted glow around high contrast bright regions, like lights or reflections. Halation can also be caused by light reflections within processing and development equipment, or in the camera itself. These minor flaws can add a subtle organic and analog look to digital files.

The Halation effect can add an organic and analog look to your digital files. Original (L), Halation (R).

There are a variety of tools and controls to give you fine detail on exactly how the halation will appear.

The shot before the Halation effect

The Halation effect on the same image; note the halation in the water reflections and the woman in the white T-shirt.
Processing Color Space

Lets you choose the color space for the Halation effect. The default is the same as the current timeline.

Isolation

The Isolation controls define which regions of your clips will form halation halos.

— **Threshold**: The level low clip level for the Halation effect.
— **Normalization**: The high clip level for the Halation effect.
— **Film Saturation Level**: The level below which all color is suppressed and saturated to white. Especially useful in HDR workflows so the resulting Halation effects are visible at HDR brightness levels.
— **View Isolated Regions**: Shows only the regions isolated for generating the Halation effect.

![View Isolated Regions](image)

The View Isolated Regions checkbox shows you the areas that will be affected by the halation.

Dye Layer Reflections

The Dye Layer Reflections controls give you the ability to fine tune the physical characteristics of the halation glow.

— **Strength**: Controls the brightness of the reflection.
— **Gamma**: Controls how the glow spreads out.
— **Saturation**: Controls the intensity of the color of the glow.
— **Spread**: Defines the extent of the dye reflection.
— **Fine Tune Relative Spread**: Checking this box allows you to manually adjust the red, green, and blue reflection distances.
Secondary Glow

The Secondary Glow controls add additional halation characteristics.

— **Strength**: Controls the brightness of the secondary glow.
— **Gamma**: Controls how the glow spreads out.
— **Spread**: Defines the extent of the glow around bright detail.
— **Filter**: Limits the color of the glow in the selected color.

Basic Grain

These controls are a subset of the Film Grain effect for quick grain settings. If you prefer, you can add an instance of the full Film Grain effect after the Halation effect on the same node for greater detail.

— **Append Gain internally**: Turns on the simplified grain control.
— **Strength**: Adds grain to the halation layer.
— **Size**: Controls the size of the grains in the halation layer.
— **Softness**: Softens the grain texture.
— **Saturation**: Applies saturation on the grain.

Global Adjustments

— **View Glow Alone**: This checkbox shows the Halation effect alone before its added to the frame. This is a useful setting to turn on when modifying any of the above tools.

The View Glow Alone checkbox shows you only the Halation effect in isolation and not blended with the underlying image.

— **Reduce Highlights**: Reduces the effect where it will brighten the scene without contributing to the halo. This essentially confines the halo to the edges of a region, without blowing out the region itself.
— **Aspect Ratio**: Stretch or squeeze the glow and grain horizontally for anamorphic projects.
— **Detail Loss**: Removes sharp detail that the film stock should not have captured by defocusing the image under the effect.
Mirrors

An effect that lets you reflect part of the image in any direction you like. At its simplest, this can create a split mirror effect like that found at the end of Prince’s “When Doves Cry.” At its most complicated, multiple reflections can be set up, to create whirling Kaleidoscope patterns in the image.

Main Controls

These controls let you choose what kind of effect this plug-in has.

— **Mirror Placement**: Lets you choose different types of mirror effects including Individual (a simple reflection), Rosette, and Kaleidoscope.
— **Reflect at Borders**: Lets you add another reflection of the image whenever the angle and position of your reflection would result in offscreen black coming into the frame.

Individual Controls

When Mirror Placement is set to Individual, a series of six sets of Mirror parameters lets you add multiple mirrored edges in different combinations; by default only one is on, but you can turn more edges on to create more complicated mirror effects. Each group of Mirror parameters has the following parameters:

— **Enable Mirror**: Turns that mirror reflection on.
— **X and Y Position**: Positions the center of the mirror split reflection.
— **Angle**: Lets you adjust the angle of the seam along which a reflection will run.
— **Flip**: Flips which side of the image is reflected.

Rosette Controls

When Mirror Placement is set to Rosette, a single set of parameters creates a variety of circular patterns.

— **X and Y Position**: Positions the center of the circular rosette reflection.
— **Angle**: Lets you adjust the orientation of the rosette pattern about its center.
— **Wedge Width**: Lets you adjust the thickness of the wedges around the outside of the rosette pattern, and by extension how many wedges there will be. Thicker wedges results in fewer reflections around the rosette pattern and thinner wedges result in more reflections around the rosette pattern.

Kaleidoscope Controls

When Mirror Placement is set to Kaleidoscope, a single set of parameters lets you create a variety of kaleidoscopic images:

— **X and Y Position**: Positions the center of the mirror split reflection.
— **Center Size**: Lets you shrink or expand the cells comprising the kaleidoscopic image.
— **Angle**: Lets you adjust the angle of the seam along which a reflection will run.
— **Number of Sides**: Three sides produce a triangular pattern, while four sides produce a rectilinear pattern aligned with the currently selected angle.
Pencil Sketch in DaVinci
(Studio Version Only)

A plug-in with highly customizable controls for making an image look like it was drawn.

— **Sketch Stroke Controls**: Parameters to control the thickness of outlines, the threshold at which they appear around objects in the frame, and their length.

— **Sketch Tone Controls**: Parameters to control how many levels of tonality are in the rendered result, and contrast controls to influence how much of the image falls into shadows, mid-tones, and highlights.

— **Sketch Texture Controls**: Parameters to apply a customizable stippled texture over the image, with a checkbox to auto animate it.

(Left) The original image, (Right) The image with Pencil Sketch applied

Prism Blur

Simulates flat chromatic aberration and a vignetted lens.

— **Blur Strength**: Lets you blur the primary image.

— **X and Y Position**: Let you change the center of the effect within the frame about which chromatic aberration is created.

— **Aberration Distance**: Adjusts how far the aberration effect appears from the source image.

— **Aberration Strength**: Intensifies the zoom blur used to create the chromatic aberration effect to intensify it.

— **Vignette Size**: Lets you add edge vignetting to the image; setting this to 0 removes the vignette, while 1 is the maximum size of a vignette using this filter.

— **Vignette Sharpness**: Lets you adjust the feathering of the vignette effect; lowering this value softens the edge, while raising this value sharpens, but never fully eliminates the softness from this edge. The Vignette effect is designed to fall off in a way that simulates how a lens would exhibit vignetting.
Scanlines

Simulates television scanlines, or any effect where you want alternating lines to darken the image. A variety of parameters makes this an extremely flexible effect that can be applied in numerous ways.

Appearance

Let you customize the type of scanline effect you want.

— **Line Frequency**: Lets you choose how many or few lines are superimposed on the image; fewer lines automatically space themselves to be thicker as they’re uniformly distributed across the image.
— **Line Sharpness**: Lets you blur the border between each line, softening the effect.
— **Line Angle**: Lets you rotate the lines to appear at any angle; the default is 0 which results in horizontal lines.
— **Line Width**: Lets you increase or decrease the width of the blanking lines that obscure the image (which default to black but are tinted by the Color 2 parameter), thus increasing or decreasing the amount of image showing through.
— **Line Shift**: Lets you offset the lines being overlaid on the image. Animating Line Shift lets you create a rolling scanlines effect.

Color

Lets you tint and shift channels of the alternating scanlines created by this filter. Exaggerated, this can create numerous other stylistic effects.

— **Color 1 and Color 2**: Color picker and eyedropper controls that let you tint each alternating set of lines (eyedroppers let you sample a color from the RGB image being input into the current node).
— **Shift Red, Green, and Blue**: Lets you offset individual channels.
— **Scanlines Only**: Lets you see just the scanlines in isolation while you adjust them.

Composite

Lets you choose how to composite the scanlines effect against the original image.

— **Scanlines Only**: Lets you output an image consisting only of the scanlines pattern you’ve created. Good for creating different kinds of patterned textures and mattes.
— **Composite Type**: Lets you choose which composite mode is used to blend the scanline effect into the image.

Stylize (Studio Version Only)

A plug-in that lets you apply one of a variety of painterly styles to an image based on analyses of different paintings, in such a way as to provide a temporally stable result for moving images as the style strokes will appear to be applied to individual objects in the scene that move and flow in a consistent way. There are two controls:
— **Styles:** A pop-up menu lets you choose an artistic style to apply to the image.
— **Style Scale:** This slider lets you adjust how large or small the applied art strokes should be applied.

![Original Image](image1.png) ![Image with Style Transfer](image2.png)

(Left) The original image, (Right) The image with Style Transfer applied and set to Dance with a Style Scale of 4

**TIP:** This plug-in is more flexible than you think, if you apply Style Transfer in a layered way against the original image. You can do this using a duplicate layer in the Edit page, or using two nodes representing the Style Transfer effect and original image connected with a Merge node in the Fusion page or a Layer node in the Color page. Once that’s set up, simply combine the Style Transfer output with the original image using composite modes and opacity adjustments for more sophisticated blending. In particular, using the Luminosity composite mode lets you combine the texture from the Style Transfer while retaining the color of the original image, or using the Saturation composite mode lets you combine the color from the Style Transfer while retaining the texture of the original clip.

---

**Tilt-Shift Blur (Studio Version Only)**

Simulates depth-of-field effects using a progressive blur that’s applied with a generated Z-depth map. The default settings create a “miniaturization” illusion, where the image appears to be tiny due to the top and bottom depth-of-field settings used.

**Main Controls**

These controls select and control the overall effect.

— **Blur Type:** You can choose between Fast Blur and Lens Blur (Lens Blur is the default).
— **Blur Strength:** A slider lets you adjust the amount of blur you add.

**Lens Iris**

The Lens Iris controls are only available when Blur Type is set to Lens Blur. This is a simplified set of controls from those of the Lens Blur filter.

— **Iris Shape:** Lets you choose what type of apertures you want to use, with which to influence the shape of the bokeh effect. Aperture Shape options include Triangle, Square, Pentagon, Hexagon, Heptagon, or Octagon shaped aperture.
— **Blade Curvature**: (Only available with Real and Creative Apertures) Lets you round off the edges of the Aperture Shape you selected.

— **Rotation**: Lets you adjust the angle the shape appears at.

— **Anamorphism**: Lets you adjust the aspect ratio of this effect in order to match the lens blur created by anamorphic lenses.

— **Highlights**: Lets you adjust how the highlights of the image affect the blur, dilating or eroding the image more or less depending on how high Smooth Strength is.

### Depth of Field

Additional Depth of Field settings let you adjust the depth map being used to create the depth-of-field effect.

— **Depth Map Preview**: This checkbox lets you see the grayscale depth map directly while making these adjustments. The white area will be blurred, while the black area will be unaffected.

— **Center X, Center Y, and Angle**: These parameters let you transform the depth map.

— **In Focus Range**: Lets you expand or contract the black center of the depth map that defines the blurred region.

— **Near Blur Range and Far Blur Range**: Two parameters let you individually adjust the falloff of the white bottom and top of the depth map.

### Vignette

A plug-in with two modes for creating vignette effects of different kinds.

— Basic mode gives you Size, Anamorphism, and Softness controls for quickly creating a traditional lens vignetting effect to darken the edges of the frame. A Color control lets you tint the vignette.

— Advanced mode adds Border Shape, Rotation, Center, Transparency, and Composite Type controls for customizing this vignetting effect even more specifically.

### Watercolor (Studio Version Only)

A variation on the Abstraction filter, this filter reduces images into simplified washes of softly blended colors, in a very painterly fashion.

— **Channels**: This pop-up menu lets you choose whether to use Luminance or RGB to derive the smoothed color from.

— **Show Gradient**: This checkbox lets you see the boundaries that define each area of smooth color, based on the value you choose from the Smoothness slider below.

— **Smoothness**: Adjusts the amount of detail in the final result. Low smoothness values result in more detail in the smoothed result, while higher values result in larger pools of lower detail yet smoother color.
DaVinci Resolve comes with several Resolve FX that focus on the application of an effect over time.

**Contents**

- Advanced Options 3368
- General 3368
Motion Blur (Studio Version Only)

This effect replicates the Motion Blur panel in the Color page’s Motion Effects palette. The Resolve FX version allows you to use these tools across the other pages in the program. Motion Blur settings use optical flow-based motion estimation to add artificial motion blur to clips that have none. This can be useful in cases where a program was shot using a fast shutter speed, and you later decide that the resulting video has too much strobing. By analyzing the motion within a clip, the Motion Blur settings can selectively apply blurring to the image based on the speed and direction of each moving element within the scene.

Three parameters let you set how much motion blur to add, and at what quality:

- **Motion Est. Type:** A setting of Better provides more accurate pixel mapping at the expense of being more processor intensive. Faster provides a more approximate result but is less processor intensive.
- **Motion Range:** Determines what speed of motion to consider when defining regions being blurred.
- **Motion Blur:** Raise this parameter to add more motion blur to the image, lower it to add less. The range is 0–100, where 0 applies no motion blur, and 100 applies maximum motion blur.
- **Blur Direction:** Allows you to chose which way the blur extends from the current frame. The options are: Both Directions, From Previous Frame, and Towards Next Frame.
- **Granularity:** Adjusts how much detail is added to the blur.

Motion Trails (Studio Version Only)

The Motion Trails effect copies the image to create ghost-like trails on moving images. This effect can be used to simulate clips shot with long shutter speeds and analog video feedback effects.

**General**

The first two sliders control the number and strength of the copied frames.

- **Trail Length:** Determines the number of copies that are used to create the trails.
- **Dropoff:** Sets the fade applied to each copied frame. The Dropoff value is compounded. For instance, using a value of .5 applies 50% opacity to the first copy, 25% to the second, 12.5% to the third, and so on.

**Advanced Options**

The advanced options are used to control how the overlapping copied frames are blended.

- **Composite Gamma:** The Composite Gamma menu provides four options for controlling the brightness of the overlapping frames.
- **Timeline:** Uses the Timeline Color Space setting in the Project Settings to control the overlapping brightness. This setting, by default, is Rec. 709, Gamma 2.4.
- **Rec. 709:** Uses a Rec. 709 color space with Gamma 2.2 to control the overlapping brightness.
— **Linear:** Uses Linear Gamma, often producing much stronger highlights.
— **Custom:** Provides a custom gamma slider which defaults to Gamma of 2.4. Setting this to a value of 1.0 is the same as setting the menu to Linear.

— **Input Alpha:** There are three choices in the Input Alpha menu that determine how the alpha channel is used for blending the frames. All three options assume there is an alpha channel present on the clip that has the Motion Trail applied.
— **Ignore:** This is the default option and will cause the alpha channel to be ignored. Disabling the Use Alpha checkbox when Ignore is selected will cause the alpha to act as a stencil effect for the trails.
— **Onto Current:** Uses the alpha channel for the trails, but instead of compositing it over the lower video track, the trails are composited over themselves using the current frame.
— **Onto Black (Alpha Out):** This option uses the alpha channel for the trails and compositing over the lower video track, assuming the Use Alpha checkbox is enabled.

**Move Trail**
This group of controls determines the offset, direction, size, and rotation of the copies. Adjustment amounts are applied as offsets from one copy to the next. For instance, if rotation is set to 5 degrees, the first trail copy is rotated 5 degrees, the second trail copy is rotated 10 degrees, the third copy is rotated 15 degrees, and so on.

— **Pan:** Adjusts the offset of the trail copies from the original image.
— **Pan Angle:** Changes the angle at which the trails are offset from the original image. The values are shown in degrees.
— **Zoom:** Adjust a scale adjustment, successively, to each copy.
— **Rotate:** Applies an angle of rotation, successively, to each copy.
— **Reuse Current Frame:** When this checkbox is disabled (the default), each copy uses the frame after the copy before it. For instance, the first copy is the current frame -1, and the second copy is the current frame -2. When this checkbox is enabled, all copies use the same frame as the current frame in the clip.
— **Border Type:** This menu determines how edges of the frame are handled when the copies are scaled smaller than the timeline resolution.
— **Black:** The area outside the image is set to black.
— **Soften:** This control blends the edges of the rectangular frame borders to give the images a more organic appearance.
— **Replicate:** Duplicates the outermost pixels along the edge of the image. The pixels are stretched out from each side to reach the timeline resolution boundary.
— **Reflect:** The image is flipped and flopped to create a mirrored image that extends to the timeline resolution frame boundary.
— **Wrap-Around:** Duplicates the image to create a video wall effect, used to fill in the space to the timeline resolution frame boundary.
Smear (Studio Version Only)

The Smear effect simulates motion blur in a clip by blending a user-definable number of frames.

- **Frames Either Side**: Determines the number of frames that are blended on either side of the current frame. For instance, entering a value of 2 uses two frames before and two frames after the current frame to create the effect.

- **Luma Threshold**: This control sets how bright a pixel must be to contribute to the smear effect. A lower value causes only darker pixels to be smeared. A higher value includes brighter pixels in the effect.

- **Chroma Threshold**: This control sets how saturated a pixel must be to contribute to the smear effect. A lower value causes only low saturated pixels to be smeared. A higher value includes more saturated pixels in the effect.

Stop Motion

This plug-in is used to replicate the stuttering motion effect found in stop motion animations. Traditional stop motion animation exposes each frame of the shot individually, while the subject is manually moved in tiny increments between frames. An extremely labor intensive process, often individual frames were repeated in a shot to speed up the production which resulted in a staccato motion cadence.

Advanced Options

- **Set Reference Frame**: Selects the current frame in the Viewer as the reference frame.

- **Reference Frame**: The frame number of the reference frame used for the skip pattern. The frame number is calculated from the start of the entire original media clip (frame 0).

- **Sampling Variation**: This slider increasingly produces more uneven motion in the clip.

General

- **Frame Repeat**: Selects how many frames (from 1-10) to duplicate in the shot. A larger number makes a more staggered cadence.

- **Blend**: Lets you adjust the amount of blending of the clips original frame rate, with the repeating frames you’ve selected above. 0 is none, and 1.00 is the full frame rate of the clip.
Chapter 163

Resolve FX Texture

These plug-ins are designed to add texture to images, to replicate both naturalistic and other effects.

Analog Damage (Studio Version Only)

A Texture category plug-in that simulates different kinds of signal degradation resulting from analog transmission and recording, Analog Damage can be used to create “old TV” or “junky videotape” effects of various kinds. A Preset pop-up menu lets you choose from a variety of different looks, while a Custom option lets you create your own.

(Left) The original image, (Right) The image with Analog Damage applied

It has the following categories of parameters:

— **Telecine Source**: Options for lens vignetting and automated shutter weave to the left and right.
— **Broadcast Signal**: Options for customizable noise, detail loss, signal ghosting, and chroma misalignment.
— **Color Dials**: Television-signal specific color adjustment controls.
— **Scan**: Controls to simulate problems with television scanning. H- and V-Shift let you “roll” the television signal, while V-Hold interacts with the V-Hold Latch parameter to make it easy to use simple key framing to trigger animated vertical rolls that “bounce” in a realistic way for broadcast. Overscan and vertical scale interact with Vertical Blanking to produce distortions that seamlessly loop to duplicated images at the top and bottom of the frame.
— **Scan lines**: Simulate customizable television scan lines that are capable of simulating moire and color artifacts.
— **TV Construction**: Controls to simulate issues with CRT phosphor brightness, tint, and defocus, and the ability to add a customizable curved border and warped screen curvature.
— **VHS**: Lets you add a customizable “Restless Foot” to simulate recorded tape artifacts.

**TIP:** Using the Analog Damage plug-in on the Fusion page makes it possible connect Modifiers to add automatic animation (such as Perturb) to different parameters in order to quickly and easily create automated video damage effects.
**Detail Recovery (Studio Version Only)**

Detail Recovery is a utilitarian effect that lets you extract image detail from the second input, in order to re-add it to the image coming in the first input. In this way, you can selectively add detail back to an image in which it’s been removed. Because of how it works, this is an effect that’s intended to be used on the Color page.

To use Detail Recovery, you must add it to the node tree as a Resolve FX node (dragging it directly from the Open FX library into the node tree as its own node), in order to expose both of the RGB inputs that appear on the node when you do this. By default, the first RGB input is for the image you want to add detail to, and the second RGB input is for the image you’re extracting image detail from.

In the following example, Node 1 is the base grade, and Node 2 is a grade in which the highlights are being blown out for stylistic effect. The Detail Recovery node is then being added to add specific image detail from Node 1 back to the output of Node 2.

![Setting up the Detail Recovery effect to add image detail from Node 1 to the image coming from Node 2](image)

The result, compared with the image in Node 2, is an image that’s still harshly exposed, but that has traces of fine image detail so it doesn’t look so clipped.

![The image with highlights compressed harshly, The image with high-frequency detail added back](image)

Detail Recovery has the following parameters.

**Detail Recovery**

- **Transfer Direction:** This drop-down menu lets you choose which input provides the detail and which input the detail is combined with.
Details Extraction

— Frequency Cutoff: A slider that lets you choose how much detail you want to extract for recovery. Lower values isolate finer details; higher values include progressively larger details.

— Strength: This slider lets you exaggerate or attenuate the detail that’s extracted for recovery.

— Detail Mix: At a value of 1.000, this slider blends the extracted detail with the image you’re adding it to so that both layers blend together. At a value of 0.000, the extracted detail replaces whatever overlapping pixels are in the image you’re adding it to. Using this slider, you can choose the best blend for your purposes.

— Preview Detail checkbox: Turning this checkbox on lets you see the detail that’s being extracted using the Frequency Cutoff and Strength sliders.

Fast Noise

Fast Noise creates computer-generated noise patterns that can be composited on, or used to warp a video clip for a variety of special effects, such as smoke, haze, or water ripples.

(Left) The original image; (Right) the image with Fast Noise’s Smoke preset applied. The onscreen controls for position and rotation are visible.
Appearance
Controls for what noise pattern is generated. All parameters are keyframeable for changing the noise pattern over time.

- **Preset:** Select from some common noise pattern use cases: Mist, Smoke, Water Surface, River, and Heat Haze. Default is the standard noise pattern, and Custom is auto-selected if you change any of the parameters below.
- **Scale:** The size of the noise pattern.
- **H/V Ratio:** Controls the horizontal/vertical spread ratio.
- **Detail Level:** How many levels of fine detail to generate.
- **Detail Balance:** Applies weighting to the different scales of detail. The slider lets you choose between stronger large detail or stronger fine detail. A value of 0.000 removes fine detail entirely.
- **Evolution:** Changes the noise pattern gradually. This slider controls the “progress” of the noise pattern over time, rather than just modifying its current state.

Adjustment
Controls for adjusting the parameters of the noise pattern once it’s been generated. Especially useful for modifying the noise pattern’s Alpha channel for compositing. All parameters are keyframeable for changing the noise pattern over time.

- **Brightness:** Increases or decreases the gain of the noise pattern.
- **Contrast:** Moving this slider to the right makes the light areas lighter and dark areas darker in the noise pattern, increasing the contrast. Moving it to the left reduces the contrast.
- **Saturation:** This slider controls the scale between a grayscale and color noise pattern. A value of 0.000 is completely grayscale, and a value of 1.000 is fully color.
- **Color Tint:** Sets the overall color of the effect.

Position
Controls that adjust the center and direction of the noise pattern.

- **Position X/Y:** Location of the center of the noise pattern
- **Rotation:** Rotates the noise pattern around its center.
- **Position Reference:** Controls how to position the effect when a clip is re-sized or moved in the Timeline.
  - **Sizing and FX Tracker:** The noise pattern follows Sizing and FX Tracker adjustments in the Color page. For example, if you used the FX Tracker to track a camera pan, the noise pattern would move with the pan, rather than stay in one place as the shot panned underneath it.
  - **Keyframed Positions:** The noise pattern position can be adjusted as normal using keyframes.

The position and rotation controls can also be adjusted directly in the Viewer when the Open FX Overlay mode is selected from the drop-down menu in the bottom left of the Viewer. Dragging the star in the Viewer adjusts the X/Y position, Dragging the circle clockwise or counterclockwise sets the rotation.
Auto-Animation

These controls allow you to adjust the animation of the noise pattern.

— **Velocity X/Y:** How far to automatically advance each frame from the start position. You can keyframe these controls to change the noise pattern’s direction, without adjusting its actual X/Y position. This lets you mimic motions like smoke changing direction in the wind.

— **Seethe:** Controls how far to automatically evolve each frame from the starting Evolution value.

— **Randomize Start Frame:** Aligns the skipping cycle to the current frame. This allows you to re-use a favorite effect in multiple clips without it looking exactly identical in each instance.

— **Start Frame:** Lets you set the reference frame for the skip pattern. This allows you to control the sequence of noise you get, just in case you need to match it to the same noise pattern on another clip. This frame will be repeated.

Output

— **Preview Noise:** Checking this box shows the noise pattern alone.

— **Output:** Choose how to use the noise pattern.

  — **Composite Onto Clip:** The noise pattern is placed on top of or mixed into the video clip.

  — **Composite Type:** Selects composite mode for the noise pattern.

  — **Put Into Alpha Channel:** The noise is inserted into the node’s Alpha channel, allowing you to use the noise pattern for compositing purposes. Please note, you will also need to right click on the node and select “Use OFX Alpha” to activate this setting. Alternatively, you can drag the Fast Noise effect directly into the Node Graph as an FX Node instead of applying it to a corrector node, and you can use the Alpha without additional settings.

  — **Use to Warp Image:** The noise pattern is used to distort the image.

  — **Input Alpha:** Controls what to do with the input Alpha channel.

  — **Limits Warping Effect:** Limits the warp to certain areas as defined by the Alpha channel. For example, when you want to have a water ripple or heat shimmer on only certain part of the clip.

  — **Gets Warped as Well:** The warp affects the Alpha channel in addition to the RGB channels. For example, when warping a logo with a transparent background.

Film Damage

Found in the ResolveFX Texture category. After you’ve used the new ResolveFX Revival plug-ins to fix damage in archival footage, you can turn around and use the Film Damage plug-in to make brand new digital clips look worn, dirty, and scratched instead. When used in conjunction with the Film Grain and Flicker Addition plug-ins, you can convincingly recreate the feel of poorly kept vintage archival footage.
Blur and Shift Controls

The three parameters at the top let you alter the foundation of the image to begin creating the look of an older film.

— **Film Blur**: Adds just a bit of targeted defocusing to knock the digital sharpness out of the image.
— **Temp Shift**: Defaults to warming the image just a bit to simulate the warmer bulb of a film projector, although you can use it to cool or warm the image in varying amounts.
— **Tint Shift**: Defaults to yellowing the image to simulate damage to the film dyes, but you could move the slider in the other direction to add a bit of magenta, simulating a different kind of dye failure.

Add Vignetting

These parameters simulate lens vignetting darkening the edges of the image.

— **Focal Factor**: Adjusts how far the vignetting extends into the image.
— **Geometry Factor**: Affects how dark the vignetting is and how pronounced the edges are.
— **Tilt Amount**: Affects how balanced the vignetting at the top of the image is versus the bottom of the image.
— **Tilt Angle**: Affects how balanced the vignetting left of the image is versus the right, but only when Tilt Amount is set to something other than 0.

Add Dirt

These parameters let you simulate dirt particles (not dust) that have adhered to the film. These are larger specks, although there’s several ways you can customize these.

— **Dirt Color**: This control lets you choose what color you want the dirt particles to be (black simulates dirt on a print, while white simulates dirt on a negative).
— **Changing Dirt**: This checkbox lets you alternate between simulating temporally unstable dirt on the film (checkbox on) and dirt on the lens that doesn’t move (checkbox off).
— **Dirt Density**: Lets you choose more or less dirt particles appearing over time. Dirt Size lets you choose the average size of dirt particles to appear.
— **Dirt Blur**: Lets you defocus the dirt, so it’s not so sharp.
— **Dirt Seed**: Changes the random distribution of dirt when you change this value, but for any given value, the results for any given set of control adjustments remain consistent.
Add Scratch

Five sets of Add Scratch parameters let you add up to five scratches to the image, simulating something scratching the emulsion while the film played.

— **Scratch Color**: Lets you choose the color you want the scratch to be (scratches can be a variety of colors depending on the depth of the scratch, type of film, and method of printing).
— **Scratch Position**: Lets you adjust the scratch's horizontal position on the image.
— **Scratch Width and Scratch Strength**: Let you adjust the scratch's severity.
— **Scratch Blur**: Lets you defocus the scratch.
— **Moving Scratch**: This checkbox lets you choose whether the scratch is jittering around or not.
— **Moving Amplitude**: Determines how far it moves. Moving Speed determines how fast it moves.
— **Moving Randomness**: Determines how it meanders about.
— **Flickering Speed**: Determines how much the scratch flickers lighter and darker in severity.

Film Grain (Studio Version Only)

Composites a procedurally generated layer of simulated “film grain” over the image. Individual simulated grains with falloff are generated to match the resolution of the project.

Main Controls

These controls let you quickly choose and apply a film grain effect.

— **Film Grain Presets**: This pop-up lets you quickly choose from among different 8mm, 16mm, and 35mm film grain effects.
— **Composite Type**: Lets you choose a composite mode with which to combine the image with the grain simulated by this plug-in.
— **Opacity**: Lets you fade the Film Grain effect against the original image.
— **Grain Only**: This checkbox lets you see just the grain layer that you’re creating, so you can evaluate its look prior to it being composited into the image.

Grain Params

The Grain Params group lets you adjust the quality of the grain.

— **Texture**: Larger values create more separation between the grains generated by this plug-in, while smaller values bunch them up closer together to create denser grain patterns.
— **Grain Size**: Larger values zoom into the individual simulated grains generated by this plug-in, while smaller values zoom out.
— **Grain Strength**: Adjusts the contrast of the simulated grain layer. Higher values produce more contrast, lower values less.
— **Offset**: Lightens or darkens the entire simulated grain layer. The practical effect is that lower values emphasize lighter grains, while higher values emphasize darker grains.
— **Symmetry**: An asymmetrical contrast adjustment. Lower values darken the lighter grains, while higher values brighten the darker grains.
— **Softness**: Lets you blur the grain layer to create even softer transitions from one grain to another.
— **Saturation**: Lets you make the grain more or less colorful. At a value of 0, grain is monochrome.

**Advanced Controls**

In the Advanced Controls, the Shadow, Midtone, and Highlight Gain controls let you adjust the amount of grain that’s composited into each of these tonal regions of the image. When the Optimized Mode checkbox is turned on (the default), performance should improve substantially. Turning on the Animate on Every Refresh checkbox will animate the grain as you adjust the sliders, allowing you a better idea of how the grain pattern will look in motion.

**JPEG Damage**

Simulates the kinds of minor or major artifacts you get when doing JPEG compression; useful for simulating compression damage.
— **Quality**: Lets you lower the bit depth of the image.
— **Resolution**: Lets you increase the size of macroblocking artifacts that appear.
— **Block Aspect Ratio**: Lets you adjust the macroblocks to be more square or rectangular.
— **Frequency Scale**: Sharpens the effect.
— **Scale Component**: Lets you base this effect on All Frequencies, the X-Frequency, or the Y-Frequency.

**Texture Pop (Studio Version Only)**

Texture Pop is a more sophisticated and flexible version of the Midtone Detail control found in the Primaries and HDR palette. Using the controls of this effect, you can either remove texture or exaggerate it. There are two modes of operation that determine how specific a result you can achieve.
— In Simple mode, you can apply more extreme versions of the Midtone Detail effect found in the Primaries and HDR palette. A single Details slider lets you soften or sharpen midtone detail in the image with a greater range of operation, while a Strength slider lets you exaggerate the effect further or attenuate the effect to back it off.
— In Advanced mode, you can fine-tune the softness or sharpness of high, medium, and low-frequency image detail with great specificity via seven individual “details” sliders, labeled Rough, Coarse, Medium, Small, Fine, and Tiny. This lets you adjust the textural characteristics of multiple frequencies of image detail in different ways, for example softening Fine detail while intensifying Medium detail. The Strength slider lets you exaggerate or attenuate the overall effect caused by all sliders.

In either mode, the Details/Range sliders default to 0.000, which causes no change to the image. This is the level to choose to preserve the original quality of detail in the image. They range from -1.000.
(maximum softening) to +1.000 (maximum sharpening). Additionally, a set of Tonal Range controls (described later) lets you choose how much of this effect is applied to the Shadows, Midtones, and Highlights of the image, giving you even more specific control over which parts of the image are softened and/or sharpened.

**Understanding Advanced Mode**

Advanced mode is the most exciting way to use this effect. The best way to learn what Advanced mode does is to set all of the Details sliders to -1.000, and then raise each one individually to see what kind of image detail get reintroduced, and ultimately enhanced, if you raise each slider above 0.000. In the following image, each of the Details sliders has been set to -1, which is the maximum smoothing for each setting. The result is an image with minimal detail.

In the following example, a person and the mechanical details of a helicopter shot are smoothed by setting each detail slider to -1.000. You can see that the resulting images both retain the broad strokes of color and contrast that define each region of color, but outside of high-contrast edges, all textural detail has been smoothed to a clean gradient.

(Left) An image of a person with all detail smoothed, (Right) An image of mechanical detail with all detail smoothed

Then, by raising each of the Details sliders back to 0 or even +1 one at a time, you can see exactly what kind of detail that slider is affecting. As you can see in the example of the person, the Tiny and Fine sliders are affecting only the smallest details, hairs, lines, and pores of the skin. In the helicopter detail, you can see the kind of small textures, tiny lines, and rivet details that come back.

(Left) The same image of the person with the Tiny and Fine sliders raised to add subtle detail back to the image, (Right) The helicopter detail with Tiny and Fine detail added back to the image

Here are two sets of generalizations that hold true if you’re thinking about the detail of a human face.
— Tiny, Fine, and Small controls affect the smallest details in an image, including the pores (tiny), blemishes (fine), and wrinkles (small) of average closeup shots. Other features affected would include high-frequency edge detail of strands of hair, leaves on a tree, or text on a page of paper or screen.
— Rough, Coarse, and Medium tend to affect progressively smaller shadow contouring of faces, bodies, and objects.

Of course, the granularity of a particular type of image detail depends on how much of a closeup or long shot the clip is. When the camera is closer to the subject being adjusted, you’ll be able to adjust much finer details. When the camera is distant, then even large details on the subject are affected by the Tiny, Fine, and Small controls. This means when you create an adjustment for a subject in a closeup, you’ll need to make changes to the adjustment if you try and apply it to a long shot.

**Mode Controls**
— **Operating Mode:** Lets you choose between the Simple and Advanced modes of this plug-in.
— **Color Mode:** Lets you choose between working in RGB and Luma/Chroma mode. In RGB, a single set of parameters affect all three color channels at once. In Luma/Chroma mode, two sets of controls let you fine-tune the luma and the chroma separately.
— **Output Mode:** Lets you choose between outputting the Final Result, Differences mode, which lets you see the effect differenced against the original image, and Difference Magnitude, which shows a high-contrast differencing comparison.

**Details Controls**
— **Strength:** Lets you exaggerate the effect of the other Details sliders further, or attenuate the effect to back it off.
— **Details:** (Simple mode only) Lets you soften or sharpen midtone detail in the image with a greater range of operation.
— **Rough/Coarse/Medium:** (Advanced mode only) These three sliders affect progressively larger contours of the image, appearing to affect the shadows and structure of the image.
— **Small/Fine/Tiny:** (Advanced mode only) These three sliders affect progressively smaller details and texture of the image, adjusting medium to tiny details, lines, and specks.

**Tonal Range Controls**
— **Shadows:** Lets you reduce the effect you’ve created in the shadows of the image, as defined by the Low Range parameter.
— **Midtones:** Lets you reduce the effect you’ve created in the midtones of the image, as defined by the Low and High Range parameters.
— **Highlights:** Lets you reduce the effect you’ve created in the highlights of the image, as defined by the High Range parameter.
— **Low Range:** Lets you define the image value that defines the transition from Shadows to Midtones.
— **High Range:** Lets you define the image value that defines the transition from Midtones to Highlights.
Chapter 164

Resolve FX Transform

The plug-ins in this category allow different types of animated and non-animated transforms than are possible in the Sizing palette or Clip Transform controls of the Inspector.

Camera Shake (Studio Version Only)

This effect replicates random camera motion for Horizontal and Vertical position, Rotation, and Zoom. A variety of parameters are provided to let you customize the quality of motion, from slow meandering drift to abrupt, jagged jerks and pops.

Main Controls
The primary controls governing how much camera shake is added.

— Motion Scale and Speed Scale: These sliders let you adjust the overall amplitude and speed of camera shake that’s introduced to the image.

— Motion Blur: Lets you add simulated motion blur to the image being shaken, which can add a more realistic look to the motion. Motion blur is more visible on fast-moving motion, as DaVinci Resolve is simulating the effect of a motion picture camera’s shutter speed on exposed subjects in motion.

Shake Levels
These controls let you adjust the intensity of camera shake.

— Pan Amplitude: Lets you set how much horizontal motion you want.

— Tilt Amplitude: This slider lets you choose how much vertical motion you want. These sliders are completely independent of one another.

— Rotation Amplitude: Lets you introduce rotational motion to the camera shake, as well.

— PTR Speed: This slider lets you choose how fast the Pan, Tilt, and Rotation camera shake is.

— Zoom Amplitude: This slider lets you add zooming to the camera motion being created.

— Zoom Speed: This slider lets you choose how fast this random zooming should occur.

— Zoom Type: This pop-up menu lets you choose how to add zooming; you can choose Outward Only, Inward Only, or Outward and Inward. If you choose Inward Only, you don’t have to worry about blanking appearing around the edges of the frame.

Shake Quality
These controls let you customize the type of shaking you want.

— Motion Method: This pop-up menu lets you choose from different ways of generating the motion this plug-in introduces. You can choose from SINE, Rectified SINE, Rectified SINE (Invert), and Square Wave (good for popping or flickering motion).

— Phase: This slider lets you set the starting point of the camera shake you’re creating, based on the Motion Method and Amplitude settings you’ve chosen.

— Randomness Scale: This slider lets you introduce irregularity to the Horizontal, Vertical, and Rotational motion of the camera shake. The greater this value, the more irregularity will be introduced.

— Randomness Speed: This slider lets you choose between smoothly erratic motion (at lower values) or more jagged motion (at higher values).

— Pause Length: This slider lets you adjust the frequency of intermittent pauses that break up the random motion added by this filter.
— **Pause Interval:** This slider lets you adjust the duration of intermittent pauses that break up the random motion added by this filter.
— **Pause Randomness:** This lets you add a degree of randomness to the intervals that happen.
— **Random Seed:** This slider lets you alter the value that sets what random values are being produced. Identical values result in identical randomness.

**Blanking Handling**

These controls let you determine what to do when camera shake causes blanking past the edge of the image.

— **Border Type:** This pop-up menu lets you choose how you want to fill the empty spaces at the edge that appear if the camera shake you create pushes the image out of the current frame size of your project. Four options let you choose to Replicate, Reflect, or Wrap-Around the image to fill the gap.
— **Zoom to Crop:** This slider lets you zoom in on the image to crop out unwanted blanking being introduced by the Camera Shake effect.

**Match Move** *(Studio Version Only)*

**TIP:** Match move workflows are now much more effectively accomplished in the Fusion page using the tools and methods found there.

The Match Move filter is a patch-based tracker that follows a pattern region defined by a tracker control. You can place as many trackers as you like by applying this filter to a node and clicking on a feature you want to track in the Viewer. Ideal features for tracking are high contrast details that have sharp angles that are clearly defined.

Each tracker control consists of (a) a center point that indicates where the tracked motion path will be centered, (b) an inner box that identifies the patch of image you’re tracking (that can be resized), (c) an outer box that defines the search region for the track (that can also be resized), and (d) a patch window that shows you a zoomed in closeup of the patch you’re tracking. Patch windows can be resized, and the other tracking controls hidden or shown, using controls in the Display Options section of the Match Move controls.

A tracker control in the Match Move filter
If you’ve accidentally placed a tracker control somewhere you don’t want one, you can either drag anywhere within the inner box to move it to another location, or you can Option-click it to delete that tracker.

Once placed, you can choose how much image detail is considered for analysis by resizing that tracker control. To resize a tracker, move the pointer over the edge of the inner box, and drag to shrink or enlarge it.

This plug-in will automatically derive as much motion data as the number of trackers you’ve placed allows:

- One tracker tracks horizontal and vertical position (pan and tilt).
- Two or more trackers also track rotation.
- Four or more trackers also track perspective.
- If you place six or more trackers, then the Match Move filter is capable of automatically choosing the best tracker data from the overall collection to give you the most accurate track that’s possible.

A Match Move Workflow

The following example shows the simplest complete workflow for importing a foreground clip to composite with a match move to follow a background clip that’s already in the timeline. This workflow is suitable for such operations as placing a graphic as a sign on a side of a building, or into the display of a phone.

To match move:

1. Open the Media Pool in the Edit page, right-click a clip you want to match move to a clip in the Timeline, and choose “Add as Matte For Color Page Clip” to add it to the Color page Node Editor of the currently selected clip as a Timeline Matte. This is currently the only way you can match move and composite a foreground clip against a background clip in the Color page.

2. Open the Color page, make sure the background clip you want to match move to is selected, then open the OpenFX library and drag the Match Move plug-in directly onto the connection from the last node in the tree to the Output, to add it as a stand-alone FX node.

3. Right-click any corrector node in the node tree (Node 01 in this example) and choose the clip you added in step 1 in the Add Matte > Timeline Mattes submenu of the contextual menu to expose that clip as an Ext. Matte node. Delete the connection between the new Ext. Matte node and the node it’s connected to, and then reconnect its RGB output to the second input of the FX node.
4 Select the FX node, make sure the OpenFX onscreen controls are enabled, choose whether you want to start at the first or last frames of the clip to begin the tracking process, and then click within the Viewer to place tracker controls on the surface of the image you’re going to attach the foreground image to. If you want to do a perspective track, place at least four tracker patches in areas you know won’t be occluded by other things in the frame. Choose features that are high contrast and angular for the best results, and try to make sure the features you track won’t go offscreen or be occluded by other features within the frame. As you place tracking controls, their patch window will be tinted the color of the channel that DaVinci Resolve automatically determines will provide the best tracking result.

5 (Optional) If necessary, you can delete trackers you don’t want by Option-clicking them.

6 Now that your tracker controls are all set up, you’re ready to begin the tracking analysis. If the playhead is at the beginning of the clip, click Track Forward, otherwise click Track Backward. DaVinci Resolve will automatically analyze all tracker controls within the clip until the last frame of the clip is reached.
Using the Tracking controls

7  (Optional) If anything occludes a patch that’s being tracked, or if the tracked feature starts going off the edge of the frame, that tracker control may veer off course and will eventually turn off. If this happens, there’s a way to continue the track that’s surprisingly easy:

a.  Click the Track Forward or Track Backward button again to stop the analysis.

b.  Move the playhead back to the last good frame of tracking data, then click the inner box of each tracker control that went wrong to make sure they’re turned on (you know it’s on if the patch window is displayed), and then click “Clear tracking forward” or “Clear tracking backward” as necessary to delete the incorrect tracking data. When you’re done, click the inner box of each tracker that went wrong to turn it back off again, so it doesn’t continue trying to track incorrectly (you know it’s off if the patch window is hidden).

c.  Now, place additional trackers on different features of the same surface to replace the trackers that you had to turn off.

d.  Click “Track forward” again to continue the track, and DaVinci Resolve will automatically use those additional features to continue the analysis.

e.  When the analysis is complete, turn the trackers you disabled back on again. All trackers that are turned on contribute data to the match move, for whichever ranges of frames they contain valid tracking data.
8 When DaVinci Resolve finishes its analysis, move the playhead back to the first frame of the track, and choose Positioning from the “Show controls for” pop-up menu. This takes you to the next stage in the Match Moving process.

Choosing the Positioning controls

9 A grid appears, covering the Viewer. This is the positioning canvas, and it lets you corner-pin the area in which the foreground image you connected in step 3 will be composited and tracked. You can corner-pin and resize it by dragging it by the corners, and you can move it by dragging the center.

Resizing the canvas to fit the foreground image into the background

10 Once you’ve positioned the grid, scrub back and forth to verify that it tracks correctly and looks right once it’s in motion.

11 Choose Compositing from the “Show controls for” pop-up menu to expose the compositing controls.

12 Set the Output pop-up menu to “Composite” to output the final match-moved composite. If necessary, you can use the Composite Type and Plate Cropping controls to choose how the foreground image is blended with the background and whether you need to crop unwanted parts of the image from the edges.
At this point, you’ve finished the match move.

**Main Controls**

The “Show controls for” pop-up menu lets you choose one of four pages of controls that take you through the match moving workflow. The Output pop-up menu lets you choose what you want to output, with choices for Disabled, Positioning Reference, and Composite.

**Tracking Controls**

The Tracking Controls govern the first stage of the match moving process, and this page of controls provides everything you need for setting up, executing, and refining multi-patch motion tracks.
The Tracking Controls group
The primary controls used to initiate tracking. These consist of the tracking buttons that let you execute tracks either automatically using the outer Track Forward or Track Backward buttons, or manually using the inner Track Next or Track Previous buttons. The middle button lets you pause tracking.

The Next Track End and Previous Track End let you jump to previous and subsequent tracked sections of frames; in cases where there may be gaps in your tracking data, these controls let you jump to different segments of contiguous tracking data.

Two checkboxes let you choose whether you want to track and analyze Zoom and/or Rotation. These must be set before you begin tracking.

The Manage Tracking Patches group
The two buttons at the top let you choose which tracking patches are enabled to contribute to the overall match moving result, or disabled. Activate None and Deactivate All let you turn all patches on or off at once.

Clear Past and Clear Future let you clear bad tracking data forward or back in time from the playhead’s current position, for enabled tracker controls. Delete Tracking lets you delete the tracking data at the current frame only for enabled tracker controls.

Refresh Tracks updates a tracker control’s patch when the feature it’s tracking changes shape, color, or lighting enough to interrupt the track. Select one or more trackers and click Place New Patch in Track to update the tracked feature at that frame.

The Display Options group
This group lets you turn the visibility of different onscreen controls off and on. Checkboxes let you Show Trackers, Show Center (the red tracking center point), Show Paths (the tracked motion paths), and Show Active Patches. A slider lets you adjust the size of each patch window.

Show Comp Result lets you see the composited foreground layer against the background layer.

Positioning
The Positioning controls govern the second stage of the match moving process. They provide everything you need to transform the foreground image to fit against the background by moving, corner-pinning, and resizing.

The controls that are exposed when Main Controls is set to Positioning
**Canvas Options**

The Canvas Controls pop-up menu lets you switch between corner-pin controls, where dragging the four corners lets you corner-pin, dragging the center lets you reposition, and dragging the top, bottom, and sides lets you resize vertically or horizontally.

A Reset Corners button lets you reset the grid to full screen, if you need to scrap what you’re doing and try again.

**The Display Options group**

This group lets you turn the visibility of different onscreen controls off and on. Checkboxes let you Show Trackers, Show Center (the red tracking center point), and Show Paths (the tracked motion paths).

Show Comp Result lets you see the composited foreground layer against the background layer.

**Compositing**

The Compositing controls govern the third stage of the match moving process, to use when fitting the foreground image against the background image to make a seamless composite. Note, if you need to color correct the foreground image to match the background, you’ll need to add a corrector node between the Ext. Matte that’s routing in the foreground image into the Color page and the FX node that’s doing the compositing.

**Rendering Options**

The Composite Type pop-up menu lets you choose whether the composite that’s being output is an overlay of the Ext. Matte over the background, or the background Plate only.

**Plate Cropping**

Four sliders let you crop the Left, Right, Top, and Bottom of the image, if necessary.

**Global Blend**

The Blend slider, present in every ResolveFX plug-in in DaVinci Resolve, lets you adjust the opacity of the effect, effectively controlling the opacity of the foreground layer.
Stabilizing

The Stabilizing controls actually have nothing to do with match moving, but instead allow you to use the motion tracking accomplished with the Tracking Controls to stabilize the image. An Edge Behavior pop-up menu lets you choose how to handle blanking around the edges as a result of the background image being transformed to keep the subject of the frame in place.

![Match Move controls](image)

The controls that are exposed when Main Controls is set to Stabilizing

Transform

The Transform Resolve FX adds considerable control over the standard transforms in the Inspector’s Sizing or the Color page Sizing palette. This effect includes all the standard Position, Tilt, Zoom, and Rotate controls but adds corner pinning, two kinds of on-screen controls, motion blur, and Edge behavior controls.

General

— **Control Mode:** This drop-down menu includes three methods for controlling the transforms. One is based on sliders in the Inspector, while the other two are based on manipulating the Viewer’s image.

— **Sliders:** Uses sliders and checkboxes in the Inspector to control the transforms. This method has no Viewer overlays with which to control the position, scale, or rotation but provides exact control using numeric values.

— **Interactive-Canvas:** Choosing this mode moves the controls from the Inspector to the Timeline Viewer. The Viewer’s controls are shown as a bold white outline and four vertices, one at each corner. You can drag on any part of the white outline for stretching, squeezing, and corning pinning. Dragging the center of the image repositions the frame. The red subdivision overlays make it easy to create shearing effects by dragging line segments to move two corners simultaneously.

— **Interactive-Pins:** Adjusting the image in this mode is done by manually placing control points, called pins, in the Timeline Viewer. Adding one pin only gives you position control. At least two points are required for scaling and rotation. Dragging on one of the pins scales or rotates the image around the other pin. Using three pins, you can create perspective distortions by dragging any one of the pins. You can add up to four pins for unique corner pinning distortions.

**TIP:** You can Option-Click on a pin to remove it or use the Reset Canvas button to remove all the pins.
Only one Control mode can be active at a time. For instance, you cannot make adjustments with the sliders and then switch to one of the interactive methods. The sliders will be reset once a different method is selected. However, can you apply two Transform effects to a clip, adjusting one with Sliders and the other using an interactive method.

**Position Controls**

- **Canvas Keyframe:** Only displayed when the Control mode is set to Interactive-Canvas or Interactive-Pins. The Canvas Keyframe has no control except for a keyframe button allowing you to keyframe the changes you make in the Viewer.
- **Reset Canvas:** Resets any interactive changes made in the Viewer and any keyframes created from those changes.

The following parameters are only displayed when the Control Mode is set to Sliders.

- **Position X and Y:** Moves the image within the frame, allowing pan and scan adjustments to be made. X moves the image left or right, and Y moves the image up or down.
- **Zoom:** Allows you to blow the image up or shrink it down.
- **Rotate:** Rotates the image around the center.
- **Width:** Stretches or squeezes the image in one direction only.
- **Height:** Stretches or squeezes the image in one direction only.
- **Pitch:** Rotates the image toward or away from the camera along an axis running through the center of the image, from left to right. Positive values push the top of the image away and bring the bottom of the image forward. Negative values bring the top of the image forward and push the bottom of the image away. Higher values stretch the image more extremely.
- **Yaw:** Rotates the image toward or away from the camera along an axis running through the center of the image from top to bottom. Positive values bring the left of the image forward and push the right of the image away. Negative values push the left of the image away and bring the right of the image forward. Higher values stretch the image more extremely.
- **Flip Horizontal/Vertical:** Two checkboxes let you flip the image in different dimensions.
  - **Flip Horizontal:** Reverses the image along the X-axis, left to right.
  - **Flip Vertical:** Reverses the clip along the Y-axis, turning it upside down.
Image Adjustment

— **Crop:** This checkbox exposes the crop tools, allowing you to selectively remove parts of the frame from each side.
— **Edge Softness:** This control sets the amount of feathering to the Alpha channel for compositing.
— **Edge Rounding:** This control rounds the corners of the Alpha channel for compositing.

Animation

— **Motion Blur:** Keyframing the transform so the frame moves rapidly will create a blurring effect. The amount of the blur is controlled using the Motion Blur slider.

Advanced Options

— **Edge Behavior:** This menu determines how edges of the frame are handled when the transforms are scaled smaller than the Timeline Resolution.
  — **Transparent:** The area outside the transformed image is set to be transparent, allowing the video on tracks underneath this one to be shown behind the image.
  — **Reflect:** The image is flipped and flopped to create a mirrored image, which extends to the Timeline Resolution frame boundary.
  — **Wrap-Around:** Duplicates the image to create a video wall effect, which is used to fill in the space to the Timeline Resolution frame boundary.
  — **Replicate:** Duplicates the outermost pixels along the edge of the image. The pixels are stretched out from each side to reach the Timeline Resolution boundary.

— **Composite Type:** Sets the Composite type for blending multiple video layers together. For more information on what each Composite type does, see Chapter 50, “Compositing and Transforms in the Timeline.”

Global Blend

— **Blend:** Lets you dissolve between the image with no Transform applied and one with the Transform fully applied.

Video Collage

Video Collage is designed to make it easier to create grid-based layouts of multiple video layers to create different kinds of split-screen effects, where each video layer appears within a “tile” that can be styled in different ways. Layout controls let you choose how many rows and columns there are, which determine how many tiles are available to arrange tiles of video next to one another in different ways, with additional controls for creating offsets, changing the margins around and spacing between the tiles, and rounding the corners of each tile.

This effect is designed to be used in the Cut and Edit pages, and there are two ways that you can set this up, which are chosen using the Workflow drop-down menu.
Create Background

The Create Background option is perhaps the simplest way to create a split-screen using this effect. This mode creates a frame with holes in it, behind which you can position multiple layers of video. These clips are placed on tracks underneath the background clip in the Timeline, and use each clip’s individual sizing controls in the Inspector (which can be used via on-screen Transform controls in the Viewer) to scale and position them correctly within the holes. The Video Collage effect is applied to the topmost superimposed video or still image clip in the Timeline, in order to use that clip as a background for the frame.

In the following example, the Video Collage effect is applied to the clip on track 5, which has four other clips underneath it in a stack, each of which has been positioned to fit in one of the holes of the frame.

![A stack of clips to create a split-screen effect; the top-most clip is used as the background by the Video Collage effect in Create Background mode, while the stack of clips underneath are all positioned to fit into the holes created in the top clip.](image)

Create Background mode makes it easy to create a split-screen layout of different clips without having to resize them with precision to align the edges and sizes of each clip. The width of the frame that’s created gives some wiggle-room to reposition and animate each individual clip within the hole it shows through. You can see the resulting effect created in the previous example below.

![The resulting split-screen effect, with four clips arranged to show through the holes created in the top “background” clip that’s creating the frame; you can see the onscreen controls corresponding to the clip on track 4 that have been used to position and resize it to fit.](image)
Create Tile

This mode of operation is a bit more work to set up, as it requires you to create a layout in one instance of this effect, but it gives you more options, automatically transforming each layer of video in your stack of clips in the Timeline to fit a layout you design. The best way to work in Create Tile mode is to edit a stack of superimposed clips in the Timeline, but this time if there's a clip you want to use as the background, it should go at the bottom of the stack.

A stack of clips to create a split-screen effect in Tile mode; the bottom clip is going to be used as the background.

Then, apply the Video Collage clip to the topmost clip, and set the Workflow drop-down menu to Create Tile. Immediately, you'll see that the current layer has been fit inside the first rounded tile of the default layout of four tiles. For clarity, video tracks 4, 3, and 2 have been muted so you can see the current clip turned into a tile against the bottom clip that serves as the background for this arrangement.

The topmost clip set to create the first tile in a layout; video tracks 4, 3, and 2 are disabled to show the top clip against the bottom clip that's being used as the background.

Ultimately, you’ll use Paste Attributes to apply a copy of this effect to each clip on the Timeline that’s supposed to fit inside a tile, and once you choose which clip goes inside each tile, that’s what will create the arrangement. Before you do that, however, you need to customize the layout.
To get a preview of the entire layout for further customization, turn on the Preview Layout checkbox in the Inspector. This draws a preview of how all the tiles will be placed using the current layout. Using this preview, you can make whatever changes you want to set things up, before you copy this plug-in to all the other clips in the stack.

Turning on Preview Layout to customize the layout

With Preview Layout enabled, you can use the Layout controls below to choose how many columns and rows of tiles there are, to stagger the tiles horizontally or vertically, to round or square off each tile by a variable amount, and to alter the margins and spacing. In this way, you can create a wide variety of different symmetrical layouts really easily. In this example, we’ll create a layout with one row, three columns, that’s staggered vertically.

Our new customized layout, shown next to the Inspector controls for this effect

Now that this is done, we’ll turn off Preview Layout to focus on the current clip’s integration into our layout, and we can see that it doesn’t quite fit into the box. Click the Tiles button in the Inspector. This reveals the Tile-specific controls, which include the Resize Content controls. Click the disclosure control to open these up, and use the Pan, Tilt, and Zoom controls to make this image fit into the tile full screen.
Tiles controls in the Inspector with Preview Layout disabled, so we can focus on customizing the current tile

You should also note the Active Tile drop-down menu. This menu serves two purposes. First, it defines which tile the current clip is displayed within. This becomes important later on when you apply this effect to multiple superimposed clips. However, it also determines which tile you further customize using the Tile-based controls of the Inspector. If needed, tiles can be individually styled.

The Manual Tile Management checkbox is off by default, which enables DaVinci Resolve to automatically update the number of tile entries in the Active Tile drop-down menu with items equal to the number of grid positions (or grid nodes) defined by the rows and columns you’ve set, without you needing to do anything. For simple symmetrical layouts, this is easiest. However, if you turn Manual Tile Management on, you gain the ability to add and delete tile positions manually, which enables other options. For now, we’ll leave this turned off.

So, now we’ve created a custom overall layout, and we’ve tailored the top clip in the stack to fit the first tile in the layout. Now it’s time to apply this effect to the next two clips in the stack (remember the bottom clip will be used as a background, so it doesn’t need this plug-in applied to it). Select the top clip with the effect applied to it in the Timeline, and press Command-C to copy it. Then, select the next two clips, right-click one of them, and choose Paste Attributes (Option-V). When the Paste Attributes window appears, turn on the Plugins checkbox, in Video Attributes and click Apply. Those two clips disappear as they receive the Video Montage effect and fit themselves into Tile 1, just like the top clip.
Using Paste Attributes to apply the copied effect from the top clip to the other clips in this arrangement.

To assign each clip to the correct tile in the layout, select each clip in the arrangement, one at a time, open the Effects panel of the Inspector, click the Tiles button in the Inspector (if necessary), and set each clip to be the next available tile in the Active Tile drop-down menu. In this example, the top clip was in Tile 1, the second clip down will be in Tile 2, and the third clip down will be in Tile 3.

Assigning the Active Tile for each layer in the Timeline

**TIP:** If you enable the Open FX Overlay of the Timeline Viewer, each tile has an overlay that lets you click a tile in the Viewer to make that the Active Tile.

If you like, you can rearrange which clips go into which tiles using this control, but for now we’ll keep things simple. As you do this, each tile becomes populated, and the final layout is revealed, with the background clip showing behind everything. If necessary, you can use the Resize Content controls (in Tiles mode) to resize each tile’s contents to fit the tile better.
The current layout, with each clip in the stack assigned to a different tile

**NOTE:** If you’ve customized a layout, copied and pasted attributes to the other clips you want to use in that layout, and have assigned each clip to its position in the layout, and you then decide you need to make a change to the Globals layout controls, you’ll need to go through the process of copying the updated effect, pasting attributes to the other clips, and reassigning each clip to the appropriate position in the layout to make that update to the other clips as well.

So, these are the overall workflows of the Video Collage effect. There is, of course, much more you can do, but this is the basis of how you create your initial layout.

**Animating Tiles and Advanced Layouts**

One of the more powerful aspects of the Video Collage effect is the ability to quickly and easily create animated intros and outros for each tile. These effects can be fully automated over a customizable duration, or their duration can be manually keyframed. All animations can be automatically eased, and you can also enable motion blur for the Fly, Shrink, and Rotate animations.

When you use these controls in Create Background mode, the transparent holes through which other clips in the background show through are animated to "open or close" to reveal the contents. When used in Create Tile mode, the actual tile and its contents are animated to fly, shrink, rotate, and/or fade to appear or disappear.
Tile Animation controls let you create automatic Intro and/or Outro animations.

Additionally, you have the ability to keyframe the Mute, Start and End Column and Row parameters, Tile Styling and Drop Shadow parameters, and other aspects of tiles in Tiles mode, either individually or all together.

In particular, the Start and End Column and Row parameters let you create tiles that span multiple grid positions, and also move tiles from one grid position to another. Without keyframing, this lets you create more kinds of layouts with asymmetric arrangements of large and small tiles. With keyframing, you gain the ability to easily create sophisticated grid-based animations to move tiles from position to position, and to have tiles expand and contract to encompass neighboring tiles in the layout, all with a minimum of keyframing.

Keep in mind that, when using multiple instances of the Video Collage effect on superimposed clips in the Timeline, once you’ve defined your overall layout and used Paste Attributes to copy a particular instance of this effect with your layout to the rest of the clips, you need only keyframe each instance of each tile within the clip it’s applied to. Furthermore, since Intro and Outro animations are applied to the entire duration of the clip, you can easily offset each Intro and Outro animation by offsetting the clips in the Timeline.
TIP: If you change the duration of clips in a stack that are creating a Video Collage effect, you can use the Synchronize Keyframing controls in Globals mode to offset all keyframes applied to that instance of the Video Collage effect by the same amount. You could do the same thing by opening the keyframe track or Curve Editor for all Video Collage parameters in the Timeline and offsetting them that way, but this provides a quick shortcut.

**Video Collage Controls**

Here’s a detailed explanation of all the parameters found in the Video Collage effect.

- **Workflow**: Defines what the output of Video Collage is, depending on how you want to use it.
  - **Create Background**: Outputs a frame with holes, behind which you can position individual layers of video to show through.
  - **Create Tile**: Outputs a single tile, transformed and styled to be one element of a multi-tile layout

- **Preview Layout**: Turning on Preview Layout lets you see a graphical preview of the entire layout, and how each tile fits together. In Create Tile mode, this lets you configure how you want the layout to look before you copy the clip and use paste attributes to apply this effect to the rest of the video layers you want to arrange into a split-screen.

- **Globals/Tile buttons**: Choose between the Globals controls, which expose controls that let you adjust the overall layout, and the Tiles controls, which let you choose the currently active tile and style it.

**Layout**

These controls appear inGlobals mode.

- **Columns**: Choose how many vertical columns worth of tiles there are.
- **Rows**: Choose how many horizontal rows worth of tiles there are.
- **Stagger Horizontally**: Lets you create an offset from one row to the next in a balanced way, so the rows are all staggered from one another.
- **Stagger Vertically**: Lets you create an offset from one column to the next in a balanced way, so the columns are all staggered from one another.
- **Rounding**: Rounds the edges of each tile in the layout. A value of 0.000 sets the edges to be square. Increasing rounding increasingly curves the corners of each tile, until a value of 1 sets the tile to be perfectly round.

**Margins and Spacing**

These controls appear inGlobals mode.

- **Left/Right Margins**: Alters the spacing from the edge of the frame to the left and right edges of the group of all tiles. Increasing this parameter makes all tiles progressively more narrow, as they squeeze in towards the center of the frame.
— **Top/Bottom Margins:** Alters the spacing from the edge of the frame to the top and bottom edges of the group of all tiles. Increasing this parameter makes all tiles progressively shorter, as they squeeze in towards the center of the frame.

— **Horizontal and Vertical Offset:** These two sliders let you offset the group of all tiles from the center however you like.

— **Horizontal and Vertical Spacing:** These two sliders increase or decrease the spacing between each tile, making them narrower or wider as a result.

**Synchronize Keyframing**

These controls appear in Globals mode. They’re basically a built-in utility that lets you offset all Globals and Tiles parameter keyframes that are applied to the current effect, to account for times when you’ve done elaborate keyframing to create animated split-screen effects, and you then need to change the duration of the clip this effect is applied to. Instead of forcing you to expose the keyframes of each parameter in the Timeline in order to move them, these controls let you move all keyframes for all parameters forward or backward by a particular number of frames, all at once.

— **Offset Frames:** Lets you specify how many frames you want to offset all keyframes applied to this effect forward. Negative values move keyframes to the left.

— **Apply Keyframing Offset:** Executes the offset.

**Manage Tiles**

These controls appear in Tiles mode.

— **Active Tile:** This menu serves two purposes. First, it defines which tile the current clip is displayed within. This becomes important later on when you apply this effect to other superimposed clips you want to use together in a layout. However, this control also determines which tile you further customize using the Tile-based controls of the Inspector. If you enable the Open FX Overlay of the Timeline Viewer, each tile has its own overlay that lets you click a tile in the Viewer to make that the Active Tile.

— **Bring Tile Forward/Send Tile Back:** These two buttons let you rearrange the order of tiles in the Active Tile drop-down menu.

— **Manual Tile Management:** While this checkbox is turned off (the default), changing the Columns and Rows parameters automatically updates the Active Tile drop-down menu with one tile per node on the resulting grid arrangement. Turning this checkbox on lets you Add and Delete tiles manually, which lets you create more advanced layouts with overlapping tiles and asymmetric spacing between tiles.

**Mute Tiles**

These controls appear in Tiles mode. A single checkbox parameter, Mute Tile, lets you enable and disable the visibility of the active tile. This checkbox is keyframable, so you can animate the appearance and disappearance of different tiles to create different effects.
**Custom Size/Shape**

These controls appear in Tiles mode. They let you further customize layouts on a tile-by-tile basis and can also be used to quickly and easily animate a single tile to move and resize itself around the grid of the overall layout.

- **Start/End Column and Row:** These four controls serve two purposes, letting you change a tile’s position by row and column number, or enlarge a tile to encompass multiple tile row or column positions (“spanning”). To use these parameters, you must first choose which tile you want to adjust from the Active Tile drop-down menu. With the tile you want to edit active, you can then drag the appropriate sliders to create either effect, as explained below.

- **To change Tile Position:** When adjusted together so that the Start and End values are identical, they let you manually adjust the position of each tile in the grid that’s defined by the number of rows and columns you’ve set. This is particularly useful when you want to quickly keyframe animated changes to tile position, in order to jump a tile around the grid of the layout.

- **To make a tile span multiple positions:** Setting the Start and End Row and/or Column parameters to different values changes the currently active tile to span multiple grid positions in the layout, making that tile bigger in order to create asymmetric arrangements of larger and smaller tiles. You can also keyframe these values to easily animate the effect of a tile expanding to occupy more grid positions, or shrinking from occupying several grid positions to occupying a single position.

Choose how many rows/columns and in which directions you want that tile to span. Note that if you span multiple rows or columns that have been offset, the resulting tile is enlarged to encompass the entire rectangular region defined by the outer boundaries of both offset tiles.

- **Custom Size/Shape:** Turning this checkbox on enables the rest of the controls in this group, enabling you to set individual scale and rounding for the active tile that’s selected.

- **Custom Scale:** Lets you adjust the size of the active tile independently of the other tiles.

- **Custom Rounding:** Lets you adjust the rounding of the active tile independently of the other tiles.

**Resize Content**

These controls appear in Tiles mode. They let you resize the image being fit within each tile to show exactly what you want shown.

- **Pan/Tilt/Zoom:** These three sliders let you move and resize the video layer shown inside of the active tile to fit however you need it to.

- **Edge Behavior:** These settings allow you to control how the edges of the video layer respond inside the tile.

  - **Transparent:** Any positioning that goes past the edge of the video is transparent, showing the Tile Color set in the Tile Styling options.

  - **Reflect:** Any positioning that goes past the edge of the video mirrors back on itself.

  - **Wrap:** Any positioning that goes past the edge of the video repeats itself.

  - **Replicate:** Any positioning that goes past the edge of the video shows a duplicate of the edge stretched to the boundary of the control, essentially filling in the remaining space with the pixels used at the extreme edges of the video clip.
Move With Tile: Defines how the image is fit into the tile when the tile size changes due to other parameters of the Video Collage effect.

Position Only: The video content in the tile only is sized using Pan and Tilt; Zoom is ignored.

Position and Scale: The video content in the tile is sized using Pan, Tilt, and Zoom.

Tile Styling

These controls appear in Tiles mode. They let you add a colored border and adjust the opacity of all tiles or just the currently active tile. These parameters are animatable.

Apply to All Tiles: When checked, this applies any changes made in the Tile Styling parameters to all tiles in the Video Collage, regardless of which tile is currently active.

Tile Border: This slider controls the width of the tile’s border. It has a possible range of values from -0.250 to 0.250, where negative numbers expand the size of the border inside the tile, and positive numbers expand it outside the tile.

Tile Color: Allows you to choose the background and border color of the tile.

Tile Opacity: This slider changes the transparency of the tile itself; it does not effect the video clip inside the tile. The possible ranges are 0.000 (fully transparent) to 1.000 (fully opaque).

Drop Shadow

These controls appear in Tiles mode. They let you add and customize a drop shadow, either to all tiles or just to the currently active tile. These parameters are animatable.

Apply to All Tiles: When checked, this applies any changes made in the Drop Shadow parameters to all tiles in the Video Collage, regardless of which tile is currently active.

Strength: This slider controls drop shadow transparency. The possible ranges are 0.000 (fully transparent) to 1.000 (fully opaque).

Color: Allows you to choose the color of the Drop Shadow.

Drop Angle: Lets you set the angle that the shadow is cast from. The slider represents 360 degrees of movement from -180.0 to 180.0.

Drop Distance: Allows you to set the distance that the shadow appears from its source tile. The possible values are from 0.000 to 0.200.

Expand: This slider controls how far the shadow expands from its origin. The possible values are from 0.900 to 1.250.

Blur: Allows you to control the amount of diffusion of the Drop Shadow. The possible ranges are 0.000 (no blur) to 1.000.

Tile Animation

These controls appear in Tiles mode. They make it easy to create simple intro/outro animations to bring all or some tiles onscreen, and to push all or some tiles offscreen, in different ways. The Animate drop-down menu determines whether this animation will be automatic or manually created using keyframes.

Apply to All Tiles: When enabled, any animation that’s set up will be applied to all tiles in the layout simultaneously.
Animate: This drop-down menu lets you choose between Manually Keyframing intro or outdo animations or automatically creating animations to introduce or conclude a tile. The options are:

— Manually Keyframe: In this mode, you must manually keyframe the four progress sliders below to create animated Intro and Outro animations.

— Intro Only: Animation is automatically created to bring each tile onscreen according to the types of animation you choose from four checkboxes below. Options include: Fly, Shrink, Rotate, and Fade, in any combination. A Duration slider appears that lets you choose how long the Intro will be.

— Outro Only: Animation is automatically created to send each tile offscreen according to the types of animation you choose from four checkboxes below. Options include: Fly, Shrink, Rotate, and Fade, in any combination. A Duration slider appears that lets you choose how long the Outro will be.

— Intro & Outro: Animation is automatically created to bring each tile onscreen and then send each tile offscreen, according to the types of animation you choose from four checkboxes below. Options include: Fly, Shrink, Rotate, and Fade, in any combination. A Duration slider appears that lets you choose how long the Intro and Outro will be.

— Fly Animation: Lets you choose a direction for tiles to fly in from and fly out to.

— Shrink Animation: Lets you choose a method of shrinking out or in when the Fly Progress slider is animated.

— Fly Progress: (manual key framing only) A slider that, when animated, lets you fly a tile into or out of the frame. A value of 0.000 positions the tile in its default grid position. A value of 1.000 positions the tile entirely off screen.

— Shrink Progress: (manual key framing only) A slider that, when animated, lets you shrink a tile down to nothing or up to the current size. A value of 0.000 sizes the tile at its largest state. A value of 1.000 shrinks the tile to nothing.

— Rotate Progress: (manual key framing only) A slider that, when animated, lets you fly a tile into or out of the frame. A value of 0.000 positions the tile in its default grid position. A value of 1.000 positions the tile entirely off screen.

— Fade Progress: (manual key framing only) A slider that, when animated, lets you fly a tile into or out of the frame. A value of 0.000 positions the tile in its default grid position. A value of 1.000 positions the tile entirely off screen.

Easing & Blur

These controls appear in Tiles mode. They let you adjust the easing of the tile animation created in the previous group of controls.

— Motion and Size Ease: These controls set the curve used for simulated momentum in animating the Tile Position and Size keyframes of the tiles.

— None: No curves are applied. The animation snaps immediately from keyframe to keyframe.

— Linear: No easing curves are applied; motion is neither accelerated or decelerated.

— In: The animation curve starts slower and ends faster.

— Out: The animation curve starts faster and ends slower.

— In & Out: The animation curve starts slower, accelerates in the middle, and slows down at the end.
Animation Effects Ease: These controls set the curve used for simulated momentum in animating the Tile Animation keyframes of the tiles.

- **None:** No curves are applied. The animation snaps immediately from keyframe to keyframe.
- **In:** The animation curve starts slower and ends faster.
- **Out:** The animation curve starts faster and ends slower.
- **In & Out:** The animation curve starts slower, accelerates in the middle, and slows down again at the end.

Ease Amount: The relative strength of the animation curve in speeding up and slowing down. The values range from 0.000 to 1.000.

Motion Blur: This slider controls the amount of motion blur added to the animation, in order to make it smoother and more organic looking. The values range from 0.000 (no motion blur), to 1.000 (maximum motion blur).

Global Blend

- **Blend:** This slider controls the overall opacity of the entire Video Collage effect. The values range from 0.000 (completely transparent) to 1.000 (completely opaque).
Chapter 165

Resolve FX Warp

The filters in this category let you warp the image in different ways, creating procedural or custom distortion effects, some of which can be automatically animated. The Warper plug-in is a point-based free-form Warp tool.

Dent

A warp effect that creates different types of circular bowing and folding effects.

- **DentType**: This lets you choose from six different types of “dent” warping effects. The options are Type 1, Type 2, Type 3, Sine, Cosine, and Black Hole.
- **X and Y**: Position sliders let you offset the center of the warp.
- **Size**: This lets you adjust the diameter of the warp.
- **Strength**: This lets you adjust the extent and direction of the warp, lowering this below zero “pulls” the image into the center of the effect, while raising this above zero “pushes” the image outward to buckle according to the DentType you’ve chosen.
- **Edge Behavior**: This eliminates any blanking caused by negative distortion by filling black areas in one of several user-defined ways; options include Black (do nothing and leave the blanking), Reflect, Wrap-Around, and Replicate.

Lens Distortion (Studio Version Only)

Lets you add convex or concave lens distortion to an image, to make it warp by bulging outward or bulging inward, similar to a poorly made lens. This filter could also be used in a corrective manner, to compensate for images exhibiting barrel distortion. Additionally, the amount of distortion applied to each color channel can be varied, in order to create the effect of chromatic aberration using the curvature of the distortion you’re adding for a more accurate effect.

- **Red, Green, and Blue Distortion**: These sliders are ordinarily locked together by the Gang checkbox. When adjusted as ganged, moving these sliders to the left (negative values) increases “fisheye” distortion, while moving these sliders to the right (positive values) creates an inverted “fisheye” effect that bows the image inward rather than outward. Turning Gang off lets you set the Red, Green, and Blue Distortion sliders to different values, introducing more accurately simulated chromatic aberration to the image.
- **Fine Adjustment**: This checkbox results in the distortion sliders operating within a much smaller range, enabling more precise adjustments.
- **Edge Behavior**: The options available in this pop-up eliminate blanking caused by negative distortion by filling black areas in one of several user-defined ways; options include Black (do nothing and leave the blanking), Reflect, Wrap-Around, and Replicate.
- **X and Y Position**: These sliders let you change the center of the distortion effect.

**TIP:** To resize a clip with an extreme distortion effect that introduces blanking around the edges of the frame, you’ll need to use the Zoom control found in the Node Sizing mode of the Sizing palette. Edit and Input sizing will only zoom the image within the border created by blanking.
Ripples

A warp effect that creates different types of ripples.

Main Controls

These controls govern the type of ripple and the quality of optional ripple shine that you want.

— **Ripple Shape**: Lets you choose from Circular, Square, Horizontal, Vertical, Exponential, Star, and Radial ripples.

— **Wave Shape**: Lets you choose from Sinusoidal, Triangular, Fresnel In, Fresnel Out, and Natural waves.

A set of Shine parameters lets you overlay a simulated shine on top of these ripples.

— **Shine**: A checkbox lets you turn this shine on and off.

— **Shine Direction**: Lets you add a light shine to the peaks of the ripples. Works best at low shine strength.

— **Vertical Shine Height**: Lets you adjust the thickness of the highlights running along the ripples.

— **Shine Size**: Lets you adjust the length of the highlights running along the ripples.

— **Shine Strength**: Lets you adjust the overall appearance of the shine.

— **Animate**: This checkbox, if checked, reveals a Speed slider that lets you set how quickly the ripple effect auto-animates the phase of the currently configured ripple effect, without the need to use keyframes.

Ripple Controls

A separate set of Ripple parameters lets you enable up to five overlapping ripples.

— **X and Y Position**: Lets you change the center position of each set of ripples.

— **Amplitude**: Lets you adjust the “height” of each ripple caused by this effect.

— **Frequency**: Lets you choose how many ripples are being created.

— **Decay**: Lets you adjust the falloff of the ripple effect, where ripples gradually diminish as they reach the point of decay.

— **Phase**: Lets you adjust the phase of the ripple effect relative to the center origination point. If you want to animate a ripple simply, you can also choose to keyframe the Phase parameter to create the same effect created by the Animate checkbox above.

Vortex

Vortex begins as an S shaped warp effect, but you can adjust the parameters to create many types of warping effects.

— **X and Y position**: Two sliders let you offset the center of the warp.

— **Size**: Adjusts the diameter of the warp.

— **Angle**: Adjusts the direction and intensity of the warp effect; setting Angle below 0 twists the image to the left, while raising Angle over 0 twists the image to the right.
— **Power:** Rotates the area that’s affected to create a harder border between what is warped and what isn’t.
— **Swirl:** Intensifies the effect, twisting the image into an even tighter swirling effect.

**Warper** *(Studio Version Only)*

The Warper is a free-form image warper that uses points, rather than a mesh or splines, to push and stretch features in an image as if they were on a sheet of rubber. While the Warper has a lot of options and settings, getting started is really easy.

To warp a feature of the image, just click on it to add a warp point, and drag to push that part of the image in the direction you want it to go. By default, warp points influence the entire image, which is pinned down at the corners. This system makes it simple to warp large regions of the image, such as when you want to warp an edge of the image to get rid of a boom dip. Warp points are gray unless they’re selected, in which case they’re white.

(Left) The original image (Right) The image warped with a single control point

To “pin down” parts of the image you don’t want to warp, Shift-click to place limiter points (which are red, pink if they’re selected). By combining warp points with limiter points, you can quickly create extremely specific warp effects to squish and stretch features in an image in any way you want.

(Left) The original image (Right) The image warped with control (gray) and limiter (red) points

As you work, you can Option-click any unwanted warp or limiter point to delete it. To start from scratch, you can click the Warper plug-in’s master reset control in the OpenFX Inspector.

Additionally, you can use the FX mode of the Tracker palette to motion track the feature you’re warping. Then, by setting the Tracking pop-up menu to FXTracker, every warp and limiter point you’ve placed will move along with the feature you’re tracking, meaning you can create warp effects that move along with someone’s face, with a car driving on the road, or with something in a shot with camera motion.
Additionally, starting in version 16, warp and limiter points can be keyframed via the Warp Scale and Warp Point Positions parameters.

**Effect Options**

These controls affect how warp points that you add will affect the image.

— **Warp Limits**: A pop-up menu lets you choose how to treat the edges of the image when you’re warping it. There are three modes:

   — **Corners** (the default) lock the four corners of the image in place, but allow the sides to bulge in or out as you warp and allowing blanking to creep in.
   
   — **Edges** locks the full width and height of all four edges in place as you warp, preventing blanking. Distance locks parts of the image that are n pixels away, but the default setting is very permissive.
   
   — **Manual** allows the entire image to be warped without locking any part of it, allowing for extreme warps all along an entire edge of the image, but requiring you to place at least one limiter point prior to adding a warp point.

— **Warp Sharpness**: A pop-up menu lets you choose one of three methods of interpolating how the image bends around a Warp point: Sharp, Rubber-Sheet (the default), and Rounded. Sharp produces the “most pointy” warps, while Rounded produces the most gently curved warps. Rubber-Sheet strikes a balance between the two extremes.

![Sharp](image1.png)

![Rubber-Sheet](image2.png)

![Rounded](image3.png)
— **Edge Behavior:** A pop-up menu eliminates any blanking caused by warping that affects the edge of the image by filling black areas in one of several user-defined ways; options include Black (do nothing and leave the blanking), Reflect, Wrap-Around, and Replicate.

— **Quality:** A pop-up menu lets you choose from among three methods of calculating the warping effect you’re creating: Faster, Default, and Better. Each choice is an obvious trade-off between image smoothness and performance.

— **Warp Scale:** This slider lets you scale the overall warp effect you’re creating. Setting this to 0.000 reduces the warp effect to nothing, while raising it to the maximum value of 2.000 doubles the warp effect. Warp Scale can be keyframed to animate the warping effect.

### Onscreen Controls

The second set of controls lets you customize which of the Warper’s onscreen controls appear, with different options that make it easier to see certain things in various situations.

— **Render a reference grid:** This checkbox superimposes a reference grid over the image to make it easier to see what kind of warping you’re applying.

— **Show Warp Boundaries:** This pop-up menu has three choices for letting you see which areas of the image will be locked off by limiter points you place in the image.
  — None hides this information and is the default setting.
  — As Border shows a red line at the boundary where warping becomes locked off.
  — As Mask dims the area that’s protected from warping by limiter points.

![Show Warp Boundaries set to As Mask](image)

— **Control Visibility:** This pop-up menu lets you choose whether the warp and limiter points you create are visible as you work. Show (the default) leaves all control points visible all the time. Auto Hide hides all control points whenever you’re dragging one, letting you see the image as you adjust it without having control points in the way. Hide makes all control points invisible. You can add new control points, but you can’t see existing control points to edit them.

— **Show:** This pop-up menu lets you choose how to represent warp points, and there are two options.
  — Warp Points (the default) simply shows warp points as gray dots.
  — Warp Vectors display pairs of controls connected by a line; a round dot shows the anchor, or the part of the image the warped portion of the image came from, and an arrow shows the destination, where you’ve warped that part of the image to. Seeing the anchor and destination of each warp operation can sometimes be useful when you’re doing something complex.
— **Scale Controls**: This slider lets you shrink or grow the control points or warp vector handles to the most convenient size for the task at hand.

— **Warp Point Positions**: A parameter without any controls, save for key framing controls, that lets you keyframe the position of warp and limiter points. All points are keyframes within a single parameter and keyframe track, visible in the timeline of the Edit page, or the Keyframe Editor of the Fusion and Color pages.

### Waviness

— **Waviness Type**: Lets you choose Vertical or Horizontal waviness.

— **Scale**: Lets you choose the size of the waves.

— **Strength**: Lets you adjust the amplitude.

— **Phase**: Lets you “move” the wave and is a good parameter to keyframe if you’re animating this effect manually.

— **Animate**: A checkbox that reveals a Speed slider that lets you set how quickly the Waviness effect auto-animates without the need to use keyframes.

Chapter 166

Using the Fairlight Page

The completely redesigned Fairlight Audio Core engine allows for simultaneous playback of up to 1,000 tracks with no additional hardware, and up to 2,000 tracks when used with the Fairlight PCI Audio Accelerator. It also utilizes self-learning load balancing for maximum plug-in support.

Fairlight’s increased track count meets the demanding needs of both clients and immersive formats, such as Dolby Atmos. Major studio films and series television require high track counts to accommodate complex mixes and the export of multiple deliverables. Immersive formats, such as Dolby Atmos, multiply the necessary track counts with their demands for deliverables from 7.1 up to 22.2.

This chapter covers the basic user interface controls found on the Fairlight page, where they are and what they do, in order to give you an overall orientation of how to work with this integrated audio environment.

The Fairlight Page User Interface

In single monitor mode, the Fairlight page is an optimized look at the audio tracks of your project, with an expanded mixer and custom monitoring controls that make it easy to edit and manipulate your audio media and evaluate and adjust the levels of your program in order to create a smooth and harmonious mix.

The Interface Toolbar

At the very top of the Fairlight page is a toolbar with buttons that let you show and hide different parts of the user interface. These buttons are as follows, from left to right:

- **Media Pool**: Shows and hides the Media Pool, from which you can edit audio clips into the Fairlight page Timeline.
- **Effects Library**: Opens the Audio FX panel of the Effects Library, from which you can apply Fairlight FX, VST, and other audio effects to clips or tracks in the Timeline.
- **Index**: Shows and hides the Index and its Tracks and Markers panels. The Tracks panel lets you manage the tracks of the Timeline, showing and hiding which ones you want to work with. The Markers panel lets you see every marker in the Timeline, along with associated data, so that it’s easy to browse through your markers all at once to quickly find the information you need.
- **Sound Library**: Shows and hides your sound library. There are search and filter fields to locate desired sounds. There is a playback window to audition the sounds prior to editing into the Timeline.
— **ADR:** Shows and hides the ADR section of Fairlight. Here you will find tabbed controls for List, Record, and Setup that control the functions of the ADR panel.

— **Mixer:** Shows and hides the Mixer, to the right of the Timeline, that lets you adjust various effects and levels associated with each track of the Timeline in order to create a harmonious mix.

— **Meters:** Shows and hides the Monitoring audio meters and viewer at the top of the Fairlight page.

— **Metadata:** Shows and hides the clip metadata Inspector.

— **Inspector:** Show and hides the Inspector, from which you can edit different clip attributes.

---

### Showing Which Panel Has Focus

Whenever you click somewhere on the DaVinci Resolve interface using the pointer, or use a keyboard shortcut to “select” a particular panel (such as in the Edit page), you give that panel of the user interface “focus.” A panel with focus will capture specific keyboard shortcuts to do something within that panel, as opposed to doing something elsewhere in the interface. A highlight appears at the top edge to show you which panel has focus so that you can keep track of which part of the current page is taking precedence, and you can switch focus as necessary to do what you need to do.

![Focus Indicator](image)

The focus indicator shown at the top edge of the Media Pool, shown next to a Viewer that doesn’t have focus.

---

### The Audio Timeline

The heart of the Fairlight page, the Audio Timeline, presents the audio channels and tracks of the currently selected Timeline differently than the Edit page does, in a one-channel-per-track format that’s optimized for audio mixing and sweetening. The Audio page Timeline cannot be closed.

![Audio Timeline](image)
Controls in the Audio Timeline

The Audio Timeline has the following controls.

— **Timecode fields and Range buttons**: Four timecode fields show the current timecode value corresponding to the position of the playhead (at the very top), the Range In point, the Range Out point, and the Range duration. Clicking the Range In and Range Out buttons (to the left of the timecode fields) set these points and their corresponding timecode value.

— **Transport controls**: The bar defining the top of the Timeline contains the Fairlight page’s audio-specific transport controls, which differ from those found on the Media, Edit, Color, and Deliver pages due to its inclusion of recording capabilities. These include Fast Reverse, Fast Forward, Play Forward, Stop, Record, Loop, and the Automation toolbar display icon.

— **Automation toolbar**: Clicking this button opens a secondary toolbar with all the controls you need to configure the recording of mixer automation. For more details on Automation, see Chapter 174, “Automation Recording.”

— **Monitoring controls**: At the far right of the transport controls, a set of three monitoring controls let you quickly control the output volume of your mix. The speaker icon is an Enable/Disable button allowing for muting audio playback. The icon turns red when audio is muted. The slider lets you change the monitor volume and has a decibel indicator of the amount of level that has increased or decreased. The DIM button lets you temporarily reduce the monitored volume being output in order to have a quick chat with your client about sports or the state of the world while keeping half an ear on the mix. The slider turns yellow when audio monitoring is dimmed. Dim and Mute commands are also available from the Fairlight menu.
— **Timeline Ruler:** The Timeline Ruler shows the program's timecode. The playhead indicates the current frame and sample where you're working in the Timeline, and the playhead has a handle that appears within the Timeline Ruler. Dragging within the Timeline Ruler moves the playhead. When you add markers to the Timeline, these markers appear within the Timeline Ruler, as well.

— **Playhead:** Shows the current frame and sample of playback, and provides a visual representation of where you are while playing, shuttling, and jogging through the Timeline. Also used as a reference point for editing operations. The largest timecode display at the upper left-hand display shows the position of the playhead.

— **Audio tracks:** The Fairlight page of DaVinci Resolve supports multiple audio tracks, and each audio track may contain multiple lanes with which to accommodate the audio channels that are contained within multi-channel audio clips using track mappings such as stereo, 5.1, 7.1, Atmos, or Adaptive (1–24 channels). All audio clips that have been edited into the Timeline appear within each track, with the recorded channels within each clip occupying as many lanes as that clip has available. At the left of each track is a header area that contains a number of controls.

The Fairlight timeline is divided into tracks and lanes; track A1 has a single lane for the mono audio within it, and track A2 has two lanes to accommodate stereo audio.

— **Track header:** The track header contains different controls for selecting, locking/unlocking, and soloing/muting tracks. Each track header also lists how many clips appear on that track. The track header contains the following five controls, from left to right:

The track header controls of the Fairlight page timeline

— **Track color:** Each track can be color-coded with one of 16 different colors. These color codes correspond to the Edit page Mixer, and to the Fairlight page Mixer and Audio Meters. You can choose a new color for any track by right-clicking the track header and choosing from the Change Track Color submenu. You can set multiple tracks to the same color by Command-clicking in the track header of multiple tracks to select them, and then right-clicking one of the selected track headers and choosing from the Change Track Color submenu.

— **Track number:** Indicates the number of each track.

— **Track name:** Each track has a name that defaults to the track number, such as Track 1, Track 2. However, you can click any track's name and edit it to be whatever you like. For example, you can rename each track with the type of audio you're editing onto it, such as Production, Ambience,
SFX, or Music. These track names are also used to identify each track’s channel in the Mixer, in the middle of each channel strip (each channel strip’s track number is simultaneously displayed at the top).

— **Audio channel type indicator:** Audio tracks also show which channel configuration that track uses, listing the number of channels for mono, stereo, 5.1, 7.1, Atmos, adaptive, and others.

— **Fader value:** A field displays the current fader setting at the position of the playhead, in dB. This value corresponds to the track’s fader level on the Mixer panel. You can drag this value up or down and the fader will follow.

— **Lock Track button:** Light gray when turned on, dark gray when turned off. When a track is locked, clips can’t be replaced, moved, or otherwise edited, although clips on locked tracks can be graded when in the Color page.

— **Arm button:** This button arms recording onto that track.

— **Solo button:** Disables all other tracks but the current one, enabling you to quickly hear a single track in isolation. This affects rendering, so if one or more tracks are soloed, the muted tracks won’t be output or rendered.

— **Mute button:** Temporarily disables audio on that track so it’s neither monitored nor output. This affects rendering, so if one or more tracks are muted, they won’t be output or rendered.

— **Audio meters:** Each track has audio meters in the track header that let you see levels during playback.

— **Toolbar editing tools:** The toolbar contains both modal and command buttons to let you work on your projects. More detail on these appears in the following section.

— **Vertical and horizontal scroll bars:** If your project is longer than the current width of the Timeline, or the number of audio tracks is taller than the current height of the Timeline, these scroll bars let you drag to navigate around your program. When you scroll horizontally, you also move the playhead. You may also scroll vertically using the scroll wheel (or other scroll control) of your mouse or other pointing device. You may scroll horizontally by holding the Command key down while using your scroll control.

— **Individual Timeline track resizing:** Any track in the Timeline can be individually resized by right-clicking anywhere within that track’s header control area and choosing a track height from the Lock Track Height To submenu of the contextual menu. You can choose a fixed size including Micro, Mini, Medium, Large, Extra Large, and Custom. When you choose a fixed track height, vertical zooming no longer affects that track until you change that track’s Lock Track Height to option back to None. You can also highlight several or all tracks and set the track height to one size. All highlighted tracks will change to that particular size unless changed again, either globally or individually.

![Resizing an individual audio timeline track using contextual menu options](image)
Zooming Audio Waveform Height

You can zoom into or out of the audio waveforms shown in each clip of one or more tracks, to make them taller or shorter, or you can reset them to unity. This doesn’t change the audio levels of clips in affected tracks, it just lets you make the audio waveforms easier to see. When zooming into sample level of a clip, the zero crossing of the samples will display.

To zoom audio waveform height using your scroll wheel:
— Hold down Command-Option, and roll the scroll wheel or control up or down to resize all waveforms in all tracks.

You can also use commands that are accessed in the top menu View > Track Waveform View for any track on the Timeline. You can also select one or multiple tracks to resize their waveforms all at once. There are three sets of commands in the menu:
— Reset Zoom All/Selected Tracks
— Zoom In All/Selected Tracks
— Zoom Out All/Selected Tracks

Right-clicking any clip in the Timeline offers the same options in the Track Waveform Zoom submenu of the contextual menu.

Track Layering

Audio layering is a special audio editing mode that lets you superimpose multiple audio clips in the same track, with audio clips edited into the top layers muting overlapping sections of audio clips appearing on lower layers. With audio layering enabled, superimposed audio clips are treated similarly to superimposed video clips that have opacity set to 100%, with clips on top obscuring (or muting) clips underneath. You can toggle this on and in the off in the View menu > Show Audio Track Layers.

Turning on track layers opens up space to edit more audio into each track.

Audio layering is incredibly useful for any situation where you’re combining segments of multiple takes together to create a single voiceover, audio vocal track, ADR, or dramatic performance, as you can choose which segments to use via their superimposed position in the stack of clips appearing in that track, while at the same time you’re preserving the other takes underneath in case you might want them later.

**TIP:** Track layering can be enabled for audio tracks on the Edit page as well.
Switching Among Multiple Timelines

Timelines can be organized like any other clip in the Media Pool. To open or switch among timelines, use the following procedures. Each Timeline retains the view settings last made within it, including track heights, zoom settings, etc.

To switch timelines, do one of the following:

— In the Edit page Media Pool, double-click a timeline.
— In the Edit page Timeline Viewer, choose a timeline from the Timelines drop-down menu at the top of the viewer.
— In the Color page, choose a timeline from the Timelines drop-down menu at the top of the viewer.
— In the Fairlight page, choose a timeline from the Timelines drop-down menu to the left of the transport controls.

Toolbar

The Toolbar has buttons that let you choose modes of functionality and other buttons that let you execute commands such as placing markers and flags.

Timeline View Options drop-down menu: Contains a variety of controls with which to customize the display of clips and set navigation and scrolling options in the Timeline.

Selection mode: The default mode in which you can move and resize clips in the Timeline, roll edits, and do other basic editing tasks. While this mode can be used with the pointer, it’s designed for letting you make automatic selections of clips at the position of the playhead in selected tracks, using keyboard shortcuts or the Fairlight Editing console.

Range Selection mode: An editing mode in which you can select partial regions of one or more clips for partial editing. It’s designed for letting you make automatic selections using In and Out points to define regions of selected tracks, using keyboard shortcuts or the Fairlight Editing console.

Edit Selection mode: A multi-function editing mode that’s optimized for pointer-based editing in the GUI. Multiple selection and editing functions like trimming, fades, clip level, and more can be accessed by clicking or dragging on different regions of audio clips in the Timeline with this one tool. Additionally, an important aspect of working in Edit Selection mode is that this is the only mode that lets you edit the Timeline during playback, which you can’t do in Selection and Range modes.

Pencil: A tool with which you can write automation data using the pointer as a pencil. The Pencil tool appears when automation is enabled.

Select Range: A tool that allows you to click and drag any automation keyframe up or down and left or right (bounded by its neighboring keyframes) to adjust it directly. Displayed when Automation mode is enabled.
**Add Cut**: Click to add a cut to every clip on an unlocked track that intersects the position of the playhead.

**Snapping**: Enables or disables clip snapping. When turned on, clip In and Out points, markers, and the playhead all snap to one another for reference while you’re editing.

**Linked Selection**: When you select an edit point with both video and audio components, and Linked Selection is enabled, both the video and audio edit points are selected, so when you apply a video transition to an edit, a crossfade is added to the audio.

**Automation Follows Edit**: Enables or disables automation that is unique to a timeline to be embedded into the clips so that when cutting and pasting new instances of them in the Timeline they retain the levels, panning, filter settings, etc. This is extremely useful when making multiple instances of the same audio clips throughout an edit. The Automation Follow Edit button appears when automation is enabled.

**Flag Clip/Flag Colors drop-down menu**: Flags identify clips, and indicate all clips that correspond to the same item of media in the Media Pool. Clips can have multiple flags. Clicking the Flag button automatically adds a flag to whichever clip is currently selected in the Timeline. A drop-down menu to the right lets you choose differently colored flags, and clear all flags from the currently selected clip.

**Add Marker/Marker Colors drop-down menu**: Markers identify specific frames of individual clips. Clicking the Add Marker button adds a marker of the currently displayed color to the clip at the position of the playhead in the Timeline. A drop-down menu to the right lets you choose differently colored markers, and clear all markers from the currently selected clip.

**Transient Detection**: Enables transient detection on a track’s set of clips. Once enabled, a transient button appears on tracks to enable the transients on the track’s clips to be easily identified and navigated. When the Jump to Transient button is enabled, the Up and Down arrow keys navigate transients within a clip.

---

**Timeline View Options**

Selecting the Audio Timeline View options
Track Display Options

**Video Tracks:** This button lets you display or hide the video tracks in the current Timeline, for use as a reference while you work.

**Full Waveforms:** This button lets you toggle full waveforms on and off, optionally hiding the divider bar that keeps the waveform separate from the file name area of each audio clip, so the waveform occupies the full space of each audio bar in the Timeline.

**Waveform Borders:** This button lets you toggle waveform outlines on and off, drawing a dark border around the edges of each waveform to make them easier to see.

**Gain Line:** This button lets you toggle the clip gain indicator line on and off. Also available in the Fairlight Menu > Show Clip Gain Line.

Navigation Options

**Jump to Clip:** When toggled this lets you jump from clip to clip using the Up or Down Arrow keys.

**Jump to Fade:** When toggled this lets you jump from fade to fade using the Up or Down Arrow keys.

**Jump to Marker:** When toggled this lets you jump from marker to marker using the Up or Down Arrow keys.

**Jump to Transient:** When toggled this lets you jump from transient to transient using the Up or Down Arrow keys. Transient Detection must be turned on in the Timeline and the track for this navigation.

Timeline Scrolling

**Fixed Playhead:** This button lets you set the playhead to be fixed so that during playback the tracks scroll past the playhead as it remains in place, which is useful when working with the Fairlight control surface.

**Page Scrolling:** This button lets you set the playhead to scroll to the end of the current Timeline view and then start a new page at the end of the Timeline play. The rate of the page turn is dictated by zoom level of the Timeline.

**No Scrolling:** This button sets fixes the Timeline in place so that it will not update with the playhead. Depending on the zoom level, it is possible that the playhead will play offscreen with no timeline updating.

NOTE: These options are also available in the View menu > Timeline Scrolling.
Scroller

**Video:** This button lets you see video tracks scrolling in the bottom of the Fairlight timeline with the option of low, medium, or high viewing of the video media immediately surrounding the playhead.

**Audio 1:** An audio scroll bar and zoomed-in visual reference for the audio media immediately surrounding the playhead. A drop-down menu allows for the choice of what audio track will scroll.

**Audio 2:** An additional audio scroll bar and zoomed-in visual reference for the audio media immediately surrounding the playhead. A drop-down menu allows for the choice of what audio track will scroll.

Zoom Presets

**Presets 1-7:** These buttons let you choose from one of seven zoom levels.

Customizing Clip Display in the Timeline

Choose Fairlight > View Clip Info Display to open a dialog with which you can customize what information is shown at the bottom of each clip in the Fairlight timeline. This dialog has options for viewing no clip name, the file name, or the clip name, and for choosing from among a variety of metadata that you might want available to view as you work with clips in the Timeline.
Customizing the Timeline’s Display

There are a variety of ways you can customize the Timeline to better see what you’re working on.

**Playhead Modes**

Turning on the Fixed Playhead mode in the Timeline View Options drop-down menu, or choosing View > Show Fixed Playhead, puts the Fairlight timeline into an audio-centric mode where the playhead remains fixed in place, and the Timeline scrolls underneath it as you use the transport controls or JKL to play, shuttle, or scrub forward or back. There are also options for Page Scrolling and No Scrolling as outlined in the Timeline View Options section above.

**NOTE:** When the Keyboard Customization has changed from the default DaVinci Resolve mapping to a different mapping, many default key commands are altered. For instance, the Pro Tools Keyboard Customization does not offer JKL transport.

**Visible Video Tracks**

A checkbox in the Timeline View Options drop-down menu of the toolbar lets you display small versions of the video tracks in the Fairlight timeline for reference. These video tracks are uneditable; they’re simply there so you can see which audio clips correspond to which video items, and so they can be used as snapping targets for positioning audio.
Video and Audio Scrollers

Checkboxes in the Timeline View Options let you optionally show one Video Scroller and up to two Audio Scrollers at the bottom of the Fairlight timeline.

At the default Low zoom level, the Video Scroller provides a scrollable frame-by-frame filmstrip view of the video of your program, where one frame of the scroller equals one frame of your video. Each of the two Audio Scrollers, on the other hand, let you focus on a continuous waveform view of a particular audio track. You choose which track populates an Audio Scroller via a drop-down menu in the Timeline header.

What Are They Used For?

The Audio Scrollers always provide a zoomed-in view of specific audio tracks that you’re focused on, regardless of the zoom level of the Timeline tracks above. This means you can focus on subtle details of the audio of one or two tracks that you’re working on, while the rest of the Timeline shows you the overall stack of tracks with clips that are playing together at that moment.

Meanwhile, the Video Scroller always shows the exact frame of video that corresponds to the current moment in time, so it’s an aid to precision editing involving frame-specific adjustments.

Additionally, both the Filmstrip and Waveform viewers scroll continuously during playback, giving you a preview of what visual actions and audio cues are coming a few moments forward in time that you can refer to while performing automation or recording foley.
Repositioning the Scroller Playhead
While the scrollers are visible, the Scroller playhead can be dragged to the left or right in the Timeline to give you more or less preview room to the right.

Zooming the Video Scroller
Right clicking on the Video scroller lets you choose a Low, Medium, or High zoom level. At Low, you get a frame-by-frame view of the program that feels like scrolling a strip of film on a Steenbeck. At Medium and High, you get a progressively abbreviated film strip that lets you zoom more quickly.

Scrolling the Fairlight Timeline Using the Scroller Tracks
Dragging the scroller tracks to the left or right smoothly scrubs through the Timeline in greater detail, regardless of the zoom level of the Timeline tracks above.

Mixer

The Audio Mixer provides a set of graphical controls you can use to assign track channels to output channels, adjust EQ and Dynamics, add filters and Fairlight FX, set levels and record automation, pan stereo, surround and immersive audio, and mute and solo tracks.

The Audio Mixer, with channel strips corresponding to the tracks in the Timeline

The Audio Mixer exposes two sets of channel strips with controls that correspond to the tracks in the Timeline. The leftmost set of channel strips expose one set of controls for each track in the Timeline, while the rightmost set of channel strips expose another set of controls for each bus you’ve created to bus the mixed audio tracks to your set of desired output tracks.

— **Track color:** Each track can be differently color-coded, to help you keep organized.
— **Track number:** The number of the Timeline track corresponding to each channel strip appears here.
— **Input**: A drop-down menu that lets you patch inputs, patch buses, and configure the input settings of audio signals routed through Blackmagic Design or other hardware interfaces.

— **Order**: A drop-down menu that lets you choose the order of processing per track of the EQ, Dynamics, and Effects.

— **Effects**: Fairlight FX, VST, and Audio Unit effects that you apply to tracks from the Effects Library appear here, with controls for enabling/disabling each effect, opening an effect’s custom controls, and deleting that effect.

— **Effects In**: A button to globally mute or enable all effects on a track.

— **Dynamics**: Double-clicking exposes a set of dynamics controls with three sets of controls corresponding to an Expander or Gate, a Compressor, and a Limiter that can be used separately or in concert to manage the dynamics of the audio on that track.

![The channel strip Dynamics control window](image)

— **EQ**: Double-clicking exposes a four-band parametric equalizer, with additional Hi and Lo Pass filters, that has both graphical and numeric controls for boosting or attenuating different ranges of frequencies of audio on each track. You can select from among four types of EQ filtering from the Equalizer Type drop-down menu, with options for Earth (the default), Air, Ice, and Fire. These four equalizer types affect the Curves aspect and Q-factor of the transfer function. Each band has controls for the filter type (Bell, Lo-Shelf, Hi-Shelf, Notch), Frequency, Gain, and Q-factor (sharpness of the band), with the available controls for each band of EQ change depending on the filter type.
— **Bus Sends**: Click the + sign to add bus sends.

— **Pan**: A pan control compatible with stereo and surround panning. You can drag within this control to adjust pan, or you can double-click to expose a pan window. What controls are available in the pan window depend on the mapping of the audio track, but both stereo and surround panning controls are available, with corresponding numeric controls.

Option-double-clicking on the Pan control of the Mixer opens an alternate 3D Audio Pan window. Whereas the regular Pan window lets you do stereo and conventional 5.1 and 7.1 surround panning, the 3D Audio Pan window lets you do the kind of spatial audio positioning enabled by advanced surround formats, such as Dolby Atmos, Auro 3D, and NHK 22.2.
— **Bus Outputs:** These buttons let you assign a track or Sub’s channels to one or more of the main buses.

— **Group:** These buttons let you assign that track’s channels to up to 10 Groups as well as assign a VCA.

— **Track name:** This mirrors the track name found in the header controls of the Timeline. You can customize a track’s name in the Mixer by double-clicking and typing in the name field.

— **Arm, Solo, and Mute buttons:** Identical to the controls found in the track header controls of each timeline audio track. Arm lets you enable a track to be recorded onto. Solo lets you mute all other tracks in order to play that track in isolation (along with any other Soloed tracks). Mute disables audio playback from that track.

— **dB:** Shows you the volume, in decibels, that track is currently set to.

— **Automation:** Enable/disable automation per track.

— **Level Indicator:** This is a real time graphical representation of a track’s signal measured from -60db to 0db.

— **Fader:** Each track’s vertical faders let you adjust the level of that track, and perform automation recording.

**NOTE:** Starting with DaVinci Resolve 17.4, the mixer panel has changed from prior versions. Some of the items are in a different order than earlier versions. Also, when using the Fixed Legacy Busing option, then the bus structure as it applies to the Mixer panel also offers different busing usage. The redesigned Mixer panel makes a more efficient use of the Fairlight page but rest assured that no features have been removed, simply improved.
The Monitoring Panel

The Monitoring panel that runs along the top of the Fairlight page shows all of the audio meters corresponding to the tracks in the Timeline, as well as the Master Output meter, Control Room meters, and a video viewer.

At left, a row of audio meters corresponds to the channel strips of the Mixer, one meter for every audio track in the Timeline. Each track displays the number of meters that corresponds to that track’s audio mapping, with mono tracks having a single audio meter, stereo tracks having two, 5.1 tracks having six, and so on. All of these track and bus meters (with the exception of the Loudness meters) display both peak and RMS (root mean square) levels against a dB scale.

To the right of the Track meters are the Bus meters, in which all Flexbus buses appear, separated by type, and each displaying the number of meters that corresponds to that track’s audio mapping. This way you can see the sum of all tracks that have been routed to a particular bus. When in legacy bus mode, those buses will be Mains, Subs, and Aux buses.

The last set of meters, to the right of all others, are the Loudness meters, which consist of two sets of meters and a numerical readout. The Control Room meter reflects that main output level from the program and the Loudness meter measures the mix’s loudness according to the user’s chosen scale. This lets you keep track of the integrated loudness of the overall mix, which is the standard to which all contemporary mixing specifications refer when describing the deliverables you’re expected to provide to the client.

**Absolute and Relative Measurement Scales**

While some users prefer to measure their levels to correspond to a relative scale of “0,” similar to a VU meter where the needle rides above the “0,” others want to see the absolute measure of the amplitude in LUFS and true peak. By default, the Loudness meter is set to relative scale, but you now have the option to choose between relative scale and absolute scale in the Loudness meter.

Relative scale in the Loudness menu is relative to the selected scale, so a loudness unit of 0 corresponds to the target of the chosen measure type. For instance, if EBU R128 is selected, whose target measure is -23dB LUFS, the “0” LU (Loudness Unit) is equal to -23dB. If ATSC A/85 is chosen, whose target is -24dB, then that becomes the corresponding equivalent of the relative LU of 0.

When using the absolute scale, the Loudness meter displays the increments to reflect the the chosen measure type. In absolute scale the EBU R128 meter will display -23 instead of the relative scale’s 0.
The option in the Loudness panel reveals the various measure types as well as the option for absolute scale.

With the additional track counts now available with DaVinci Resolve, a double height level monitor is available by double-clicking anywhere in the track field.

The double height Monitoring panel

**Viewer**

A small viewer at the far right of the Monitoring panel shows the frame of video at the position of the playhead. A button in the lower right-hand corner lets you expand the Viewer into its own floating window. The Fairlight page has Cinema Mode viewing (Command > F) or through the Workspace menu, Workspace > Viewer Mode > Cinema Viewer.
The Media Pool

In the Fairlight page, the Media Pool serves as the repository of all audio clips in your project, both clips that appear within the Timeline, and clips that you’ve added to your project but have not yet used. When you record audio into the Timeline, the resulting clips are stored in the Media Pool as well, for future use. The Media Pool is also mirrored on the Media and Edit pages, and contains all of the video clips and timelines within that project.

The Bin list at the left shows a hierarchical list of folders called bins used for organizing your media, which is also used to organize your timelines. By default, the Media Pool consists of a single bin, named “Master,” but you can add more bins as necessary to organize timelines and clips by right-clicking anywhere in the empty area of the Media Pool and choosing Add Bin. You can rename any bin by double-clicking on its name and typing a new one, or by right-clicking a bin’s name and choosing Rename Bin. The Bin list can be hidden or shown via the button at the upper left-hand corner of the Fairlight page toolbar.

The browser area to the right shows the contents of the currently selected bin in the bin list. Every clip you import, every timeline you create, and every AAF, XML, or EDL file you import appears here. You can create or import as many timelines as you need within a single project.

As elsewhere, the Media Pool can be displayed in either Metadata view, Thumbnail view, or List view. In List view, you can sort the contents by any one of a subset of the total metadata that’s available in the Metadata Editor of the Media page. Of particular interest to audio editors are columns for Clip Name, Reel Name, different timecode streams, Audio Channels, Format, Audio Codec, Date Added, Flags, and Duration.
For more information on using the myriad features of the Media Pool, see Chapter 18, “Adding and Organizing Media with the Media Pool.” In the sections that follow, some key features of the Media Pool are summarized for your convenience.

## Importing Media Into the Media Pool on the Fairlight Page

While adding clips to the Media Pool in the Media page provides the most organizational flexibility and features, if you find yourself in the Edit or Fairlight pages and you need to quickly import a few clips for immediate use, you can do so in a couple of different ways.

**To add media by dragging one or more clips from the Finder to the Fairlight page Media Pool (macOS only):**

1. Select one or more clips in the Finder.
2. Drag those clips into the Media Pool of DaVinci Resolve, or to a bin in the Bin list.
   Those clips are added to the Media Pool of your project.

**To use the Import Media command in the Fairlight page Media Pool:**

1. With the Fairlight page open, right-click anywhere in the Media Pool, and choose Import Media.
2. Use the Import dialog to select one or more clips to import, and click Open.
   Those clips are added to the Media Pool of your project.

For more information on importing media using the myriad features of the Media page, see Chapter 18, “Adding and Organizing Media with the Media Pool.”

### Media Pool Preview Player

The Media Pool has a preview player at the top that provides a place to open selected source clips in the Media Pool, play them, add marks to log them, and set In and Out points in preparation for editing them into the Timeline via drag and drop. The Media Pool Preview Player effectively acts as a Source monitor for editing in the Fairlight page.

![The preview player in the Media Pool](image)

— Various viewing controls populate the title bar at the top. A drop-down menu at the upper left lets you choose a zoom level for the audio waveform that's displayed. To the right of that, a Timecode window shows you the duration of the clip or the duration that's marked with In and Out points. Next to the right, a real-time performance indicator shows you playback performance. In the center, the title of the currently selected clip is shown, with a drop-down menu to the right that shows you
the most recent 10 clips you’ve browsed. To the far left, a Timecode field shows you the current position of the playhead (right-clicking this opens a contextual menu with options to change the timecode that’s displayed, and to copy and paste timecode).

— The center of the Media Pool Preview Player shows you the waveforms in all channels of the currently selected clip, at whatever zoom level is currently selected.
— Transport controls at the bottom consist of a jog bar for scrubbing, Stop, Play, and Loop buttons, and In and Out buttons.

**Bins, Power Bins, and Smart Bins**

There are actually three kinds of bins in the Media Pool, and each appears in its own section of the Bin list. The Power Bin and Smart Bin areas of the Bin list can be shown or hidden using commands in the View menu (View > Show Smart Bins, View > Show Power Bins). Here are the differences between the different kinds of bins:

— **Bins**: Simple, manually populated bins. Drag and drop anything you like into a bin, and that’s where it lives, until you decide to move it to another bin. Bins may be hierarchically organized, so you can create a Russian dolls nest of bins if you like. Creating new bins is as easy as right-clicking within the bin list and choosing Add Bin from the contextual menu.

— **Power Bins**: Hidden by default. These are also manually populated bins, but these bins are shared among all of the projects in your current project library, making them ideal for shared title generators, graphics movies and stills, sound effects library files, music files, and other media that you want to be able to quickly and easily access from any project. To create a new Power Bin, show the Power Bins area of the Bin list, then right-click within it and choose Add Bin.

— **Smart Bins**: These are procedurally populated bins, meaning that custom rules employing metadata are used to dynamically filter the contents of the Media Pool whenever you select a Smart Bin. This makes Smart Bins fast ways of organizing the contents of projects for which you (or an assistant) has taken the time to add metadata to your clips using the Metadata Editor, adding Scene, Shot, and Take information, keywords, comments and description text, and myriad other pieces of information to make it faster to find what you’re looking for when you need it. To create a new Smart Bin, show the Smart Bin area of the Bin list (if necessary), then right-click within it and choose Add Smart Bin. A dialog appears in which you can edit the name of that bin and the rules it uses to filter clips, and click Create Smart Bin.

**Showing Bins in Separate Windows**

If you right-click a bin in the Bin list, you can choose “Open As New Window” to open that bin into its own window. Each window is its own Media Pool, complete with its own Bin list, Power Bins and Smart Bins lists, and display controls.

This is most useful when you have two displays connected to your workstation, as you can drag these separate bins to the second display while DaVinci Resolve is in single screen mode. If you hide the Bin list, not only do you get more room for clips, but you also prevent accidentally switching bins if you really want to only view a particular bin’s contents in that window. You can have as many additional Bin windows open as you care to, in addition to the main Media Pool that’s docked in the primary window interface.
Filtering Bins Using Color Tags

If you’re working on a project that has a lot of bins, you can apply color tags to identify particular bins with one of eight colors. Tagging bins is as easy as right-clicking any bin and choosing the color you want from the Color Tag submenu.

For example, you can identify the bins that have clips you’re using most frequently with a red tag. A bin’s color tag then appears as a colored background behind that bin’s name.

Once you’ve tagged one or more Media Pool bins, you can use the Color Tag Filter drop-down menu (the drop-down control to the right of the Bin List button) to filter out all but a single color of bin.

To go back to seeing all available bins, choose Show All from the Color Tag Filter drop-down.
Sorting the Bin List

The Bin list (and Smart Bin list) of the Media Pool can be sorted by Bin Name, Date Created, Date Modified, in either ascending or descending order. Simply right-click anywhere within the Bin list and choose the options you want from the Sort by submenu of the contextual menu.

You can also choose User Sort from the same contextual menu, which lets you manually drag all bins in the Bin list to be in whatever order you like. As you drag bins in this mode, an orange line indicates the new position that bin will occupy when dropped.

Filtering Clips With Audio in the Fairlight Page

The Media Pool in the Fairlight page has one additional feature: the ability to filter out audio-only clips, or clips with audio, in the currently selected bin. This makes it easy for you to find audio clips that you’re looking for, which are hidden along with lots of video clips in the same bin. To use this feature, click the Option menu of the Media Pool and choose Show All Clips, Show Audio Only Clips, or Show Clips With Audio, Show Audio Waveforms, and Show Non-Rectified Audio Waveforms.
Effects Library

The Effects Library on the Fairlight page displays both the built-in Fairlight FX audio plug-ins that accompany DaVinci Resolve on macOS, Windows, and Linux, as well as whatever Audio FX are available on your workstation.

— Fairlight FX are built-in audio processing effects that are fully cross-platform on all platforms DaVinci Resolve supports.
— On macOS and Windows, DaVinci Resolve supports the use of third-party VST audio plug-ins.
— On macOS, DaVinci Resolve supports Audio Unit (AU) audio plug-ins.

Once you install third-party effects on your workstation, they appear in this panel of the Effects Library alongside the Fairlight FX that are always available. Audio plug-ins let you apply effects to audio clips or entire tracks worth of audio, to add creative qualities such as echo or reverb, or to take care of mastering issues using noise reduction, compression, or EQ.

Similar to the Media Pool, the Effects Library’s Bin list can be opened or closed using a button at the top left.

Effects Library Favorites

You can click on the far right of any transition, title, or generator to flag that effect with a star as a favorite effect. When you do so, the favorited effects appear in a separate Favorites area at the bottom of the Effects Library Bin list.

Stars indicate a flagged favorite effect, all favorites are currently filtered
ADR

The Fairlight page of DaVinci Resolve has a sophisticated interface for doing ADR, or automated dialog replacement, in a structured and straightforward manner. Simple yet powerful cue list management, industry-standard audio beeps and visual cues, and sophisticated take management with star ratings and layered take organization help you manage the resulting recordings to use the best parts of each take in your program.

When open, the ADR interface consists of three panels to the left of the Timeline: a List panel, a Record panel, and a Setup panel.

The Setup panel of the ADR interface

The List Panel

This is where you create a list of cues you need to re-record, either from within the Fairlight page, or imported from a .csv file that someone provides you. It presents controls for adding, editing, importing, and exporting cues that you want to record.
The List panel of the ADR interface

The Record Panel

This is where you actually run the ADR recording session you’ve set up, using the dialog cues you’ve put into the Cue list. It presents controls for displaying and selecting which cues to record, previewing and initiating recording, and adding metadata to rate the different takes you’ve recorded and to keep track of which cues have been completed.
The Setup Panel

As its name implies, the Setup panel is where you configure your ADR session. It presents the controls letting you set up which audio input you want to use and what tracks to listen and record to, as well as preferences governing what the actors will see on the video output display to help them keep their performance in sync.

For more information on using the ADR panel, see Chapter 170, "ADR (Automated Dialog Replacement)."

Sound Library Browser

A Sound Library panel is available from the Interface toolbar for browsing sound effects libraries that you have available to you, on your system or on a SAN you’re connected to. It includes the capability of scanning specified file paths to catalog available sound files and their metadata, storing this data within the currently selected project library (or another project library that you select) to use when searching for the perfect sound effect within your library. Once you’ve cataloged your sound effects collection, it’s easy to search for sounds, preview what’s been found in the list, and edit the one you like best into the Timeline.
The Sound Library panel

**TIP:** You can download the Fairlight sound library, a royalty-free collection of over 500 professionally recorded foley sounds that you can use in your own projects, which are directly downloadable from the Sound Library panel. The Fairlight sound library features everything from atmospheric ambient sounds to foley sounds such as foot steps, explosions, hits, effects, and more. This free sound library is designed to work with the Fairlight foley sampler, which lets you use a MIDI keyboard to trigger sounds so they can be recorded at precisely the right time in your program.

**Library Controls**

Clicking the Library button (to the right of the Search field) reveals a menu that lets you choose which project library to use for searching (and cataloging) sound effects collections. Each network project library can have a different catalog.
Choosing a library to search

**NOTE:** The Sound Library is now capable of using the Mapped Mount option in the Media Storage panel of the Preferences, in order to access sound effects located on remote volumes using other operating systems.

**To catalog all audio files within a given file path for searching using the Sound Library:**

1. Using the Project Manager, create an empty network project library in which to store the sound effects catalog.
2. Open a project, open the Edit or Fairlight pages, and open the Sound Library.
3. (Optional) Click the Library button (to the right of the Search field), and select the PostgreSQL-based network project library you created to save the resulting metadata analysis to, using the Library drop-down menu that appears. The current project library is selected by default. If you’re working within a local project library instead, the top compatible PostgreSQL project library in the list will be the default.
4. Do one of the following:
   a. If you’ve not yet connected a library of sound effects, an Add Library button appears in the center of the Sound Library. Click this button, and from the file dialog that appears, select the top-most directory of a file path that contains sound effects; if you’ve selected a directory with subdirectories inside, each subdirectory will be examined for content.
   b. If you’re adding more sound effects to an existing library, then click the Option menu and choose Add Library. From the file dialog that appears, select the top-most directory of a file path that contains sound effects; if you’ve selected a directory with subdirectories inside, each subdirectory will be examined for content.
5. Click Open.
   A progress bar will show you how long the operation will take. When you’re finished, a dialog will appear letting you know how many clips were added to the current library.

**Display Controls and the Search Field**

The Sound Library title bar has controls for sorting the sound effects list, showing it in List or Icon view, and an Option menu with various other settings and commands.
Underneath, a text field lets you enter search terms, while a drop-down menu to the right lets you choose whether to search the current project library for sound effects by name, description metadata, or all.

To search for a specific sound effect and edit it into the Timeline:

— Type a search term into the Search field. The case of search terms is ignored, except for boolean operators.

To help you to eliminate false positives, the search field supports different kinds of searches, such as literal searches, and/or/not boolean searches, wildcard searches, and ranges of characters.

**NOTE:** If you want to perform boolean searches, the boolean operators must be typed in all upper caps, such as AND, OR, and NOT. In lower caps, and, or, and not will be treated as search terms.

**Or/And/Not Searches**

Simply typing words separated by a space is treated as a series of OR searches for each word independently of one another, either literally or as part of another word. For example, if you type either of the following:

```
car door
```

```
car OR door
```

both yield the same results. Every sound effect in your library containing either the letters “car” or “door” (or both) will appear, whether these letters appear independently, or within other words. Results will include files such as “CarExDoorClose,” “Doormouse_Squeak,” “Carburetor dropped on cement,” and “Carpet Shake.”

Using AND (it must be upper caps) lets you specify multiple criteria for a search, when each file that’s returned should contain every word you type somewhere within, in any order. For example, if you type:

```
car AND door
```

every sound effect in your library containing both the strings “car” and “door” will appear, even if these words appear either singly, in combination, or within other words, such as “NewCarDoorSlam” and “Carpet_Footsteps_Indoors,” and “GarageDoorHitsCar.”
Using NOT lets you omit sound effects that have a particular word. For example, if you type:

```
car NOT door
```

only sound effects with “car” will appear, and all sound effects with “door” will be omitted.

**Literal Searches**

Using quotations specifies a literal search for only the specified term, separated from other text by a space. For example, if you type:

```
“cat”
```

evory sound effect in your library with the standalone word “cat” appears. Sound effects with “cats” and “caterpillar” will be omitted. Results will include “Space cat drone” or “Cat meowing.”

**Wildcard and Range Searches**

The * (asterisk) specifies a wildcard search of any number of characters. Adding an * between two search terms identifies any sound effect with the two search terms connected by any number or combination of characters with no spaces (even no characters). For example, if you type:

```
close*door
```

results include “Door-Wood Cheap-Wooden-Closet-Door-Kick-In-Flimsy-Rattle,” “ElevatorCabinCloseDoor,” and “LatchSwingCloseSqueakDoorSecur.” If you instead type:

```
door*close
```

results include “DoorHvyMetalCloseSlam,” “DoorLidWoodenChestCloseAntique,” and “ElevatorDoorCloseSlam.” If instead you type:

```
c*r
```

results include “lectrohummin,” “KiaShumaEXTBootCloseTrunkaka,” and “Ambience with Piana, Louder.”

The ? (question mark) specifies wildcard search specifying only a single character. The number of question marks you type specifies how many characters of wildcard searching you want to perform. For example, if you type:

```
door?close
```

you may get no results at all, unless you have a sound effect named “door-close.” However, if you type:

```
door????close
```

results include “DoorWoodClose” since the word wood is four letters, matching the number of wildcard letters you’ve specified.
Preview and Audition Controls

Selecting an item in the Sound Effect list loads it into the preview player where you can play it or audition it in your timeline using the controls underneath the search field.

- **Clip name:** The name of the current clip you’ve selected.
- **Next/Previous buttons:** Two buttons let you select the next or previous sound effect clip in the Sound Effect list.
- **Zoom control:** Controls the zoom level of the Playthrough waveform.
- **Duration field:** Shows the duration of the current clip, or of the section of the clip marked with In and Out points.
- **Playhead timecode field:** The timecode of the playhead’s position.
- **Navigation waveform:** The waveform of the entire sound effect appears here, making it easy to jump to different parts of the selected clip. All channels are summed together in this display.
- **Playthrough waveform:** A zoomed-in section of the selected clip that lets you see more waveform detail for setting In, Out, and Sync points.
- **Jog bar:** Lets you scrub around the clip.
- **Transport controls:** Stop, play, and Loop buttons let you control playback, although you can also use the space bar and JKL controls. Right-click the Stop button to switch it into “Stop and Go to Last Position” mode.
- **Marking controls:** The Sync Point button lets you mark which frame of the sound effect you want to use to sync to a frame of the Timeline when you audition. In and Out points let you mark how much of the sound effect clip you want to edit into the Timeline.
- **Audition controls:** The Audition button puts you into Audition mode where the currently selected sound effect clip appears at the position of the playhead in the currently selected Timeline track. Cancel and Confirm buttons let you choose whether you want to remove the clip from the Timeline and try again with another clip, or leave the sound effect clip in.

Auditioning clips you’ve found in the Timeline:

1. Select a sound effect clip you’ve found from the list that you want to audition in the Timeline.
2. In the Sound Library, use the scrubber bar to move the playhead to the part of the sound effect that you want to sync to, and click the Sync Point button to place a sync mark on that clip. For example, if you’re syncing the sound effect of a car door closing, you might sync the first frame of the door fully closed to the peak of the “slam” sound effect, rather than any door squeaking earlier in the sound effect.
3. Set In and Out points to define the range of the sound effect you want to potentially use.
4. Select a track you want to preview the sound effect in by clicking its track header or Mixer channel strip.
5. Position the playhead at the place in the Timeline you want to align the sync mark you set in Step 2.
6. Click the Audition button in the Sound Library. That clip now appears, temporarily, in the Timeline, and you can play through that section of the Timeline to see how you like the sound effect in context with the rest of the mix.
7. If you like the sound effect, click Confirm to keep it in the Timeline. If you don’t, click Cancel, and it will disappear from the Timeline.
**Sound Effect List**

All sound effect clips that match the current search criteria appear in this scrollable list. Double-clicking anywhere on an item of this list plays that sound effect in its entirety.

- **Clip Name**: The name of that sound effect file in the storage system.
- **Description**: Any metadata that’s embedded within the files of professionally created sound effect libraries appears here.
- **Duration**: The duration of that sound effect file.
- **Audio Channel**: The number of channels in that sound effect file.
- **Star rating**: A clickable control you can use to rate sound effects within DaVinci Resolve. Star rating information is not saved outside of DaVinci Resolve.
- **Waveform**: The overall waveform of the entire sound effect library is stretched or compressed within the available width of the Sound Library, regardless of the actual duration of each clip.

**Index**

The Index provides a handy interface for listing all of the clips in the current edit, all the tracks in the current Timeline, and all the markers in the current Timeline. Using these lists, multiple items can be selected, tracks can be managed, and marker notes can be consulted with ease. Each of these three categories of information is displayed in separate panels: the Edit Index, Tracks, and Markers.

**Edit Index**

Displays the Edit Index as seen in the Edit page. Each audio clip in the currently open Timeline corresponds to a row in the Edit Index, with columns for video track, Source In and Out, Record In and Out, Name, and other descriptive metadata. All selected clips (including clips that are automatically selected because they intersect the playhead) are selected in the Edit Index. The Option menu lets you filter the Edit Index by various criteria, for example showing only clips with a particular color of flag, marker, or color, only clips with speed effects, only clips with audio filters, or compound audio clips.

---

The Tracks panel shows a row of information for each of the tracks in the Timeline.
Tracks

Every track in the currently open Timeline corresponds to a row of controls and information in this panel. From left to right, each track has a color control, a visibility control, a number, a name, track controls, a format, ADC, Tags, and a numbered VCA group that it belongs to. These controls can be used to hide or show tracks, color code them, rename them, turn track controls on singly or by dragging over several at a time, change their format, and rearrange them (by dragging one or more rows up and down this list) and toggle the automatic delay compensation (ADC).

The Tracks panel shows a row of information for each of the tracks in the Timeline.

**NOTE:** The ADC column (automatic delay compensation) has a check box allowing the enabling of ADC on a track-by-track basis.

If you have MPEG-H enabled for immersive audio authoring in the preference pane of Video and Audio I/O, additional columns appear in this panel.

When MPEG-H is enabled, the Tracks panel shows additional columns of information for defining each track in the Timeline.
These columns include:

- **Track Type**: Allows definition of either a static component or a dynamic object. When dynamic is selected, the dynamic track-level pan automation from that track is also exported. Only a track can be set to dynamic.

- **Kind**: A content type label, such as Mixed content, Music, Dialogue, Effect, etc. When Kind is defined for a bus (rather than the default state of Undefined), that bus is automatically bounced during the export process.

- **Language**: The content-specific language for that track.

- **Switch Group**: Allows the track to be assigned to a user-defined switch group. A switch group allows the track to be grouped together with other tracks in the final content, forming a selectable item when rendered. For example, a switch group of dialogue, containing an English and a Chinese language track, could allow the user to select between these languages on playback. In order to define a switch group, click that track's cell in the Switch Group column, and choose “Sw Groups…” to open the Switch Groups Manager window, which lets you create new switch groups.

![The Switch Group Manager](image1)

Once one or more groups has been created, they're available for selection in the drop-down menu of any cell in the SW Groups column. This lets you quickly make a variety of custom assignments.

![The drop-down in the SW Group column](image2)

- **Presets**: Allows a track to be assigned to a user-defined preset. For example, a Bed Mix and Language switch group could form one preset, while the same tracks and a spoken subtitle could form another. In order to define a Preset, click that track's cell in the Presets column, and choose “Presets…” to open the Preset Manager window, which lets you create new Presets.
Once one or more presets has been created, they’re available for enabling in the drop-down menu of any cell in the SW Groups column. Any track can be added to multiple presets, so the Presets drop-down contains one checkbox per preset so you can make multiple assignments.

Once configured, the metadata from these presets form how the content is exported in the final deliverable, so there will be a set of presets that contain all configured components and switch groups.

**Markers**

The markers panel can be displayed in either thumbnail or list mode. In thumbnails mode, each marker in your timeline corresponds to a thumbnail displaying the timecode of its location underneath it, and the color of the marker to the left of the timecode location. In list view, each marker displays a row with the following information; marker number, frame (showing a thumbnail), marker name, start timecode, end timecode, duration, marker color, and notes.
The Markers panel shows a row of information for each of the markers in the Timeline.

Inspector

When you add an audio effect to a clip or a track, those effects appear in the Inspector when that clip or track is selected.

For details on the Inspector for the Fairlight page, see Chapter 172, “Audio Clip Specific Inspector Adjustments.”

Metadata Editor

In the File tab of the Inspector there is a Metadata Editor that lets you view and edit the metadata of selected clips in the Fairlight page.
Test Tone Settings for Generating Tone, Noise, and Beeps

The Fairlight page has a general purpose oscillator, the settings of which you can customize by choosing Fairlight > Test Tone Settings. This opens the Test Tone Settings window that you can configure to generate tones, noise, or beeps using five sets of controls:

- **Enable/Disable Test Tones toggle**: Lets you turn the Oscillator on or off system-wide.
- **Frequency dial**: Sets a custom frequency of oscillating tone, from 20 Hz to 10kHz. Defaults to 1kHz.
- **Frequency buttons**: Lets you quickly select 100, 440, 1K, or 2K preset tones, or a continuous rising sweep of frequencies from 1 Hz to 15kHz.
- **Noise type buttons**: Two buttons let you choose from White noise or Pink noise.
- **Level dial**: Sets the output level for the tone or noise, from –50dB to +10dB. Defaults to –15 dB.

You can set up the Oscillator to output whatever kind of tone or noise you require, and then patch it to tracks for recording tones, or patch it to audio outputs for calibrating speakers. If you use the beep options of the ADR panel, those are performed via the Oscillator.

**To play the Test Tone out of your speakers:**

1. Choose Fairlight > Patch Input/Output to open the Patch Input/Output window.
2. Choose System Generator from the Source drop-down menu, and choose Audio Outputs from the Destination drop-down menu.
3. At the left, click the button of what you want to output, Osc (Oscillator) or Noise.
4. At the right, click the connected audio outputs that you want to patch to, and click Patch. Tone or noise should immediately start playing out of your configured speakers. Depending on any particular track’s I/O settings, if you have patched the Osc through a track you may need to either Arm the track by pressing the R button, or in the channel’s Path Settings press the Thru button, to have the signal pass for output monitoring.
5. To stop, select one of the patched buttons, and click Un-Patch.

**To record a tone or noise from the Oscillator to an audio track:**

1. Choose Fairlight > Patch Input/Output to open the Patch Input/Output window.
2. Choose System Generator from the Source drop-down menu, and choose Track Input from the Destination drop-down menu.
3. At the left, click the button of what you want to output, Osc (Oscillator) or Noise.
4. At the right, click the connected audio outputs that you want to patch to, and click Patch. Close the Patch Input/Output window.
5. Click the Arm Record (R) button in the track header of the track you patched the Oscillator to. If your Main is properly patched to your outputs, you should hear the tone or noise, and that track’s audio meter should immediately rise to the level being output by the Oscillator.
6. Click the Record button of the transport controls to initiate recording of that tone to the patched track. Click the Stop button or press the Spacebar to halt recording when you’re done.
Pro Tools AAF Import

DaVinci Resolve can import AAF projects and media from Pro Tools, enabling you to move an audio project from a Pro Tools workstation to a Fairlight workstation. AAF import supports the import of embedded audio and track automation. To do so choose File > Import Timeline > Import AAF/EDL/XML.

Dual Monitor Layout

The Audio page has a dual monitor layout that provides maximum space for the mixer and audio meters on one screen and a full-screen timeline on the other.

**To enter dual screen mode:**

— Choose Workspace > Dual Screen > On.

The Fairlight page in dual screen mode
To switch which UI elements appear on which monitors:
— Choose Workspace > Primary Display > Display 1 or Display 2, which reverses the contents of both monitors in dual screen mode.

Customizing the Fairlight Page

The default layout is quite efficient for a number of tasks on most displays. You can always return to the default layout by choosing Workspace > Reset UI Layout. However, the Fairlight page can be customized to create more room for specific areas of the interface to accommodate different tasks.

To resize any area of the Fairlight page:
— Drag the vertical or horizontal border between any two panels to enlarge one and shrink the other.

To resize the height of individual audio tracks:
— Move the pointer to the bottom border of any audio track header, and when it becomes a resize cursor, drag that border up or down to resize that track. Each track can have an independent size when you do this.

To resize any column of the Index:
— Move your pointer over the divider between any two columns and drag when the horizontal resize cursor appears.

To rearrange Index columns:
— Drag the header of any column to the left and right to move that column.

Undo and Redo in DaVinci Resolve

No matter where you are in DaVinci Resolve, Undo and Redo commands let you back out of steps you’ve taken or commands you’ve executed, and reapply them if you change your mind. DaVinci Resolve is capable of undoing the entire history of things you’ve done since creating or opening a particular project. When you close a project, its entire undo history is purged. The next time you begin work on a project, its undo history starts anew.

Because DaVinci Resolve integrates so much functionality in one application, there are three separate sets of undo “stacks” to help you manage your work.
— The Media, Edit and Fairlight pages share the same multiple-undo stack, which lets you backtrack out of changes made in the Media Pool, the Timeline, the Metadata Editor, and the Viewers.
— Each clip in the Fusion page has its own undo stack so that you can undo changes you make to the composition of each clip, independently.
— Each clip in the Color page has its own undo stack so that you can undo changes you make to grades in each clip, independently.
In all cases, there is no practical limit to the number of steps that are undoable (although there may be a limit to what you can remember). To take advantage of this, there are three ways you can undo work to go to a previous state of your project, no matter what page you’re in.

**To simply undo or redo changes you’ve made one at a time:**

— Choose Edit > Undo (Command-Z) to undo the previous change.
— Choose Edit > Redo (Shift-Command-Z) to redo to the next change.
— On the DaVinci control panel, press the UNDO and REDO buttons on the T-bar panel.

**TIP:** If you have the DaVinci control panel, there is one other control that lets you control the undo stack more directly when using the trackballs, rings, and pots. Pressing RESTORE POINT manually adds a memory of the current state of the grade to the undo stack. Since discrete undo states are difficult to predict when you’re making ongoing adjustments with the trackball and ring controls, pressing RESTORE POINT lets you set predictable states of the grade that you can fall back on.

You can also undo several steps at a time using the History submenu and window.

**To undo and redo using the History submenu:**

1. Open the Edit > History submenu, which shows (up to) the last twenty things you’ve done.
2. Choose an item on the list to undo back to that point. The most recent thing you’ve done appears at the top of this list, and the change you’ve just made appears with a check next to it. Steps that have been undone but that can still be redone remain in this menu, so you can see what’s possible. However, if you’ve undone several changes at once and then you make a new change, you cannot undo any more and those steps disappear from the menu.

Once you’ve selected a step to undo to, the menu closes and the project updates to show you its current state.
To undo and redo using the Undo window:

1. Choose Edit > History > Open History Window.

2. When the History dialog appears, click an item on the list to undo back to that point. Unlike the menu, in this window the most recent thing you’ve done appears at the bottom of this list. Selecting a change here grays out changes that can still be redone, as the project updates to show you its current state.

3. When you’re done, close the History window.
Chapter 167

Setting Up Tracks, Buses, and Patching

One of the first things you need to do when you’re setting up a new project for mixing in the Fairlight page is to define all of the audio tracks and buses you’re going to need that route and combine the audio being output.

This chapter covers how to create audio tracks, and how to use buses to manage your mixes in the most efficient possible way. Rest assured, however, that Fairlight offers many options once your work has begun to change whatever needs it at will.

The new FlexBus structure completely upgrades Fairlight’s bus capabilities, offering users the option for bus-to-bus, track-to-bus, or bus-to-track signal routing. All of these additional tracks and FlexBus features have expanded Fairlight’s Dolby Atmos capabilities to include the import, export, and manipulation of Atmos ADM files.

Audio Tracks

Each audio track in a DaVinci Resolve timeline corresponds to a single channel strip on the Mixer’s left side. Depending on how an audio track has been configured, each audio track is assigned a specific audio format, such as mono, stereo, LCRS, 5.1 surround, or 7.1 surround so that multiple audio channels within the clips on that track can be correctly routed to the proper audio output for monitoring and rendering via the lanes that can be seen within each track on the Fairlight timeline.

Audio tracks in DaVinci Resolve have been designed to contain multiple channels of clip audio within a single track, but how those individual audio channels are displayed depends on the page. The Edit page hides these individual audio channels, displaying only a single clip in the timeline to make it easier to edit multi-channel sources without needing to manage a huge number of tracks. However, the Fairlight page has a unique track and lane system for displaying audio.
The Fairlight page displays the same number of tracks as the Edit page, but each track on the Fairlight page is divided into lanes, which expose each individual channel of clip audio for editing and mixing.

Now that you understand how tracks work on the Fairlight page, the next important concept you need to understand in order to unlock the power of the Fairlight page is the FlexBus, which lets you combine multiple audio tracks in different ways.

**What Is a Bus?**

In audio postproduction, a bus is essentially a destination channel to which you can route multiple audio signals (typically the audio tracks of the Timeline) so they are mixed together into a single signal that can be controlled via a single channel strip. For example, by default a single bus called a Main (named Main 1) combines the levels of every clip edited onto every track of a timeline into the signal that’s output to your speakers.

Mains are one kind of bus, but there are other kinds of buses with which you can organize the output of tracks in a timeline. For example, if you have five audio tracks into which have been edited all of the dialog audio clips for a particular program, you can route the output of all five dialog tracks to a Submix bus, which combines them so that the combined levels from all dialog tracks can be processed, adjusted, and mixed using a single channel strip of controls.

Ultimately, you’ll use multiple levels of buses to mix programs in an organized fashion. For example, individual tracks can be routed to Submix buses, as described above. Then, multiple Submixes can be routed to one or more Mains. For example, you could have four submix buses, one for German dialog, one for English dialog, one for Music, and one for Effects. You could route the German, Music, and Effects submix buses to Main 1 to output the German version of the program, and route the English, Music, and Effects submix buses to Main 2 to output the English language version of the program.

Audio tracks from the Timeline are routed to buses via each channel strip’s multi-format surround panner, so buses can be configured to accommodate specific audio formats such as mono, stereo, LCRS, 5.1 surround, or 7.1 surround, and immersive formats, such as Atmos.

**Bus to Bus Routing and Mixing**

Fairlight has a redesigned audio engine as of DaVinci Resolve 17 and has advanced capabilities in the bus structure within Fairlight. This new FlexBus structure offers complete user flexibility for bus types and signal routing, which changes the prior Main, Sub, and Auxiliary bus formats in older versions of DaVinci Resolve to now be completely user-definable. This new structure makes it possible to patch outputs and/or sends in any way you need, as dictated by your project. Each track can output to up to ten buses and sends with additional level and pan controls to a further ten buses. Buses can be sent to other buses up to six layers deep, facilitating complex stem building, processing, and allowing discrete deliverables.

User-definable buses allow for bus-to-bus, bus-to-track, or track-to-bus routing, with each bus having the ability to pass signals from mono to fully immersive formats, such as Dolby Atmos, at the user’s discretion. As with any and all of the tracks in Fairlight, these bus types can be changed at any time by the user, if needed.
The FlexBus structure allows for many different bus track types to be created or changed.

The power of the FlexBus system is that it allows users to direct signals to many different places at one time, achieving complex mixing scenarios. Perhaps you need to generate two mixes that are identical in content but need to be of different output levels. You can designate two mix buses, one with an output level of -2dB true peak and one with an output level of -10dB true peak. The final mix signal is sent to one bus that is then broken into two more buses, one with a limiter set to -2dB and one set to -10 dB, creating these two different mixes at one time.

Using Legacy Fixed Busing

If you want to work using the previous method of fixed bus mapping, you can do so for new projects by opening the Fairlight panel of the Project Settings, and turning on the “Use fixed bus mapping” checkbox.

If your project has fixed busing enabled and you want to change to FlexBus, then uncheck the “Use fixed bus mapping” checkbox. Note that once you have made the change it will not allow you to change it back to legacy busing. The advantages to changing from legacy busing to FlexBus are enormous, so you will not regret making the change.
Types of Buses

FlexBus makes all buses inputs, outputs, and sends user definable. A brief discussion of typical bus types and their uses is described below.

Mains

Main buses are typically the primary output of a program; each new project you create starts out with a single Main called M1, to which all tracks are routed by default. You can add additional Mains, and you can use them however you like, as either full or partial mixes of the program you’re working on. Mains can be directly output in the Deliver page.

Submix

Sub buses are often the means by which multiple tracks of audio that belong to the same category (dialog, music, effects, ambience, and so on) are combined together so that everything in that category can be mixed as a single audio signal. Users can define every aspect of the submix as well as submixes of submixes.

Auxiliary

Each channel strip includes the ability to expose bus sends, which are typically used to route audio to software or hardware effects of some kind. Typically, an audio signal is sent to the effect (or hardware) applied to that bus and then is routed back to the channel it came from. Auxiliary send signals can be connected either immediately before or after a channel strip’s fader, based on a Pre setting. Each auxiliary bus can also be configured to accommodate specific audio formats such as stereo, LCRS, 5.1 surround, or 7.1 surround.
Buses in Nested Timelines

When you nest a timeline inside of another timeline that has buses set up for mixing in the Fairlight page, all bus routings work as intended within the nested timeline, which exposes all channels of Main 1 in the enclosing timeline. In this sense, the audio of the nested timeline can be considered to be a submix that outputs its resulting audio to the audio track it’s edited onto.

Exposing Bus Tracks in the Timeline

You can expose any bus as a track in the Timeline. This makes it possible to view and edit automation that’s applied to parameters on that bus.

To show a bus in the Timeline:
1. Open the Automation controls by clicking the automation button on the Fairlight toolbar.
2. Open the Index, and click the eye button for the bus you want to see in the Timeline.
3. You can choose any automation curve you want to view by choosing it from the drop-down menu in the track header controls.

Controlling Signal Flow

The process of setting yourself up for editing and mixing in the Fairlight page involves:

— First, customizing the tracks of the timeline to be organized and configured as required.
— Second, creating the buses you need in order to organize your signal flow.
— Third, creating the buses and patching the audio tracks to them, in order to create the signal flow you need.

Managing Audio Tracks

When you’re getting ready to record or edit audio clips into the Fairlight Timeline, you need to make sure you’ve got enough tracks to do the job. The following procedures cover the different methods available for adding, removing, and rearranging tracks as you work. These commands are all available via the contextual menu that appears when you right-click anywhere in the Timeline header area (the header of the Timeline is the area to the left where each track’s various buttons and controls are located).

Defining Timeline Audio Track Channels at Creation

If you decide to create a new audio track, you have to choose what kind of audio track it will be. Right-clicking in the bottom audio portion of the Timeline track header reveals a contextual sub-menu that lets you create different kinds of audio tracks.

— **Mono**: Holds a single channel with only one lane.
— **Stereo**: Holds stereo left and right channels, with two lanes.
— **5.1**: Holds the six channels corresponding to a 5.1 surround mix, for a total of six lanes. For broadcast, SMPTE specifies Left, Right, Center, LFE, Surround Left, and Surround Right. For cinema distribution these tracks are ordered Left, Center, Right, Left Surround, Right Surround, and LFE.
— **7.1**: Holds the eight channels corresponding to a 7.1 surround mix, for a total of eight lanes. For broadcast, SMPTE specifies Left, Right, Center, LFE, Left Surround, Right Surround, Back Left Surround, and Back Right Surround. For cinema distribution these tracks are ordered Left, Center, Right, Left Surround, Right Surround, Back Surround Left, Back Surround Right, and LFE.

— **Dolby Atmos**: There are several Atmos formats available: 5.1.2, 5.1.4, 7.1.2, 7.1.4, and 9.1.6. The naming of the channel configurations in the Dolby Atmos format includes the height channels in the nomenclature. Channel configurations are presented as three digits separated by periods, such as 7.1.4. The first digit describes the number of main, or ear-height monitoring channels that surround the listener. The second digit describes the number of subwoofer channels. The third digit describes the number of height channels, which are speakers positioned on, or in the case of a soundbar pointed to, the ceiling.

— **Adaptive**: Capable of holding up to 24 audio channels, which would display up to 24 lanes within the track. An adaptive audio track can hold clips with different combinations of channels, up to the maximum number of channels allowed within that track. The number of channels allowable on a particular Adaptive track is user-definable (1–24) at the time that track is created. If you edit a clip with more channels into an Adaptive track that was created to hold fewer channels, the extra clip channels are muted.

**NOTE**: The FlexBus structure in Fairlight enables user-definable buses. Atmos mixes call for several bus formats that are now available in DaVinci Resolve 17 (some only in the Studio version) which are 9.1.4 as well as 22.2.

### Creating Tracks

There are two commands with which to create new audio tracks, and both are in the contextual menu found by right-clicking within any audio track’s header controls. Add Track adds a single audio track of the type you choose from a submenu. Add Tracks lets you insert as many tracks as you like, of a type and at a position you designate using the Add Tracks dialog.

### Rearranging Tracks

You can rearrange tracks by right-clicking in a track’s header area and choosing either Move Track Up or Move Track Down in the contextual menu that appears. You can also move tracks in the Index by grabbing them and moving them to the desired position.

### Changing How Many Channels an Audio Track Has

If you had set up your timeline with one kind of audio track, but you discover you actually need a different kind, you can change any audio track’s type at any time. Just right-click anywhere in that audio track’s timeline header, and choose an option from the Change Track Type To submenu of the contextual menu.

### Deleting Tracks

Right-click within a track’s Timeline header and choose Delete Track. If there are clips on a track you remove, they are also deleted from the Timeline, but preserved in the Media Pool.
You can remove all empty audio tracks in the Fairlight timeline by right-clicking any track header and selecting Delete Empty Tracks from the contextual menu.

You can delete a multiple selection of tracks in the Fairlight timeline by right-clicking any selected track header and selecting Delete Tracks from the contextual menu.

 Right-clicking on a track or the track field reveals the Delete Tracks and Delete Empty Tracks functions.

**Linked Groups of Mono Tracks**

Linked groups are an organizational construct that you can create only using mono tracks (other kinds of tracks such as stereo, 5.1, 7.1, Atmos, or Adaptive cannot be used for a Linked Group). Unlike a multi-channel track with lanes, a linked group of mono tracks functions as five independently editable tracks in the Timeline. However, each track is mapped just like an audio channel using one of the standard multi-channel mappings (stereo, 5.1, 7.1, Adaptive), and linked groups of mono tracks are mixed using only a single channel strip.

Linked groups are extremely useful when you’ve been given a set of six independent audio files that need to be assembled as a single surround mix, or when you have surround channels that need to be specifically re-edited on a channel by channel basis.

**To create a Linked Group from individual mono tracks:**

1. Create two or more Mono audio tracks that you want to group together. If you need to create a linked group with a specific channel mapping, such as 5.1, make sure you create enough tracks (in this case, 6).
2. Choose Fairlight > Link Group.
When the Link Group dialog appears, Mono audio tracks are represented by active buttons (all other channel mapped tracks are disabled, since they can’t be linked). Click to enable the button of every track you want to include in the group you’re about to create. Which mappings are available to use for creating your group depends on how many tracks you’ve selected.

Selecting six tracks to use for creating a link group

After you’ve selected all the tracks you need to, click one of the available “Link as” buttons below. In this example, six tracks have been selected, so you could click 5.1 Film or 5.1.

When you select enough tracks, you can create groups linked as specific surround mappings.

Afterwards, the tracks you selected should turn into a single block, showing they’ve been linked.

The Link Group window shows the link indicator line next to the track names.

Depending on the number of mono channels selected, Fairlight will offer possible linking options. For instance, when ten channels have been selected, both Atmos 7.1.2 and 5.1.4 are option choices.

The Link As option is dependent on the number of channels being linked.

Close the Link Group window when you’re finished.

Once you’ve created a linked group, the mono tracks in the timeline that you linked appear with a bar to the left in the track header that spans every track that’s linked. If the tracks are tall enough, they’ll also be labeled to identify which track corresponds to which surround channel, L, R, C, LFE, Ls, Rs, and so on. At this point, you can edit each channel of a surround mix into the appropriate track.
Tracks in a Linked Group are labeled to identify which track corresponds to which surround channel.

If you’ve edited a multi-channel audio clip onto a multi-channel track, you can convert that track and its contents into a Linked Group of mono tracks, each of which contains a single clip for that track’s channel. This can be useful if you need to fix a multi-channel surround audio clip with an incorrect track mapping. You can convert it into a Linked Group, at which point you can easily rearrange the channels.

To create a Linked Group from a single multi-channel timeline:

— Right-click the track header of a multi-channel audio track, and choose Convert to Linked Group from the contextual menu. This automatically creates one new audio track for each channel, all of which are linked together. For example, converting a 5.1 audio track results in six new tracks with six individual audio clips (one for each channel), all of which are linked together.

If necessary, you can also unlink a linked group to turn it back into independent mono tracks.

To unlink a Linked Group:

1. Choose Fairlight > Link Group.
2. When the Link Group dialog appears, select the Linked Group you want to unlink.
3. Click Unlink.
4. Close the Link Group window when you’re finished.

The variations of routing of the multi-channel files are due to the path order of SMPTE or Film standards. They are:

— L, C, R, Ls, Rs, LFE = 5.1 film order
— L, C, R, LFE, Ls, Rs, = 5.1 SMPTE order
— L, C, R, Lss, Rss, Lsr, Rsr, LFE = 7.1 film order
— L, C, R, LFE, Lss, Rss, Lsr, Rsr = 7.1 SMPTE order
Creating Buses

Choosing Fairlight > Bus Format opens the Bus Format window, which lets you create the buses you need (up to the limitations of your system) to organize the tracks and channels of your program.

The depth of options in the FlexBus system

To turn on the immersive formats, go to Preferences > Video and Audio I/O > System > Immersive Audio, and choose from among the appropriate options. Once enabled, the various bus types are available in the Bus Format panel.

The Bus list lets you rename the bus, choose the format of each bus (a drop-down menu appears in the Format column of each entry of the list), shows the number of channels associated with that bus, and lets you color-code each bus (a Color drop-down lets you choose that bus's color). Simply click any item on the Bus list to select it, and choose different options from the Format and Color drop-down menus, or click on the User Name of any bus to select it, and type a custom name.

At the bottom of the list are three buttons that let you Add Bus, Duplicate, or Remove selected Buses. When you're done modifying the available buses, you can click OK to accept the change and close the Bus Format window, Cancel to close the window (although any buses you've made remain in place), or Bus Assign to open the Bus Assign window. The bottom button row also has a Used tally of what has been used and what is available for your workstation.

**NOTE:** Once you’ve created one or more timelines, the busing is locked to whatever it was originally set for to retain the previous mix options. Projects created in prior versions of Fairlight will use the legacy fixed bus mapping options.
Legacy Busing

Four buttons at the top of the legacy Bus Format window let you create any type of bus Fairlight supports. Creating a new bus, whether it’s a Main, Sub, Aux, or Multi Track, adds the new bus to the list that appears below.

The legacy Bus list works the same as the FlexBus list in that it lets you rename the bus, choose the format of each bus (a drop-down menu appears in the Format column of each entry of the list), and color-code each bus (a Color drop-down lets you choose that bus’s color). Simply click any item on the Bus list to select it, and choose different options from the Format and Color drop-down menus, or click on the User Name of any bus to select it, and type a custom name.

At the bottom of the list are two additional buttons that let you Duplicate or Remove selected Buses. When you’re done modifying the available buses, you can click OK to accept the change and close the Bus Format window, Cancel to close the window (although any buses you’ve made remain in place), or Bus Assign to open the Bus Assign window.

**NOTE:** Text at the bottom of the window lets you know how many buses you’re using out of how many your workstation will support.
Assigning Buses

Once you’ve created one or more buses, you’ll want to assign different tracks to specific buses, also perhaps buses to buses, buses to tracks and the final Main bus destinations. This is accomplished in the Bus Assign window, which you can open by choosing Fairlight > Bus Assign, or by clicking the Bus Assign button in the Bus Format window. The Bus Assign window allows you to do multiple bus assignments at once; these new assignments will be reflected in the Bus Outputs section on the channel strips in the Mixer.

The options in the FlexBus Bus Assign window

The top shows the Send and the Out of all of the available buses, while the bottom shows all available tracks and buses. The Bus Assign window defaults to Icon view, in which each bus and track is shown as a button, but it can be switched to List view, in which the Available Tracks section is shown as a list.

Methods of making bus assignments:

— **To assign a bus:** Click a button in the Buses section to select the Send or Out of that bus, and then either click or drag a bounding box over all the available tracks that you want to assign to that bus. Once assigned, the Available Tracks buttons display which Bus they’ve been assigned to. When assigned, the Bus number will be followed by an “o” or an “s” to indicate if its the send or the out of that bus.

Assigning multiple tracks to a bus by dragging a bounding box

— **To assign every track, Sub, and Aux to a bus:** Click a button in the Buses section to select that bus, and then click Assign All.

— **To clear all track assignments from a particular bus:** Click a button in the Buses section to select that bus, and then click Unassign All.
When you're done making bus assignments, click Save.

The Bus Assign window with legacy Fixed Busing enabled

**TIP:** If you are in legacy Fixed Busing due to a prior created project, you can bring it into FlexBus mapping. Create a new project with FlexBus as well as a blank new Timeline. Then open the project to change and highlight all and then copy all in the Timeline. Show the video tracks if you want those to copy over as well. Then open the new project and copy all into the empty Timeline. Now all FlexBus mappings should be available.

**Patching Signal Paths**

While bus creation and assignment is a straightforward way of creating a cascade of routing from tracks to buses, sometimes you need to create more specific signal paths. For example, if you need to record audio to a track, you need to patch the audio input you want to record from to the track you want to record to. This, and many other scenarios, are accomplished using the Patch Input/Output window.

The Patch Input/Output window is available on the Fairlight page, the Edit page, and the Deliver page, providing patching changes on any of these pages.
Using the Patch Input/Output Window

Choosing Fairlight > Patch Input/Output opens the Patch Input/Output window, which can be displayed in either Icon or List view. This window is split into two halves, with the left half containing whichever Source controls you choose, and the right half containing whichever Destinations you choose.

Creating a Patch

By default, the Patch Input/Output window shows the available Audio Inputs as the Source, and the Track Inputs as the destination. This makes it easy to patch whatever audio source (such as a microphone connected to a USB audio interface) to a specific audio track of the timeline to prepare for recording. Patching and unpatching a source to a destination is straightforward. In the following screenshot, the Audio 1 Input from an audio interface is highlighted and is being patched to the Track labeled DX 1.

To patch a source to a destination:

1. Choose a type of source from the Source drop-down menu at the upper left-hand side of the window.
2. Click the button or list item of the source you want to patch on the left side of the Patch Input/Output window.
3. Choose a destination from the Destination drop-down menu at the upper right-hand side of the window.
4. Click the button or list item of the destination you want to patch on the right side.
A selected audio source and audio destination pair

5 Click the Patch button at the bottom right of the window. The source and destination will both display the connection they’re patched to.

To unpatch a source and destination pair:
1 Click a button or list item corresponding to a source or destination you want to unpatch.
2 Click Unpatch.

Choosing Source and Destination Controls

The Audio Source and Destination drop-down menus let you choose different categories of source and destination controls to patch together.

The following Source options are available:
- **Audio Inputs**: The available physical audio inputs on your workstation, for example SX-36, MADI, or system audio. Useful when patching to record audio.
- **Bus Out**: Bus Output.
- **Bus Send**: Bus master insert send.
- **Control Room Monitor Direct**: Monitor system Direct out. Post fold up/down matrix, pre the Monitor Volume Level/Dim/Mute.
- **Control Room Monitor Out**: Monitor system output. Post fold up/down matrix and Monitor Volume Level/Dim/Mute.
- **System Generator**: Oscillator outputs. Sine, Pink noise, White noise.
- **Track Direct**: Track Direct Out, can be pre or post the track fader, with an offset.
- **Track Reproduction**: This is the signal from the track playback, before any processing.

The following Destination options are available:
- **Audio Outputs**: The available physical audio outputs on your workstation, for example SX-36, MADI, or system audio.
- **Bus Return**: Bus master insert return.
- **Talk Back**: The Talkback system for patching the General Purpose Input/General Purpose Output used for talkback.
- **Track Input**: Input to the Record and Thru path; simply put, the available audio tracks in the current Timeline.
- **Dolby Atmos Send**: The internal Dolby Atmos Render; you will need to patch this manually if you are creating original content. If you import a Dolby Atmos master file, the Send patching for the bed and object tracks will be created automatically.
When using the legacy Fixed Busing, the options are a bit different. Here is how they look when that is enabled.

**The following Audio Source options are available:**

- **Audio Inputs:** The available physical audio inputs on your workstation, for example SX-36, MADI, or system audio. Useful when patching to record audio.
- **Track Repro:** Short for Reproduction, this is the signal from the track playback, before any processing.
- **Track Send:** Track Insert send.
- **Track Direct:** Track Direct Out; can be pre or post the track fader, with an offset.
- **MT-Bus Dir:** Multitrack Bus Direct Out; can be pre or post the multitrack bus master fader, with an offset.
- **MT-Bus Out:** Multitrack Bus Out; always post the Multitrack bus master fader.
- **Aux-Bus Send:** Aux bus master insert send.
- **Aux-Bus Dir:** Aux Bus Direct Out; can be pre or post the Aux bus master fader, with an offset.
- **Aux-Bus Out:** Aux Bus Out; always post the Aux bus master fader.
- **Sub-Bus Send:** Sub bus master insert send.
- **Sub-Bus Dir:** Sub Bus Direct Out; can be pre or post the Sub bus master fader, with an offset.
- **Sub-Bus Out:** Sub Bus Out; always post the Sub bus master fader.
- **CR-Mon Dir:** Monitor system Direct out. Post fold up/down matrix, pre the Monitor VolumeLevel/Dim/Mute.
- **CR-Mon Out:** Monitor system output. Post fold up/down matrix and Monitor VolumeLevel/Dim/Mute.
- **Main Send:** Main bus master insert send.
- **Main Dir:** Main Bus Direct Out; can be pre or post the Main bus master fader, with an offset.
- **Main Out:** Main Bus Out; always post the Main bus master fader.
- **Osc:** Oscillator outputs. Sine, Pink noise, White noise.
- **Solo Out:** AFL and PFL Solo Bus Out; always post the respective bus master fader.

**The following Audio Destination options are available:**

- **Track Input:** Input to the Record and Thru path; simply put, the available audio tracks in the current Timeline.
- **Track Return:** Track insert return.
- **Aux-Bus Return:** Aux Bus master insert return.
- **Sub-Bus Return:** Sub Bus master insert return.
- **Main Return:** Main Bus master insert return.
- **CR-Mon In:** Input to the Monitor system’s fold up/down matrices.
- **Talk Back:** The Talkback system, showing Comm1 and Comm2.
- **Audio Outputs:** The available physical audio outputs on your workstation, for example SX-36, MADI, or system audio.
Using a Channel Strip’s Input Menu

The Input drop-down menu at the top of each track’s channel strip in the mixer provides some shortcuts for patching different inputs and buses to the tracks of your mix. Each option in this menu makes the Patch Input/Output window appear with various Source and Destination selections automatically set up.

Input

The Patch Input/Output window appears set up to let you patch different inputs (such as the system audio input) to the tracks of the timeline. This makes it fast for setting up audio inputs in preparation for recording.

Bus

A shortcut to open the Patch Input/Output window (discussed previously in this chapter) that lets you patch Bus Out or Bus Sends to Timeline track channels.

Path Settings

Choosing Path Settings opens the Path Settings window for that track. This window contains controls for adjusting the input level of audio signals being input via an input/output device.

These parameters control the following:

— **Mic/Instr.** Adjusts the Mic/Instrument level for this source, from 0 to 100 dB.
— **On:** Enables Microphone/Instrument level for this source.
— **48V:** Enables phantom power for that input.

— **Record Level:** Controls the level going to the disk before recording. It does not affect the track when in Thru mode.

— **Rec:** Enabling this button makes this track ready to record. Only turn this on if there is an audio source patched to the current track.

— **Thru:** When on, this makes the affected track into the equivalent to a live feed. When enabled, this track will monitor its input, but will not respond to a record command. Only turn this on if there is an audio source patched to the current track.

— **Trim:** This parameter controls the level as the channel enters the mixer. For timeline tracks, this controls the signal coming from disk, and does not affect any current levels being recorded.

— **Phase Button:** To the left of the Trim knob there is a button that allows reversing the phase of the signal.
— **Direct Output:** Controls the level going from this channel to the direct output.
  — **On:** Toggles direct output on and off.
  — **Pre:** Toggles the direct output to connect either pre or post the main channel fader.

— **Insert:** Controls the insert return only. When enabled, the channel connects to its insert return, otherwise the Channel connects to the straight-through path. The insert send, on the other hand, is always active (though it must be patched somewhere before it can be heard).

**NOTE:** Insert sends and returns are only audible if patched to physical outputs or inputs, or to other paths. Sends can be sent to the input of any path in the system, and returns can come from the output or send of any path. This is done in the Patch I/O screen (press the Patch I/O button).

When using the legacy Fixed Busing, the options there are a bit different. Here is how they look when that is enabled.

**Input**
The Patch Input/Output window appears set up to let you patch different inputs (such as the system audio input) to the tracks of the Timeline. This makes it fast for setting up audio inputs in preparation for recording.

**Aux Bus**
A shortcut to open the Patch Input/Output window (discussed previously in this chapter), which appears set up to let you patch different Aux buses to specific submix and Timeline track channels.

**Sub Bus**
A shortcut to open the Patch Input/Output window (discussed previously in this chapter), which appears set up to let you patch different Sub (submix) bus channels to specific Timeline track channels.

**Main Bus**
A shortcut to open the Patch Input/Output window (discussed previously in this chapter), which appears set up to let you patch different Main bus channels to specific Timeline track channels.

**Path Settings**
Choosing Path Settings opens the Path Settings window for that track. This window contains controls for adjusting the input level of audio signals being input via a BMD input/output device.
The Fairlight page has unique transport control, zooming, and scrolling options not found in the other pages of DaVinci Resolve that help you to work with audio more efficiently. This chapter covers how to navigate around the Fairlight version of the Timeline.

Transport Controls and JKL Navigation

Because of the Fairlight page’s audio-focused workflow, the transport and playback controls differ from those found in the Media, Edit, Color, and Deliver pages.

Transport Controls

The Fairlight transport controls are also designed to mirror their counterparts on the Fairlight control panels. They include the following functions:

— **Rewind and Fast Forward:** Initiates accelerated playback through the Timeline in either direction. Pressing either of these buttons multiple times speeds up this motion, cycling through 8x, 24x, 60x, 150x, and 360x play speeds.

— **Play:** Plays forward. Identical to pressing the Spacebar or L keys while playback is stopped.

— **Stop:** Stops playback. Identical to pressing the Spacebar or K keys while playback is engaged.

— **Record:** Initiates recording if you have an audio source patched to a track, and if that track is enabled for recording. For more information about recording, see Chapter 169, “Recording.”

— **Loop:** Toggles looped playback off and on. While looped playback is on, playback will loop at the end of the Timeline, and will also loop when you use the Play In to Out command, and will continue to loop automatically until you stop playback.

— **Automation controls:** This button exposes the automation toolbar. For more information about recording automation, see Chapter 174, “Automation Recording.”

Using JKL to Control Playback

The JKL keyboard shortcuts are common to many editing applications, and experienced editors know these to be some of the most useful controls for playback and editing there are. Here’s a list of the many different ways you can use these three keyboard shortcuts to play through clips and timelines as you work.

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>J</td>
<td>Plays 100% backward.</td>
</tr>
<tr>
<td>K</td>
<td>Stops playback.</td>
</tr>
<tr>
<td>L</td>
<td>Plays 100% forward.</td>
</tr>
<tr>
<td>Press J repeatedly</td>
<td>Increases backward play speed each time you press J, for a range of fast-reverse speeds.</td>
</tr>
<tr>
<td>Press L repeatedly</td>
<td>Increases forward play speed each time you press L, for a range of fast-forward speeds.</td>
</tr>
<tr>
<td>Shift-J</td>
<td>Plays in fast reverse.</td>
</tr>
<tr>
<td>Shift-L</td>
<td>Plays in fast forward.</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>K+J</td>
<td>Plays backward at slow motion (with slow motion audio playback).</td>
</tr>
<tr>
<td>K+L</td>
<td>Plays forward at slow motion (with pitch-corrected audio playback on OS X).</td>
</tr>
<tr>
<td>Pressing K while tapping J</td>
<td>Moves the playhead back one frame.</td>
</tr>
<tr>
<td>Pressing K while tapping L</td>
<td>Moves the playhead forward one frame.</td>
</tr>
</tbody>
</table>

If you’re using Fairlight with the keyboard, then this will probably become one of the main ways you move the playhead around in DaVinci Resolve.

**NOTE:** All of the keyboard commands listed in this document are based on the DaVinci Resolve keyboard customization preset. There is great power in the remapping of keyboard commands to systems that may be more familiar to you like Premiere Pro or Pro Tools. However, if their keyboard command set does not offer the same commands as the DaVinci Resolve keyboard commands, they won’t work the same. For instance, the Pro Tools keyboard preset does not support J-K-L timeline navigation.

### Dragging the Playhead to Scrub

You can also drag the playhead left and right to scrub through the visible area of the Timeline by clicking and dragging anywhere within the Timeline ruler at the top of the Timeline, directly below the toolbar. If you’re zoomed in at a reasonable level for editing, scrubbing the playhead using your pointer will result in smooth, tape-like slow and fast audio playback, giving you a great deal of precision while trimming audio.

### Looping Playback

Two controls govern looping on the Fairlight page, similarly to how looping works on the Edit page.

- **Loop:** Command-Forward Slash (/). Toggles looped playback off and on. While looped playback is on, playback initiated with any of the following commands will loop automatically until you stop playback.
- **Play In to Out:** Option-Forward Slash (/). If you’ve marked a section of a clip or timeline with In and Out points, this command lets you preview how it will play.

### Loop Jog Scrubbing

Currently available only on the Fairlight page, choosing Timeline > Loop Jog enables a brief sample preview to be heard while scrubbing the playhead through the Timeline. This can make it easier to recognize bits of dialog or music as you’re quickly scrubbing through tracks, in situations where you’re trying to locate specific lines or music cues. It also enables this brief sample preview to loop endlessly when you hold the playhead on a frame, so you can pause while scrubbing and hear (by default) the current 80 ms prior to the playhead as it loops.
A pair of settings in the User Preferences let you customize this behavior.

— **Loop Jog Alignment**: Three options let you choose whether you loop audio Pre the position of the playhead, Centered on the playhead, or Post the position of the playhead.

— **Loop Jog Width**: A field lets you choose how many milliseconds of audio to loop when Loop Jog is enabled. How many milliseconds of audio corresponds to one frame depends on the frame rate of the video. For example, at a frame rate of 25 fps, there are 1000/25 = 40 ms per frame, so the default value of 80 ms equals two frames of looping.

**Moving the Playhead Using Timecode**

You can use absolute or relative timecode entry to move the playhead in the Timeline. Timecode entry lets you move the playhead very precisely or jump to specific timecode values really quickly.

**How to Enter Timecode Values**

When entering timecode, type each pair of hour, minute, second, and frame values from left to right, with a period representing a pair of zeros for fast entry. The numbers you enter appear in the timecode field at the upper left-hand corner of the Viewer with focus. When you’re finished typing, press the Return key to execute the timecode command. The rules for timecode entry are as follows:

— The right-most pair of timecode values (or period) you enter is always the frame number.
— A period to the left or to the right of any number you type is considered to be a pair of zeroes.
— A single period between two numbers is considered to either be a single zero or ignored if it’s between two pairs of numbers.
— Any untyped pairs of values to the left of what you enter are assumed to be whatever those values were prior to the timecode you entered; this makes it easy to type partial timecode values even when the Timeline starts at hour one.
— It’s not necessary to enter colons or semicolons.

**Absolute Timecode Entry**

Absolute timecode is entered simply by typing the timecode value you want to move the playhead to, and when you press the Return key, the playhead will move to that timecode value.

Here are some examples of absolute timecode entry using this method:

<table>
<thead>
<tr>
<th>Original TC Value</th>
<th>User-Typed Value</th>
<th>New TC Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>01:10:10:10</td>
<td>15245218</td>
<td>15:24:52:18</td>
</tr>
<tr>
<td>01:10:10:10</td>
<td>2..</td>
<td>01:02:00:00</td>
</tr>
<tr>
<td>01:10:10:10</td>
<td>15</td>
<td>01:10:10:15</td>
</tr>
<tr>
<td>01:10:10:10</td>
<td>12</td>
<td>01:10:10:12</td>
</tr>
<tr>

<td>1115..</td>
<td>11:15:00:00</td>
</tr>
<tr>
<td>01:10:10:10</td>
<td>23...</td>
<td>23:00:00:00</td>
</tr>
</tbody>
</table>
**Relative Timecode Entry**

Relative timecode is entered by starting the timecode value with a plus (+) or minus (–). Adding a plus results in the value you type being added to the current timecode value for purposes of offsetting the playhead from its current position. Adding a minus will subtract the value you type from the current timecode value.

Here are three examples of relative timecode entry:

<table>
<thead>
<tr>
<th>User-Typed Value</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>+20.</td>
<td>00:00:20:00 is added to the current timecode value.</td>
</tr>
<tr>
<td>+3..</td>
<td>00:03:00:00 is added to the current timecode value.</td>
</tr>
<tr>
<td>-5</td>
<td>00:00:00:05 is subtracted from the current timecode value.</td>
</tr>
</tbody>
</table>

**Clip, Marker, and Track Navigation**

The Up and Down Arrow keys are used to move the playhead from one edit point to the next in the Fairlight page Timeline, just as in the Edit page Timeline.

However, holding Command-Option down while using the Arrow keys gives you Fairlight page-specific behaviors that are used to navigate among clips, markers, and tracks in the Fairlight page in a way that’s different than other pages of DaVinci Resolve but very useful to the way the Fairlight page operates. This section covers the basics.

**Selecting Tracks**

Which tracks are selected determine the behavior of the Arrow keys.

— **In Selection mode:** You can select tracks by clicking or Command-clicking (to select multiple tracks) anywhere in the background area or on the track number of the track headers. If you click and drag in the track header, you can use a bounding box to select multiple tracks. Selection mode will not select in unused areas of the Timeline.

— **In Range Selection or Edit Selection mode:** You can select tracks by clicking or Command-clicking anywhere either in the background area or on the track number of the track header, or in any unused area of the track itself in the Timeline. If you click and drag, you can use a bounding box to select multiple tracks.

**Moving the Clip Selection**

The Command-Option-Left and Command-Option-Right Arrow key shortcuts are used to move the playhead left and right in the Timeline, navigating from clip to clip or from marker to marker. How these keys function depends on whether or not one or more tracks is selected in the Timeline.

— **If no tracks are selected:** The Left and Right Arrow keys will jump the playhead from Timeline marker to Timeline marker. Clip markers will be ignored.

— **If one or more tracks are selected:** The Left/Right Arrow keys will jump the playhead among clip In points, clip Out points, and Timeline markers.

Moving the Track Selection

The Command-Option-Up and Command-Option-Down Arrow key shortcuts are used to move the track selection up and down in the Timeline, changing which tracks are selected. By changing which tracks are selected, you can alter which clip’s In and Out points are used to jump the playhead around the Timeline.

If no tracks are selected, then nothing happens.

Zooming and Scrolling

The Fairlight page has several methods of zooming into and out of the Timeline, and scrolling when you’re zoomed to the point where your edited sequence of clips extends past the left and right edge of the visible timeline.

The Playhead

Zooming is always centered on the position of the Playhead. By default the Playhead moves along the Timeline as it plays. However, Fairlight offers the option of a Fixed Playhead where the Timeline moves while the Playhead remains centered.

Setting the Zoom Level of the Timeline

Depending on how you like to work, there are several methods of zooming into and out of the Timeline.

— Using the Vertical Zoom slider: A pair of sliders at the right of the toolbar let you zoom vertically and horizontally. The first one lets you scroll vertically in order to see more detail in the height of your waveforms. If no tracks are selected, then zooming is centered on the top audio track in the Timeline. If one or more tracks are selected, then zooming is centered on the topmost selected audio track.
— **Using the Horizontal Zoom slider:** A pair of sliders at the right of the toolbar let you zoom vertically and horizontally. The second one lets you zoom horizontally in order to see more detail in the width of your waveforms.

— **Pressing Command-EQUAL (=) and Command-MINUS (–):** Command-Equal (also referred to as Command-Plus) and Command-Minus let you zoom horizontally into the Timeline.

— **Use Shift-Z to Zoom to Fit:** Command-Z lets you zoom horizontally to fit all clips in your program to the available width of the Timeline.

— **Using scroll controls of your pointing device to scroll horizontally:** Holding the Option key down and using the scroll wheel (or scroll control) of your pointing device will zoom horizontally into the Timeline. Holding the Command key down and using the scroll wheel will move the Timeline earlier or later than its current time, without moving Playhead.

— **Using scroll controls of your pointing device to scroll vertically:** Holding the Shift key down and using the scroll wheel (or scroll control) lets you zoom vertically in the Timeline. In this case, if no tracks are selected, then zooming is centered on the top audio track in the Timeline. If one or more tracks are selected, then zooming is centered on the topmost selected audio track.

— **Using the Fairlight panel’s Jog/Edit wheel:** If you have a Fairlight panel, you can hold the ZOOM button down while turning the Jog/Edit wheel to zoom into the Timeline at the position of the playhead.

### Scrolling Through the Timeline

However closely you’re zoomed into the Timeline, if you’re zoomed enough so that clips extend past the visible area of the Timeline, scroll bars appear below. If the playhead is offscreen, a small orange tic mark indicates its position relative to the entire timeline, which is represented by the total width of the scroll bar’s background.

If you drag the playhead, or otherwise use any of the transport controls or playback key shortcuts to move through the Timeline, the contents of the Timeline refresh every time the playhead hits the left or right edge of what’s visible.

### Using Flags

Flags are meant to mark an entire clip, and they also flag every other clip in the Timeline that shares the same Media Pool source clip, making this a handy way of quickly identifying which clips in a given timeline come from the same Media Pool source. Flags are visible in every page of DaVinci Resolve, making them an excellent method of tracking media from page to page.
You can apply multiple flags to clips, with a variety of colors to choose from. In addition to flagging specific media files, flags can be useful for sorting by column in the Media Pool, as well as a variety of other operations. Whenever you enter text into a flag, it displays a small dot that indicates there’s more information inside of it.

**Methods for flagging clips in the Fairlight page:**
- **To flag a clip:** Select one or more clips, and either click the Flag button to flag that clip with the current color, or click the Flag pop-up in the toolbar to choose a different color and then click the Flag button. In the Edit page, flags appear in the Timeline superimposed in the name bar of each clip.
- **To remove all flags from a clip:** Select one or more clips with flags you want to remove, then click the Flag pop-up in the toolbar, and choose the top “Clear All” option.
- **To change the Flag color or remove individually:** Double-click the Flag icon on the clip and a Marker dialog box appears to change the Flag color, remove the flag, or make a note regarding the flag.

**Using Markers**

Markers are used to call attention to a particular frame within a specific clip. Markers can be individually colored, and can have customized name and note text. Whenever you enter text into a marker, that marker displays a small dot that indicates there’s more information inside of it. Once placed, markers snap to In and Out points, edit points, the playhead, and other markers whenever snapping is enabled, making it easy to use markers to “measure” edits and trims that you make in the Timeline. Markers are visible in every page of DaVinci Resolve, making them an excellent method of tracking frames in clips and specific moments in the Timeline from page to page.

You can add markers to the Timeline (in the Timeline ruler) or to clips. The full procedures for placing and editing markers in the Fairlight page’s onscreen interface are identical to those for the Edit page, so for more information, see Chapter 40, “Marking and Finding Clips in the Timeline.” For now, here’s a summary.

**Adding Markers to Clips**

The following procedures describe how to add markers to clips in the Timeline of the Media page.

**To mark a clip in the Timeline, do one of the following:**
- Select one or more clips you want to mark, then move the playhead to the frame of a selected clip in the Timeline, and click the Marker button in the toolbar (or press M) to place a marker at that frame, using the current color (if multiple overlapping clips are selected, you’ll add a marker to all clips).
- To place a marker during playback and immediately open the marker dialog to enter a name or note within it, select one or more clips you want to mark, play through the selection until you want to place a mark, then press Command-M. Playback pauses until you enter some text and close the marker dialog again, at which point playback continues.
- Select one or more clips you want to mark, and then click the Marker pop-up to choose a different color, and click the Marker button.
Adding Markers to Timelines

You can also place markers of any color into the Timeline ruler to denote specific times for future reference, or add notes about issues you want to keep track of. You should note that all markers placed on clips or in the Timeline also appear within the Mini-Timeline of the Color page, making it easy to place notes to reference particular audio cues that might be valuable when editing or grading.

To mark the Timeline itself, make sure all clips are deselected, and do one of the following:

— Click the Marker button (or press M) to place a marker of the currently selected color in the Timeline ruler.

— To place a marker during playback and immediately open the marker dialog to enter a name or note within it, select one or more clips you want to mark, then press Command-M. Playback pauses until you enter some text and close the marker dialog again, at which point playback continues.

— Click the Marker pop-up to choose a different color, and click the Marker button.

— Right-click in the Timeline ruler and choose a marker color from the Add Marker submenu of the contextual menu.
Chapter 169

Recording

It’s possible to record to one or more tracks on the Fairlight page, accommodating workflows as varied as editors recording scratch voiceover or temp sound effects, recording engineers recording narration, ADR, or foley as part of the audio finishing process, music studios recording orchestras for the music score, or garage bands recording their latest magnum opus.

While DaVinci Resolve is a comprehensive post-production environment for cinema and video, the Fairlight page can be used for any audio recording application you might have, from books on tape to live music to feature films and television.

Setting Up to Record

Depending on how your workstation is set up, it’s possible to simultaneously record to multiple tracks in the Fairlight page at once. How many tracks you can record to depend entirely on what hardware you have available. This section describes the process of recording to tracks in the Fairlight page.

Patching Inputs

Before you can record anything, you need to use the Patch Input/Output window to patch an available audio input to a track. If your computer has nothing else, the inputs of your workstation are available to connect whatever audio device is set up as the default audio input on your system to the track you want to record to.

To open the Patch Input/Output window, do one of the following:

— Choose Fairlight > Patch Input/Output.
— Click the Input menu at the top of the channel strip of the track you want to record to, and choose Input.

To patch an audio source to an audio destination:

1. Make sure that the Source menu is set to Audio Inputs, and the Destination menu is set to Track Input.
2. On the right, click the audio input that you want to patch so it’s highlighted.
3. On the left, click the audio destination that you want to patch so it’s highlighted also, if it’s not already. In this simplified example, channel 4 of the ULN is being connected to Audio 4.
4 Click the Patch button at the bottom of the window, and your recording setup will be patched.
5 Continue steps 2 and 3 until you’ve patched all the inputs you want to record from to all of the tracks that you want to record onto. You can patch as many inputs to as many tracks as your system is set up to accommodate. In this example, there are twelve available audio sources, and the first four have been patched.
6 When you’re finished, close the window.

Arming Tracks

To record on a track, it must be armed. You should note that it’s impossible to arm a track that hasn’t been patched first, so make sure you’ve patched the audio source you want to record from to the track you want to record to first. Then arming that track is as simple as clicking the R button in the track header controls, or in the channel strip for that track in the Mixer.

(Left) The arm button turned on in the track header,
(Right) the arm button turned on in the channel strip

Once a track has been armed, you’re ready to record.

Record Name Prefix

A right-click on the designated record track header has the option to set a recording name prefix to the recordings for that track. This is a useful way to keep tabs of the various recordings required by your project. For instance, if recording ADR you can add a prefix for each character’s recordings as in the example below for a character named Pilot.

Right-clicking a track header reveals the Set Track Record Name option
Choosing Where to Record Audio Clips To

The process of recording in the Fairlight page creates new clips and generates additional media on disk. You can specify the location on disk where you want to save these recordings by opening the Capture and Playback panel of the Project Settings. In the Capture section use the Browse button, found underneath the “Save clips to” field, to choose a new location (a folder named “Capture” on your scratch disk is the default location).

To choose where the new clips that are created are placed in the Media Pool, simply open the Media Pool and select any bin in the Bin list, or create a new bin and select it if you want to put your recordings in their own location.

User-Selectable Input Monitoring Options

The Fairlight > Input Monitor Style submenu presents five options governing how you want to monitor inputs while recording.

— **Input**: You only hear the live signal being input; you never hear the contents of tracks.

— **Auto**: When one or more tracks are armed for recording, you hear the live input signal; on playback you hear the contents of each track.

— **Record**: You only hear the live input signal while actively recording, meaning the Record button has been pressed while one or more tracks are armed for recording. You don’t hear the input signal while tracks are merely armed.

— **Mute**: You hear nothing.

— **Repro**: While recording, you only hear what’s just been recorded, played from the track. In other words, you’re not listening to the live input, but you’re reviewing what’s just been recorded as it’s recording.

Recording Using the Onscreen Controls

You can record anywhere you want on the currently armed track or tracks by placing the playhead where you want recording to begin. In this way, you can record to specific areas of your program as you record voiceover, sound effects, foley, or other timed performances that need to fit into a particular region of the edit.
To begin recording:
1. Position the playhead where you want recording to begin.
2. Click the Record button in the transport controls. Recording immediately begins, and the material being recorded immediately begins drawing a waveform in real time, giving you immediate feedback that the input you’re recording is properly connected or not, as well as where on the currently armed track material is being recorded.

To stop recording, do one of the following:
— Click the Stop button in the transport controls.
— Press the Spacebar.

Recording and Editing Multiple Takes Using Layering

There are two ways you can record multiple takes. You can either record them one after the other, sequentially, and then edit them later. However, you also have the ability to record multiple takes to the same region of the timeline, one on top of another, while at the same time preserving every take using track layering.

In the following screenshot, multiple takes have been recorded over the same section of the timeline, including some partial takes to correct specific phrases in the voiceover being recorded. When you do this, the result looks like a series of cuts and overwritten clips, with the most recently recorded segments being the ones that play back over the previously recorded segments.

Overlapping recordings with Audio Track Layers turned off

However, if you choose View > Audio Track Layers, you’ll see that all your recordings have actually been preserved via a vertical stack of overlapping audio clips.
Overlapping recordings with Audio Track Layers turned on, showing layering within the same track.

The layering of audio clips in DaVinci Resolve means that the topmost superimposed clips in a layered stack like this mutes the audio of overlapping clips that are lower in the stack.

Using layering, it’s easy to edit the best segments of the best takes, while preserving all other takes, simply by adding edits and rearranging clips in the stack so the best parts are on top.

For more information about audio layering, see Chapter 171, “Editing Basics in the Fairlight Page.”

Recording VSTi Instruments

DaVinci Resolve supports VSTi instruments working with connected MIDI controllers to trigger instrument sounds that can be recorded live on audio tracks of the Timeline. Davinci Resolve Studio includes the Fairlight FX Foley Sampler. This can be loaded with foley sounds such as footsteps or human movements, so you can perform these sounds in real time and record the result to another track as you watch performers walking or punching in the edit, even if you lack a recording booth with foley pits and props.
For more information about the Foley Sampler, see Chapter 176, “Fairlight FX.”

On the other hand, if you’re a musician, there’s nothing stopping you from loading VSTi musical instruments of different kinds for playback, and using the Fairlight page as a multi-track recorder. DaVinci Resolve doesn’t have MIDI sequencing functionality, but you can record live playback straight to the Timeline, using layered audio to manage multiple takes for later re-editing. Bet you never thought you’d be recording music in DaVinci Resolve.

A VST Instrument (in this case Serato Sample) loaded into a track of the Timeline

To enable a MIDI controller in macOS:

1. If DaVinci Resolve is running, quit before connecting your MIDI controller and setting it up.
2. On macOS you’ll use the Audio Midi Setup utility to choose output hardware and select a speaker configuration to be made available on your system. In the Finder, use Spotlight and search for Audio MIDI Setup to open it.
3. In Audio MIDI Setup, choose Window > Show MIDI Studio. A window showing icons for all connected MIDI controllers appears. Your controller should be showing an icon. If it’s not, you may need to install drivers for it.
4. Select the icon for your controller and turn on the “Enter test MIDI setup mode” button (it looks like a little keyboard) to test if your keyboard is connecting with the computer. If it is, then turn this off.

For more information on setting up MIDI on different systems, see the DaVinci Resolve Configuration Guide, available on the web from the Blackmagic Design support page at https://www.blackmagicdesign.com/support/family/davinci-resolve-and-fusion.
To set up the Fairlight page for VSTi instrument recording using a sampler:

1. Open DaVinci Resolve.
2. Make sure you have at least two available audio tracks in the Timeline, one for the instrument you’ll be playing, and one to record into. This example will use tracks A4 and A5 for this.
3. Open the Effects Library, find a VSTi sampler you have installed on your system, and drag it to the track header of the track you want to use for playing, for example track A4.

Massively-featured sampler/synth combinations such as Native Instruments Kontakt and Steinberg Halion are ubiquitous and useful when you want to specifically map a collection of sound effects to specific keys or pads to create re-usable multi-purpose instruments. However, more streamlined samplers that emphasize automatic audio clip slicing such as Serato Sample (Windows and macOS) or Image Line Slicex (Windows only) can make short work of the more specialized task of loading library sound effects recordings (or custom recordings you create) with multiple footsteps, punches, keyboard presses, cloth rustles, or other foley activities, and quickly splitting them up into individually playable samples you can trigger with pads or a keyboard.

4. When the VSTi interface window appears, open the MIDI menu at the upper right-hand corner of the VSTi window and choose the correct MIDI channel from your MIDI controller’s submenu. If you’ve selected the correct MIDI channel, the instrument should start responding to the keys or pads on your controller.

5. Next, configure the VSTi instrument you’re using to play the sound effects you want to use for foley. In this example, the Serato Sample VSTi plug-in is being used to automatically slice up a recording of footsteps from one of Sound Ideas’ many sound effects libraries.

Because the VSTi you added is patched to that track’s Insert (if you look at the Mixer you should see that the I button is enabled on the channel strip the instrument is patched to), the Send is PRE the Instrument. This means you need to patch that track’s Track Direct output to the input of another track to record the instrument.
Choose Fairlight > Patch Input/Output to open the Patch Input/Output window, then set the Source drop-down menu to Track Direct and the Destination drop-down menu to Track Input. Click Audio 4 to the left, and Audio 5 to the right, and click the Patch button; this sets you up to play the VSTi plug-in on track A4, and record its output on track A5.

Be aware that after patching Track Direct from the track with the instrument to the track you’re recording onto, you also need to turn “Direct Output” on for that track in the Path Settings of that track’s channel strip in the Mixer.

Open the Mixer (if necessary), click the Input drop-down menu at the top of the channel strip that shows the VSTi instrument you’re using, and choose Path Settings. When the Path Settings window appears, click the ON button for Direct Output, then close the Path Settings window.

At this point, you’re ready to begin recording.

**To play and record a VSTi instrument:**

1. Click the Record Arming button of the track you’re recording to (in this example A5), move the playhead to where you want to begin recording, and then click the Record button to begin recording.

2. As the video of your program plays, use your MIDI controller to trigger sound effects as necessary. When you’re finished, click the Stop button.

   If necessary, you can record multiple takes using track layering until you get the timing right. When you’re finished, you can remove the instrument from the track it’s on since the recorded audio is all you need.
Chapter 170

ADR
(Automated Dialog Replacement)

The Fairlight page of DaVinci Resolve has a sophisticated interface for doing ADR, or automated dialog replacement, in a structured and straightforward manner.

Simple, yet powerful, the ADR panel incorporates Cue list management, industry-standard audio beeps and visual cues, and sophisticated take management with star ratings and layered take organization to create and manage the re-recording of dialog in any program. With this sophisticated organization and layering, it’s easy to edit together the best parts of each take into your program.

Manually Creating an ADR Cue List 3501
Importing Cues 3502
Recording ADR to the Timeline 3503
**ADR (Automated Dialog Replacement)**

Clicking the ADR button on the Interface toolbar opens up the celebrated Fairlight ADR panel, which provides a thoroughly professional workflow for doing automated dialog replacement. Dialog replacement, for those who don’t know, is the process whereby audio professionals bring in actors to re-record unsalvageably bad dialog recordings from the comfort of their recording studios, line by line and with a great deal of patience.

It’s an old joke that ADR isn’t really automatic, but the Fairlight page aims to give you all the help it can to make this a structured and straightforward process. Simple, but powerful, Cue list management lets you efficiently assemble a re-recording plan. Industry-standard audio beeps and visual cues via your BMD video output device help the actors in the booth nail their timings and their lines. Then, sophisticated take management with star ratings and layered take organization in the Timeline help you manage the resulting recordings to pick and choose the best parts of each take when you edit the results.

**The ADR Interface**

When open, the ADR interface consists of three panels to the left of the Timeline: a List panel, a Record panel, and a Setup panel. The controls of these panels are described in the order in which they’re used.

**The Setup Panel**

As its name implies, the Setup panel is where you configure your ADR session.
This panel presents the following controls:

- **Pre Roll and Post Roll**: Specifies how many seconds to play before and after each cue's specified In and Out points, giving actors a chance to listen to what comes before and after each cue in order to prepare. If you enable the Beep options below, beeps provide a countdown during the specified pre-roll.

- **Record Source**: (Disabled until you select a Record Track) A drop-down menu lets you choose the input you want to record from, creating a patch to the Record Track.

- **Record Track**: A drop-down menu lets you choose the track you want to record to. Selecting a track with this menu creates a patch from the Record Source to the Record Track, and automatically toggles Record Enable on.

- **Guide Track**: A drop-down menu lets you choose which track the original production audio you need to re-record is on. This is used for sending audio playback to the talent to use as a guide for recording their own replacement performance.

- **Record File Name**: A text entry field that lets you provide a name for the audio files being recorded to be saved with.

- **Character Setup**: A list for adding the names of all the characters that have dialog cues you'll be re-recording, to help with cue creation and management. An Add New button lets you add additional names to this list, while a Remove button lets you delete characters you no longer need.

- **Beep to In Point**: Enables a three-beep sequence to be heard leading up to the recording. For beeps to be audible, the Beeps channel of the System Generator is a source that must be patched to your audio outputs using the Patch Input/Output window.

- **Beep at In Point**: Enables one last beep at the In point. For beeps to be audible, the Beeps channel of the System Generator is a source that must be patched to your audio outputs using the Patch Input/Output window.

- **Count In**: An onscreen counter that counts down to the start of the cue.

- **Video Streamer**: A visual cue for the talent to watch during pre-roll to ready them for recording. A pair of vertical lines superimposed over the program being output to video move towards one another across your video output screen during the pre-roll to the cue. This gives the talent a visual indication of the time remaining until they should begin talking. When the beeps play, these lines get taller. Both lines come together at the Time In frame, at which point a cross shows that recording is beginning.

- **Smart Timeline**: When turned on, this option automatically moves the playhead to each cue as it's selected in the Cue list, and zooms in to frame the duration of that cue in the Timeline.

- **Mixing Control**: Enables automated switching of audio playback, to independently control what the talent and the audio engineer hear at various stages of the ADR recording process. For example, with this enabled, the Guide track is not routed to the Control room while the engineer is reviewing a take.

**The List Panel**

This is where you create a list of cues you need to re-record, either from within the Fairlight page, or imported from a .csv file that someone provides you.
The List panel of the ADR interface

This panel presents the following controls:

— **Cue editing controls**: Displays the data for the currently selected cue (or a cue that was just created). In and Out timecode fields store the Timeline In and Out points that were set when the cue was created but can be manually edited for fine tuning. A Character drop-down menu lets you choose which character that line of dialog belongs to. A text entry field lets you enter the dialog cue that's to be re-recorded, so you and the talent can both refer to it.

— **New Cue button**: Clicking this button adds a new cue to the list using whatever In and Out points have been set in the Timeline, and whatever character was last selected.

— **Cue list**: The list of all cues that have been entered or imported. The Cue list can be filtered using the Filter drop-down menu at the top-right of the ADR panel (next to the option menu). You can choose to show the cues for all characters, or for any selected combination of characters. You can also choose to hide all cues that are marked as done to experience the joy of this list shrinking more and more the closer you are to being finished.

Additionally, the ADR interface option menu has three commands pertaining to the List panel:

— **Import Cue List**: Lets you import a properly formatted .csv file to create cues that have been prepared in a spreadsheet. Correct formatting for cue lists you want to import is no headers, one line per cue, with four individual columns for In timecode, Out timecode, Character Name, and Dialog.

— **Export Cue List**: Lets you export the contents of the Cue list to a .csv file, for exchange or safe-keeping.

— **Clear Cue List**: Deletes all cues in the Cue list. It's recommended you export a copy of your Cue list before eliminating it completely, in case you ever need to revisit a cue.
The Record Panel

This is where you actually run the ADR recording session you’ve set up, using the dialog cues you’ve put into the Cue list.

This panel presents the following controls:

- **Record and rehearse controls:** Four transport controls and two buttons let you control recording during ADR sessions. These controls are only clickable when you’ve selected a cue from the Cue list to record.
- **Rehearse:** Runs the section of the Timeline specified by a cue without actually recording anything, giving the talent an opportunity to run through their dialog and practice their timing and delivery. Beeps and on-screen streamers are not played during a rehearsal.
- **Play:** Plays the currently selected take from the Take list (described below). If no take is selected, the most recently recorded one on top is played.
- **Stop:** Immediately stops rehearsal, playback, or recording.
- **Record:** Initiates recording of the cue to the specified audio track, with cue beeps and video streamer cues.
- **Keep Playing:** At the end of a take you may wish to keep playing, so the talent can hear the next section of the track. Pressing the Keep Playing button at any time, even while recording, results in post roll being ignored and normal playback resuming after the cue’s Out time.
- **Keep Recording:** At the end of a take you may wish to keep recording until you manually stop. Pressing the Keep Recording button at any time, even while recording, results in the Out point of the current cue being ignored and recording continuing until you stop it.
— **Take list**: The Take list shows every take you’ve recorded for the current cue, with take number, name, and a five-star rating that you can set to keep track of which takes worked and which didn’t. Earlier takes are at the bottom of this list, while recent takes are at the top (the same order in which the corresponding layered audio clips appear in the Timeline track they’ve been recorded to).

— **Cue list**: The list of all cues that have been entered or imported. The Cue list can be filtered using the Filter drop-down menu at the top-right of the ADR panel (next to the Option menu). You can choose to show the cues for all characters, or for any selected combination of characters. You can also choose to hide all cues that are marked as done to experience the joy of this list shrinking more and more the closer you are to being finished.

— **Cue list Done column**: A sixth column appears in the Record panel only, labeled Done. It contains check boxes for each cue that you can turn on to keep track of which cues you’ve successfully finished.

Additionally, the ADR interface Option menu has one command pertaining to the Record panel:

— **Record Early In**: Enables recording during pre-roll, in the event you’re working with talent that likes to start early.

---

**Setting up to Do an ADR Session**

Setting up to record ADR is straightforward but requires a few steps.

**Creating tracks in preparation to record ADR:**

1. In the Timeline, create a new audio track to which you’ll be doing ADR recording. Make sure it has the correct channel configuration for your recording (mono is typical for dialog).
2. If you’re recording ADR to your main timeline, you may want to Solo both the Guide track and the Record track, so you and the talent can focus on the audio being re-recorded without hearing all the other tracks of the current mix.

Now you’re ready to configure the Setup panel.

**Configuring the Setup panel:**

1. Open the ADR interface, and then open the Setup panel.
2. Choose the Pre Roll and Post Roll you want to use, in seconds. A pre roll of at least 3 seconds is recommended to give the talent time to get ready.
3. From the Record Source drop-down menu, choose the microphone you patched earlier.
4. From the Record Track drop-down menu, choose the Record track you created.
5. From the Guide Track drop-down menu, choose the track with the original production audio that you’re replacing.
6. At the bottom of this panel, turn on which Preroll Cue options you and the talent want to use as you record each cue. Options include:
   a. Beep to In Point and Beep at In Point provide an audible count down to when to start performing.
   b. An animated Video Streamer gives a countdown to the start time, shows the duration of the cue being recorded, and also displays the text of the dialog for that cue on screen for the actor to refer to, so they can keep their eyes on the screen and not a script.
Next, if you’ve enabled Beep to In Point and Beep at In Point, you need to patch the Fairlight oscillator to your output channels so the talent can hear the preview beeps.

**Patching the Oscillator to play beeps over your audio output:**

1. Choose Fairlight > Patch Input/Output to open the Patch Input/Output window.
2. Choose System Generator from the Source drop-down menu, and click to select Beeps.
3. Choose Audio Outputs from the Destination drop-down, and choose the left/right outputs you want these preview beeps to play out of. You can drag a bounding box to select multiple outputs, thereby connecting the mono Beeps input to stereo output for comfortable listening.
4. Click Patch to make the connection, then close the Patch Input/Output window.

---

**Creating and Importing ADR Cue Lists**

You must have a list of cues to be able to use the ADR interface properly. There are two ways you can create a Cue list to record with, make one from scratch on the Fairlight page, or import one. The ADR panel accommodates both workflows.

**Manually Creating an ADR Cue List**

If you’ve been doing all of your dialog editing inside of DaVinci Resolve, you can go ahead and create a list by marking the sections of the Timeline you need to re-record and creating cues from those timings. To create cues properly, you should start by adding the names of each character you’ll be creating a cue for in the Setup panel. These names make it easier to enter cues and will help you to filter and sort the list as necessary later on.

**To add character names before entering cues:**

1. Open the Setup panel of the ADR interface.
2. Click Add New.
3. When a selected entry appears in the Character Setup list, type a name.
4. Press Return when you’re done.

**To edit the Character Setup list, do one of the following:**

— If you mis-spell a name, you can double-click any name in this list to edit it.
— To delete a name, you can select it and click Remove to eliminate it.

Once you’ve created a complete set of character names, you can begin creating your Cue list.

**To manually add cues to the Cue list:**

1. Open the List panel of the ADR interface. This is where all the controls for creating and editing cues are.
2. In the Timeline, set In and Out points to mark the section of dialog you want to turn into a cue. Those timecode values appear in the Cue Editing section of the List panel.
3. Click New Cue to add a blank cue to the Cue list.
4. In the Cue Editing section, choose the character who’s speaking that cue from the Character drop-down (only names that have been entered in the Setup tab appear in this list).
5 If necessary, select the text field below, and type the dialog that needs to be re-recorded.
6 Repeat steps 2 through 5 until you’re finished creating all the cues you intend to re-record. If you need to edit any cue, simply click to select that cue, and edit it in the Cue Editing section above.

**Importing Cues**

If you or an assistant has already created a Cue list using a spreadsheet with separate columns for character names, dialog, and In/Out timecode values, then you can also create a Cue list by importing this data from an exported .csv file.

To import a .csv file to the Cue list:

1 Choose Import Cue List from the ADR option menu, then use the dialog to choose the .csv file containing the Cue list you were given, and click Open.
2 An ADR Setup dialog appears, showing the data from the .csv file previewed as a series of columns. This lets you see if each column of incoming data is being assigned correctly. If it’s not, you can reassign each column of the incoming data to the correct column of the ADR panel.
   Correct formatting for Cue lists you want to import is to have no header text, and to enter information using one row per cue, with four individual columns for In timecode, Out timecode, Character Name, and Dialog. If any of these columns are transposed, you can correct this by choosing the correct data type for each column from the drop-down menus at top.

![Dialog for rearranging columns of cue data, if necessary](image)

3 Click Import CSV. The cues should appear in the Cue list.

**To export a .csv file from the Cue list:**

— Choose Export Cue List from the ADR option menu, choose a location to save the file, and click Save.
Recording ADR to the Timeline

Once you’ve configured your workstation for recording, and you’ve set up a Cue list to work with, it’s time to start recording each cue.

To record a cue from the Cue list:

1. Open the Record panel of the ADR interface.
2. If you want to record a particular character’s cues, you can select each unnecessary character in the ADR Option menu to uncheck that character, hiding their dialog in the Cue list.
3. With the list showing the character cues you need, select the cue you want to start recording. That cue contains the timecode necessary to determine which part of the Timeline to record to, and the playhead automatically moves to that part of the Timeline.
4. Click the Rehearse button a few times to run through the cue with the talent. When you click Rehearse, both audio and video corresponding to that cue will play, including pre roll and post roll, along with all beep and onscreen cues.
5. When the talent is ready to try a take, click the Record button, and let the Fairlight page do the work of playing through pre roll with beep notifications and visual streamer cues, initiating recording, and then stopping recording automatically once the cue is done. To record another take, simply click the Record button again.

Every time you complete a recording, a take appears in the Take list. Making multiple recordings results in multiple takes in the list. In the Timeline, all new takes appear as layered audio, so you can record as many takes as you like into the same area of the Timeline. Once you’ve finished recording takes, you’ll have a neatly organized stack of alternate takes to draw upon as you edit together the best parts of each recording.

6. If you or the talent want to hear a particular take again, select it in the Take list and click Play. You can use the 5-star ratings control to keep track of how you liked each take.
7. When you’re finished recording a cue, click the Done checkbox for that cue, and select the next cue you want to record. When you’re finished re-recording dialog, simply close the ADR interface.
You can use the Fairlight page to refine the editing of audio that was initially assembled in the Edit page, or you can use the Fairlight page to both record and edit audio programs from scratch.

Because audio clips have properties that video clips do not, audio editing encompasses additional procedures that are not available in the Edit page. This chapter takes you through the fundamental steps of editing audio the Fairlight way.

Compatible Audio Formats

DaVinci Resolve is compatible with WAVE, Broadcast WAVE, AIFF, MP3, AAC (M4A), CAF (macOS only), both MTS and QuickTime containers that use the AC3 audio format, and Enhanced AC-3 (macOS and Windows only). DaVinci Resolve is compatible with audio at sample rates including 32, 44.1, 48, 88.2, 96, and 192 kHz. Linux users have the added ability to encode and decode MP3 files in Fairlight.

DaVinci Resolve 17 adds Dolby Atmos ADM file creation and manipulation as well as the ability to export Atmos masters as IMF deliverables. IMF (Interoperable Master Format) is a SMPTE standard for a single master file format that incorporates all the media and metadata necessary to deliver what’s necessary.

ADM Import

Importing an ADM file into a project will open the Bed mix or mixes and any associated Object tracks into a timeline. They will be imported onto corresponding track types of the audio files embedded into the ADM. For instance, if a Bed file is 7.1.2, then on import that file will open in a 7.1.2 track in Fairlight. Object files will be created as separate tracks in Fairlight containing all of their panning data. Object tracks can only be mono or stereo files due per the Dolby Atmos specification.

NOTE: If bringing in a Dolby Atmos file from the Media Pool, it will render the file dynamically to the chosen output format directly on the Timeline using the Dolby Renderer. However, Fairlight can import the full Atmos file with beds and objects if imported from the Fairlight menu instead - Fairlight > Immersive > Audio > Import Master File. By bringing a file in this way, it will create a timeline with all of that file’s Atmos program and dynamic metadata properly mapped and routed.

Editing Audio Clips Into the Timeline

The Fairlight page offers a complete audio editing environment that lets you either record and assemble clips from scratch, or refine tracks full of audio clips that have been edited together in different ways. There are four ways of adding media to the Timeline in the Fairlight page, depending on the type of work you do:

— Recording new audio into one or more tracks (for more information, see Chapter 169, “Recording”)
— By dragging and dropping new audio clips from the Media Pool into the Fairlight timeline
— By editing audio clips into audio tracks on the Edit page
— By importing a project with audio clips
— By auditioning and confirming sound effects from the Sound Library

However audio clips come to be in your timeline, the rest of this chapter covers the myriad methods available to edit and sweeten the contents.
Overwriting Vs. Layering Clips That Overlap

When you add clips to the Timeline, what happens when you add a clip that overlaps another clip that's already in the track you're editing to depends on the Timeline > Layered Audio Editing setting. By default, with Layered Audio Editing turned off, overwriting one audio clip with another results in the overlapping part of the overwritten clip being non-destructively deleted from the Timeline by the incoming clip.

However, if you turn Layered Audio Editing on, then incoming clips do not overwrite overlapping clips in the Timeline; instead, they're layered within that track, such that the incoming audio clip takes precedence over what was previously there, but overlapping audio segments that were previously in the Timeline are preserved, which can be seen when you choose View > Show Audio Track Layers.

In this way, you can choose whether you want to overwrite previously edited clips, or layer newly edited clips, as your needs require, regardless of whether or not Audio Track Layers are visible. Audio layering can be enabled in both the Edit and Fairlight pages.

For more information about audio layering, see the section later in this chapter.

Choosing Parts of Clips to Edit in the Media Pool

The Media Pool has a preview player at the top that provides a place to open selected source clips in the Media Pool, play them, add marks to log them, and set In and Out points in preparation for editing them into the Timeline via drag and drop. The Media Pool Preview Player effectively acts as a Source monitor for editing in the Fairlight page.

![](image)

The preview player in the Media Pool

— Various viewing controls populate the title bar at the top. A drop-down menu at the upper left lets you choose a zoom level for the audio waveform that’s displayed. To the right of that, a Timecode window shows you the duration of the clip or the duration that’s marked with In and Out points. Next to the right, a real-time performance indicator shows you playback performance. In the center the title of the currently selected clip is shown, with a drop-down menu to the right that shows you the most recent 10 clips you’ve browsed. To the far left, a Timecode field shows you the current position of the playhead (right-clicking this opens a contextual menu with options to change the timecode that’s displayed, and to copy and paste timecode).

— The center of the Media Pool Preview Player shows you the waveforms in all channels of the currently selected clip, at whatever zoom level is currently selected.

— Transport controls at the bottom consist of a jog bar for scrubbing, Stop, Play, and Loop buttons, and In and Out buttons.
Dragging Audio Clips Into the Timeline

You can show the Media Pool in the Fairlight page, and edit audio clips into the Timeline in their entirety by dragging and dropping individual clips onto whichever audio track you want them to appear. You can drag any clip onto any track, regardless of whether or not the channels of the clip match the channel mapping of the track. However, if you edit a clip with more channels than a track has (for example, editing a stereo clip onto a mono track), only the channels supported by that track will be output, with all other channels in that clip being muted. If this happens, you can always remap the audio track by right-clicking the track header and choosing a new mapping from the Change Track Type To submenu.

**TIP:** Dragging one or more clips to the empty area underneath the existing audio tracks of the Timeline results in the creation of new tracks, each of which is automatically mapped to however many channels are required by each audio clip being edited.

If you want to edit several clips into the Timeline at once by dragging them from the Media Pool, you’ll probably want to do a bit of preparation to make sure they’re edited in the right order.

**Dragging several clips into the Timeline as one contiguous series of edited clips:**

1. Change the sort order of the Media Pool’s browser area to put the clips into the order in which you want them to appear. In Thumbnail view you can use the Sort Order menu, but in List view you can click the header of any metadata column to sort by that column’s data.

2. Use the Media Pool thumbnails, the Media Pool List view Filmstrip, or the Source Viewer to set In and Out points to define the part of each clip that you want to edit into the Timeline.
3 Select the Media Pool clips you want to edit into the Timeline by dragging a bounding box, Command-dragging multiple bounding boxes over different sets of clips, by Shift-clicking a range of clips, or by Command-clicking individual non-contiguous clips.

4 Drag any of the selected clips to the desired position in the Timeline to perform an overwrite edit. The clip(s) you drag overwrite whatever other clips they overlap in the Timeline. Multiple clips dragged from the Media Pool will be edited in the order in which they’re sorted in the Media Pool, using each clip’s In and Out points.

It’s possible to edit audio clips into the Timeline so that each clip’s timecode lines up with the Timeline Ruler. This can be useful if you’re organizing multiple source audio recordings that you want to synchronize together on multiple tracks.

Dragging multiple clips to edit them into a track at their timecode positions:

1 Select the Media Pool clips you want to edit into the Timeline by dragging a bounding box, Command-dragging multiple bounding boxes over different sets of clips, by Shift-clicking a range of clips, or by Command-clicking individual non-contiguous clips.

2 Hold Command-Shift down, and drag the selected clips into the track you want them to appear, to perform an overwrite edit.

Each clip edited into that track appears at the same timecode position as its embedded timecode. This means that if you were recording time-of-day timecode, each clip will appear on the Timeline at the time it was recorded. A series of clips recorded during hour 10 through 13 will appear distributed throughout hours 10-13 on your timeline.

A series of audio clips edited into the Timeline by timecode position

You can also edit two or more audio clips into the Timeline as a stack, in preparation for layering multiple sound effects for doing sound design work.

Dragging multiple clips to edit them into a track as a parallel stack:

1 Select the Media Pool clips you want to edit into the Timeline by dragging a bounding box, Command-dragging multiple bounding boxes over different sets of clips, by Shift-clicking a range of clips, or by Command-clicking individual non-contiguous clips.

2 Command-drag the selected clips into a track of the Timeline. The first of the selected clips appears in the track you’re dragging to, the other clips appear either in audio tracks underneath the first one, or if there are no audio tracks available, in new audio tracks that will be created to hold those clips.

All clips you’ve edited appear as a parallel stack, in separate tracks, one on top of another.
Moving Audio Clips to Embedded Timecode Position

All clips have a timecode embedded into their metadata. There are options to place clips onto the Timeline from either the Media Pool or in the Timeline itself with this metadata.

Right-clicking a clip in the Timeline has the choice to Move to Embedded Start Timecode. When this is clicked the clip will spot onto the Timeline on a selected track with the timecode.

It’s important to be aware of the embedded audio timecode and the Timeline timecode. The two must have overlapping timecode, or this function will not work. For example, a clip that has an embedded timecode of 00:00:00:00 may be difficult to find on a Timeline that starts at 00:59:58:00. If you have spotted a clip using these tools and still don’t see the clip in question, then check the embedded timecode in the Metadata panel of the Inspector as well as the timecode of the Timeline itself.

Right-clicking a clip in a Timeline reveals the Move to Embedded Start Timecode option.

Right-clicking a clip in the Media Pool reveals the Insert Selected Clips to Timeline option.
Right-clicking a clip in the Media Pool has the choice to Insert Selected Clips to Timeline Using Timecode. When this is clicked the clip will spot onto the Timeline on a selected track with the embedded timecode.

**NOTE:** You can find the embedded timecode for a clip in the Inspector in the File tab under timecode.

![Timecode metadata in the Inspector window](image)

**Support for Mixed Audio Track Formats from Source Clips**

DaVinci Resolve supports media with multiple audio tracks that have differently formatted channels embedded within them. For example, a clip with one stereo track, one 5.1 surround track, and six mono tracks can all be appropriately set up in the Audio panel of Clip Attributes after that clip has been imported.

The Audio panel of Clip Attributes has controls over what format (Mono, Stereo, 5.1, 7.1, Adaptive) the channels embedded within a particular audio track should be configured as. This means you can set up clips with multiple tracks, each one using different formats of audio employing different combinations of channels, which is useful for setting up imported audio mix files that you want to output when mastering a program.
Making Audio Clip Selections in the Timeline

Nearly every editing operation described in this chapter and others requires you to make a selection to define which clips will be affected. Three editing modes in the toolbar give you different ways of selecting clips, depending on what you’re trying to do, and how you like to work. These are (from left to right) the Selection mode, the Range mode, and the Edit Selection mode. Which mode you choose determines how clips and clip segments are selected in the Timeline in preparation for all manner of editorial operations.

Fairlight Edit Mode Remains Between Application Restarts

Fairlight retains the Edit Mode the project was saved with between restarts. Whatever edit mode you were working in prior to closing the application will be active when reopened.
Why Are There Three Edit Modes?

While the Selection and Range modes can also be used with the pointer, they’re really designed to enable automatic selections based on the position of the playhead. This is accomplished when using the Fairlight Editing console, the Fairlight Desktop Console, or keyboard shortcuts to control Timeline transport, while specific tracks are selected to enable selection and editing on those tracks.

The Edit Selection mode is designed for efficient selections made using the pointer via a mouse, trackpad, or pen and tablet, made in conjunction with a variety of commands for extending and editing selections triggered via keyboard shortcuts. If you’re editing with a keyboard and mouse, this mode is designed to let you work quickly by enabling a variety of different selection functions based on clicking different parts of clips.

Selecting Tracks

In order to understand clip selection, you must first understand track selection. The Timeline on the Fairlight page lets you select entire tracks to facilitate the automatic selection of clips that intersect the playhead on those tracks using keyboard shortcuts, the Fairlight Desktop Console, or the Fairlight Editing panel, in Selection and Range Selection modes (described in upcoming sections).

For example, were you to select tracks A2, A3, and A4, then moving the playhead to intersect two clips on those tracks in Selection mode automatically selects them, so they’re ready for any operation you want to perform on both clips. To give a few examples, you could now split both clips at the playhead, Cut Head or Tail to the playhead, Delete both clips, or Copy them in preparation for pasting elsewhere.

Command-clicking multiple track headers selects those tracks
Additionally, there are times when clicking or dragging on one or more clips with the pointer results in both those clips being selected, along with the tracks on which they sit. For example, selecting clips using the Edit Selection mode will also select the tracks those clips are on.

If you’re manually selecting tracks using the pointer, there are different ways to do so.

**Methods of selecting and deselecting tracks in the Fairlight page Timeline:**

— **To select a single track:** Click anywhere in the background or on the track number of that track’s header (not on a button). In Range Selection mode you can also click in any unused area of the track itself.

— **To deselect a single track:** Click anywhere in the background or on the track number of a previously selected track’s header (not on a button). In Range Selection mode you can also click in any unused area of the track itself. If multiple tracks are selected, Command-clicking one will remove just that track from the selection.

— **To select multiple tracks:** Command-click in the track header background of every track you want to select. In Range Selection mode you can also Command-click in any unused area of the tracks themselves. Command-clicking an already selected track will deselect it.

— **To select multiple continuous tracks:** Click anywhere in the background or on the track number of a track header, and then drag a bounding box up or down over all other tracks you want to select. In Range Selection mode you can also drag a bounding box over any part of the tracks themselves, while also defining a range in which you want to work.

— **To move the selection to higher or lower tracks:** Press Control-Option-Up Arrow or Down Arrow to move the selection state to the next track higher (Control-Option-Up Arrow) or lower (Control-Option-Down Arrow). If multiple tracks are selected, then the multi-selection will be moved as a block; for example, selecting tracks A2 and A3 and then pressing Control-Option-Down Arrow will result in tracks A3 and A4 being selected.

**Using Selection Mode**

Selection mode uses the position of the playhead to make automatic selections when using the Fairlight Editing console or keyboard shortcuts to make clip selections on selected tracks. However, you can also use this mode in conjunction with the pointer and keyboard shortcuts to make selections in a different style. Selection mode is primarily intended to allow efficient editing of whole clips.

— **If no tracks have been selected:** Clips that intersect the playhead are not selected. You can use the pointer to select one or more clips by clicking, Command-clicking, or dragging a bounding box. Clips you select in this way are highlighted in orange. Making selections in this way is similar to making clip selections in the Timeline of the Edit page.

— **If tracks have been selected:** All clips that intersect the playhead on selected tracks will be automatically highlight selected, but no In and Out points will be set. Clips on de-selected tracks will be ignored. Selecting one or more clips with the pointer (by Command-clicking or dragging a bounding box) creates an orange-highlighted selection.

— **If you set In and Out points:** Some functions will affect ranges of clips between In and Out points on selected tracks. Clips on unselected tracks are ignored.
To choose Range Selection mode:
— Click the Range Selection tool (the crosshairs at the bottom of a track) in the toolbar.
— Choose Trim > Range Selection Mode.
— The keyboard shortcut is pressing - R.

To automatically select clips using the playhead position in Selection mode:
1. Press A to enter Selection mode.
2. Select one or more tracks with clips you want to select.
3. Move the playhead to intersect those clips.
   All clips that intersect the playhead on selected tracks of the Timeline are automatically selected in their entirety. Automatic selections are illuminated brighter to indicate their selection. Intersecting clips on unselected tracks are not selected.

Methods of selecting clips using the pointer in Selection mode:
— Click any clip to select it.
— Command-click multiple clips to select them all at once.

Command-clicking multiple clips selects those clips, even if they’re separated by other clips.

— Click anywhere in the background of the Timeline and drag a bounding box over multiple clips.

Dragging a bounding box over multiple clips selects all of them.

**Using Range Selection Mode**

Range Selection mode also uses the position of the playhead to make selections of a partial range of clips in the Timeline when using the Fairlight Editing console or keyboard shortcuts. You can also use this mode in conjunction with the pointer and keyboard shortcuts to make partial selections of clips.

— **If no tracks have been selected:** Clips that intersect the playhead are not selected. You can use the pointer to click a clip and select it in its entirety along with the track it’s on. You can also use the pointer to drag on one or more clips to select a partial range in preparation for different editing operations. Whenever you make a selection with the pointer, Timeline In and Out points are set to the boundaries of the selection.

— **If tracks have been selected:** Selected tracks are brightened in the Timeline, and any clip on a selected track that intersects the playhead will be automatically highlighted brighter. Clips on deselected tracks will be ignored. Dragging a crosshairs over one or more clips with the pointer overrides all automatic selections and selects the regions of the clips you drag over, and the tracks they’re on.

— **If you set In and Out points:** Partial regions of all clips on all selected tracks between the In and Out points will be highlighted brighter. Clips on unselected tracks are ignored. While In and Out points are set, the playhead no longer makes automatic selections; you must set new In and Out points to modify the selection in this mode.
To choose Range Selection mode:
— Click the Range Selection tool (the crosshairs) in the toolbar.
— Choose Trim > Range Selection Mode.
— Press R.

To automatically select clips in Range Selection mode using the playhead position:
1 Press R to enter Range Selection mode.
2 Select whichever tracks have clips you want to select.
3 Move the playhead to intersect those clips.

All clips that intersect the playhead, on the tracks you selected, define a selected range from the beginning of the first selected clip to the end of the last selected clip.

Clips intersecting the playhead on a selected track in Range Selection mode are automatically selected.

To create custom clip ranges using In and Out points in the Timeline:
1 Press R to enter Range Selection mode.
2 Select whichever tracks have clips you want to select.
3 Move the playhead and press the I (Mark In) and O (Mark Out) keys to define a range in the Timeline.
4 All clip segments that fall within the range of your In and Out points on selected tracks will be selected.
Using the Range mode to select clip segments on selected tracks using In and Out points

**Methods of selecting clips in Range Selection mode via clicking and dragging:**

— **To select a single clip:** Click any clip to select both it and the track it’s on, and define a range in the Timeline that matches the duration of that clip.

— **To select multiple clips:** Command-clicking multiple clips to select them all at once defines a range in the Timeline that matches the total overlapping duration of all clips in the selection, from the beginning of the first selected clip to the end of the last selected clip.
— **To drag to select a range within a single clip:** With the Range Selection tool selected, drag anywhere on top of a clip to drag a bounding box over whatever segment of that clip (or of one or more clips) to select both that clip segment and the track it appears on. This is a good way of selecting part of a recording you want to move or delete.

— **To drag to select a range within multiple clips:** Click and drag a bounding box over whatever segment of one or more clips you want to select to select both those clip segments and the tracks they appear on. Or, Command-click and drag anywhere on top of any clip to drag a bounding box over whatever region of clips and tracks you like.
In Range Selection mode, whenever you make a selection, the In and Out point fields update with the range that you’ve created.

These ranges can be cleared if necessary.

**Methods of clearing In and Out points to clear the current range:**

- Press Option-I to clear the current In point.
- Press Option-O to clear the current Out point.
- Press Option-X to clear both the In and Out points.

**Using Edit Selection Mode**

Edit Selection mode is designed for making efficient pointer-based selections and edits, in conjunction with an assortment of commands for extending and editing selections that can be triggered via customizable keyboard shortcuts. If you’re editing with a mouse and keyboard, this mode is designed to let you work quickly by enabling a variety of different functions based on clicking different parts of each clip in the Timeline.
Additionally, an important aspect of working in Edit Selection mode is that this is the only mode that lets you edit the Timeline during playback, which you can’t do in Selection and Range modes.

— **If no tracks have been selected:** Whenever you make a selection with the hand, Timeline In and Out points are set to the boundaries of the selection. Whenever you make a selection with the crosshairs, Timeline In and Out points are set to the boundaries of the region you dragged. In all cases, the tracks that contain selected clips and regions of clips are also selected.

— **If tracks have been selected:** Any clip on a selected track that intersects the playhead will be automatically highlighted brightly. Clips on de-selected tracks will be ignored. Dragging a crosshairs over one one or more clips with the pointer overrides all automatic selections and selects the regions of the clips you drag over, and the tracks they’re on.

— **If In and Out points have been set:** Clicking the bottom half of clips in the Timeline will select that clip and track, and the In and Out points will change to encompass that clip.

**To choose Range Selection mode:**

— Click the Edit Selection tool (the crosshairs at the bottom of a track) in the toolbar.

— Choose Trim > Edit Selection Mode.

— This mode has no keyboard shortcut at this time.

**To select an entire clip using the Hand tool of the Edit Selection mode:**

— Move the pointer to the bottom half of a clip until a hand cursor appears, and click once to select that clip in its entirety.

— Use the Hand to Command-click multiple clips to make either contiguous or noncontiguous selections.

— Use the Hand to Shift-click multiple clips to make contiguous selections.
To select a range using the I-beam cursor of the Edit Selection mode:

— Move the pointer to the top half of a clip until an I-beam cursor appears, and drag to select a region of one or more clips. As you drag, the playhead follows the Out point.

— Using the crosshairs, you can also Shift-click to expand or contract the selected region across one or more clips.

— Using the crosshairs, you can also double-click to select an entire clip.

— Partial edit selections that contain a fade will copy with the fade intact.

To select a single frame using the I-beam cursor of the Edit Selection mode:

— Move the pointer to the top half of a clip until the I-beam cursor appears, and click once to place a point selection at the frame you clicked. The playhead also moves to this frame.
— Using the I-beam cursor, you can also Command-click clips on higher and lower tracks to add them to the single frame selection, aligned at the same frame. For example, you could do this to split multiple clips at once. One frame selections can be on discontiguous tracks.

Command-clicking within the top half of multiple clips on multiple tracks to add single frame selections at the same frame

To move a selection using the Hand tool of the Edit Selection mode:
— Once you’ve made a selection of one or more clips or regions using the Hand or I-beam cursor of the Edit Selection mode, you can move the pointer to the bottom half of any selected clip and drag the selection to another position on the Timeline.

Commands For Editing and Extending the Selection

Once you’ve made one or more selections in the Timeline, there are a series of commands you can use to modify or expand the selection. These commands were designed to be used alongside the Edit Selection mode, but they can be used in any mode.

Editing the Selection

There are six commands for changing the current selection, moving it from one clip or group of clips in the Timeline to another. These commands only move the range of clips/frames that are selected; they do not move the clips themselves. These commands are found within the Timeline contextual menu when you right-click on a clip.

— Move To Previous/Next Edit: Moves the current selection to the next clip/edit point to the left or right in the Timeline.
— Move To Previous/Next Track: Moves the current selection to the next track up or down in the Timeline.
— Move to Previous/Next Frame: Nudges the current selection to the left or right in the Timeline.

Extend Edit Selection

There are four commands for expanding the range of what’s selected in the Timeline, one clip or track at a time. These commands are found within the Timeline contextual menu when you right-click on a clip.

— To Previous Edit: Expands the selection to include the previous clip to the left in the Timeline.
— **To Next Edit:** Expands the selection to include the next clip to the right in the Timeline.
— **To Previous Track:** Expands the selection to include the clip in the next track up in the Timeline.
— **To Next Track:** Expands the selection to include the clip in the next track down in the Timeline.

### Locking Audio Tracks

Another step you can take to prepare before performing any kind of editorial operation is to lock tracks with media that you don’t want to be affected by whatever it is you’re about to do. For example, if you have a complex set of music edits on track A3 that you don’t want to be affected by operations that will delete media that overlaps it, you can lock track A3 so those clips remain unaffected.

Clips on locked tracks cannot be moved, deleted, cut, or otherwise affected by editorial operations. Furthermore, parameters of clips on locked tracks cannot be edited in the Inspector. However, clips on locked tracks can be played back and mixed like any other audio clips.

**To toggle the lock or unlock state of audio tracks in the Fairlight page, do one of the following:**

— Click any track’s lock control to toggle lock on and off.
— Click any track’s lock control and drag over the lock controls of other tracks in the Timeline to quickly lock or unlock several adjacent clips.
— Open the Index and click/drag one or more track lock controls to toggle lock on and off.

### Splitting Clips

In many situations you may find yourself splitting audio clips in order to separate multiple rolling takes.

**To split one or more clips in either Selection or Range Selection mode:**

1. Select each track that has a clip you want to split.
2. Move the playhead to intersect the clips you want to split at the frame where you want the split to happen.
3. Do one of the following:
   b. Choose Timeline > Razor or press Command-B.
When you split a clip in the Edit page, a through edit appears to show that you currently have an edit with continuous timecode running from the outgoing to the incoming half. This is called a through edit and is displayed in the Edit page with a dotted line running along its edge so you know that it’s special. The Fairlight page doesn’t display through edits as of the time of this writing.

**Linked Clips in the Fairlight Page**

Clips can be linked together in the Fairlight page. When multiple clips are linked, Fairlight editing commands treat all linked clips as if they were a single clip. Anything you would do to a single clip is done to all linked clips at once. Selecting one item of a linked clip selects all items. Editing the In point of one item of a linked clip edits them all.

**To link two or more clips together:**

1. Select all clips you want to link together.
2. Right-click one of the selected clips, and choose Link Clips from the contextual menu.

A link indicator at the bottom left of every clip you’ve just linked shows their new linked status.

**Trimming Clips Without Rippling the Timeline**

Most basic adjustments in the Fairlight page only affect the selected clip or region of the Timeline. Clips to the right of the adjusted area of the Timeline are generally left alone so as not to inadvertently change sync when you don’t expect it. This section covers the most basic parts of the Fairlight page’s “seven-point editing” paradigm.

**Multi-Point Editing Overview**

Each clip in the Timeline has several draggable handles and click targets that let you perform different editing tasks using the pointer.

- **In point:** The left edge of the clip can be dragged to resize the beginning of the clip.
- **Out point:** The right edge of the clip can be dragged to resize the end of the clip.
- **Fade In handle:** A handle at the upper left-hand corner of the clip that only appears when the mouse is positioned over that clip, used to fade the audio in by dragging it to the right, or as part of a crossfade between two audio clips. Fades can be reset (eliminated) by double-clicking the fade handle.
- **Fade In curve:** A handle at the center of the Fade In curve that only appears when the curve is exposed, used to adjust the power of the fade in. This handle can be dragged vertically to change the X-Level of the fade, and horizontally to change the X-Point of the fade. Fade curves can be reset by double-clicking the curve handle.
- **Fade Out handle:** A handle at the upper right-hand corner of the clip that only appears when the mouse is positioned over that clip, used to fade the audio out by dragging it to the left, or as part of a crossfade between two audio clips. Fades can be reset (eliminated) by double-clicking the fade handle.
— **Fade Out curve**: A handle at the center of the Fade Out curve that only appears when the curve is exposed, used to adjust the power of the fade out. This handle can be dragged vertically to change the X-Level of the fade, and horizontally to change the X-Point of the fade. Fade curves can be reset by double-clicking the curve handle.

— **Level**: Considered an editorial characteristic, the level of any given audio clip can be adjusted via a level overlay running across each clip. The level of any clip can be reset to the default 0.0 dB by double-clicking the level overlay.

— **Position**: Clicking anywhere within the middle of a clip in Selection or Range mode, or on the bottom of Edit Selection mode, lets you drag that clip either forward or backward in time, or to another track.

### Resizing the In and Out Points of a Clip

Trimming the head or tail of a clip in the Fairlight page means to resize the In or Out point of that clip, making it shorter or longer accordingly.

**To resize the beginning or end of a clip:**

— **To shorten or lengthen clips**: Move the pointer over the beginning or end of a clip, and when it turns into the Resize cursor, drag the In or Out point to the left or right to change the clip’s length. As you drag the In or Out point of an audio clip in the Fairlight page, an overlay appears showing the waveform of all available media at the head (if you’re dragging the In point) or tail (if you’re dragging the Out point) of the clip you’re resizing.

![Overlay seen when resizing the In point of an audio clip in the Fairlight page](image)

**To quickly resize the beginning or end of a clip to the very beginning or end of available media:**

— Double-click the In point of the clip to move the In point to the very beginning of that clip’s media.

— Double-click the Out point of the clip to move the Out point to the very end of that clip’s media.

If you resize a clip’s In or Out point to overlap one or more neighboring clips in the Timeline, the overlapping parts of the neighboring clips will be overwritten by the clip you’ve resized.

### Trim Start and Trim End

The Trim > Trim Start (Shift-\[) and Trim End (Shift-\]) commands let you move the In or Out point of all clips that intersect the playhead as either a ripple operation (in Trim mode) or a resize operation (in Selection mode). You do not need to make a selection to use Trim Start and Trim End, making these commands fast to use in the right situation. A classic use of Trim End is when you have several superimposed clips of different lengths that you want to either start or end at the same time.
— Trim Start resizes or ripples (depending on what mode you’re in) all clips that intersect the playhead, so that each clip’s In point is moved to the current playhead position.
— Trim End resizes or ripples intersecting clips so that each intersecting clip’s Out point is moved to the current playhead position.

Clips that don’t intersect the playhead are not affected. Furthermore, you can exclude clips on specific tracks from this operation by locking those tracks.

**Trim to Selection**

The Trim > Trim to Selection (Shift-Command-T) command simultaneously trims the heads and tails outside of a selection of one or more clips so that the selection is all that remains. This command is found within the Timeline contextual menu when you right-click on a clip.

![Trim to Selection](image)

(Left) A selection that includes parts of two clips, (Right) The result of using Trim to Selection to eliminate the heads and tails outside of this selection.

**Moving and Overwriting Clips**

There are a number of ways to move clips in the Timeline. Clips can be nudged and moved within a track, changing the timing of that clip’s position in the edit or they can be moved up or down to other tracks.

**To move clips in the Timeline, do one of the following:**

— **To move one or more selected clips in the Timeline**: Drag any clip in the Timeline to any other position. If you’re in Edit Selection mode, you must drag using the bottom half of the selection. If you drag a clip to overlap another clip, the clip you’re dragging overwrites the clip you’re moving it over.

— **To nudge one or more selected clips in the Timeline by frame using the keyboard**: Make a selection, then press the Comma key (nudge 1 frame left) or Period key (nudge 1 frame right) to roll the selected edit to the left or right. Shift-Comma and Shift-Period nudges by 5 frames.

— **To move one or more selected clips up or down to other tracks at the same time**: Make a selection, then hold the Shift key down while dragging one of the selected clips up or down in the Timeline to lock their position in time while moving them to other tracks. Or, you can hold the Option key down and press Up or Down Arrow.
**Sync Offset Indicator**

Audio clips in the Fairlight page display an “out-of-sync” or sync offset indicators when they’re moved out of sync with the video items they’re linked to.

**Subframe Nudging**

In the Preferences/User/Editing panel under General Settings you can change the nudge amount by either subframes or by milliseconds for the Fairlight page. These are completely user definable so that you can type your desired nudge amount into the corresponding box.

Be sure to fully investigate this settings panel, which includes pre-roll and post-roll settings and other useful Fairlight adjustments.

**Slipping**

Formerly called resyncing, slipping an audio clip keeps that clip in the same place in the Timeline while changing the range of media that appears in that spot. Slip edits do not change the duration of the overall Timeline, and they don’t move the clip’s position relative to the other clips in the Timeline. Slipping simply changes the range of media that clip represents.

**NOTE:** While available in previous versions of Fairlight, slipping is not available at the time of this writing.

**Duplicating Clips**

The Duplicate Selection command duplicates one or more selected clips, placing the duplicates immediately after the Out point of the selection. If you’re duplicating a region of a clip with tails, or a clip that’s in between other clips, the duplicated selection will overwrite whatever is to the right of the current selection, for the duration of the duplicate.
Using the Duplicate Selection command to duplicate a selected region

If you hold the Option key down while dragging a clip in the Timeline, you’ll place a duplicate clip wherever you drop it.

Option-dragging to duplicate a clip in the Timeline

### Disabling and Re-Enabling Clips in the Timeline

Sometimes there’s one or more audio clips in the Timeline that you don’t want to play along with the rest of the edited sequence, but you don’t want to remove from the Timeline either, in case you change your mind later. For this reason, it’s possible to disable clips, effectively turning them off without removing them. Previous versions of Fairlight referred to this operation as Mute clip.

Disabled clips appear dimmed in the Timeline. They don’t play back, they’re not rendered, and they’re not output to video. However, their position is preserved in the Timeline, so you can always re-enable them at a later time if you change your mind and decide you want to use them.

Disabled clips appear in the Timeline in gray.

**To disable or re-enable one or more selected clips:**

— Right-click part of the selection and choose Enable Clip from the contextual menu.
— Choose Clip > Enable Clip.
— Press D.
Deleting Audio Clips and Regions

You can delete any clips or clip regions that are selected, in either Selection or Range Selection modes, by pressing the Delete key, or by right-clicking a clip and choosing Delete Selected from the contextual menu. By default in the Fairlight page, deleting anything leaves a gap. Under the Edit Menu > Ripple Delete you can ripple delete selected clips changing the placement of all of the clips that follow.

Cut, Copy, and Paste

The Fairlight page has a unique copy and paste methodology that takes advantage of the “ghost” overlays that are used for the waveforms of selected audio clips. This method makes it easy to copy and paste clips using keyboard shortcuts and the JKL keys.

Conventional Cut, Copy, and Paste

The typical cut, copy, and paste commands expected of every software application are available in the Fairlight page, but with a unique twist that’s particularly advantageous for users of the Fairlight control surface, or for anyone who uses the JKL transport key shortcuts to move around the Timeline for keyboard-driven editing.

To cut or copy and paste either all or part of a clip:

1. If you’re cutting or copying a whole clip, then choose either the Selection (press A) or Range Selection (press R) mode. If you’re cutting or copying part of a clip, then make sure you’re in Range Selection mode (press R).

2. To use the playhead to make a clip selection, select the track that contains the clip you want to copy or cut. If one or more tracks are already selected, you can use the Control-Option-Up or Down Arrow key shortcuts to move the track selection state up or down to the tracks with the clip you want to cut or copy.

Selecting the track with a clip you need to cut
3 Do one of the following:

a. To cut or copy a whole clip, move the playhead so that it intersects the clip you want to cut or copy. If the playhead intersects a clip on a selected track, that clip should become selected. You should note that even if you use the mouse to select a clip without selecting a track first, you should still move the playhead to intersect the clip you’re copying or pasting, as this sets up an important reference point for the operation.

b. To cut or copy a segment of a clip, move the playhead so that it intersects the clip you want to cut or copy. If the playhead intersects a clip on a selected track, that clip should become selected. Then, using JKL and the I (In) and O (Out) keys, mark a range in the Timeline that includes the segment of the clip you want. That segment should appear highlighted as a result.

4 Making sure the playhead is over the section of the waveform that you want to use as the frame to move the clip by, press Command-X to cut or Command-C to copy that clip (you can also right-click a clip and choose Copy or Cut). That clip will immediately become highlighted.
At this point, there are two things you can do to position the cut or copied clip to the position in the Timeline at which you want to paste it:

a. Moving the playhead will now also move the clip you cut or copied, shown as a ghost clip with waveform that’s “attached” to the playhead at the frame you chose. Whether you drag the playhead with your mouse or use JKL to move the playhead through the Timeline, the cut or copied clip will move along with it, so that moving the playhead repositions the cut or copied clip on that track.

b. If you want to move the cut or copied clip to another track, use the Control-Option-Up or Down Arrow key shortcuts to change the selected track; the ghost clip will move along with change in track selection.

When the clip is positioned where you want it, press Command-V to paste the clip at the position you’ve chosen (you can also right-click a track and choose Paste from the contextual menu). The clip becomes solid, and you’re finished.
Using this method of cutting and pasting makes it quick to cut or copy clips using only keyboard commands, with the clip’s ghost overlay making it easy to precisely align the clip you’re pasting to fit exactly where you need it to, perfectly in sync.

### Using the Cut/Copy Head and Tail Commands

Four additional commands make it easy to cut or copy portions of one or more clips that intersect the playhead, either from the In point to the current position of the playhead (the Head), or from the current position of the playhead to the Out point (the Tail).

**To cut or copy the head or tail of a clip, and paste the result:**

1. Using these commands, there’s no need to make a partial selection, so you can use either the Selection (press A) or Range Selection (press T) modes.

2. Select the track that contains the clip you want to copy or cut. If one or more tracks are already selected, you can use the Control-Option-Up or Down Arrow key shortcuts to move the track selection state up or down to the tracks with the clip you want to cut or copy.

3. Move the playhead so that it intersects the clip you want to cut or copy at the frame you want to define, either the end of the head or the beginning of the tail. If the playhead intersects a clip on a selected track, that clip should automatically become selected. You should note that even if you use the mouse to select a clip without selecting a track first, you should still move the playhead to intersect the clip you’re copying or pasting, as this sets up an important reference point for the operation.

4. Choose Edit > Cut/Copy Head/Tail to cut or copy the portion of the selected clip you want to paste. That portion of the clip will immediately become highlighted.

5. At this point, there are two things you can do to position the cut or copied head or tail of the clip to the position in the Timeline at which you want to paste it:
   a. Moving the playhead will now also move the clip you cut or copied, shown as a ghost clip with waveform that’s “attached” to the playhead at the frame you chose. Whether you drag the playhead with your mouse or use JKL to move the playhead through the Timeline, the cut or copied clip will move along with it so that moving the playhead repositions the cut or copied clip on that track.
   b. If you want to move the cut or copied clip to another track, use the Control-Option-Up or Down Arrow key shortcuts to change the selected track; the ghost clip will move along with change in track selection.

   This way, you can use the playhead to align the ghost waveform with other audio clips surrounding it in preparation for pasting it.

6. When the clip is positioned where you want it, press Command-V to paste the clip at the position you’ve chosen (you can also right-click a track and choose Paste from the contextual menu). The clip becomes solid, and you’re finished.
Paste and Remove Attributes

The Fairlight page has Paste Attributes and Remove Attributes commands that allow for the copying and resetting of audio parameters and effects, similar to the same commands on the Edit page.

Clip Attributes Naming

By double-clicking any clip in the Timeline, you can access the Clip Attributes window to rename the clip. You can still access this window with a right-click, revealing the drop-down menu of options.

Copying and Pasting Clip Attributes

For clips, this works as simply as copying a clip, then selecting one or more audio clips and right-clicking another clip and choosing Paste Attributes from the contextual menu. A dialog appears letting you choose which audio attributes you want to paste before clicking Apply.

Copying and Pasting Track Attributes

For tracks, it works a little differently. Right-click on a track header and choose Copy Attributes to copy all track settings and effects. Then, select one or more other track headers, right-click the selection, and choose Paste Attributes. A dialog appears letting you choose which track attributes you want to paste before clicking Apply.
Removing Attributes

For either clips or tracks, you can right-click and choose Remove Attributes to open a dialog with which to choose which attributes you want to reset to their default settings.

**NOTE:** By choosing the Volume check box in Remove Attributes you will delete all of the Clip Gain keyframes that have been added to a clip.

Audio Clip Layering

Audio layering is a special audio editing mode that lets you superimpose multiple audio clips in the same track, with audio clips edited into the top layers muting overlapping sections of audio clips appearing on lower layers. With audio layering enabled, superimposed audio clips are treated similarly to superimposed video clips that have opacity set to 100%, with clips on top obscuring (or muting) clips underneath.

An example of multiple audio performance editing using layers, where the top layer mutes overlapping sections of audio clips in lower layers

Audio layering is incredibly useful for any situation where you’re combining segments of multiple takes together to create a single voiceover, audio vocal track, or dramatic performance, as you can choose which segments to use via their superimposed position in the stack of clips appearing in that track, while at the same time you’re preserving the other takes underneath in case you might want them later.

**TIP:** Track layering can be used on the Edit page as well.

To enable audio layering:

— Choose Timeline > Layered Audio Editing so that a check mark appears by the command. All overlapping audio will be layered instead of overwritten from that point forward.
To view audio layering:

1. Choose View > Show Audio Track Layers to reveal track layers for each audio track (and each lane within a given audio track) in the Timeline. When layering is on, space appears at the top of each track in the Timeline which provides a region into which you can edit layered audio clips.

2. To edit an audio clip or segment as a layer within a particular audio track, drag it from elsewhere in the Timeline or from the Media Pool, and drop it into the empty area above whatever audio is already in that track.

3. Edit the different superimposed layers of audio such that the segments of each take that you like are on top. Only the topmost clip segments will be audible. Audio segments that overlap underneath are silent. To put another layer on top, drag it from its current position to the empty area at the top of the track.

4. When you’re finished editing clips in track layers, choose View > Show Audio Track Layers again to hide the individual layers, so that only the topmost clips appear as a flat sequence in each track and lane.
Audio Compound Clips

DaVinci Resolve supports audio compound clips, which are created just like any other compound clip, by selecting multiple audio clips, right-clicking one of them, and choosing New Compound Clip. Alternately, compound clips with video clips may now contain multiple audio items as well.

When compound clips containing audio are opened in the Edit or Fairlight pages by right-clicking an audio compound clip and choosing Open in Timeline, breadcrumb controls appear beneath the Timeline that let you exit the compound clip and get back to the master Timeline.

Opening an audio compound clip; note the path control at the bottom left of the Timeline

Audio Crossfades

You can add Cross Fade transitions to any edit point between two audio clips that have enough handles similarly to how you add video transitions, by dragging and dropping from the Effects Library, by right-clicking an edit and choosing an option from the contextual menu, or by selecting an audio edit point and choosing Timeline > Add Audio Only Transition (Shift-T).

Cross Fade transitions are a quick and easy way to fade the volume of the outgoing clip down while simultaneously fading the volume of the incoming clip up, letting you create a smooth aural transition between two audio clips.

An audio Cross Fade transition applied between two clips

You can double-click a Cross Fade transition to open it into the Inspector, revealing the following parameters:

- **Duration**: The duration of the transition, shown in both seconds and frames.
- **Alignment**: A drop-down that lets you choose the transition’s position relative to the edit point it’s applied to. Your choices are “End on Edit,” “Center on Edit,” and “Begin on Edit.”
- **Transition style**: You can choose –3dB, 0dB, or +3dB to set both the Fade In and Fade Out levels to the same value. For more information on what these levels mean, see the following parameter.
— **Fade In/Fade Out levels:** There are three options that affect the incoming and outgoing halves of the Cross Fade effect independently. 0dB applies a linear fade (this is the default). +3dB applies a boosted curve; when applied to both Fade In and Fade Out, this can compensate for diminished levels in the middle of a Cross Fade. –3dB applies an attenuating curve, which deliberately lowers the level of the Cross Fade.

Crossfades can be created and edited on both the Edit and Fairlight pages.

**Fades and Crossfades**

Part of audio editing in the Fairlight page is the use of fades and crossfades. This section shows you how to create these effects for smoothly segueing from one audio clip to another.

**Using Fades**

Like the Edit page, each audio clip has fader handles that appear at the upper right and left corners of a clip you’re hovering the pointer over.

Fader handles appear when you hover the pointer over a clip

Pulling these handles out creates a fade effect with a duration equal to the length you extended the handle.

Creating a fade effect by pulling out one of the fader handles

Once you’ve created a fade effect, you can adjust the curve of the fade by dragging the handle that appears right on top of the fader curve. Dragging the handle up and down affects the angle of the curve, and dragging the handle left and right affects the shape of the curve. In this way, you can create all manner of fade effects.
Batch Fade and Crossfade Editor in the Fairlight Page

Multiple fades are available to multiple clips with multiple tracks selected, significantly increasing fade functionality. The Batch Fades window has fade shapes for Fade In, Cross Fade, and Fade Out. The Fade Length is user definable by frame for each of these fade types, and there is an option to overwrite existing fades on the highlighted clips.

There are six options per Fade type for precise usage. When adding Fades between sources, it’s important to determine the shape so that only the desired media is included in the fade. The curves indicate the ramping slopes of the fade.

Each box has similar controls for affecting the individual Fade type.

1. Next to the Fade type name is the on/off toggle
2. There are six Fade curves to create the precise fade needed.
3. A Length box determines how many frames the fade will extend,
4. A click box to overwrite any previous fades, if needed.
The Crossfade box has three additional controls.

1. Equal Power maintains the signal level through the fade.
2. Equal Gain is used when crossfading media that could phase when combined. For instance, if a music cue is crossfaded at the mid-point of the fade, there could be a jump in level or added phasing issues. Using this option maintains the gain across the fade for that type of media.
3. Unlinked allows for a different curve type on either side of the crossfade.

This window will retain the settings that were last made so once a series of Fade types have been chosen, then Batch Fades can be made without opening this window and can be accessed via the Fairlight menu with a single click across highlighted regions. The Apply Batch Fades in the Fairlight menu are applied with the settings made in the Batch Fades window.

![Batch Fade options in the Fairlight menu](image)

This graphic shows highlighted clips and tracks ready to have Batch Fades applied.
Tracks and clips highlighted for Batch Fades

The graphic below shows how the Batch Fades are applied. Clips that are not connected have Fade In and Fade Out applied. Clips that are connected have Crossfades applied. The Batch Fades window determines each of the Fade parameters and then applies them to all of the selected clips. In this example, the Overwrite box was unchecked. Compare the fades that were already there and see that they retain their original Fade length and shape.

All of the highlighted clips have been faded according to the Batch Fades window.
NOTE: If the media is too short, a dialog box will alert you that there are insufficient handles and that the fade could not be created. You can then choose to trim clips, skip clips, or cancel the Batch Fade. If you cancel, you can then alter the settings to better suit the media.

**Fade In and Out to Playhead**

A pair of commands in the Trim menu let you move the playhead over a clip, and use the playhead position to “Fade In to Playhead” or “Fade Out to Playhead.” These commands work in both the Edit and Fairlight pages.

(Top) Placing the playhead where you want a fade in to end,  
(Bottom) Using Fade In to Playhead

**Creating Crossfades With Overlapping Fades**

While a fade gradually fades a single track of audio up or down, a crossfade fades two overlapping clips at the same time, fading one clip up and another clip down, for the aural equivalent of a cross dissolve. There are currently two ways of creating a crossfade in the Fairlight page. Both depend on clip layering to allow you to have overlapping fades over overlapping clips.

**To create a crossfade by overlapping two clips together:**

1. Add a fade out to the end of one clip, and a fade in to the beginning of another clip. By default, all fades you add in this way are linear, although you can adjust them to whatever gain you want.
Adding fades to adjacent clips

2 Drag the first clip to overlap the second clip by the length of the fade you've created.

3 Drop the clip. The overlapping fades will both be preserved thanks to clip layering, and a crossfade will appear in the Timeline.

To create a crossfade over two clips that are already layered:

— Drag a fader handle at the beginning or end of a clip that's layered, and a crossfade will automatically appear.
Using Crossfades From the Edit Page

You can also add crossfades in the Edit page, but they appear in the Fairlight page as transitions in the Edit page style.

The resulting crossfade

Finding Clips in the Media Pool

You can right-click any clip in the Timeline and choose Find in Media Pool to automatically select that clip in the Media Pool, for instances where you might want to edit another copy of that clip somewhere else in the Timeline, or re-edit another segment from that clip into the same area.

**NOTE:** Automation Follows Edit when clips with embedded automation are moved or pasted from the Timeline. When clips with automation are instead pulled from the Media Pool, they are in their default state with no automation attached.

Changing Clip Color in the Timeline

You can right-click one or more selected clips in the Timeline to change the clip color, to be more organized. For example, you might set production audio clips containing dialog from different actors to different colors, or you could set clips with dialog, music, and effects to different colors in order to easily differentiate each clip’s purpose.

Editing Audio Clips in External Editors

While working in the Fairlight page, you have the ability to process an audio file using a third-party application if necessary, in the event you need to use another application’s capabilities to create an effect or solve an issue that can’t be accomplished in the Fairlight page itself. To do this, you must first add one or more applications to the External Audio Process list in the Audio Plug-ins panel of the System Preferences.
To add an external audio process:

1. Open the System tab of the DaVinci Preferences, and select the Audio Plugins panel.
2. Click the Add button in the "Setup External Audio Processes" section.
3. To give the audio process a different name, double click in the Name column and type a new name.
4. Double-click in the empty Path column for the new process, and choose an application to assign to that process from the dialog.
5. Choose the type of process you want it to be from the drop-down menu in the Type column.

Once you have one or more external audio applications configured in Preferences, you can use them to process any audio clip in the Fairlight page by right-clicking an audio clip and choosing the application you want to use from the External Audio Process submenu of the contextual menu.

When you do this, a duplicate of the audio clip media is copied (bounced) to the directory location specified by the “Save clips to” field of the Capture and Playback panel of the Project Settings. At that point, the external application is either opened or launched as a command from the command line (depending on how the external application has been configured in Preferences).

Once the bounced audio is opened in the external application, you can process it however you need to and bake in any changes made by saving/rendering/outputting and overwriting the original copied audio media file. DaVinci Resolve detects when changes have been made, and the altered result is automatically reimported as an additional audio layer on top of the original clip in the Timeline.

The way an audio application is configured in the DaVinci System Preferences dictates how the bounced audio file is passed to the external program. There are three choices:

- **Command Line:** As a command line parameter, if your audio application is able to be run from the Terminal.
- **Clipboard:** By placing the path to the bounced file in the clipboard, so you can paste it into the application which has been automatically launched, or import it via a File > Open dialog.
- **Reveal:** By revealing the bounced copy in the file manager of your workstation, so you can drag and drop it onto the application which has been automatically launched.
Exporting Audio Clips to External Files

For any workflow where you need to write clips from the Timeline to external files with extensive file altering capabilities, you can use the Export Audio Files command.

To export clips to external files:

1. Select one or more clips in the Timeline.
2. Right-click the desired selected files and choose Export Audio Files from the contextual menu.
3. When the Export Audio Files dialog appears, choose the following:
   a. Click Browse to choose a location to save the exported audio files.
   b. (Optional) Enter a tag and one of the various Name options.
   c. Choose a File Format, Sample Rate, and Bit Depth for the exported files.
   d. Choose a Channel Format of Multi-Mono or Interleaved for the exported files.
   e. Choose a Source of Individual Clips or Consolidated Clips; a drop-down menu further defines the ranges of the complete timeline, a selected range, or just the selected clips.
   f. Checkboxes can further define using only the selected tracks, including hidden tracks and padding to frame boundaries.
   g. When exporting you can choose to include the Clip Level, the Clip Fades, the Clip EQ and FX, and the Clip iXML.
   h. The exported files can be normalized to predetermined target levels and target loudness values with all of the standards offered throughout the Fairlight page.
4 Click Export.
The selected audio files are written to the location you chose.

Sample Editing

You can zoom quite far into audio clips on the Fairlight page timeline, until you see the individual samples that comprise the audio waveform of each clip. Samples are represented by control points once you’ve zoomed in far enough.

When you zoom in far enough, you can see the individual samples of an audio clip as control points.

You can non-destructively edit these control points to eliminate clicks and pops, and to effect other fixes to problem audio clips.
Methods of editing audio samples:

— **To see the editable audio samples**: Zoom all the way into an audio clip until you see the sample control points, using either Command-Plus or Command-Minus, the scroll wheel of your pointing device, or by holding down the ZOOM button of your Fairlight editing panel and turning the JOG/EDITING wheel.

— **To edit a single audio sample**: Click and drag that audio sample up or down to change its height.

— **To edit a section of samples**: Click and drag horizontally left or right across the samples you want to edit to “redraw” the waveform any way you’d like.

— **To reset all edited samples to their original state**: Right-click an audio clip with edited samples, and choose Reset Edited Samples from the contextual menu.

Sample editing can be undone, just like any other editing procedure, as the edited sample points are stored non-destructively within the DaVinci Resolve project.

**Waveform Zero Crossing Indicator**

Waveforms have a zero crossing indicator line. Since a waveform is an image representation of sound continually moving positive to negative, the zero crossing point is the level at which that fluctuation occurs. When zooming into a waveform at the sample level, the waveform will display the zero crossing line to enable precise editing.

The zero crossing is a useful feature when editing audio, since clean edits are made at the zero crossing to avoid inducing clicks or pops. A crossfade between two audio clips automatically brings both sides of the fade to the zero crossing.
Chapter 172

Audio Clip Specific Inspector Adjustments

Each audio clip in a track has individual settings that are specific to that clip, which can be adjusted and animated in the Inspector. This makes it easy to adjust the levels and EQ of several clips to match one another, while reserving the track level for your overall mix.

An additional set of clip-specific pitch controls make it easy to make small pitch adjustments, either static or keyframed, where necessary.

This chapter describes how to use these clip-specific controls.

Making Adjustments in the Inspector

Clip-specific audio parameters like Volume, Pan, Pitch, and Equalization can be adjusted and animated in the Inspector. This section walks you through how this works.

Using the Inspector

Audio clips in the Fairlight page expose similar controls to those found in the Audio Inspector Panel of the Edit page. Additionally, the Inspector will display controls for audio plug-ins that you apply to clips as well. All parameters are organized into groups, with a title bar providing the name of that group, along with other controls that let you control all parameters within that group at the same time.

These controls include:

— **Enable button**: A toggle control to the left of the parameter group’s name lets you disable and re-enable every parameter within that group at once. Orange means that track’s enabled. Gray is disabled.

— **Parameter group title bar**: Double-clicking the title bar of any group of parameters collapses or opens them. Even more exciting than that, Option-double-clicking the title bar of one parameter group collapses or opens all parameter groups at once.

— **Keyframe and Next/Previous Keyframe buttons**: This button lets you add or remove keyframes at the position of the playhead to or from every single parameter within the group. When the button is highlighted orange, a keyframe is at the current position of the playhead. When it’s dark gray, there is no keyframe. Left and right arrow buttons let you jump the playhead from keyframe to keyframe for further adjustment.

— **Reset button**: Lets you reset all parameters within that group to their default settings.
Audio Settings in the Inspector

Each selected clip and each selected Main or Bus channel strip in the Mixer exposes some audio-specific parameters in the Inspector Panel tabs.

The Audio Tab in the Inspector

These are the options in the Audio tab:

- **Volume**: Each clip has a single volume control, which corresponds to the volume overlay over each audio clip.
- **Pan**: (Only exposed for clips) A simple Pan slider that controls stereo panning.
- **Pitch**: (Only exposed for clips) Each clip has two pitch controls for altering clip pitch without altering clip speed. You can control pitch in Semi Tones and Cents.
- **Speed Change**: Any adjustments made using Elastic Wave to the clip is found here.
- **Equalizer**: (Only exposed for clips) Each clip also has a four-band EQ, complete with low-pass, high-pass, and parametric settings for fine tuning and problem-solving audio issues at the clip level.

The Effects Tab in the Inspector

If you’ve applied any Fairlight FX, VST plug-ins, or Audio Unit plug-ins, those controls will appear in the Effects tab the Inspector. For more information, see Chapter 175, “Audio Effects.”

Additionally, when you apply other audio plug-ins from the Audio FX panel of the Effects Library, additional parameters and controls are exposed.
The Transition Tab in the Inspector

If you’ve applied any Transitions between clips, you can make adjustments in the Transition tab.

Crossfade controls in the Transition tab of the Inspector

Adjusting Multiple Clips at the Same Time

There’s an easy way to make adjustments to the Inspector parameters of multiple clips at the same time, without needing to use Paste Attributes (described later in this chapter). All you need to do is simultaneously select every clip you want to alter, and then modify the parameter in the Inspector that you want to change. As a result, every selected clip will be adjusted by the same amount. This works for compositing effects, transforms, text parameters, filters, and audio settings, just about anything that can be simultaneously exposed in the Inspector for multiple selected clips.

When you select multiple clips, the Inspector will display “Multiple Clips” as the title. If each of the selected clips have different values in the parameter you’re adjusting, that parameter will have two dashes in the value field. There are two ways you can make adjustments to multiple clips:

— If you want to make a relative adjustment to all selected clips while keeping their original offsets from one another, then drag the virtual slider in the parameter field which will display a + or – before however many units your adjustment is.

— However, if you want to set all selected clips to the same value, you can double-click in the number field, type the value, and press Return.

Making a relative adjustment of plus 4.00 in the Volume level of all selected clips
Animated Inspector Adjustments

Keyframing in the Edit page works slightly differently than when using the Keyframe Editor in the Color page. Most simple keyframing tasks can be performed in the inspector using three buttons that appear to the right of any parameter that’s capable of being keyframed. It takes two keyframes at minimum to create an animated effect.

The three keyframe controls that appear in the inspector, from left to right: Previous keyframe, Create/ Delete keyframe, Next keyframe

Methods of keyframing parameters in the Inspector:

— **To add a keyframe:** Select a clip, open the inspector, then move the timeline playhead to the frame where you want to place a keyframe, and click the keyframe button next to the parameter of the inspector you want to animate. Once you’ve added at least one keyframe to a parameter, all other adjustments you make to parameters in the inspector, or using the onscreen transform/crop controls in the timeline viewer, add new keyframes automatically if the playhead is at another frame.

— **To move the playhead to the next or previous keyframe:** Click the small left- or right-hand arrow to either side of a parameter’s keyframe control to jump the playhead to the next or previous keyframe. You can also press Right-bracket ([) and Left-bracket (]) to go from keyframe to keyframe.

— **To edit an existing keyframe of a parameter:** Move the playhead to be on top of the keyframe you want to edit, and then change that parameter, either in the inspector, or using the onscreen controls of the timeline viewer.

Methods of changing keyframe interpolation in the Inspector:

— **To change a keyframe to Ease In or Ease Out:** Eased keyframes create animated changes that begin slowly and accelerate to full speed, or slow down gradually to decelerate to a stop. This only works when you have two or more keyframes creating an animated effect. Move the playhead to a frame with a keyframe using the next/previous keyframe controls, then right-click the orange keyframe button and choose Ease In, Ease Out, or Ease In and Out, depending on which keyframe you’re editing and the effect you want to create.

— **To change a keyframe to Linear:** Move the playhead to a frame with a keyframe using the next/previous keyframe controls, then right-click the orange keyframe button and choose Linear.

Methods of deleting keyframes and disabling keyframed effects:

— **To delete a single keyframe:** Open the inspector, move the timeline playhead to a frame with a keyframe, and click the orange Keyframe button in the inspector to delete it.

— **To delete all keyframes for one parameter:** Click the reset button to the right of a parameter’s keyframe control in the inspector.

— **To delete all keyframes in a group of parameters in the inspector:** Click the reset button to the right of a parameter group’s title bar in the inspector.
— **To disable or enable a single parameter’s keyframed effect:** In the Timeline, click the toggle control at the left of a parameter’s keyframe track. Orange means that track’s enabled. Gray is disabled.

— **To disable or enable a group of parameters in the Inspector:** Click the toggle control at the left of a parameter group’s title bar in the Inspector. Orange means that group is enabled. Gray is disabled.

## Paste and Remove Attributes

The Fairlight page has Paste Attributes and Remove Attributes commands that allow for the copying and resetting of audio Inspector parameters and effects, similar to the same commands on the Edit page. For more information on how to do this, see Chapter 171, “Editing Basics in the Fairlight Page.”

## Setting Clip Volume

Each audio clip, or audio item in the case of audio clips with linked audio on multiple tracks, has its own Volume level. This means that audio clips with multiple channels share a common Volume setting. There are several ways you can adjust these levels simply.

### Adjusting Volume in the Inspector

Each clip has individual Volume parameters that are accessible in the Audio panel of the Inspector when one or more audio clips are selected.

![The Volume parameters available for audio clips in the Inspector](image)

Selecting an audio clip in the Timeline and adjusting its Volume only alters the volume levels of that clip, which lets you adjust basic levels for individual clips in your program. The Volume control affects every channel within that clip simultaneously.

If you select multiple clips in the Timeline, then adjusting the Volume or Pan sliders or virtual sliders for all of them simultaneously will make a relative adjustment to all of the clips, preserving their offsets from one another. If you want to set all clips to the same level, then making a numeric adjustment will set all selected clips to the same absolute level.

### Adjusting Volume in the Timeline

Each clip (or item) of audio in the Timeline has a Volume overlay that lets you set that clip’s gain level by simply dragging it up or down with the pointer. This overlay corresponds to the Volume parameter in the Inspector.
Additionally, you can click any clip’s Audio Curve Editor button, at the bottom right-hand corner of each audio clip, to open an audio-specific Curve Editor with which you can keyframe not just volume, but pan, and the parameters of any audio filters you might have applied to that clip.

**NOTE:** Under the Fairlight menu > Show Clip Gain Line, you can show each clip’s gain in the Timeline. This is a handy way to quickly see all of the relative gains of clips in the Timeline.

---

**Adding and Adjusting Volume Keyframes in the Timeline**

Mixing audio by adding and adjusting individual keyframes can be a fast and effective way of balancing clip levels with one another and of fixing clip-specific dynamic level problems. When manually editing any audio parameter curve, you can use the following procedures.

**Methods of adjusting the Volume curve using the pointer:**

— **To adjust any curve segment:** Position the pointer over the overall segment for clips with no keyframes, or position it between any two keyframes, directly on top of the curve segment you want to raise or lower. When the move cursor is displayed, click and drag up to raise the Volume, or down to reduce the Volume.
To adjust a section of level in a clip: Use the Edit Selection tool to highlight the portion to adjust. Then with the Clip Gain line showing, increase or decrease to the desired level and keyframes will automatically be created at the boundary of the gain adjustment.

To add keyframes to the level curve: Hold the Option key down and click the curve to place a keyframe at that frame. You must add at least two keyframes to create an automated change in Volume. By using the Option and Command key you can remove any keyframe.

To adjust a keyframe in any direction: Move the pointer over a keyframe so that the four-way cursor appears, and then click and drag up or down to change the Volume, or side to side to change its timing.

To adjust a keyframe in only one direction: Move the pointer over a keyframe so that the four-way cursor appears, and then click and drag in the intended direction of adjustment, either vertically to change the volume of the clip at that frame, or horizontally to move the keyframe to a different point in time. Once you start dragging a keyframe into a particular direction, keyframe movement is constrained in that direction until you release that keyframe.

To select one or more keyframes: Click any keyframe to select it.

To select multiple discontiguous keyframes: Command-click all keyframes you want to select, whether they’re next to one another or not.

To select multiple contiguous keyframes: Click the first keyframe you want to select, and then shift-click the last keyframe you want to select, and all keyframes between will also be selected.

NOTE: When adjusting the gain on clips, the tooltips will show the current gain level and reflect whatever changes you make indicating the amount of change as the keyframe moves.

Normalize Audio Levels Command

The Normalize Audio Levels command automatically adjusts the level of clips to a specific target level, and you can choose the method used to analyze each audio clip’s levels to determine how to normalize each clip’s volume. Options include a variety of loudness normalization algorithms specific to various international standards, which are useful for balancing the perceived overall loudness of several clips to one another, regardless of transient levels throughout each clip. You can also do Peak normalization, with options for both Sample Peak and True Peak.

The various loudness options are designed to analyze an audio signal based on its perceived loudness to the listener, which results in a more accurate automatic balancing of different clips’ audio levels to one another, regardless of transient peaks occurring throughout different clips.

The target peak meter now uses the BS.1774 standard for measuring maximum “true peak,” which means that this meter is capable of measuring “inter-sample peaks,” rather than only the peaks at each sample of a waveform. However, you still have the option to measure Sample Peak, which is the previous method of measuring the actual peak of the samples in a media file.

The change made by the Normalize Audio Volume command is only a volume adjustment; no dynamics are applied, so the result of using this command is that the loudest parts of each selected clip are going to match one another at the target level. This command is also available in the Fairlight page.
To normalize one or more selected audio clips:

1. Right-click one of the selected clips and choose Normalize Audio Levels. The Normalize Audio Level dialog appears.

   ![](image)

   The Normalize Dialog in the Fairlight page

2. Choose the Normalization Mode you want to use. You can choose among a variety of standardized loudness measurement algorithms, or Sample Peak, or True Peak.

3. Choose the reference level that you want to set the peak volume of the selected clips to match, in dBFS.

4. Choose how you want to set the level of multiple selected clips:
   — When Set Level is set to Relative, all selected clips are treated as if they're one clip, so that the highest peak level of all selected clips is used to define the adjustment, and the volume of all selected clips is adjusted by the same amount. This is good if you have a series of clips, such as a dialog recording, where the levels are consistent with one another, and you want to normalize all of them together.
   — When Set Level is set to Independent, the peak level of each clip is used to define the adjustment to that clip, so that the volume of every selected clip is adjusted by an amount specific to that clip. The end result may be a set of very different volume adjustments intended to make the peak levels of each audio clip match one another. This is good if, for example, you're trying to balance a series of different sound effects with one another that have very different starting levels.

For more information about loudness normalization, see Chapter 177, “Audio Meters and Audio Monitoring.”

**Volume**

Each audio clip in the Timeline has a simple Volume control that lets you adjust the gain of that clip.

![](image)

Volume Control in the Inspector
Pan

Each audio clip in the Timeline has a simple stereo Pan control that lets you pan that clip. While most professional mixes will restrict panning to the more robust panner found in the Fairlight page Mixer, this simple clip-based Pan control is useful for editors of visuals working in the Edit page to quickly create simple panning effects to aid in a craft edit. Dragging the slider lets you pan audio left to right. This control is centered at 0 by default.

Pitch Controls

Each audio clip in the Timeline has Pitch controls that let you alter the pitch of a clip without changing the speed. Two sliders let you adjust clip pitch in Semi Tones (large adjustments, a twelfth of an octave) and Cents (fine adjustments, 100th of an octave).

Speed Change Controls

Each audio clip in the Timeline has Speed Change controls that lets you alter the speed of the clip. It has the option to have the clip’s pitch follow the adjusted speed change or maintain the original speed’s pitch.

The Speed Change window has the following overall controls:

- Enable button: Turns the overall Speed Change effect off and on, without resetting the controls.
- Reset button: Resets all controls of the Speed Change window to their defaults.
— **Direction:** The Right Arrow maintains the forward direction of the waveform, the Left Arrow reverses the direction of the waveform, and the Snowflake icon creates a freeze frame.
— **Speed %:** A flywheel control to adjust the speed by a percentage plus or minus 100%.
— **Frames Per Second:** A flywheel control that syncs with the Speed % control showing the FPS relative to the speed change.
— **Duration:** Indicates the new timing of the clip.
— **Ripple Sequence:** When checked this moves all the media after the action to ripple edit to the new duration.
— **Pitch Correction:** When checked this maintains the original pitch of the clips when speed changed. When unchecked the audio will speed up or slow down with the speed adjustment. The slower the speed change, the lower the pitch; the higher the speed change, the higher the pitch.

**NOTE:** When in the Speed Change controls, do not use the freeze frame option. This will negatively affect the selected audio file.

**Equalizer Controls**

Each audio clip in the timeline has a four-band equalizer that has both graphical and numeric controls for boosting or attenuating different ranges of frequencies within that clip, before it even gets to the EQ built into the mixer. Each band has controls for the filter type (Bell, Lo-Shelf, Hi-Shelf, Notch), Frequency, Gain, and Q-factor (sharpness of the band), with the available controls for each band of EQ changing depending on the filter type.

When a channel strip's EQ is enabled, the equalization curve that's being applied is displayed in the Mixer. A channel strip's EQ settings affect all the clips on that track, so you must open the EQ window to make those modifications.

The channel strip's EQ indicator
Master EQ Controls

The Equalizer window has the following overall controls:

— **Enable button:** Turns the overall EQ effect off and on, without resetting the controls.
— **Reset button:** Resets all controls of the EQ window to their defaults.

Graphical EQ Controls

A graph at the top shows a curve with handles that correspond to each of the enabled EQ bands listed below. You can drag any numbered handle to boost or attenuate the range of frequencies governed by that band, using whatever type of equalization that band has been set to.

![The EQ graph with user-draggable handles](image)

Dragging the numbered handles on this graph in turn modifies the parameters of the corresponding band, and changing each band’s parameters will also alter the EQ graph, which serves the additional purpose of providing a graphical representation of the equalization being applied to that track.

Bands 1 and 4

The outer two sets of band controls let you make high-pass and low-pass adjustments, if necessary.

— **Band enable button:** Turns each band of EQ on and off.
— **Band filter type:** Bands 1 and 4 can be switched among six specific filtering options for processing the lowest or highest frequencies in the signal. These include (from top to bottom) Hi-Shelf, Hi-Pass, Bell, Notch, Lo-Pass, and Lo-Shelf. Bands 2 and 3 can be switched among Lo-Shelf, Bell, Notch, and Hi-Shelf.
— **Freq:** Adjusts the center frequency of the EQ adjustment.
— **Gain:** Adjusts the amount by which the affected frequencies are affected. Negative values attenuate those frequencies, while positive values boost those frequencies.

Bands 2 and 3

The middle two sets of band controls let you make a wide variety of equalization adjustments.

— **Band enable button:** Turns each band of EQ on and off.
— **Band filter type:** Bands 2–5 can be switched among four different filtering options (from top to bottom): Lo-Shelf, Bell, Notch, and Hi-Shelf.
— **Frequency:** Adjusts the center frequency of the EQ adjustment.
— **Gain**: Adjusts the amount by which the affected frequencies are affected. Negative values attenuate those frequencies, while positive values boost those frequencies.

— **Q Factor**: Adjusts the width of affected frequencies. Lower values include a wider range of frequencies; higher values include a narrower range of frequencies.

**NOTE:** This may seem obvious, but not all parameters are available for every curve type. For instance, a Bell curve filter has Frequency, Gain, and Q adjustments, but a Lo-Pass or Hi-Pass filter will only have Frequency available to adjust.

### Paste and Remove Attributes for Clips and Tracks

The Fairlight page has Paste Attributes and Remove Attributes commands that allow for the copying and resetting of audio parameters and effects, similar to the same commands on the Edit page.

![Paste Attributes dialog in the Fairlight page](image)

The Paste Attributes dialog box gives you three types of attributes to choose from. Volume will paste the copied attributes to the clip. Plugins will paste any plug-in attributes to the clip. Equalizer will past EQ data copied from another clip. One or all of these can be copied at one time.

The Remove Attributes dialog box gives you the same three types of attributes to choose from for removal of a clip. When the Volume box is enabled, all Clip Gain keyframes will be removed from the clip.
Chapter 173

Mixing in the Fairlight Page

The Mixer is the spider at the center of the web that is the Fairlight page, and provides the primary tools you’ll use to mix the various audio tracks of your program into a harmonious whole using EQ, Dynamics, Panning, level control, and VST and Audio Units audio effects of all kinds, all with full automation, to hone your sound and balance each track’s elements with the others.

This chapter focuses on explaining the various functions of the Mixer so you can harness its power for yourself.

Introduction to Mixing

This chapter describes the use of the Mixer to adjust the levels and fine-tune the audio of each track in the timeline. It’s focused on the function of the channel strip controls, with the following exceptions:

— For more information about busing, see Chapter 167, “Setting Up Tracks, Buses, and Patching.”
— For more information about recording audio, see Chapter 169, “Recording.”
— For more information about recording automation, see Chapter 174, “Automation Recording.”

The Mixer

The Audio Mixer provides a set of graphical controls you can use to assign track channels to output channels, adjust EQ and dynamics, set levels and record automation, pan stereo and surround audio, and mute and solo tracks. At its most basic, each audio track in your timeline corresponds to an individual channel strip in the Mixer, and by default there’s a single Main bus labeled Main that combines all these tracks into an overall mix.

Tracks and Buses

Once you start creating buses, the Audio Mixer exposes two sets of channel strips. The leftmost set of channel strips correspond to the audio tracks in the Timeline, while the right-most set of channel strips expose sets of controls for each bus that you’ve created.
The Audio Mixer is divided into two sections, one for tracks (at left) and one for buses (at right).

If you have more tracks and buses than can be displayed all at once given the width of your computer display, then each half of the mixer has independent scroll bars so you can choose which tracks and which buses you want to see next to one another.

**Bus to Bus Routing and Mixing**

The new Fairlight audio engine has advanced capabilities in the bus structure within Fairlight. The new busing system, called Flexbus, offers complete user flexibility for bus types and signal routing, which changes the prior Main, Sub, and Auxiliary bus formats to be completely user-definable. This new structure makes it possible to patch outputs and/or sends in any way you need, as dictated by your project. Each track can now output to up to ten buses and sends with additional level and pan controls to a further ten buses. Buses can be sent to other buses up to six layers deep, facilitating complex stem building, processing, and allowing discrete deliverables.

User-definable buses allow for bus-to-bus, bus-to-track, or track-to-bus routing, with each bus having the ability to pass signals from mono to fully immersive formats, such as Dolby Atmos, at the user’s discretion. As with any and all of the tracks in Fairlight, these bus types can be changed at any time by the user, if needed.

The Flexbus structure allows for many different bus track types to be created or changed.
The power of the Flexbus system is that it allows users to direct signals to many different places at one time to achieve complex mixing scenarios. Perhaps you need to generate two mixes that are identical in content but need to be of different output levels. You can designate two mix buses, one with an output level of -2dB true peak and one with an output level of -10dB true peak. The final mix signal is sent to one bus that is then broken into two more buses, one with a limiter set to -2dB and one set to -10dB creating these two different mixes at one time.

Flexbus has substantially expanded Dolby Atmos capabilities, for more information, see Chapter 179, “Immersive Audio Workflows.”

Using Legacy Fixed Busing

If you want to work using the previous method of fixed bus mapping, you can do so for new projects by opening the Fairlight panel of the Project Settings, and turning on the “Use fixed bus mapping” checkbox. This checkbox can only be enabled in new projects in which no timelines have yet been created. Once you’ve created one or more timelines, this option is locked to whatever it was set to. Older projects have this setting enabled by default to preserve the previous mix.

Legacy Busing

Due to the new Flexbus busing, the Mixer looks slightly different from versions prior to DaVinci Resolve 17. Specifically, the Aux panel on the old Mixer has been renamed Bus Send and the the Main/Submix panel has been changed to Bus Outputs.

Each audio track’s channel strip has a set of Main and Submix bus buttons that let you assign the audio output by that channel strip to a Sub (typically used to combine different subsets of tracks into submixes) or to a Main (typically used to output or render overall mixes). Each Sub and Aux’s channel strip has a set of Main buttons so that different combinations of Subs can be assigned to each Main. Main channel strips have no buttons because, from a busing perspective, they’re the final output.

Main and Submix buttons let you assign tracks to buses, and buses to other buses
Customizing the Onscreen Mixer Controls

The Option menu at the upper right-hand corner of the Mixer provides a number of different options for customizing the look of the Mixer, as well as which controls are shown or hidden.

First, you have the options of showing the Full Track Mixer or the Small Track Mixer. While the Full Track Mixer provides more room for buttons and controls that are large enough you don’t have to squint to see them, the Small Track Mixer lets you have many more channel strips onscreen at one time, for those times where you’re doing incredibly ambitious mixes.

Second, there’s an option to Show Labels, which are the control names listed in a column to the left of the mixer channel strip area. If you’re first getting started, these Labels are useful, but once you’ve gotten used to the layout of the Mixer, hiding these will give you a bit more room to work with for another channel strip or two.

Third, there’s a set of options that let you toggle the visibility of specific channel strip controls, so you can hide controls you know you’re not going to be using, or that you’ve used but no longer need to adjust or want to protect from accidental adjustment by a wandering mouse or pen.
Managing Channel Strips Using the Index

The Index is a consolidated list view of all the tracks in the current Timeline, designed to make it easier to manage timelines with lots of tracks. Columns let you see each track’s visibility, track number, name, controls, channel format, and Group assignment. The controls in these columns let you manage the tracks in the current Timeline by showing or hiding them, toggling track controls, or rearranging them. You can also right-click on one or more selected tracks to color code them, or change the channel assignment.

![The Tracks panel of the Index showing all tracks on both the Timeline and the Mixer](image)

Showing and Hiding Tracks

You can use the Tracks panel of the Index to hide tracks you don’t need to work on in order to create more room for tracks you need to see. To quickly show or hide a number of tracks, you can click and drag up or down over the eyeball button of each track for which you want to reverse the visibility.

Color Coding Tracks

Select one or more tracks, then right click one of the selected tracks and choose a color from the Change Track Color submenu of the contextual menu.

Toggling Lock, Record, Solo, and Mute

You can also use the Lock, Record, Solo, and Mute controls to quickly enable or disable multiple tracks by clicking and dragging up or down over the Lock, R, S, or M buttons you want to toggle.

Rearranging Tracks

You can rearrange tracks in the Tracks tab in the Index by clicking any track strip area between other controls, and then dragging that track up or down in the Index. As you drag, a white line shows you where that track will be inserted when you release it. You can even select a contiguous series of tracks and drag them all to a new position in the Timeline at once.

There are two areas of tracks in the Index, one area is for audio tracks and one area for buses with a dividing line separating them. Buses can be dragged up out of the divider and into any position for any order. This can be quite useful when having a series of dialog tracks, for instance, and pulling the dialog bus up next to them.
Once the order has been changed in the Index, this is reflected in both the Mixer panel as well as in the Meter panel. By reordering buses and tracks, you can adjust your workflow for whatever set of tasks you are working on.

Clicking the three dot option menu at the top of the Mixer panel offers an option for Single Mixer view. The Single Mixer view removes the divider line from the Tracks tab in the Index and provides a continuous scroll of the tracks, both in the Mixer panel horizontal scroll and the Index vertical scroll.

**Reassigning Channel Mappings**
Select one or more tracks, then right click one of the selected tracks and choose a channel assignment from the Change Track Type to submenu of the contextual menu.

## Selecting Channel Strips and Tracks

When you select a track in the Timeline, you also select that track’s accompanying channel strip, and vice versa. It’s possible to select multiple tracks in the Timeline and thereby select multiple channel strips, but you can also Command-click to select multiple channel strips in order to select multiple tracks.

![Selecting multiple channel strips results in the selection of multiple tracks](image)

**Multiple Selection of Mixer Tracks**
You can select multiple channel strips in the Mixer panel, which in turn selects those tracks in the Timeline. These selections can be made by command-clicking each track you want to add to the selection, or by clicking on one track and then dragging a bounding box around all other tracks you want to select.
Track Organization

Each channel strip has three organizational properties that let you keep track of which channel strip is responsible for which part of the mix.

— **Track color:** Each track can be differently color-coded, to help you keep organized. These colors appear in the timeline track header, the mixer, and the meters to help you keep track of which track corresponds to which channel strip and meter.

— **Track number:** The number of the timeline audio track corresponding to each channel strip appears here.

![Track Color and Number](image1)

The track color and track number appear at the top of each channel strip.

— **Track name:** This mirrors the track name found in the header controls of the timeline. If you customize an audio track’s name in the Timeline or in the Mixer, that name appears here.

![Track Name](image2)

Each track’s name appears between the assignment buttons and the arm/solo/mute buttons.

Input

A drop-down menu that lets you patch inputs, patch buses, and configure the input settings of audio signals routed through Blackmagic hardware interfaces.

![Input Menu](image3)

The Input drop-down menu provides shortcuts for patching different buses using the Patch Input/Output window.

For more information on using the options of the insert menu, see Chapter 167, “Setting Up Tracks, Buses, and Patching.”
Effects

When you apply Fairlight FX, VST, or Audio Unit effects to a track from the Effects Library, those effects appear here. Clicking the Plus button opens a drop-down menu with which you can apply any VST or AU effects installed on your machine to that track.

Hovering the mouse over any listed effect reveals controls for enabling/disabling each effect, opening an effect’s custom controls, and deleting that effect.

Copying and Pasting Effects

You can copy effect chains with their specific effect parameters intact, track by track. Let’s say that you’ve created a plug-in chain on a dialog track that has Noise Reduction, a De-Hummer, and a Reverb plug-in that you have tweaked to the exact settings needed for those dialog recordings to sound great.

You also have another track that has similar recordings that could benefit from the exact same chain of plug-ins and those particular settings. Rather than install each plug-in to the track and redo the settings, you can simply right-click the track header (A1 for example) and click Copy. Then go to the track header of the new track you want effected, right-click, and click Paste. You will now have the identical plug-in chain copied over to the new track, all with each of the settings exactly as you had created on the source plug-in dialog track.

Copying and Pasting Effect Settings

If you have a setting for one effect that you spent a lot of time getting right and see that it could also work just as well on another track’s effect, you can copy and paste those settings in a very simple way.

For example, you have a Reverb on a dialog track that you have tweaked to perfection. You see that those exact settings will work well for another dialog track that is on your timeline. Rather than try to recreate those settings, you can simply copy and paste them in the plug-in’s Options menu.
By clicking the Options menu in the top right of any plug-in, you have the option to copy and paste. To apply those settings to the other track, just click Copy from the Options menu of the source Reverb effect, then open the Reverb plug-in window of the destination Reverb effect, and click the Options menu to paste. Now all of the parameters are the identical between the two plug-ins.

For more information on using audio effects, see Chapter 175, "Audio Effects."

**Insert**

Enables the routing of effects from Blackmagic audio interface hardware to outboard effects boxes and back again. This button can be toggled to enable/disable such routing.

**EQ**

Double-clicking exposes a four-band parametric equalizer with additional Hi and Lo Pass filters, that has both graphical and numeric controls for boosting or attenuating different ranges of frequencies of audio on each track. You can select from among four types of EQ filtering from the Equalizer Type drop-down menu, with options for Earth (the default), Air, Ice, and Fire. The Equalizer Types available in the drop-down menu control the transfer function of the curve controls. Each band has controls for the filter type (Bell, Lo-Shelf, Hi-Shelf, Notch), Frequency, Gain, and Q-factor (sharpness of the band), with the available controls for each band of EQ changing depending on the filter type.

![Equalizer - DIALOGUE](image)

The channel strip EQ window

When a channel strip’s EQ is enabled, the EQ button displays the equalization curve that’s being applied. This indicator cannot be adjusted, you must open the EQ window to make modifications.
Master EQ Controls

The Equalizer window has the following overall controls:

- **Enable button:** Turns the overall EQ effect off and on, without resetting the controls.
- **Reset button:** Resets all controls of the EQ window to their defaults.
- **Equalizer Type:** Changes the EQ control functionality to emulate different EQ characteristics from “classic” mixing consoles. Specifically, they determine the transfer function of the curve controls.

There are four options:

- **Earth:** (Default) Native Fairlight controls
- **Air:** Emulates the SSL 4K
- **Ice:** Emulates the Neve V
- **Fire:** Emulates the Focusrite

- **Preset Menu:** A drop-down menu that has several useful EQ presets available. You can create, change, and save presets, and use the default presets as excellent starting points for your track’s specific needs.
- **Gain fader:** A post-EQ level control that lets you boost or attenuate the signal to compensate for the EQ adjustment you’re making raising or lowering the level.

Graphical EQ Controls

A graph at the top shows a curve with handles that correspond to each of the enabled EQ bands listed below. You can drag any numbered handle to boost or attenuate the range of frequencies governed by that band, using whatever type of equalization that band has been set to.

![EQ Graph with User-Draggable Handles](image)

Dragging the numbered handles on this graph in turn modifies the parameters of the corresponding band, and changing each band’s parameters will also alter the EQ graph, which serves the additional purpose of providing a graphical representation of the equalization being applied to that track.
Bands 1 and 6

The outer two sets of band controls let you make high-pass and low-pass adjustments, if necessary. They're off by default.

![Band 1 and 6 controls](image)

- **Band enable button**: Clicking the band name turns each band of EQ on and off.
- **Band filter type**: Bands 1 and 6 can be switched among four specific filtering options for processing the lowest or highest frequencies in the signal. These include (from top to bottom) Hi-Shelf, Hi-Pass, Lo-Pass, and Lo-Shelf.
- **Frequency**: Adjusts the center frequency of the EQ adjustment
- **Gain**: Adjusts the amount by which the affected frequencies are affected. Negative values attenuate those frequencies, while positive values boost those frequencies.

Bands 2–5

The middle four sets of band controls let you make a wide variety of equalization adjustments. They're on by default, to make it easy to begin making adjustments.

![Band 3 controls](image)

- **Band enable button**: Clicking the band name turns each band of EQ on and off.
- **Band filter type**: Bands 2–5 can be switched among four different filtering options (from top to bottom) Lo-Shelf, Bell, Notch, and Hi-Shelf
- **Frequency**: Adjusts the center frequency of the EQ adjustment
- **L, ML, MH, H Buttons**: Sets the EQ frequency to predetermined starting points per band of Low, Medium Low, Medium High, and High settings.
- **Gain**: Adjusts the amount by which the affected frequencies are affected. Negative values attenuate those frequencies, while positive values boost those frequencies.
— **Q Factor:** Adjusts the width of affected frequencies. Lower values include a wider range of frequencies, higher values include a narrower range of frequencies. The Equalizer Types in the drop-down menu alter the Q to mimic the emulated console type.

### Dynamics

Double-clicking exposes a set of dynamics controls with three sets of controls corresponding to an Expander or Gate, a Compressor, and a Limiter that can be used separately or in concert to manage the dynamics of the audio on that track.

The channel strip Dynamics control window

When you enable whatever combination of dynamics controls you need for that track, the dynamics graph updates with curves that show you how the signal is being affected by the Expander or Gate, Compressor, and/or Limiter settings that are being applied.

The dynamics graph shows how the signal is being affected by the current settings
With these dynamics enabled, the Dynamics button on the channel strip displays these curves, so you know what’s happening to that channel. This indicator cannot be adjusted, you must open the Dynamics window to make modifications.

The channel strip’s Dynamics indicator

**Master Dynamics Controls**

The Dynamics window contains the following overall controls at the top of the window:

- **Enable button**: Turns the overall dynamics effect off and on, without resetting the controls.
- **Reset button**: Resets all controls of the Dynamics window to their defaults.
- **Preset Menu**: A drop-down menu that has several useful dynamics presets available. You can create, change, and save presets, and use the default presets as excellent starting points for your track’s specific needs.
- **Make Up fader**: A post-dynamics level control that lets you boost the signal to compensate for dynamics settings that have lowered the level.

**Expander/Gate**

The first of three sets of dynamics parameters, these controls can be switched between expansion and gating. Expansion emphasizes differences in volume by lowering the level of soft parts of the signal relative to the level of louder parts, and can be used to minimize noise while increasing the dynamic range of a signal. Gating reduces the level or even silences parts of a signal that fall below a certain level threshold in order to reduce or eliminate noise in quiet parts of a recording.

- **Expander**: A button that lets you enable these controls and switch them to perform expansion.
  - **Threshold**: Sets the signal level below which gain reduction occurs. Defaults to –35dB. The range is from –50 to 0dB.
  - **Ratio**: Sets the gain reduction ratio (input to output) that’s applied to signals which fall below the threshold level. Defaults to 1.0:1. The range is 1.0:1 to 10:1.
  - **Attack**: Adjusts how quickly the sidechain detector applies expansion when a signal exceeds the threshold. Defaults to 1.4mS (milliseconds). The range is 0 to 100mS.
  - **Hold**: Keeps dynamics from being triggered again until a certain amount of time has passed, in mS. Defaults to 0mS. The range is from 0 to 4000mS.
  - **Release**: Adjusts how quickly or gradually the sidechain detector stops applying dynamics when a signal goes back below the threshold. Defaults to 93mS. The range is 0.03 to 4.03mS.

- **Gate**: A button that lets you enable these controls and switch them to perform gating.
  - **Threshold**: Sets the signal level below which gain reduction occurs. The range is from –50 to 0dB.
— **Range**: Sets the maximum amount of gain reduction that will be applied when the signal falls below the gate threshold. Once the signal has fallen below the level determined by the gate threshold minus the gate range, no gain reduction is applied. The default is 18. The range is from 0 to 60.2dB.

— **Ratio**: Unused for gate.

— **Attack**: Adjusts how quickly the sidechain detector applies gating when a signal exceeds the threshold. Defaults to 1.4mS. The range is 0 to 100mS.

— **Hold**: Keeps dynamics from being triggered again until a certain amount of time has passed, in mS (milliseconds). Defaults to 0mS. The range is from 0 to 4000mS.

— **Release**: Adjusts how quickly or gradually the sidechain detector stops applying dynamics when a signal goes back below the threshold. Defaults to 93mS. The range is 0.03 to 4.03mS.

### Compressor

The second set of dynamics parameters let you apply compression, which detects the envelope of an audio signal in order to automatically change its level. Typically used to detect and reduce the peaks of an audio signal so that the overall level can be boosted without clipping, thus reducing the dynamic range of a given signal. Compression is often used to allow voices to have more presence within a mix, and to smooth out changes in the levels of tracks with too much dynamic range for the task at hand.

— **Compressor**: A button that lets you enable compression.

— **Threshold**: Sets the signal level above which compression is applied. The default is –15dB. The range is –50 to 0dB.

— **Ratio**: Adjusts the compression ratio. This sets the gain reduction ratio (input to output) applied to signals which rise above the threshold level. The default is 2.0:1. The range is 1.0:1 to 10:1.

— **Attack**: Adjusts how quickly the sidechain detector applies compression when a signal exceeds the threshold. The default is 1.4mS (milliseconds). The range is 0 to 100mS.

— **Hold**: After the attack phase has been completed, the Hold parameter controls how long this initial attenuation is maintained, before entering the release phase. Defaults to 0mS. The range is from 0 to 4000mS.

— **Release**: Adjusts how quickly or gradually the sidechain detector stops applying dynamics when a signal goes back below the threshold. The default is 93mS. The range is 0.03 to 4000mS.

— **Send**: Enable Send when you want to use the audio levels of the currently selected track to attenuate those of another track using sidechain compression. For example, you can turn on the compressor and enable Send for all tracks with dialog, in order to use those levels to attenuate the levels of another track containing music.

— **Listen**: Enable Listen when you want to use the audio levels of tracks that you set to Send to attenuate the levels of the currently selected track. If there are no tracks with Send enabled, then the current track is compressed as usual, using itself as the sidechain.

The following procedure shows how to set up a Compressor to automatically attenuate, or “duck” a music track whenever someone speaks in clips on one or more other tracks of the Timeline.
To use sidechain compression to automatically “duck” music in the presence of dialog on other tracks:

1. Edit dialog into one track of the Timeline, and edit overlapping music into another track of the Timeline.

Choosing the track header in the Fairlight timeline to add Dynamics

2. Click the track header or channel strip of a track with dialog to select that track, and then double-click the Dynamics indicator on the channel strip in the Mixer to open the Dynamics window.

3. Turn on the Send button to automatically send all levels from that track to the sidechain of a Compressor on another track (it’s not necessary to turn on Compressor for this). If you hover the pointer over the Send button, a tooltip will show you which tracks of the current timeline are set to Send.

4. If you have multiple tracks with dialog, you can repeat steps 2-3 for each so that the output levels of all dialog are sent to the sidechain.

Turning on Send in the Compressor of a track with dialog

5. Next, click the track header or channel strip of a track with music to select that track. If you haven’t closed the Dynamics window, the header will show you that the Dynamics controls are now those of the newly selected track.

6. Turn on Compressor, and then turn on the Listen button to automatically feed all “sent” levels to the sidechain of the Compressor on this track. If you hover the pointer over the Listen button, a tooltip will show you which tracks of the current timeline are set to Listen.
At this point, you need to lower the Threshold and raise the Ratio controls to the appropriate levels so that as dialog is heard, the music is compressed to be less loud. You may also want to raise Hold so this gain reduction doesn’t fluctuate too wildly, and raise Release so the volume adjustment doesn’t end too abruptly.

If you’ve set this up correctly, then during playback the Sidechain meter should show the levels of the dialog tracks with Send enabled, and the Gain Reduction meter should show you how much the gain of the music track is being reduced when triggered by the dialog being fed to the Sidechain.

As a result, you should hear that whenever speech plays, the music volume is automatically lowered. Adjust Threshold and Ratio to set the amount of this gain reduction, and adjust Attack, Hold, and Release to set how quickly gain reduction responds to changes in the Sidechain level (as defined by the Send levels).

**Limiter**

The third set of dynamics parameters let you apply limiting, which imposes a hard limit on the maximum level allowed for a particular signal.

- **Limiter**: A button that lets you enable Limiting.
- **Threshold**: Sets the maximum allowable output level. The default is –21dB. The range is from –50 to 0dB.
- **Attack**: Adjusts the attack rate time constant of the sidechain detector. The default is 0.71mS. The range is 0 to 100mS.
- **Hold**: Keeps dynamics from being triggered again until a certain amount of time has passed, in mS (milliseconds). Defaults to 0mS. The range is from 0 to 4000mS.
- **Release**: Adjusts how quickly the sidechain detector stops applying dynamics when a signal goes back below the threshold. The default is 90mS. The range is 0.03 to 4.03mS.

**Track Processing Order in the Fairlight Mixer**

The power of the built-in FX in Fairlight has been enhanced with the added functionality of a user-definable order of the processing chain in the Mixer.
The choice of what order to process tracks is dependent on the workflow of any given user as well as the needs of the media passing through it. This is to say that there is no right or wrong order for processing the audio.

Some mixer engineers will always put their EQ after the dynamics processing, while others will do the opposite. The FX may alter the EQ and dynamics in a way that it makes most sense to put them at the end of the processing chain. Or the complete opposite would work best. Now you can determine, on a track by track basis, what process order for that track and that mix is most appropriate.

The drop-down menu under Order on a channel strip shows the FX paths ordering.

**NOTE:** There are no hard and fast rules on processing order. Each track may have its own idiosyncratic needs for how the audio on that track will need to be processed. With a simple click the order can be changed and the results can be quickly auditioned.

### Bus Sends

The Flexbus on the Mixer for DaVinci Resolve 17 is a bit different than on the Legacy Mixer if you are used to prior versions of DaVinci Resolve. Don’t worry, although the layout and names have changed a bit, the functions remain the same.

This allows you to route that track’s channels through a Bus Send. Each Bus Send corresponds to a specific Bus that you created. Double-clicking any of these bars opens up the Bus Send window, with which you can enable or disable Bus Sends, set each one to be routed pre the channel strip or post the channel strip (the default), and set the send level and pan value for each Bus Send. The controls for multiple Bus Sends appear stacked within a single window.
Each Bus Send you create exposes the following controls in the Bus Send window:

- **On**: Turns that Aux send on or off.
- **Pre**: Switches that Aux send to be processed either pre or post fader. Turning this button on enables that track to send levels to the Aux bus before level adjustments on that track are applied. One common use of this is to enable a plug-in applied by the Bus Send to continue to produce a “wet” version of that track’s audio while the mixing level is set all the way down, while raising the mixing level up mixes a “dry” version of the audio track against the “wet” levels produced by the Bus Send effect. For example, with Pre turned on you could slowly mix fade the original track level up over time over an Bus Send with a Delay effect to create the illusion that the echos of someone talking down a long hallway are giving way to a character’s own voice as they walk closer to the microphone.
- **Send Level**: Adjusts the amount of signal sent from the selected feed to the auxiliary bus. The range is OFF to +10dB.
- **Pan**: Provides panning across Bus Send destinations.

The level to which you set an Aux bus will be shown within the bar that represents that Aux bus in the Mixer’s channel strip.

Legacy Auxiliaries

Prior to DaVinci Resolve 17 the Bus Send panel was called Auxiliaries. Any projects created prior to DaVinci Resolve 17 will use the legacy Fixed Busing. So for those of you, here is how the panel looks, again bearing in mind it functions the same way.
Pan

The Mixer provides access to two kinds of pan controls, depending on whether you’re doing stereo and surround or 3D positioning in your mix.

**The Stereo and Surround Pan Controls**

A Pan control that’s compatible with stereo and surround panning. You can drag the panning on the Mixer strip handle within this control to adjust panning for stereo or surround mixing, or you can double-click this control to expose a large Pan window. What controls are available in the Pan window depend on the mapping of the audio track, but both stereo and surround panning controls are available, with corresponding numeric controls. You can either adjust panning using the graphical Pan control, or you can adjust specific panner characteristics using the controls to the left.

![The Pan control window](image)

When a channel strip’s Pan control is enabled, the Pan area displays the panning that’s being applied. Unlike the EQ or Dynamics controls, you can adjust a channel’s panning by dragging the handles that appear within this small area of the channel strip.

![The channel strip’s Pan indicator](image)
The Audio Pan window contains the following controls:

— **Left/Right**: Changes the balance of signal between the left and right side speakers you’re outputting to, depending on what speaker format you’re mixing to. At its simplest, accommodates stereo output.

— **Front/Back**: Changes the balance of signal between the front and back sets of speakers you’re outputting to, depending on what speaker format you’re mixing to.

— **Rotate**: Simultaneously adjusts the left/right and front/back pan controls in order to rotate a surround mix about the centre of the room.

— **Spread**: Only available when a linked group of mono tracks is selected. Spread adjusts the perceived size of a surround mix.

— **Divergence**: Spreads the signal for an individual feed across more of the adjacent loudspeakers, making the perceived size of the sound source larger.

— **Boom**: The send level of that track to the LFE part of the mix.
  
  — **On**: Enables this functionality.
  
  — **Pre**: Lets you adjust the “dry” part of the signal separately from the “wet” part of the signal when effects are applied.

### The 3D Audio Pan Controls

Option-double-clicking on the Pan control of the Mixer opens an alternate 3D Audio Pan window. Whereas the regular Pan window lets you do stereo and conventional 5.1 and 7.1 surround panning, the 3D Audio Pan window lets you do the kind of spatial audio positioning enabled by advanced surround formats such as Atmos, Auro 3D, and NHK 22.2.
The 3D Audio Pan window has a few more controls than the ordinary Pan window:

- **Pan enable**: Toggles the entire panning effect on and off.
- **Panner viewer**: A large 3D representation of the listener’s perceived sound stage, with a blue sphere that represents the position of the track’s audio being positioned within that space, which casts a shadow straight down on the floor and projects a blue box on the four walls of this space to indicate its position more concretely.
- **Front panner**: A 2D panning control that represents the horizontal left/right axis and the vertical up/down axis, letting you make these specific spatial adjustments.
- **Side panner**: A 2D panning control that represents the horizontal front/back axis and the vertical up/down axis, letting you make these specific spatial adjustments.
- **Top panner**: A 2D panning control that represents the horizontal left/right axis and the vertical front/back axis, letting you make these specific spatial adjustments.
- **Left/Right**: A 1D knob that changes the balance of signal between the left- and right-side speakers you’re outputting to, depending on what speaker format you’re mixing to.
- **Front/Back**: A 1D knob that changes the balance of signal between the front and back sets of speakers you’re outputting to, depending on what speaker format you’re mixing to.
- **Rotate**: A 1D knob that simultaneously adjusts the left/right and front/back pan controls in order to horizontally rotate a surround mix about the center of the room.
- **Tilt**: A 1D knob that simultaneously adjusts the left/right and up/down pan controls in order to vertically rotate a surround mix about the center of the room.
- **Spread**: Only available when a linked group is selected. Spread adjusts the perceived size of a surround mix.
- **Divergence**: Spreads, or bleeds, the signal of an individual feed across the adjacent loudspeakers, making the perceived size of the sound source larger. A 2D button lets you set how this is done. With the 2D button turned off, divergence creates a one-dimensional bleed between the left/right planes only. With the 2D button turned on, divergence creates a two-dimensional bleed between both the left/right and front/back planes of sound.
- **Boom**: The send level of that track to the LFE part of the mix. An On button enables this functionality, while a Pre button lets you adjust the “dry” part of the signal separately from the “wet” part of the signal when effects are applied.

### Bus Assignment Buttons

Flexbus bus offers substantial options for bus routing. To route a created bus on the DaVinci Resolve 17 Mixer click the + sign to see a drop-down menu of all available buses.

The Bus Outputs panel is where you can route bus signals.

In the Legacy Mixer the bus assignments have two sets of buttons let you route audio from one channel strip’s output to Sub and Main buses that you’ve set up for your mix.
The channel strip’s bus assignment buttons

- **Main**: These buttons let you assign a track or Sub’s channels to one or more of the main busses.
- **Submix**: These buttons let you assign that track’s channels to one or more submix busses.

**VCA Groups (Fader Groups)**

You can assign multiple faders to a Fader Group, also referred to as “VCA group,” which is controlled by a dedicated group channel strip that appears at the right of the mixer. Fader Groups let you simultaneously adjust multiple faders using one group fader, for instances where that will help you manage the levels of complex collections of audio tracks.

The controls for doing this are found in the Group label area of each control strip, which also display which group each fader has been assigned to.

**Making Fader Group Assignments**

You can assign any fader to one of 64 groups by right-clicking the group label area and choosing a group from the drop-down that appears. If a fader is already assigned to a group, you can choose “No Group” to remove it.

**NOTE**: Each drop-down menu will only display ten groups initially. When those ten have all been assigned it will then display more available groups. This is in both Flexbus and Legacy Fixed Bus modes. When all 64 groups are in use the list is very long, so revealing only the first ten and then the subsequent buses is meant to reduce clutter.
Right-clicking a Group Label reveals a drop-down menu that lets you assign faders to or remove faders from groups.

Using Fader Groups

Once you’ve assigned multiple faders to a group, a dedicated channel strip for that group appears. Making adjustments to the group channel strip simultaneously controls all the faders, solo buttons, and mute buttons of all channel strips that are members of that group, as seen below.

Adjusting the Group 1 fader also adjusts the faders for Audio 1, 3, and 4 that are assigned to that group.
While in a group, you can still move the faders of each individual channel strip independently to make relative adjustments. Channel strip faders only move together when you adjust the group fader, and while the group fader is being moved, each individual fader’s relative offset from other faders in that group is maintained, as seen in the previous screenshot, where the Group 1 fader is moving the faders in tracks Audio 2, 3, and 4, but each individual channel strip fader in this group is offset from the others.

**Recording Fader Automation for Groups**

You can record automation data to the group fader, and all faders in that group will follow even though they’re not actually automated themselves. This makes it easy to record complex automation involving multiple faders when you still might want the freedom to finely adjust each individual fader later on.

**Arm, Solo, and Mute Buttons**

Identical to the controls found in the track header controls of each timeline audio track.

![Arm, Solo, and Mute buttons](image)

- **Record Arm:** (highlights red when enabled) Lets you enable a track to be recorded onto.
- **Solo:** (highlights green for Solo, blue for Solo Safe) Lets you mute all other tracks in order to play a track you need to focus on in isolation. If solo is enabled for multiple tracks, all soloed tracks will play, and all non-soloed tracks will be muted. This affects rendering, so if one or more tracks are soloed, the muted tracks won’t be output or rendered.
- **Solo Safe:** Command-Option-click a Solo button to put it into “Solo Safe” mode. Tracks set to Solo Safe, in which the Solo button is highlighted in blue, always play even if Solo is enabled for other tracks. This is good for tracks you want to continue listening to for reference even as you solo other specific tracks you want to pay more attention to.
- **Mute:** (highlights orange when enabled) Turning on Mute disables audio playback from that track. This affects rendering, so if one or more tracks are muted, they won’t be output or rendered.

**TIP:** You can click a button and drag across multiple channel strips to turn that button on or off for multiple tracks easily.
Fader Controls

Each track’s vertical fader lets you control the level that’s output by that track, either using your mouse, or using the physical fader of your Fairlight console. If you’re working with a console, then the onscreen faders serve as a visual reference of what levels are set.

— **.dB**: Shows you the volume, in decibels, that track is currently set to.
— **Fader**: Each track’s vertical fader can be dragged with your mouse or other pointing device to adjust the volume of that track and perform automation recording. Dragging up increases volume, dragging down decreases volume. Fader handles turn red while you record levels automation, and they turn green when automation has been recorded for that track.

![The fader area](image)

**Methods of adjusting channel faders:**

— **To change the level of that channel with the mouse**: Click and drag any fader up or down.
— **To reset the level of that channel to 0 dB**: Double-click a fader’s handle. This does not work after you’ve recorded automation for a track.

Bouncing Audio

Bouncing audio refers to mixing and rendering audio from one or more Timeline tracks onto another track of the Timeline, in the process “baking in” processor intensive effects and complicated or intricate audio edits to create a new continuous piece of audio media that’s written to the directory location specified by the “Save clips to” field of the Capture and Playback panel of the Project Settings.

There are two commands available for bouncing audio on the Fairlight page when you hit the wall with how many tracks and effects you can mix in real time.

— Timeline > Bounce Selected Tracks to New Layer
— Timeline > Bounce Mix to Track
To use Bounce Selected Tracks to New Layer:

1. Set In and Out points to define the range of the Timeline you want to bounce. If you don’t do this, nothing will happen.

2. Command click the track headers or mixer channel strips of all tracks you want to bounce in order to select them.

3. Choose Timeline > Bounce Selected Tracks to New Layer.

4. The audio on each track is processed and rendered and appears as the top layer of audio on that track. While View > Show Audio Track Layers is turned off, it will appear as if the new bounced audio is the only clip on that track. However, the original audio with live effects is still available as the bottom of the stack of layered audio on that track, and turning View > Show Audio Track Layers on will show this. The bounced audio is a new audio media file that’s written to the directory location specified by the “Save clips to” field of the Capture and Playback panel of the Project Settings.

To use Bounce Mix to Track:

1. Choose Timeline > Bounce Mix to Track. The Bounce Mix to Track window appears, showing each main, submix, and auxiliary that’s currently available.

2. In the Destination Track column, set which mixes you want to bounce by choosing either New Track, or choosing a specific existing track from the drop-down menus.

3. Click OK.

The specified mix is processed, mixed, and bounced to the specified track as a new piece of audio. This creates new audio media that’s written to the directory location specified by the “Save clips to” field of the Capture and Playback panel of the Project Settings.

**TIP:** There’s also a Bounce Audio Effects command in the contextual menu of audio clips in the Timeline that have audio plug-ins applied to them. For more information, see Chapter 175, “Audio Effects.”

For more information on exporting clips, ranges, and files, see Chapter 171, “Editing Basics in the Fairlight Page.”

### Third-Party Control Panel Support for Mixing

DaVinci Resolve supports HUI- and MCU-compatible third-party mixing control panels with up to eight faders, such as the Mackie MCU Pro Control Surface, connected via USB MIDI, and selectable in the Control Panels panel of the Resolve System Preferences. Supported basic panel controls that correspond to Fairlight features at the time of this writing include the following.
Transport controls including:
— Rewind (REW)
— Fast Forward (FF)
— Stop (double-press the Stop button for Home in the Timeline)
— Play (double-press the Play button to “play again”)
— Record (press Record+Play to begin recording if one or more tracks is record-enabled)
— Jog control (Press SCRUB and rotate the jog wheel)

Channel Strip controls including:
— Rotary controls for panning, with Rotary Value display and Rotary touch
— Alphanumeric Track Name display
— Record button to record-enable tracks (only works if an input is patched to a track input)
— Solo, with a double-press selecting or de-selecting that track
— Mute
— Select to select the track corresponding to that channel strip
— Fader control and optional Level display
— Channel and Fader Bank buttons to move left and right among banks of channel strips
— Double-press the Fader Bank Left button to move the playhead Home in the mixer (track 1)
— Double-press the Fader Bank Right to move to the Master channel strips

Marker buttons:
— Marker to add a marker
— Pressing the Marker+Stop buttons sets Home
— Pressing the Marker+FF/REW buttons jumps the playhead forward or backward

Additional supported controls for control panels that have them include:
— Master Solo clear/restore
— Undo (pressing the Undo+Option buttons does Redo)
— Arrows to move the selection
— Zoom horizontal and vertical controls
— Audio Tracks, to turn Automation On/Off
— Write/Trim/Touch/Latch switches
— Nudge controls
— Cut, Copy, and Paste

Monitoring controls include:
— Level control
— Dim
— Mute
— Alt Speaker

For more information on third-party mixing control panel support, see the Blackmagic Support site at https://www.blackmagicdesign.com/support/family/davinci-resolve-and-fusion.
Chapter 174

Automation Recording

The Fairlight page provides simple, flexible, and comprehensive facilities for recording and editing mix automation data. Once recorded, all feed and bus mix parameter automation can be played back in perfect synchronization with the audio, including channel parameters, bus assignments, inserts, and direct outs.

The Fairlight page is designed to allow the operator to record every static and dynamic parameter change you make in the process of balancing the mix of tracks in the timeline. Mixer adjustments may be recorded for one or multiple parameters or channels at a time. Additionally, more adjustments may be added with each automation recording pass, which lets you create complex and detailed mixes that can be frame-accurately replayed at will.

This chapter covers automation mixing using the combined controls of the onscreen mixer and timeline. For more information on basic mixing operations, see Chapter 173, “Mixing in the Fairlight Page.”

Automation Recording

While the recording of keyframe automation is most commonly associated with either the onscreen mixer or the Fairlight console, you can also record automation using controls found in the Inspector, or using the controls of the EQ, Dynamics, and Pan windows, thereby enabling you to record automation for the various audio effects that you’ve applied to a track.

Recording automation refers to creating high-fidelity data that records changes you make to onscreen controls and/or Fairlight console controls, in real time as the Timeline plays, that will then control how those parameters will play back. In this way, you can create a dynamic mix where different audio level, pan, and EQ, dynamics, and other audio processing settings change over time to fade swells of music up and down, pan the sound effect of a car driving by from the left to the right speaker, or slowly increase the strength of a reverb effect applied to foley footsteps as a character walks into a long, dark cavern.

What You Can Automate

You can record automation for nearly every control in the mixer for channel strips corresponding to individual tracks, track groups, or busses, including the fader. Additionally, you can record automation for controls found in audio plug-ins that you use in your mix.

Automation Controls

The automation button, to the right of the transport controls, lets you show and hide the Automation toolbar.

Clicking the Automation button displays the automation toolbar

The Automation toolbar has buttons for each option that’s available for preparing to record automation in your mix.

Options found in the Automation toolbar

The Automation toolbar displays the following options:

— Automation: Controls how automation data is recorded.
— Write: Records absolute changes to control automation.
— Trim: Records relative changes to control automation in order to increase or reduce levels that have already been recorded.
— Touch: Defines what happens when you first adjust an automatable control.
— Off: No automation is recorded.
— **Latch**: Automation is recorded once you begin moving a control and continues recording after you release the control.

— **Snap**: Automation is recorded once you begin moving a control and stops recording after you release the control; there is a brief interpolation from the last parameter you set to the prior recorded level.

— **On Stop**: Defines what happens when you release an automatable control.

— **Event**: The last recorded automation value overwrites previous levels to the start of the next available recorded automation data (or event) in that track.

— **Hold**: Deletes all previously recorded mixing data after what you’ve just recorded, to hold the last recorded level for the rest of that track.

— **Return**: The last recorded automation value is interpolated to ramp back to the previously recorded automation values on that track.

— **Enables**: The following buttons let you enable or disable different controls for recording automation.

— **Fader**: Automates track and bus volume.

— **Mute**: Automates the mute button.

— **Pan**: Automates all pan controls.

— **EQ**: Automates all EQ controls.

— **Comp**: Automates just the Compressor controls in the Dynamics window.

— **Gate**: Automates just the Gate controls in the Dynamics window.

— **Lim**: Automates just the Limiter controls in the Dynamics window.

— **Aux**: Automates the Auxiliary controls in the Auxiliaries window.

— **Plug-ins**: Automates all plug-ins.

— **Misc**: Automates the parameters of VST and Audio Unit plugins.

**How to Record Automation**

There are two different ways you can set up the recording of automation for levels, panning, EQ, Dynamics, and other audio controls in the mixer.

**Recording Automation for Multiple Tracks**

You can use the following steps to record automated changes to any audio control in any control strip:

1. **Open the Automation toolbar, and do the following three preparatory steps:**
   
   a. Choose whether you’re going to write new automation, or trim automation that’s already recorded. Write mode is appropriate when you’re recording automation for the first time, or when you’re overwriting previous automation with brand new values. Trim mode is appropriate when you’re making incremental changes to previously recorded automation.
   
   b. Next, choose Touch and On Stop behaviors that are appropriate for the kind of automation recording you need to do.

2. **Move the playhead to the beginning of the section of the timeline you want to record automation for.**
Next, initiate playback using any method (Spacebar, L, Play button, third-party or Fairlight audio control panel), and make whatever adjustments you want to the controls for which you've enabled automation recording. As you make adjustments, the affected fader control turns red to let you know you’re recording automation.

When you’re finished, stop playback using any method (Spacebar, K, Stop button, third-party or Fairlight audio control panel). Automation recording stops as well.

Recording Automation for Specific Individual Tracks

You can use the following steps to record automated changes to controls in specifically armed control strips:

1. Open the Automation toolbar, and do the following three preparatory steps:
   a. Choose whether you’re going to write new automation, or trim automation that’s already recorded. Write mode is appropriate when you’re recording automation for the first time, or when you’re overwriting previous automation with brand new values. Trim mode is appropriate when you’re making incremental changes to previously recorded automation.
   b. Next, set Touch to Off, which disables across-the-board automation recording and requires you to arm specific tracks that you want to automate.

2. Click the automation arm button above the fader of any Mixer track or any track header to which you want to record automation. Even though the Touch control is set to off, moving a control on an armed channel strip will record automation in Latch mode.

3. Move the playhead to the beginning of the section of the timeline you want to record automation for.
Next, initiate playback using any method (Spacebar, L, Play button, third-party or Fairlight audio control panel), and make whatever adjustments you want to the controls for which you’ve enabled automation recording. While you make adjustments, the affected fader control turns red to let you know you’re recording automation. If you’re displaying the same automation data in the Timeline that you’re recording, you can see the new automation being drawn in real time, in red.

When you’re finished, stop playback using any method (Spacebar, K, Stop button, third-party or Fairlight audio control panel). Automation recording stops as well. Displayed automation turns green once recording has stopped.

If you don’t like what you’ve done, you can undo and start over, or you can edit the automation using methods described later in this chapter. Or, you can back the playhead up and overwrite automation at any time with new automation.

**Automation Preview Mode**

Preview is an additional mix automation workflow, specifically for working across scene-based material. When enabled, mix items that are in preview are not controlled by pre-recorded automation, so they respond manually to their controls. These can subsequently be placed into write (or trim) to write actual automation.

Typically, Preview mode is used to audition new mix settings for one particular section of a timeline, while other sections already have recorded automation data. Preview mode prevents pre-recorded automation from moving the controls the user is trying to adjust in the targeted section. As soon as the user is happy with the new adjustments, they can be written to the targeted section.

Preview mode frees the faders (and other controls) from automation control, and lets you move them while you experiment with different levels and settings. Ordinarily, moving one or more controls implies writing automation data for those controls, but entering Preview mode lets you play with the controls as much as you like without committing to anything, only writing automation data when you’re ready.
To engage the Preview state on enabled mix items, first enter Preview mode by doing one of the following:
— Toggle Preview in the Automation toolbar.
— Press the Preview key on the Mix page of the Fairlight controller.

Once Preview is engaged:
— Individual parameters can be switched into Preview Touch Latch.
— You can use the AUTO key next to a fader to preview all enabled parameters on a channel.
— You can use the Auto button on the screen mixer strips.
— When you’re in Preview mode, all parameters in Preview are indicated by a BLUE automation indicator.

Once in Preview mode, mix items can be placed into write (or trim) by:
— Dropping in manually via the “Punch In” menu item.
— Dropping in manually with the In key on the Fairlight controller.
— Automatically using the Active In and Out points on the Fairlight controller.
 Once enabled for Preview, parameters remain in that state regardless of transport starts and stops. This is different from putting mix items into WRITE, which must be done again after each transport stop.

Other Preview-related operations include:
— Filling a range defined by In and Out points with all parameters currently in Preview.
— Gliding all parameters from their existing values at the Range In point to the Preview values at the Range Out point.

Viewing Automation in the Timeline

Once you’ve recorded automation keyframes for a particular parameter, they can be made visible in an automation graph in the Timeline. While the automation controls are visible, an additional pair of controls appear in the header of each audio track. A drop-down lets you choose which automation waveform to view, with options for Fader, Mute, Pan, EQ, Compressor, Limiter, Aux, Plugins, and Misc controls.

Mixing automation for the Fader shown in the Timeline
Overwriting Automation

Once you’ve recorded automation for a particular clip, you can overwrite that automation in subsequent passes. Using either of the previously described methods of recording automation, adjusting the levels of a track control with previously recorded automation displays a red line that shows the new level relative to the previously recorded level.

Setting new levels to overwrite previously recorded automation displays a red line.

Pressing play to actually record this new automation will overwrite the previous levels at this new value.

New automation overwrites the previous levels.

Automation data can be copied, pasted, and erased under the Fairlight Menu > Automation > Copy/Paste/Erase.

Automation Follows Edit

Picture lock can be an elusive thing, eventually devolving into multiple timelines named final_final_no_really_final_mix. Since additional sound editing is likely while projects are in the mixing phase, users can have their edits retain all of the automation data that has been added to audio clips during mixing. To enable this, choose Fairlight > Automation > Follows Edit.

This is also extremely useful when doing an initial edit of audio clips that contain automation data. For instance, if you have a recurring sound effect that pans left to right, first automate that panning to the audio clip. When this clip is copied through the Timeline it will retain the same panning automation for each new instance. This can be very useful for a variety of edits that require the same automation data for audio clips in a timeline.

Be aware, however, that it will need to be turned off when copying and pasting clips or sequences where the automation that has been applied is not relevant to the new edits.
The automation data is embedded into the clips themselves. Any of that data, for instance volume or panning, will travel with the clips. So if a complete section has been removed, all of the automation inside of the clips contained in that section are also removed. If a section of clips changes its location in the Timeline, all of the automation embedded in those clips move in the Timeline with them.

When the Automation is enabled in the Fairlight toolbar, the Automation Follows Edit button will appear.

![Automation Follows Edit button](image)

The Automation Follows Edit button to the left of the Flag button on the toolbar

**Editing Automation**

When the automation toolbar is displayed, two additional tools appear in the regular toolbar. From left to right, these are the Pencil and the Select Range tools. These tools let you edit automation in different ways.

![Pencil and Select Range tools](image)

The Pencil and Select Range tools appear when you open the Automation toolbar

**Drawing Automation Keyframes**

You can use the pencil tool to literally draw new automation curves in the Timeline for whichever parameter’s automation data is visible. This can be a good way to smooth out ragged sections of automation without needing to re-record everything you did.

Simply click the Pencil tool, choose the automation data you want to edit in a track of the Timeline using the drop-down menu in the track header, and then click and drag to draw a new curve. While you’re drawing, the new curve appears in red, while the old curve appears in green, to help you see what you’re doing. When you’re finished, release the pointer button and the automation curve will be redrawn.

![Using the Pencil tool to smooth out a section of automation](image)
Adjusting and Deleting Automation Keyframes

The Select Range tool lets you adjust automation in two different ways.

### Adjusting Individual Keyframes

Using the Select Range tool, you can click and drag any automation keyframe up or down and left or right (bounded by its neighboring keyframes) to adjust it directly. When zoomed in, this can be an effective way of making minute adjustments to troublesome keyframes. The segment of automation affected by the keyframe you’re dragging appears red to show you the new curve you’re creating, while the previously recorded curve remains green. When you release the pointer button, the new shape will be drawn.

![Using the Select Range tool to adjust an automation keyframe](image)

### Adjusting and Deleting Multiple Keyframes

You can also use the Select Range tool to drag a bounding box to select multiple keyframes, in preparation for moving them or deleting them.

![Dragging a bounding box over a section of automation using the Select Range tool](image)

Once you release the box, that section of keyframes becomes highlighted.

![Multiple automation keyframes selected](image)
Once it’s highlighted, you can drag the selection to move it, or you can press the Delete key to delete it. The remaining section of the curve flattens out to fit the first and last keyframe of the selection.

![The newly flattened section of the automation curve after deleting the selected keyframes](image)

**Adding New Keyframes**
You can also use the Select Range tool to add new keyframes to an automation curve. However, these are not Bezier keyframes, so they only let you create a single level adjustment at that frame. If you make a large adjustment with only a single new keyframe, you’ll end up with a squared off section of automation. For this reason, adding new keyframes should only be done when making small adjustments, unless you intend to create an abrupt change.

![Adding and adjusting a keyframe using the Select Range tool, exaggerated for print](image)

**Fairlight > Automation Controls**
A series of commands in the Fairlight > Automation submenu let you initiate various automation tasks. These commands are:

- **All Read**: Switches all parameters that are in Trim or in Write mode back to Read mode.
- **Punch In**: When Preview mode is on, switches all parameters currently in Preview (blue) into Write or Trim. When Preview mode is off, this switches all Automation-enabled parameters on all selected channels into Write or Trim.
- **Punch Out**: When Preview mode is on, switches all parameters currently in Write, Trim or Preview into Read. When Preview mode is off, this switches all Automation-enabled parameters on all selected channels into Read.
- **Fill Range**: When there is an active In and Out range in the Timeline, the current value of all parameters in Preview will be written over that range.
— **Glide Range:** In Preview mode, “glides” all parameters from their existing values at the In point to the preview values at the Out point of the Timeline.

— **Copy:** If there is an active In and Out range in the Timeline, this command copies the automation moves of all selected channels within this range to the clipboard (Range mode). If there is no active In and Out range, this command copies the position of all automated parameters on all selected channels at the playhead (Snapshot mode).

— **Paste:** Pasting of a clipboard can be done with a different target channel set and/or with a different target time. If there is an active In to Out range defined in the Timeline, and the clipboard is in Snapshot mode, then this range will be filled with static values of the snapshot data. If there is an active In to Out range defined, and the clipboard is in Range mode, then this range will be filled as appropriate with automation moves from the Clipboard. If there is no active In to Out range defined, then the automation clipboard is simply pasted in its entirety.

— **Erase:** If there is an active In and Out range in the Timeline, this command erases the automation moves of all selected channels within this range to the clipboard (Range mode). If there is no active In and Out range, this command copies the position of all automated parameters on all selected channels at the playhead (Snapshot mode).

### Playing Automation

After you’ve automated a mix, playing it back is as simple as moving the playhead to an area of the timeline prior to the recorded automation, and initiating playback. As the timeline plays, the onscreen controls for each automated parameter are shown in green, and move and update to show the recorded levels for those controls.
Audio Effects

Audio plug-ins let you apply effects to the audio clips in your mix, such as echo or reverb, noise reduction, aural enhancement, click and pop removal, and so on. DaVinci Resolve is compatible with a wide variety of third-party VST and Audio Unit effects for audio processing, and these can then be used either in the Edit or Fairlight pages. This chapter goes through the different methods available for applying and customizing effects for clips and for tracks.

Contents

- Elastic Wave Audio Retiming 3602

Elastic Wave Audio Retiming

Elastic Wave retiming is a fast and easy keyframe-based way of dynamically retiming audio, squishing and stretching different parts of a waveform to subtly retime audio playback for a variety of reasons, all while maintaining constant pitch. For example, if you’re using the audio from another take to replace that of the current take, but the performer’s timing is just a little bit different, you can use Elastic Audio to make small adjustments to retime the second performance to match the first.

To use Elastic Wave retiming on an audio clip:

1. In this example, two tracks of foley effects have been recorded, and the bottom one needs to be retimed to match the top one.
2. Right-click an audio clip and choose Elastic Wave retiming from the contextual menu to reveal the Elastic Wave retiming controls.

3. Command-click anywhere on the clip to add speed keyframes to parts of the waveform you want to retime by stretching or squishing. You can also place speed keyframes to lock parts of a waveform you don’t want to retime.
4 Dragging the speed keyframe to the left or right speeds up the audio on one side of the keyframe and slows down the audio on the other side of the keyframe, from that keyframe to the neighboring keyframes applied to that clip. Using an audio clip’s waveform as your guide, you can use multiple speed keyframes to match the waveform of one performance to the waveform of another, in order to make the timing match. Or, you can adjust speed keyframes freeform to manipulate performances or sounds for creative effect.

You can also drag the beginning or end of an audio clip to retime that portion of the clip going forwards or back to the next speed keyframe that’s been added.

5 If you’ve made some speed keyframe adjustments, but you find yourself wishing a speed keyframe you created had been placed at a different position relative to the audio waveform being adjusted, you can hold the Command key down and drag any speed keyframe to move it closer to or farther away from a part of the waveform you want it to retime. This fine-tunes the audio retiming adjustment occurring at that point in the clip.
When you're done, you can click the close button at the upper-left-hand corner to hide the Elastic Wave retiming controls.

**To remove Elastic Wave retiming keyframes, do one of the following:**

— **To remove a single speed keyframes:** Right-click on a speed keyframe and choose Remove Speed Keyframe from the contextual menu.

— **To remove all speed keyframes and eliminate the Elastic Wave retiming effect:** Right-click a clip and choose Reset Speed Curve.

**NOTE:** All Elastic Wave retiming adjustments you make in the Fairlight page appear in the Edit page as variable speed effects, accessible using the Retime controls. Be aware that while all Elastic Wave retiming effects can appear as Edit page retime effects, not all Edit page retime effects can appear as Elastic Wave retiming effects on the Fairlight page.

**About Audio Plug-Ins**

There is no limit to the number of single or multiple plug-ins when in Flexbus mode that can be applied to clips and to tracks. However there is a limit of 480 when using Fixed Bus Legacy. Plug-ins are accessed via each track's control strip, or via the Inspector which provides access to both clip and track plug-ins.

**Fairlight FX**

Fairlight FX are a DaVinci Resolve-specific audio plug-in format that runs natively on macOS, Windows, and Linux, providing high quality audio effects with professional features to all DaVinci Resolve users on all platforms.

**VST and VSTi**

VST (Virtual Studio Technology) is an audio plug-in standard created by Steinberg. The VST standard allows third-party developers to create VST plug-ins for use within VST host applications, or to create VST host applications themselves. The VST plug-in standard is the most widespread audio plug-in standard in use today, with thousands of available plug-ins spanning the gamut from EQ and compression to reverb, denoising, de-essing, aural exciting, and much more.

The Fairlight page supports VST effects from Mono to 7.1 - and beyond. These effects can be inserted on mono channels or Link Groups. If a stereo VST effect is inserted on a LCR, LCRS, or 5.1 Link Group, the left and right channels will be allocated to left and right Link Group channels automatically.

DaVinci Resolve supports VST3. VST effects are available on macOS and Windows workstations, but not on Linux.
VST Effects versus VST Instruments (VSTi)

A VST effect is a type of VST plug-in that is used to process audio. A VST effect might be a Reverb, Compressor, or EQ. VST Instruments are typically used to synthesize sound or play back sampled audio. VSTs have rapidly replaced hardware synthesizers and dedicated samplers due to their flexibility, repeatability, and low cost.

Audio Units

Audio Units are an audio plug-in API created by Apple. Similarly to VST, Audio Units (AU) can either process audio, or work as instruments. Audio Units are only available on macOS workstations.

Using Audio Plug-Ins

Fairlight FX are pre-installed on all DaVinci Resolve installations. If you install additional VST or Audio Unit effects on your workstation, they appear in the Audio FX panel of the Effects Library, organized in separate categories.

Audio plug-ins in the Effects Library

You can click on the far right of any effect to flag it with a star as a favorite effect. When you do so, the favorited effects appear in a separate Favorites area at the bottom of the Effects Library Bin list, and it also appears at the top of the Effects button’s menu on the Mixer when you click the “plus” button.

Stars indicate a flagged favorite effect; all favorites are currently filtered.
Audio plug-ins let you apply effects to individual audio clips or entire tracks worth of audio, to add creative qualities such as echo or reverb, or to take care of mastering issues using noise reduction, compression, or EQ.

Methods of applying audio plug-ins to clips on the Fairlight page:

— To apply an audio filter to a clip: Drag any filter from the Audio FX panel of the Effects Library onto the clip in the Timeline you want to apply it to.

— To apply an audio filter to multiple clips: Select all of the clips you want to apply an audio filter to, then drag any filter from the Audio FX panel of the Effects Library onto any of the selected clips.

When you apply an audio plug-in to a clip, a badge appears to the left of that clip’s name bar in the Timeline to let you know there’s an effect applied to it.

Methods of applying audio plug-ins to tracks on the Fairlight page:

— To apply an audio filter to an entire track in the Timeline: Drag any filter from the Effects Library onto the track header.

— To apply an audio filter to a track or bus in the Mixer: Drag any filter from the Audio FX panel of the Effects Library onto the clip in the Timeline you want to apply it to.

— To apply an audio filter to a track or bus using the Mixer controls: Click the plus button in the channel strip of the track you want to apply an effect to, and then choose a filter from the drop-down menu that appears. All filters appear within categories to make them easier to find. If you’ve clicked the star button of any filters in the Effects Library to favorite them, these favorite filters appear at the top of the plus button’s drop-down list.

— To copy audio filters from one mixer channel to another: Hold the Option key and click and drag the effect to the desired channel and slot to copy.
— **To reorder audio filters in the mixer:** Click and drag the audio filter to move to the desired slot position.

![Audio Filter Organizer](image)

Applying an audio filter to a whole track via the Mixer’s own controls

**TIP:** The categories that audio filters are organized into in the Mixer can be edited in the audio plug-ins panel of the DaVinci Resolve System Preferences window. All plug-ins on a workstation are shown in the Available Plug-ins list, and clicking within the Category column lets you use a drop-down menu with which to change categories.

---

**To edit a clip’s audio plug-ins:**

— Select that clip and open the Inspector. All audio plug-ins applied to that clip appear in the Effects tab, with that filter’s controls appearing directly in the inspector.

**To edit a track’s audio plug-ins, do one of the following:**

— Click in the background of the Timeline header to select that track, and then open the Inspector. Click the custom UI button for that filter to open its controls.

![Custom UI Button](image)

The custom UI button for audio plug-ins in the Inspector

— Move the pointer over the plugin’s name in the Effects area of the Mixer, and click on the custom UI button to open its controls.

![Custom UI Button in Mixer](image)

The custom UI button for audio plug-ins in the Mixer
Nearly all Fairlight FX, VST, and Audio Unit audio plug-ins have a custom user interface that makes it much easier to manipulate that filter’s controls. These can be opened from within DaVinci Resolve.

Methods of working with audio plug-ins in the Inspector:

— **To rearrange the order of multiple video filters applied to a clip**: Click the move up or move down buttons in any filter’s title bar, to the left of each filter’s Trash Can button.

— **To disable or re-enable a filter**: Click the toggle button at the far left of each filter’s title bar.

— **To remove a filter**: Click the Trash Can button.

— **To reset any filter parameter**: Click the Reset button at the far right of the parameter you want to reset.

— **To open or collapse a filter’s parameters**: Double-click the title bar.

— **To open or collapse the parameters of all filters**: Hold the Option key down and double-click any filter’s title bar.

Once applied to a clip or track, audio plug-ins can also be keyframed or automated just like volume and pan settings, to create dynamic audio effects that change over time.

**Applying Audio Plug-Ins to Buses**

You can apply audio plug-ins to Main and Sub buses just like any other track, with which to apply any audio mastering effects operations you require to individual submixes, or even to an entire main.
Dealing With Processor Intensive Plug-Ins

As you apply more and more plug-ins directly to clips in complicated mixes, you may discover you lack the processing power to play all audio tracks and effects in real time. When this happens, there are two ways you can ease the burden that audio clip effects are placing on your workstation.

Caching Audio Clips With Plug-Ins

One quick fix is to manually enable the caching of one or more selected audio clips with audio effects applied to them to improve your project’s performance. Once an audio clip is cached, all plug-in effects are “baked in” and that clip’s audio waveform updates to reflect the altered audio. Cached clips appear with a small badge to the right of the FX badge in the name bar of the clip.

A cache badge lets you know this audio clip has cached effects

This is a non-destructive operation that has no lasting effect on the source media of cached clips. You can still alter a cached clip’s plug-in parameters whenever you want. Opening the graphical controls of a cached clip temporarily suspends audio caching, and when you’re finished, the clip is automatically re-cached and its waveform is updated to reflect the change so long as Cache Audio Effects remains enabled.

To cache audio effects for one or more selected clips:

— Right-click an audio clip with a plug-in applied and choose Cache Audio Effects to enable audio effect caching for that clip. If you right-click one of multiple selected clips, you’ll enable Cache Audio Effects for all selected clips at once. Once enabled, that clip will be continue to be cached (and re-cached if you change the plug-in’s parameters) until you manually disable audio caching.

To disable audio caching for one or more selected clips:

— Right-click an audio clip that’s been cached and choose Cache Audio Effects to disable audio effect caching for that clip.
Exporting Audio Clips With Plug-Ins

Another way of easing the burden of audio clip effects on your system is to export the effected clip to another layer. This creates a new piece of audio media with the effect “baked in,” which is written to the directory location specified by the “Save clips to” field of the Capture and Playback panel of the Project Settings.

To bounce one or more selected audio clips with effects to another layer:

— Right-click an audio clip with a plug-in applied and choose Export Audio Files. If you right-click one of multiple selected clips, you’ll have options for what you would like exported for each selected clip all at once.

Exported clips no longer have editable effects, but you can always choose View > Show Audio Track Layers to see the original underlying clip that still has the original plug-in effect applied, and you can unmute it, move it back up to the top, edit the effect, and export another version of the clip, which appears as the topmost layer.

Exporting Clips to Files is detailed in Chapter 171 “Editing Basics in the Fairlight Page.”
Chapter 176

Fairlight FX

Fairlight FX are a DaVinci Resolve-specific audio plug-in format that runs natively on macOS, Windows, and Linux, providing high-quality audio effects with professional features to all DaVinci Resolve users on all platforms.

These audio plug-ins that can be used both in the Edit and the Fairlight page include a wide variety of plug-ins for repairing faulty audio, creating effects, and simulating spaces. This chapter explains what they do and how to use them.

Common Controls For All Fairlight FX

Before going into the specific controls of each Fairlight FX plug-in, there are some common controls that all plug-ins share, found at the top of the custom GUI window for each plug-in.

---

**Presets:** A cluster of controls that let you recall and save presets specific to each plug-in.

**Add Preset button:** Click this button to save the current settings of the Fairlight FX you’re using. A dialog lets you enter a Preset name and click OK.

**Preset drop-down menu:** All presets for the currently open plug-in appear in this menu.

**Previous/Next preset buttons:** These buttons let you browse presets one by one, going up and down the list as you evaluate their effects.

**A/B Comparison:** A set of buttons that lets you compare two differently adjusted versions of the same plug-in. The A and B buttons let you create two sets of adjustments for that plug-in, and toggle back and forth to hear which one you like better. The arrow button lets you copy the adjustments from one of these buttons to the other, to save the version you like best while experimenting further.

**Reset:** A single reset control brings all parameters in the current plug-in to their default settings.

When the Automation is turned on, an automation button appears at the top right of each of the plug-ins. Automatable parameters for that effect are available in the Plug-in drop-down menu for that track.

---

**NOTE:** Although Default is the preset when initially opened, many of the plug-ins, have presets already created. Reverb, for instance, has Cathedral, Concert Hall, and Studio presets built in. These can be excellent starting points to change, rename, and save for your specific needs. These new presets will also be available in the Preset drop-down menu.
Chorus

An effects plug-in. A classic Chorus effect, used to layer voices or sounds against modulated versions of themselves to add harmonic interest in different ways.

An animated graph shows the results of adjusting the Modulation parameters of this plug-in, giving you a visualization of the kind of warble or tremolo that will be added to the signal as you make adjustments.

The Chorus Fairlight FX

Chorus has the following controls:

— **Bypass**: Toggles this plug-in on and off.
— **Input Format**: (Only visible when Chorus is inserted on a multi-channel track.) Lets you choose how multiple channels are input to the Chorus. Stereo sets separate Left and Right channels. Mono sums Left and Right to both channels. Left inputs the Left channel only, and Right inputs the Right channel only.
— **Delay**: The amount of delay between the original sound and the Chorus effect.
— **Delay Time**: Length of the Chorus delay lines.
— **Separation**: Time separation of the delay voices.
— **Expansion**: Sets L/R length differences, phase offset of modulators.
— **Modulation**: These controls adjust the low frequency oscillator (LFO) that drives the tremolo of the chorus effect in different ways.
— **Waveform:** Specifies the shape of the LFO that modulates the rate of the Chorus, affecting the timing of the oscillations. There are six options for the oscillator for you to choose from:

- **Sine (smooth oscillations)**
- **Triangle (sudden oscillations)**
- **Saw1 (jerky oscillations)**
- **Saw2 (jerky oscillations)**
- **Square (hard stops between oscillations)**
- **Random (randomly variable oscillations)**

— **Frequency:** Rate of LFO controlling the Chorus. Lower values generate a warble, higher values create a tremolo.

— **Pitch:** Amount of frequency modulation, which affects the pitch of the Chorus.

— **Level:** Depth of level modulation. Affects the “length” of the segment of Chorus that’s added to the sound. Low values add only the very beginning of the Chorus effect, high values add more fully developed Chorus warble or tremolo.

— **Feedback:**

- **Amount (%):** The percentage of signal fed back to the Chorus Delay Line. Values can be positive or negative, the default is 0 (no effect). Increasing this parameter adds more of the Chorus effect to the signal, lowering this parameter adds more of the inverted Chorus effect to the signal. At values closer to 0, only a faint bit of Chorus can be heard in the audio, but at values farther away from 0 (maxing at +/- 99), a gradually pronounced Chorus becomes audible.

- **Blend (%):** Amount of feedback which bleeds into the opposite channel (Stereo mode only).

— **Output:** Controls for adjusting the final output from this plug-in.

- **Dry/Wet (%):** A percentage control of the output mix of “dry” or original signal to “wet” or processed signal. 0 is completely dry, 100% is completely wet.

- **Output Level (dB):** Adjusts the overall output level of the affected sound.
De-Esser

A repair plug-in specific to dialog. The De-Esser is a specialized filter that’s designed to reduce excessive sibilance, such as hissing “s” sounds or sharp “ts” sounds, in dialog or vocals.

A graph shows you which part of the signal the controls are set up to adjust, while reduction and output meters let you see which part of the signal is affected and what level is being output.

The De-Esser has the following controls:

— **Bypass**: Toggles this plug-in on and off.
— **Listen to Ess Only**: This checkbox at the top right lets you listen only to the ess that is being removed. This is very useful to determine if too much signal is being removed or if more ess attenuation can be applied.
— **Frequency Range**: Two controls let you target the frequency of the “s” sound for a particular speaker.
  — **Target Frequency**: A knob that lets you target the frequency of the offending sibilance. Sibilant sounds are usually found in the range of 5 - 8kHz.
  — **Range**: switches the operational mode of the De-Esser. Three choices (from top to bottom) let you switch among Narrow Band, Wide Band, and All High Frequency which processes all audio above the source frequency.
— **Amount**: Adjusts the amount de-essing that’s applied.
— **Reaction Time**: Adjusts how suddenly de-essing is applied. There are three choices.
  — **Slow**: Equivalent to a slow attack.
  — **Medium**: Equivalent to a medium attack.
  — **Fast**: A “lookahead” mode. Equivalent to a fast attack.
De-Hummer

A repair plug-in with general applications to any recording. Eliminates hum noise that often stems from electrical interference with audio equipment due to improper cabling or grounding. Typically 50 or 60 cycle hum is a harmonic noise, consisting of a fundamental frequency and subsequent partial harmonics starting at twice this fundamental frequency.

A graph lets you see the frequency and harmonics being targeted as you adjust this plug-in’s controls.

De-Hummer has the following controls:

— **Bypass**: Toggles this plug-in on and off.
— **Listen to Hum only**: This checkbox at the top right lets you listen only to the hum that is being removed. This is very useful to determine if too much signal is being removed or if more hum attenuation can be applied.
— **Frequency**: Target source fundamental frequency. A knob lets you make a variable frequency selection, while radio buttons let you select common frequencies that correspond to 50Hz/60Hz electrical mains that are the typical culprits for causing hum.
— **Amount**: Adjusts how much De-Hum extraction you want to apply.
— **Slope**: Adjusts the ratio of fundamental frequency to partial harmonics, the adjustment of which lets makes it possible for various kinds of hum to be targeted. For example, a value of 0 biases hum extraction towards the fundamental frequency, while a value of 0.5 gives equal extraction of all harmonics (up to 4), and finally a value of 1.0 targets the higher frequencypartials.
Delay

An effects plug-in. A general purpose stereo delay effect, suitable for tasks varying from track doubling, to early reflection generation, through simple harmonic enhancement. Processes in stereo or mono, depending on the track it is applied to.

A graph shows the timing and intensity of the echoes generated by this plug-in on each channel, and an Output meter displays the output level of the resulting signal.

The Delay Fairlight FX

Delay has the following controls:

— **Bypass**: Toggles this plug-in on and off.
— **Input Format**: (Only visible when Delay is inserted on a multi-channel track.) Lets you choose how multiple channels are input to the delay. Stereo sets separate Left and Right channels. Mono sums Left and Right to both channels. Left inputs the Left channel only, and Right inputs the Right channel only.
— **Filters**: Alters the proportion of frequencies that are included in the delay effect. When the Delay plug-in is inserted on a Mono Channel, the Left and Right sections are replaced with a single “Delay” section.
  — **Low Cut (Hz)**: A global High Pass filter.
  — **High Cut (Hz)**: A global Low Pass filter.
— **Delay**: Adjusts the timing of the delay.
  — **Left/Right Delay (ms)**: Delay time of each channel.
  — **Left/Right Feedback (%)**: Feedback % of the Left or Right channel back to itself. A negative value equates to % of feedback with a phase reverse from the original signal.
— **Feedback**: Controls for adjusting the amount of bleed between channels.
  — **High Ratio**: Adjusts the frequency of a damping filter for the feedback signal.
  — **Stereo Blend**: Adjusts the proportion of signal from Left and Right channel feedback which feeds into the opposite channel. When the Delay plug-in is inserted on a Mono channel, Stereo Blend control does not appear.
— **Output**: Controls for adjusting the final output from this plug-in.

— **Dry/Wet (%)**: A percentage control of the output mix of “dry” or original signal to “wet” or processed signal. 0 is completely dry, 100% is completely wet.

— **Output Level (dB)**: Adjusts the overall output level of the affected sound.

## Dialog Processor

The Dialog Processor chains together six different common audio processing operations inside of a single plug-in, each tuned to the specific needs of adjustments to improve recorded dialog. The specialized De-Rumble, De-Pop, De-Ess, Comp(ressor), Expander, and Excite controls each have a streamlined set of controls tailored to the specific types of common adjustments that may be required for a great sounding dialog track.

![Image of Dialog Processor plug-in]

- **De-Rumble**: Controls the frequency cut-off for the filter which can reduce or eliminate rumble.
  - **Frequency**: Sets the high-pass filter to frequencies between 40Hz to 235Hz.

- **De-Pop**: These controls adjust the low frequency oscillator (LFO) that drives the tremolo of the chorus effect in different ways.
  - **Frequency**: Sets the filter to frequencies between 50Hz to 200Hz.
  - **Amount**: Sets the amount of the filter effect on the signal with lower values effecting less and higher values effecting more. A meter next to the amount knob shows how the signal is being effected.

- **De-Ess**: These controls adjust the low frequency oscillator (LFO) that drives the tremolo of the chorus effect in different ways.
  - **Frequency**: Sets the filter to frequencies between 700Hz to 9000Hz.
  - **Amount**: Sets the amount of the filter effect on the signal with lower values effecting less and higher values effecting more. A meter next to the amount knob shows how the signal is being effected.
— **Compressor:** These controls adjust the low frequency oscillator (LFO) that drives the tremolo of the chorus effect in different ways.

— **Threshold (dB):** Sets the level at which the signal will start to be effects from -40dB to -8dB.

— **Amount:** Sets the amount of the compression on the signal with lower values effecting less and higher values effecting more. A meter next to the amount knob shows how the signal is being effected.

— **Fast/Slow:** Determines the speed at which the effect is applied, fast or slow.

— **Expander:** These controls adjust the low frequency oscillator (LFO) that drives the tremolo of the chorus effect in different ways.

— **Frequency:** Rate of LFO controlling the Chorus. Lower values generate a warble, higher values create a tremolo.

— **Amount:** Sets the amount of the expansion on the signal with lower values effecting less and higher values effecting more. A meter next to the amount knob shows how the signal is being effected.

— **Fast/Slow:** Determines the speed at which the effect is applied, fast or slow.

— **Excite:** These controls adjust the low frequency oscillator (LFO) that drives the tremolo of the chorus effect in different ways.

— **Amount:** Sets the amount of the exciter on the signal with lower values effecting less and higher values effecting more. A meter next to the amount knob shows how the signal is being effected.

— **Female/Male:** Allows for precise use on either male or female voices.

## Distortion

An effects plug-in. Creates audio distortion that's useful for sound design and effects, ranging from simple harmonic distortion simulating an audio signal going through primitive or faulty electronics (such as bad speakers, old telephones, or obsolete recording technologies), all the way to mimicking an overdriven signal experiencing different intensities of hard clipping (think someone yelling through a cheap bullhorn, megaphone, or PA system). This plug-in includes soft tube emulation in the output stage.

An animated graph shows the results of adjusting the Distortion parameters of this plug-in, giving you a visualization of the kind of harmonic distortion, waveshaping, and clipping that will be modifying the signal as you make adjustments. Input and Output meters let you see how the levels are being affected.
Distortion has the following controls:

- **Bypass**: Toggles this plug-in on and off.
- **Filters**: Two filters let you simulate devices reproducing limited frequency ranges.
  - **LF Cut**: Low frequency distortion shaping.
  - **HF Cut**: High frequency distortion shaping.
- **Distortion**: Three sets of controls let you create the type and intensity of distortion you want.
  - **Mode buttons**: Switch the operational mode of distortion. The one to the left, Distortion, creates harmonic distortion. The button to the right, Destroy, is a more extreme polynomial waveshaper.
  - **Distortion**: Adjusts the amount of distortion that’s applied to the signal. Higher values distort more.
  - **Ceiling**: Adjusts the level of input signal that triggers clipping.
- **Output**: Controls for adjusting the final output from this plug-in.
  - **Dry/Wet (%)**: A percentage control of the output mix of “dry” or original signal to “wet” or processed signal. 0 is completely dry, 100% is completely wet.
  - **Output Level (dB)**: Adjusts the overall output level of the affected sound.
  - **Auto Level button**: Applies automatic compensation for gain added to the signal due to the distortion being applied. Having this button turned on prevents the signal from becoming dramatically and unexpectedly increased, while turning it off frees you to do what you want, if what you want is to hear a lot of distortion.
Echo

An effects plug-in. A classic Echo effect, simulating the reflection of sounds that occur with a delay after the direct sound is heard. Processes in stereo or mono, depending on the track it’s applied to.

A graph shows the timing and intensity of the echoes generated by this plug-in on each channel, and an Output meter displays the output level of the resulting signal.

Echo has the following controls:

— **Bypass**: Toggles this plug-in on and off.
— **Input Format**: (Only visible when Echo is inserted on a multi-channel track.) Lets you choose how multiple channels are input to the echo. Stereo sets separate Left and Right channels. Mono sums Left and Right to both channels. Left inputs the Left channel only, and Right inputs the Right channel only.
— **Filter**: Alters the proportion of frequencies that are included in the delay effect. When the Delay plug-in is inserted on a Mono Channel, the Left and Right sections are replaced with a single “Delay” section.
  — **Low Cut (Hz)**: A global High Pass filter.
  — **High Cut (Hz)**: A global Low Pass filter.
  — **Feedback**: Adjusts the frequency of a damping filter for the feedback signal.
— **Left Channel**: Parameters that independently affect delay on the Left Channel. When the Echo plug-in is inserted on a Mono Channel, the Left Channel and Right Channel sections are replaced with a single “Echo” section with only the Delay Time, Feedback Delay, and Feedback controls.
  — **Delay Time**: Global Delay time for the Left Channel.
  — **Feedback Delay**: Echo Delay time for the Left Channel.
— Feedback: Feedback percentage of the Left channel back to itself.
— L > R Feedback: Percentage of Left feedback signal which feeds back to Right Channel.

— **Right Channel:** Parameters that independently affect delay on the Right Channel.
  — Delay Time: Global Delay time for the Right Channel.
  — Feedback Delay: Echo Delay time for the Right Channel.
  — Feedback: Feedback percentage of the Right channel back to itself.
  — R > L Feedback: Percentage of Right feedback signal which feeds back to Left Channel.

— **Output:** Controls for adjusting the final output from this plug-in.
  — Dry/Wet (%): A percentage control of the output mix of “dry” or original signal to “wet” or processed signal. 0 is completely dry, 100% is completely wet.
  — Output Level (dB): Adjusts the overall output level of the affected sound.

---

**Flanger**

An effect plug-in, giving that unmistakable Flanger sound dating from the days of dual tape machines with a slight delay added to one in periodic intervals causing flanging as they got back in sync with one another. Typically used to add a sort of warbling harmonic interest to a signal, in a wide variety of ways.

An animated graph shows the results of adjusting the Modulation parameters of this plug-in, giving you a visualization of the kind of warble that will be added to the signal as you make adjustments.

The Flanger Fairlight FX

The Flanger has the following controls:

— **Bypass:** Toggles this plug-in on and off.
— **Input mode:** (Only visible when the Flanger is inserted on a multi-channel track.) Lets you choose how multiple channels are input to the Flanger. Stereo sets separate Left and Right channels. Mono sums Left and Right to both channels. Left inputs the Left channel only, and Right inputs the Right channel only.
— **Modulation:** A low frequency oscillator (LFO) used to drive the Flanger effect.

— **Waveform (Hz):** Specifies the shape of the LFO that modulates the rate of the Flanger. The three choices are Sine (a smooth change in rate), Triangle (a jerky change in rate), and Sawtooth (an abrupt change in rate). Affects the timing of the warble that is added to the sound.

— **Rate:** Speed of the LFO, affects the speed of the warble that is added to the sound. Low rate values create a slow warble, while high rate values create more of a buzz.

— **Depth:** Affects the “length” of the warble that is added to the sound. Low values add only the very beginning of a warble, high values add more fully developed warble.

— **Width:** Consists of a single parameter, Expansion, which sets Left/Right channel length differences, along with the phase offset of modulators.

— **Feedback:** These controls determine, in large part, how extreme the Flanging effect will be.

— **Amount (%):** The percentage of signal fed back to the Delay Line. Values can be positive or negative, the default is 0 (no effect). Increasing this parameter adds more of the Flange effect to the signal, lowering this parameter adds more of the inverted Flange effect to the signal. At values closer to 0, only a faint phase shift can be heard in the audio, but at values farther away from 0 (maxing at +/- 99), a gradually increasing warble becomes audible. The type of warble depends on the Modulation controls.

— **High Ratio:** Determines the attenuation of the echo over time.

— **Output:** Controls for adjusting the final output from this plug-in.

— **Dry/Wet (%):** A percentage control of the output mix of “dry” or original signal to “wet” or processed signal. 0 is completely dry, 100% is completely wet.

— **Output Level (dB):** Adjusts the overall output level of the affected sound.

---

**Foley Sampler**

The Foley Sampler is a built-in sampler that makes it easy to add sound effects that you want to play using a keyboard, pad, or other MIDI performance device connected to your computer, to add timed sound effects to sync with onscreen visuals. This plug-in has been designed to simplify the process of recording performed audio cues on the current track to which the sampler has been added.

**Setting Up the Foley Sampler**

Using the Foley Sampler to record samples played with a MIDI controller is easy.

1. Create an audio track for your sound effects or instrument recording.

2. Drag the Foley Sampler onto the track header to assign it to that track. The Foley Sampler window automatically appears. The Fairlight page knows this is an instrument with no inputs to the plug-in, so this effect is automatically patched to that track’s input, ready for recording.

3. If you have a MIDI controller of some kind connected to your computer and properly configured, it will appear in the MIDI drop-down menu at the upper-right corner of the Foley Sampler window (next to the Keyboard button). Choose your device from this menu, and the Keyboard button will highlight to show it’s enabled.
At this point, the Foley Sampler is ready to be used, but by default it has no samples loaded to play. The next step is to add sound effects.

**Adding Sound Effects**

You can add prerecorded sound effects or instruments to the Foley Sampler in the following ways:

— Drag and drop an audio file in a supported format from the file system onto the Foley Sampler window

— Drag and drop a sound effect from the Sound Library onto the Foley Sampler window

— Click the Foley Sampler window’s Option menu and input sounds from your attached drives.

Once you’ve loaded a sound effect of some kind, it’s automatically mapped to the top four keys of your instrument, starting at C2. Pressing a key or pad of your controller will play that sound.

To see the sound’s waveform click the Sample button at the top of the Sound panel. In this example, there are a series of continuous footsteps recorded in a row that we can use.

A footsteps recording loaded into the Foley Sampler

**Splitting Sound Effects**

It’s common to use pre-recorded library sound effects that consist of a series of recorded footsteps, cloth rustles, punches, or other “foleyed” sound recordings, in order to play variations of a specific kind of repetitive sound effect in sync to action that’s happening on screen. The Foley Sampler lets you do this easily.
1 After you’ve loaded a sound effect, click the Foley Sampler window’s Option menu and choose Split Sample to automatically split the current sample into slices based on an analysis of its noise floor, and assign each slice to a set of keys or pads on your selected MIDI device. Continuing with the previous example, each footstep has been split and assigned to a different key.

2 To adjust the timing of each slice of the sound effect that’s been split apart, you can click on the assignment text above the keyboard at the bottom of the window to see that slice in the Sample view.

3 You can adjust the Range Start and Range End parameters to encompass as much or as little of that slice as you want to play back.

4 If you want a sample to loop if a note is held down, you can enable the Loop button, and then adjust the Loop Start and Loop End parameters to choose how much of each slice will loop.

5 To delete slices that aren’t useful, you can select a slice you don’t like and press Shift-Delete to clear that slice from the virtual keyboard.

Assigning Sound Effects Manually

When you first load sound effects into the Foley Sampler, they’re automatically assigned to a series of notes. Each additional sound effect that you load is automatically assigned to the next series of notes to the right. Once all notes are occupied, additional sound effects will shuffle all previous assignments to the left.

You also have the option of manually assigning sound effects that you load. This is useful when you want to manually load a variety of different sound effects all at once (such as a combination of punch
sounds, human grunts, and cloth rustles to use in a fight scene), and assign them to particular notes of your choosing.

1. Load a sound effect you want to map.
2. Click the Mapping button to remap the range of notes it corresponds to.
3. Use the Low and High parameters to select a range of notes for the selected sound.
4. You also have the option of tuning the pitch of specific sound effects, if necessary.

Adjusting Sound Effects

If you want to customize a sample or slice further, you can select it above the virtual keyboard and use the controls on the Level panel to control the dynamics of audio playback, or you can use the controls on the Filter panel to EQ the sound.

**TIP:** If a sample or slice is set to loop, you can press the Control key and click a key on the virtual keyboard to initiate looping, so you can hear these adjustments as you’re making them.

Playing and Recording Sound Effects

Once you’ve set up the Foley Sampler with sound effects you can play from a MIDI controller, recording those sound effects is simple.

1. Make sure that the “Save clips to” field in the Capture and Playback panel of the Project Settings is correctly set up to record to the desired storage volume, using the Browse button, if necessary.
2. Click the R button in the track header of the audio track to which you applied the Foley Sampler, to put that track into Record Enable mode.
3. Click the Record button in the Fairlight toolbar.
4. While Fairlight records, use the keys or buttons of your MIDI controller to play sounds in sync to the picture on your display. When you’re done, click the Stop button.

You should now have a recorded clip containing the sound effects you played, in sync to the picture. If they’re a bit out of sync, you can always use the Elastic Wave audio retiming controls to tighten the sync without re-recording everything.
A new clip of audio created by recording sounds played via the Foley Sampler

**Frequency Analyzer**

This lets you see a visualization of the levels across all frequencies of a clip or track. A Mode drop-down lets you choose to see the full audible spectrum, or to restrict the visualization to low, medium, or high frequencies.

This utility tool can analyze a clip or a track's frequencies. With this added information you can then use the EQ to further sculpt the audio to reduce the unwanted frequency and boost the desired ones.

**LFE Filter**

A low-pass filter that you can apply to a FlexBus or Main that’s in a surround sound format, to feed low-frequency sound to an LFE channel as part of a surround sound mix. The filter will exclude any sounds above your chosen frequency setting to the audio that is sent to a sub-woofer in the LFE channel. It helps keep unwanted and unnecessary audio from being sent to the sub-woofer and increases playback clarity.

A Frequency control lets you choose which low frequency range you want to include, and a Trim control lets you set the level of the resulting LFE channel. If it is multi-channel but has no LFE channel available, such as a 5.0 format, then this plug-in does nothing.
The LFE plug-in

**Limiter**

A true peak limiter that is capable of looking 64 samples ahead of the input, in order to limit the audio in a very smooth fashion. An Input control lets you adjust the level of the incoming signal, while Threshold and Release controls let you adjust the limiting that’s being done. A graph shows you an analysis of the audio as it’s processed, with a visual indication of what parts of the signal are being affected by this plug-in.

It is used to detect and reduce the peaks of an audio signal so that the overall level can then be boosted without clipping, thus reducing the dynamic range of a given signal, similar to compression.

The Limiter has the following controls:

- **Bypass**: Toggles this plug-in on and off.
- **Input Meter**: Shows the input level into the Limiter.
- **Input Level**: Allows you to adjust the level incoming to the Limiter, allowing for reducing down to -18dB or boosting up to an additional 18dB. A Soft button, when activated, makes a more gentle attack to the limit amount.
— **Limit Threshold**: Determines at what level the Limiter will activate and reduce the input signal. When set to -24dB any signal above that is limited, when set to 0 then no limiting will take place.

— **Release**: Determines the speed of the Limiter’s release from the signal’s reduction, from very fast at the lowest setting of 0.01 milliseconds to its slowest release of 1000 milliseconds.

— **Reduction Meter**: Shows the level reduction applied to the input signal.

— **Output Meter**: Shows the output level after the limit.

## Meter

A sample peak processing meter that’s useful for temporarily adding a meter to a specific track or FlexBus. These meters are useful for instances where you want a large meter that focuses on a specific bus or track while you’re working.

These meters are presented very simply, with a gray bar indicating level and a red peak line that holds for two seconds, which indicates the highest peak. A numeric reading at the top of the meter gives the exact level, in dB. This number continues to hold, indicating the loudest level measured for any given stretch of playback.

The Meter Fairlight FX

Meter can be resized by pulling from the bottom right and has the following controls located in the option menu:

— **Reset Peak on Play**: When enabled, the numeric peak level is reset every time playback stops and starts again. When disabled, the numeric peak level persists until changed by a higher peak.

— **Reset**: Resets the numeric peak level.
Modulation

An effect plug-in. General purpose modulation plug-in for sound fx/design. Four effects combine an LFO, FM adjustment, AM adjustment, Sweep and Gain filters to allow simultaneous frequency, amplitude and space modulation. In conjunction with the Rotation controls, simple Tremelo and Vibrato effects can be combined with auto-filter and auto-Pan tools in order to provide texture and movement to a sound.

An animated graph shows the results of adjusting the Modulator, Frequency, and Amplitude parameters of this plugin, giving you a visualization of the kind of modulations that will be applied to the signal as you make adjustments. Output meters let you see what level is being output.

Modulation has the following controls:

— **Bypass**: Toggles this plug-in on and off.
— **Modulator**: A low frequency oscillator (LFO), shown in blue in the animated graph.
— **Shape**: Specifies the shape of the LFO waveform that modulates the audio. Six options include Sine, Triangle, Saw1, Saw2, Square, Random.
— **Rate (Hz)**: Adjust the speed of the modulating LFO. Lower settings result in warbling audio, while extremely high settings result in buzzing audio the timbre of which is dictated by the shape you’ve selected.
— **Frequency**: Frequency modulation (FM) of a secondary oscillator, shown as green in the animated graph.
— **Level (%)**: Acts as a Dry/Wet knob controlling the amount of Frequency Modulation that’s applied, intensifying or easing off the effect.
— **Phase:** Since each of the four primary effects within this plug-in can be applied together, along with the fact that modulation with level components (Tremelo/Rotation/Filter) have the ability to combine or cancel out one another, phase controls are available. Altering the phase of an individual effect allows control of such interaction (e.g., cancel out a high level change, or offset a cancellation).

— **Filter:** Sweep and gain filters.
  
  — **Filter (%):** Acts as a Dry/Wet knob controlling the amount of filter sweep and gain to additionally use to modify the signal. The amount you’ve selected is previewed in a 1D graph to the side.
  
  — **Tone:** Adjusts the center frequency of sweep.
  
  — **Phase:** Since each of the four primary effects within this plug-in can be applied together, along with the fact that modulation with level components (Tremelo/Rotation/Filter) have the ability to combine or cancel out one another, phase controls are available. Altering the phase of an individual effect allows control of such interaction (e.g., cancel out a high level change, or offset a cancellation).

— **Amplitude:** Amplitude modulation (AM) of a secondary oscillator, shown as green in the animated graph.
  
  — **Level (%):** Acts as a Dry/Wet knob controlling the amount of Amplitude modulation applied. (Disabled in Ring Modulation Mode.)
  
  — **Phase:** Since each of the four primary effects within this plug-in can be applied together, along with the fact that modulation with level components (Tremelo/Rotation/Filter) have the ability to combine or cancel out one another, phase controls are available. Altering the phase of an individual effect allows control of such interaction (e.g., cancel out a high level change, or offset a cancellation).
  
  — **Ring Modulation Mode:** Enables a Ring Modulation effect (where the signal is multiplied by the modulator, rather than modulated by it).

— **Rotation:** These controls are only available when applied to a multi-channel track.
  
  — **Rotate:** Amount of Rotation applied.
  
  — **Offset:** Starts offset of rotation in order to further place the signal in space.
  
  — **Phase:** Since each of the four primary effects within this plug-in can be applied together, along with the fact that modulation with level components (Tremelo/Rotation/Filter) have the ability to combine or cancel out one another, phase controls are available. Altering the phase of an individual effect allows control of such interaction (e.g., cancel out a high level change, or offset a cancellation).

— **Output:** Controls for adjusting the final output from this plug-in.
  
  — **Dry/Wet (%):** A percentage control of the output mix of “dry” or original signal to “wet” or processed signal. 0 is completely dry, 100% is completely wet.
  
  — **Output Level (dB):** Adjusts the overall output level of the affected sound.
Multiband Compressor

A dynamics processor that compresses in highly definable frequency bands. The graph displays frequencies in Hertz horizontally and gain in decibels vertically. This allows for precise compression specific to defined frequency bands and is useful for taming only one or several parts of a signal.

The default setting of the Multiband Compressor

Each band has dynamics control in the determined frequency ranges of Low, Med, and High and are adjustable by pushing the intersection mark on the graph per band or by typing in a frequency.

— **Bands 1 – 4**: Controls for each band.
  
  — **Threshold**: Sets the maximum allowable output level. The default is –25dB. The range is from –50 to 0dB.
  
  — **Gain**: Can add or attenuate up to 12dB of gain.
  
  — **Ratio**: Adjusts the compression ratio. This sets the gain reduction ratio (input to output) applied to signals that rise above the threshold level. The default is 1.5:0.1. The range is 1.0:1 to 7:1.
  
  — **Limit**: Limits the output amount by up to 15dB. The default is 4.5dB.
  
  — **Attack**: Adjusts the attack rate time constant of the sidechain detector. The default is 1.4mS. The range is 0.1 to 100mS.
  
  — **Hold**: Keeps dynamics from being triggered again until a certain amount of time has passed, in mS (milliseconds). Defaults to 0mS. The range is from 0 to 4000mS.
  
  — **Release**: Adjusts how quickly the sidechain detector stops applying dynamics when a signal goes back below the threshold. The default is 150mS. The range is 50mS to 4.0S.
— **Master**: Controls for adjusting the final output from this plug-in.

— **Gain (dB)**: Adjusts the overall output level of the affected sound by adding or reducing 18dB of gain.

— **Q**: Adjusts the width of affected frequencies. Lower values include a wider range of frequencies, higher values include a narrower range of frequencies.

### Noise Reduction

A repair plug-in designed to reduce a wide variety of noise in all kinds of recordings. A graph shows a spectral analysis of the audio being targeted, along with a purple overlay that shows what noise is being targeted. Two audio meters let you evaluate the input level (to the left) versus the output level (to the right), to compare how much signal is being lost to noise reduction. There are three default presets: De-Hiss, De-Rumble, and De-Rumble and Hiss.

![Noise Reduction Fairlight FX in action](image)

Noise Reduction has the following controls:

— **Bypass**: Toggles this plug-in on and off.

— **Listen to Noise Only**: This checkbox at the top right lets you listen only to the noise that is being removed. This is very useful to determine if too much signal is being removed or if more noise attenuation can be applied.

— **Threshold (in dB)**: Relates to the signal-to-noise ratio (SNR) in the source recording. Recordings with a poor signal-to-noise ratio will require a higher threshold value, resulting in more noise reduction being applied.
— **Attack (in ms):** Primarily useful in Auto Speech mode, this controls the duration over which the noise profile is detected. Ideally, the attack time should match the variability of the unwanted noise. A low value corresponds to a faster update rate of the noise profile and is useful for quickly varying noise; a high value corresponds to a slower update rate and can be used for noise that’s more consistent.

— **Sensitivity:** Higher sensitivity values exaggerate the detected noise profile; the result is that more noise will be removed, but more of the dialog you want to keep may be affected.

— **Ratio:** Controls the attack time of the signal profile relative to the attack time of the noise profile. A faster ratio detects and preserves transients in speech more easily, but the resulting speech profile is less accurate.

— **Frequency Smoothing:** Smoothes the resulting signal in the frequency domain to compensate for harmonic ringing in the signal after the noise has been extracted.

— **Time Smoothing:** A toggle button enables smoothing of the resulting signal in the time domain as well.

— **Dry/Wet:** A percentage control of the output mix of “dry” or original signal to “wet” or processed signal. 0 is completely dry, 100% is completely wet.

— **Level:** To let you compensate for level that may be lost due to the noise reduction operation you’re applying, this applies a pre-gain in, from -6dB to +18dB, just before the dry/processed mix.

---

**Phase Meter**

Phase cancellation is a phenomena where the waveforms of a stereo recording (for example a stereo recording of a music performance) go slightly out of sync with one another for whatever reason, and begin to cancel one another out in unpredictable ways, resulting in the audio sounding strange. This results in poor quality audio and can cause problems when you’re trying to compress a mix to a distribution format such as AAF or MP3.

The Phase Meter plug-in is a visual meter that lets you evaluate whether or not a signal is in phase and is meant to be applied to a bus so you may evaluate the phase of a mix and correct whatever problems may be occurring. The position of a green dot within a horizontal meter indicates the phase of the signal. When there’s no signal or a signal on only one half of a stereo bus, the dot appears in the center (0). When the signal is out of phase, the dot appears all the way to the left (−). When the signal is in phase, the dot appears all the way to the right (+).

![Phase Meter plug-in](image_url)
Pitch

An effects plug-in that shifts audio pitch without altering clip speed.

The Pitch Fairlight FX

Pitch has the following controls:

— **Bypass**: Toggles this plug-in on and off.
— **Semitones**: A “coarse” adjustment that can shift audio pitch up to +/- 12 semitones.
— **Cents**: A “fine” adjustment that can tune audio pitch in +/- 100ths of a semitone.
— **Dry/Wet**: A percentage control of the output mix of “dry” or original signal to “wet” or processed signal. 0 is completely dry, 100% is completely wet.

Reverb

A spatial simulation plug-in, capable of recreating multichannel reverberation corresponding to rooms of different sizes, adjustable via a graphical 3D cube control. This plug-in lets you take a “dry” recording and make it sound as if it’s within a grand cathedral, an empty room, a tiled bathroom, or other spaces.

To understand this plug-in’s controls, it helps to know that the signal follows three paths which are combined to create the final effect:

— A direct path.
— An early reflection path (ER) simulating early reflection rays obtained from the first multiple reflections on the walls, traveling from the virtual source to the virtual listener.
— A late reverberation path (Reverb) simulating the behavior of an acoustic model of the room.

A graph shows an approximate visualization of the reverb’s effect on the frequencies of the audio signal.
Reverb has the following controls:

- **Bypass:** Toggles this plug-in on and off.
- **Room Dimensions:** By controlling the size of the virtual room a sound is to inhabit, these parameters simultaneously control the configuration of Early Reflection and Late Reverberation processing. The acoustic modes from this simulated room are computed and fed to Late Reverberation processing. The shape, gain, and delay of the first reflections are computed and then fed to Early Reflection processing.
- **Height, Length, Width:** Defines the dimensions of the reverberant space, in meters.
- **Room Size:** The calculated Room Width x Length, in meters.
- **Reverb:** Additional controls that further customize the configuration of Early Reflection and Late Reverberation processing.
  - **Pre Delay:** Increase or negate the propagation time from the virtual source to the virtual listener. As a result, it modifies the initial delay time between the source signal and the first reflection.
  - **Reverb Time:** Decay time of the Reverb tail. It controls the overall decay time of the acoustic modes from late reverberation processing.
  - **Distance:** Modifies the distance between the virtual source and the virtual listener. It modifies only the configuration of early reflections processing.
  - **Brightness:** Modulate the shape of the decay time over frequency. At maximum brightness, decay time is identical at any frequency. At minimum brightness, higher frequencies result in shorter decay time and therefore duller sound.
  - **Modulation:** Adds random low-frequency phase modulation from the tapping point of ER processing. At 0%, modulation is not used.
- **Early Reflection Tone:** Four post equalization controls modify the tone of early reflections to suit a particular room’s characteristics.
  - **Low Gain:** Amount of gain added to the low frequency.
— **Low Frequency**: Frequency range of 150 Hz to 500 Hz.
— **High Gain**: Amount of gain added to the high frequency.
— **High Frequency**: Frequency range of 1k Hz to 16k Hz.

— **Reverb Tone**: Four post equalization controls modify the tone of the reverb tail to suit a particular room’s characteristics.
— **Reverb Tail Low Gain**: Amount of gain added to the low frequency.
— **Reverb Tail Low Frequency**: Frequency range of 150 Hz to 500 Hz.
— **Reverb Tail High Gain**: Amount of gain added to the high frequency.
— **Reverb Tail High Frequency**: Frequency range of 1k Hz to 16k Hz.

— **Output**: These controls recombine the three audio processing paths into a single output signal.
— **Dry/Wet**: A percentage control of the output mix of “dry” or original signal to “wet” or processed signal. 0 is completely dry, 100% is completely wet.
— **Direct Level**: The amount of the direct level to mix into the final signal.
— **Early Reflection Level**: The amount of early reflection to mix into the final signal.
— **Reverb Level**: The amount of reverb to mix into the final signal.

**Soft Clipper**

The Soft Clipper is a limiting processor that reduces the output level above a defined threshold in a rounded manner so that peaks are more cleanly attenuated. The Soft Clipper plug-in will impart saturation effects when pushed hard above the threshold, allowing for the introduction of warmth and subtle distortion to the sound. A graph shows the shape of the curve adjustment this plug-in makes to the audio.

A soft clipper is often combined with a standard limiter in order to increase perceptual loudness of material without imparting harshness.

![Soft Clipper Fairlight FX](image)
— **Threshold**: Introduces input gain to the signal prior to hitting the clipper, forcing audio peaks over the threshold by that amount. As such, it will drive the saturation and distortion.
— **Shape**: The shape of the clipper can be varied to change the character of the soft clipper from full soft-clipping (all the way right, where the peaks are rounded) to full hard-clipping (all the way left, where the peaks are squared off).
— **Output Level**: Lets you adjust the output gain to compensate for signal lost during soft clipping, if necessary.

**Stereo Fixer**

A simple plug-in designed to fix stereo source material in cases where only one side of a stereo signal was recorded, where one side of a stereo recording is a different level to the other, or where the stereo channels have been incorrectly Left/Right swapped.

This plug-in can also be used as a “Mid/Side” decoder, for recordings that were made using this microphone technique.

This plug-in is for stereo clips only.

![The Stereo Fixer Fairlight FX](Image)

— **Format**: The input processing mode you want to use to fix the stereo output.
  — **Stereo**: (Default) No format conversion is performed.
  — **Reverse Stereo**: Swaps the Left and Right side.
  — **Mono**: The output from the plug-in is a mono mix of the two inputs.
  — **Left Only**: The left input is sent to both left and right outputs.
  — **Right Only**: The right input is sent to both left and right outputs.
  — **M/S**: The left output is the left (Mid) input minus the right input (Side). The right output is the left (Mid) input plus right input (Side).
— **Left/Right Gain**: Lets you apply independent gain on the left or right outputs. This gain is applied after (post) the input processing mode.
**Tip:** For a comprehensive M/S decoder solution, simply chain two Stereo Fixer plug-ins together. Use the first unit to control the Side signal level, thus controlling the width of the second unit (set to M/S).

**Stereo Width**

An enhancement plug-in that increases or reduces the spread of a stereo signal in order to widen or reduce the separation between channels. If this plug-in is added to a Mono channel, it will be disabled, as there is no stereo width to either distribute or control.

A graph shows the currently selected width of stereo distribution as a purple arc, while inside of that graph a stereo meter shows the Left and Right distribution of the audio signal. Two audio meters measure levels, an Input meter to the left, and an Output meter to the right.

Stereo Width has the following controls:

- **Width:** Lets you control the spread of the stereo output. Settings range from 0 (Mono) to 1 (Stereo) to 2 (extra wide stereo).
- **Diffusion:** Adds more complexity to the output.
- **Sparkle:** Adds more high frequencies to the spread.
Surround Analyzer

The Surround Analyzer is a graphical meter that shows a spatial image of the audio being measured, rather than a typical bar graph meter. Due to its changing shape because of the signal being played, sometimes it is referred to as the “jellyfish meter.”

This type of metering is very useful; rather than relying on bars to indicate the directions in which audio is radiating, you can clearly see the relationship of all of the channels to one another.

Vocal Channel

An enhancement plug-in for general purpose vocal processing consisting of High Pass filtering, EQ, and Compressor controls.

Side by side EQ and Dynamics graphs are presented above the controls. An output audio meter lets you monitor the final signal being produced by this plug-in.
Vocal Channel has the following controls:

- **High Pass**: Enabled by a toggle, off by default. Has a single frequency knob that sets the threshold below which frequencies are attenuated to reduce boominess or rumble.

- **EQ**: A three-band EQ for fine tuning the various frequencies of speech, enabled by a toggle, including Low, Mid, and High Mode, Frequency, and Gain controls
  - **Low/Mid/Hi Mode**: Lets you choose from different filtering options to use for isolating a range of frequencies to adjust. Different bands present different options.
  - **Low/Mid/Hi Freq (Hz)**: Lets you choose the center frequency to adjust.
  - **Low/Mid/Hi Gain (dB)**: Lets you boost or attenuate the selected frequencies.

- **Compressor**:
  - **Threshold (dB)**: Sets the signal level below which compression occurs. Defaults to -25dB. The range is from -40 to 0dB.
  - **Reaction**: Adjusts how quickly compression is applied when a signal exceeds the threshold. The default is 0.10.
  - **Ratio**: Adjusts the compression ratio. This sets the gain reduction ratio (input to output) applied to signals which rise above the threshold level. The default is 1.5:1. The range is 1.1 to 7.0.
  - **Gain (dB)**: Lets you adjust the output gain to compensate for signal lost during compression, if necessary.
Chapter 177

Audio Meters and Audio Monitoring

The Meters panel, which appears at the top of the Fairlight page when it’s enabled, provides a visual reference of the levels of each track in your mix, along with specialized meters showing the buses, monitoring mix, loudness, and a Viewer for seeing the video of the current project as you work.

This chapter describes the use of these meters, and provides information about the different options that are available.

The Monitoring Panel

Turning on the meters in the UI toolbar displays the Monitoring panel that runs along the top of the Fairlight page, which shows all of the audio meters that correspond to the tracks in the Timeline, as well as the Bus meters that correspond to the Mains, Subs, and Aux buses of your mix, the Control Room meters, and a video viewer.

Double-clicking anywhere on the Tracks panel of the meters hides or reveals a double-height Track display. With the increased track counts necessary for immersive audio, the extra metering allows you to see more tracks display in real time.

Hovering a mouse below the Tracks panel shows a cross-hairs that allows you to resize the Monitoring panel to fit a particular need for viewing.

The Compound meters and the Bus Output meters can also be resized by hovering on the right side of the Loudness meter and dragging to the desired dimensions.

Track Meters and Monitoring Controls

At left, a row of audio meters corresponds to the channel strips of the Mixer, one meter for every audio track in the timeline. Each track displays the number of meters that corresponds to that track’s audio mapping, with mono tracks having a single audio meter, stereo tracks having two, 5.1 tracks having six, and so on.
Track audio meters with different numbers of meters depending on that track’s audio mapping.

Each track and bus meter (with the exception of the Loudness meters) display RMS (root mean square) levels against a dB scale. A single line indicating the maximum value at any given moment in time is held briefly just above the current RMS levels, which appear as a solid bar extending from the bottom of the meter. RMS meters display a weighted “average” representation of the audio level that’s closer to the way audio is actually perceived, although not as accurate as the loudness meters discussed later in this section.

Each meter bar is color coded to indicate three different thresholds of sound level, from low (green) to high (yellow) to very high (red).

Each meter is identified by the track number it represents (track names are not shown over track meters) as well as the color of that track.
Using Post Fader or Track Source Meters

The Track Meters setting in the Fairlight tab of the Project Settings lets you choose how meters in the Fairlight page display their audio analysis. There are two options:

— **Post Fader**: Meters always display the level of each clip’s signal after whatever fader adjustments have taken place. Fading a track’s level down diminishes the visible level of that audio signal in the meter. This setting is good if you prefer a visual indication of the relative levels you’ve set your various audio tracks to, which is a very NLE-oriented behavior.

— **Track Source**: Meters always use the volume levels of the audio clips in that track, even if you’ve lowered the level using the sliders. If you’ve keyframed a clip’s volume, that change will be reflected by the audio meters, even though fader changes are not. Viewing meters this way means you can always see how much level is available to clips in your mix regardless of what the current fader levels are set to, in the event you want to keep track of audio you want to bring back into the mix later on. This is typically referred to as pre-fader metering.

Bus Meters

To the right of the track meters are the bus meters, in which all user-created Mains and buses appear, separated by type, and each displaying the number of meters that corresponds to that track’s audio mapping. This way you can see the sum of all tracks that have been routed to a particular bus.

![Bus meters for the Mains, Subs, and Aux buses](image)

Meter Plug-in

There is a Meter plug-in available for temporarily adding a meter to a specific track, Flexbus, or when using fixed busing to Sub, Aux, or Main. These are sample peak processing meters that are useful for instances where you want a large meter that focuses on a specific bus while you’re working.

These meters are presented very simply, with a gray bar indicating level and a red peak line that holds for two seconds, which indicates the highest peak. A numeric reading at the top of the meter gives the exact level, in dB. This number continues to hold, indicating the loudest level measured for any given stretch of playback. The option menu in this meter’s floating window presents different settings you can choose. For more information, see Chapter 176, “Fairlight FX.”
Surround Analyzer

The Surround Analyzer is a graphical meter that shows a spatial image of the audio being measured, rather than a typical bar graph meter. Due to its changing shape because of the signal being played, sometimes it is referred to as the “jellyfish meter.”

This type of metering is very useful; rather than relying on bars to indicate the directions in which audio is radiating, you can clearly see the relationship of all of the channels to one another.

The signal here is radiating more to the right, indicating the panning of the audio.
Compound Meters and Output Bus Selection Menu

The compound meters, to the right of the bus meters, consist of Control Room meters and Loudness meters, shown side-by-side to provide a comprehensive analysis of your overall audio mix. Below, drop-down menus let you choose which bus you want to monitor, as well as which set of speakers you want to use to do the monitoring.

![Control Room and Loudness Meters](image)

The Control Room meters (at left), and Loudness meters (at right)

Monitoring Menus

The monitoring menus determine which bus gets analyzed by the compound meters. When the compound meters are displayed, the Monitoring drop-down menu that otherwise appears to the left of the monitoring controls in the Transport toolbar instead moves to a position underneath the Loudness meters.

This drop-down menu lets you choose which bus you want to monitor as you work. You can choose one of your mains or user-defined Flexbus that you want to focus on for more detailed work.

![Monitoring Menu](image)

The monitoring menu lets you choose which bus you want to monitor while working

The next drop-down menu to the right lets you choose one of the available sets of speakers once you’ve configured them in the Video and Audio I/O panel of the System Preferences. This gives you the flexibility to quickly listen to your mix on a variety of speakers and configurations to see how it holds up in different situations. For more information on configuring different speaker setups, see Chapter 4, “System and User Preferences.”
Control Room Meters

The mustard-colored Control Room audio meters show the sum of all audio channels that are routed to the currently selected bus being monitored (as selected in the drop-down menu below). These are peak meters measured in dBFS.

A true peak audio measurement is displayed at the top of the Control Room meter.

Loudness Meters

The set of meters all the way to the right are the Loudness meters, which consist of a set of two graphical meters and a numerical readout. These meters let you analyze the “integrated loudness” of the overall mix, which is the standard to which all contemporary mixing specifications refer when describing the deliverables you’re expected to provide to the client. Unlike the RMS audio meters found in the Timeline or mixer which measure audio in dB, loudness meters do a different kind of analysis, measured in LU (loudness units).

What Is LU?

A value of 1 LU (loudness unit) represents the smallest difference in audio levels that humans can actually perceive. Human hearing naturally sums all channels that reach the ear, so the summed channel meter to the right in the compound meters is an analysis of the loudness you actually hear.

Loudness Meter Options

Two options in the General Options of the Project Settings let you customize the Loudness meters.

— **Target Loudness level**: Lets you set the LUFS value that’s used as a reference level for loudness metering. Defaults to –23 LUFS, which conveniently makes the display of these meters scale similarly to traditional audio meters that you’re already used to.

— **Loudness Scale**: Lets you choose which scale you want to use with which to measure the meters. Options currently include the default of EBU +9 Scale (–18 to +9), and EBU +18 Scale (–36 to +18).
Support for Multiple Loudness Standards

The Loudness Meter can be switched among a variety of international industry-standard loudness monitoring standards. The standard you choose uses the integrated loudness value (along with a specified tolerance defined by each selected standard) to indicate whether or not the current mix level is of acceptable loudness via color coding of the Integrated Loudness value, and in the Integrated Loudness graph described below. Blue values indicate loudness levels that are below tolerance, yellow indicates loudness values that are within tolerance, and red indicates loudness values that are above tolerance.

The built-in standards you can switch among include the following:

— **BS.1770-1**: An older loudness standard used by DaVinci Resolve version 15 and before.
— **BS.1770-4**: The most up-to-date loudness standard as of DaVinci Resolve 16; the algorithms specified by this standard govern the other standards that are listed below in this drop-down menu.
— **ATSC A/85**: The American standard for acceptable loudness in broadcast.
— **EBU R128**: The European standard for acceptable loudness in broadcast.
— **OP-59**: The New Zealand and Australian standard for acceptable loudness in broadcast.
— **TR-B32**: The Japanese standard for acceptable loudness in broadcast.
— **AGCOM 219**: The Italian standard for acceptable loudness in broadcast.
— **NETFLIX**: The Netflix standard for acceptable loudness in broadcast.

All of these loudness standards are available for off-line readings as well, using the Loudness Analyzer described in the next section.

**NOTE:** The target peak meter now uses the BS.1770-4 standard for measuring maximum “true peak,” which means that this meter is capable of measuring “inter-sample peaks,” rather than only the peaks at each sample of a waveform.

Graphical Loudness Meters

Two separate meters give you a dynamic graphical measurement of the loudness of the selected bus being monitored according to the loudness standard you’ve selected, which determines how to analyze the subjective loudness of a given audio mix for purposes of compliance with required broadcast quality control (QC) standards.

— A steel-blue meter labeled M (for momentary) has as many channels as the selected bus you’re monitoring, excluding the LFE channel(s) of surround formats, which aren’t factored into loudness metering. This meter measures LEQ (equivalent sound level), within a 400ms window following the playhead as measured every 100ms. This lets you evaluate the LUFS (Loudness Units Full Scale) level of the mix at the current frame as you play. This discrete-channel analysis is used to calculate all other values of the loudness metering system.

— A second steel-blue mono meter to the right displays the sum of all channels in the M meter, displayed in LU (loudness units). The number value displayed at the top of this meter is the maximum LU value that’s been analyzed during any stretch of timeline playback. This value is held until it’s reset, either by stopping and initiating playback a second time while Link to Playhead is enabled, or when you click the Reset button at the bottom of the loudness meter area.
**Numeric Loudness Meters**
A set of values to the right of the meters give running reports on the audio level of your mix. While the graphical meters are useful for analyzing your mix as you work, these numeric readouts are particularly valuable for providing the strict information you need to adhere to written QC standards. Their meaning is as follows:

— **Short**: Measures the average LU level over a 30-second window following the playhead.

— **Short Max**: Shows the maximum level over the same 30-second window. This analysis is required by EBU R128.

— **Range**: Measures the dynamic range of the Loudness of your mix (in LU), which is the difference between the average soft and average loud parts of your mix. Analyzes the overall loudness over a played range of the mix, discounts the lowest 10% and highest 5%, and then gives a standardized expression of the difference between the remaining soft and loud levels that were analyzed. The window of analysis is as long as you’ve been playing. This analysis is required by most QC specifications.

— **Integrated**: Measures the LUFS value of the portion of the range of the mix you’ve played through. As you play, this integrated value accumulates. This analysis is required by most QC specifications.

**Absolute Scales and Dialog**
While some users prefer to measure their levels to correspond to a relative scale of “0,” similar to a VU meter where the needle rides above the “0,” others want to see the absolute measure of the amplitude in LUFS and true peak. By default, the Loudness meter is set to relative scale, but you now have the option to choose between relative scale and absolute scale in the Loudness meter.

Relative scale in the Loudness menu is relative to the selected scale, so a loudness unit of 0 corresponds to the target of the chosen measure type. For instance, if EBU R128 is selected, whose target measure is -23dB LUFS, the “0” LU (Loudness Unit) is -23dB. If ATSC A/85 is chosen, whose target is -24dB, then that becomes the corresponding equivalent of the relative LU of 0.

When using the absolute scale, the Loudness meter displays the increments to reflect the chosen measure type. In absolute scale the EBU R128 meter will display -23 instead of the relative scale’s 0.
Using the Loudness Meters

When using the Loudness meters to do a structured analysis of your mix to determine QC adherence, a group of controls let you determine when analysis begins and ends.

— **Lock Metering to Transport**: This setting is found in the compound meter option menu. When enabled, all loudness metering analysis is automatically reset whenever you move the playhead to another location in the Timeline. This is useful when you’re spot-checking different parts of your mix, or working on a particular scene. Uncheck this option if you want the measurement of playback to that point in the Timeline to remain.

— **Absolute Scale**: An absolute measure of the selected scale type.

— **Pause and Reset buttons**: When you’re doing a formal analysis of your mix, the Reset button lets you reset all currently accumulated analyses, and the Start button initiates loudness value accumulation. If you need to stop playback briefly to do something else, you can click Pause, and then click Resume when you’re ready to continue the analysis.

Offline Loudness Analyzer

Users also have the ability to analyze an audio file’s loudness offline. This is a fast way to measure loudness in imported audio files or bounced mixes.

**To initiate offline loudness analysis:**

— Right-click the file in the Timeline, and choose Analyze Audio Level from the contextual menu. A dialog box displays the available options for measurement.

All of the measurements available in the real-time loudness meter are accessible in the drop-down menu inside the Analyze Audio Level panel. When the analyzer mode is chosen, the target measurements for that mode will display next to the reading in parenthesis. Once you have clicked the analyze button, the results will display in the panel next to the chosen mode’s target measurement values.

![Loudness Standard](image)

Select the audio file, choose the desired analyzer mode, in this case EBU R128, and click analyze.

Visualizing Loudness Monitoring

When you show the track of a Main bus in the Timeline, as long as the track is high enough (ahem, tall enough), you can show or hide a series of “Loudness History” curves to visualize the loudness analysis of the mix on that bus over the duration of the mix.
The available curves are:

- **Integrated**: A thick curve shows the averaged “integrated” loudness analysis of the current mix, which is a measurement that’s taken from the beginning to the end of playback. This graph is the primary gauge of whether or not measured loudness is acceptable. The color of each segment of this curve indicates whether that part of the mix is “to spec.” Blue indicate loudness levels that are below tolerance, yellow indicates loudness values that are within tolerance, and red indicates loudness values that are above tolerance. By evaluating the colors of the curve, you can easily spot which parts of your mix might need adjustment to meet the necessary specification.

- **Momentary**: A measurement of the loudness measured in the past 400ms, shown by a thin green-blue curve, which provides an analysis of transient level changes.

- **Short Term**: A measurement of the loudness of the past 3 seconds, shown by a thin blue line, which provides a more averaged analysis than the Momentary curve, yet still indicates the dynamics of the mix.

**To show the loudness history for Main 1:**

1. Open the Automation controls by clicking the automation button on the Fairlight toolbar.
2. Open the Index, and click the eye button for the Main you want to see in the Timeline. Loudness History appears as an option in the track header controls as long as the track is tall enough to show the controls. These controls will be hidden on short tracks.
3. Turn on the Loudness History toggle, and check the curves you want to see. The Integrated, Momentary, and Short Term loudness analyses can be individually displayed or hidden, to expose overlapping graphs in that track in which you can see your program’s loudness over time.

**NOTE:** Currently, loudness history is only supported for Main 1.
A small viewer to the right of the Monitoring panel shows the frame of video at the position of the playhead. This is the same image that’s output to the external broadcast display of your workstation if you have one connected.

The Viewer lets you see the picture you’re mixing to.

Clicking the Expand Viewer button at the bottom right-hand corner lets you open the Viewer into a floating window, which you can then position anywhere you want.

To close the floating Viewer, click the Dock Viewer button at the upper right-hand corner of the floating viewer window.

Click the button at the upper right-hand corner to dock the Viewer again.

Sometimes when you need to verify lip sync, sound effects sync, or simply review a new section of a mix you’ve been working on, it helps to watch the visuals of the program full screen as you listen to your mix. You can now set the Fairlight page Viewer to Cinema Mode by choosing Workspace > Viewer Mode > Cinema Mode (Command-F).
Chapter 178

Signal Flow Diagrams

The diagrams in this chapter describe the audio signal flow that takes place within the Fairlight audio processing used by DaVinci Resolve. They’re intended for people who want an in-depth understanding of how audio is processed.

Immersive Audio Workflows

DaVinci Resolve offers substantial support for object and channel-based surround or immersive audio formats.

This chapter describes how to set up and mix with these formats when mixing in the Fairlight page.

About Immersive Audio Formats

Immersive audio formats use multiple channels of audio to position audio around an audience, to add a specially creative dimension to sound design. At their simplest, formats such as 5.1 and 7.1 surround allow the mixer to send varying amounts of any given track to the combination of speakers that makes audio sound centered in front, ambient from the rear, or weighted towards the left or right of an auditorium or living room. More sophisticated “object-based” formats such as Dolby Atmos define a virtual soundstage on which you can actually position tracks in 3D space, and the resulting positional audio is rendered by specialized encoder/decoders to however many speakers in whichever configuration a venue happens to have.

Expanded Dolby Atmos Capabilities

DaVinci Resolve 17 significantly improves Dolby Atmos mixing. The traditional surround sound experience outputs a specific set of monitoring channels that requires a specific number of monitor speakers placed in particular areas of a room, which can position sound approximately within a ring around the listener. Dolby Atmos improves upon this by being an object-based sound system operating within a 3D immersive space that can accommodate a wider variety of different speaker configurations using more speakers positioned around the listener. This increases dimensionality with more precise sound placement, adding height channels to produce sound that comes specifically from above.

A practical example of this difference can be heard when panning in a 7.1 mix; since you’re sending signals to specific points in a speaker array, those points are fixed. Although the physical size of rooms can be larger or smaller, the mix is always sent to those assigned point speakers, so the experience from room to room may be inconsistent. By comparison, Dolby Atmos gives re-recording mixers a way to mix to an idealized space instead of fixed speaker positions. This means a Dolby Atmos mix, when played in a Dolby Atmos room, takes into account the actual dimensions of the space, as well as the number of speakers that are used, to recalculate audio playback to suit that exact space and playback equipment, giving a more faithful recreation of the mix with much more specific sound placement, when necessary.

To give a clear example of the benefits of Dolby Atmos, think of a small theatre that has standard left, center, and right front-screen speakers. It then has four left surround and four right surround, four overhead left, and four overhead right. For this example, let’s say you have sent a sound to the surround left in Atmos, positioned at about one-half of the distance from the screen.

Now move the Atmos mix to a much larger room with twice as many monitor speakers. The new theatre has eight left surrounds, eight right surrounds, eight overhead left, and eight overhead right. For this example, let’s say you have sent a sound to the surround left in Atmos, positioned at about one-half of the distance from the screen.

For this example, let’s say to have that audio playing back at one-half of the distance from the screen in the small room, the audio is played on the second surround speaker on the left. When this same audio is played in the larger room, Atmos determines that the fourth surround speaker is one-half the distance from the screen. The importance is not what speaker the sounds are assigned to but rather where in space the sound should be heard. Atmos calculates the ratio of the playback spaces and monitor speakers to faithfully reproduce a mix, rather than assign sounds to a fixed speaker position.
Dolby Atmos Speaker Configurations

It is important to understand that the term Dolby Atmos isn’t restricted to describing any particular speaker layout. Dolby Atmos is a complex metadata-driven system that interprets the audio from a configured Atmos mix, determines the playback system of the end user, and calculates the mix to fit each particular space and system. Assuming the possession of a Dolby Atmos compatible system, if a 9.1.6 Atmos mix is played by someone with only a two channel playback system, then it will intelligently down mix the 9.1.6 Atmos to stereo. If a user has a standard 5.1 monitor system, then the 9.1.6 Atmos soundtrack will down mix to five channel surround with a subwoofer.

The naming of the channel configurations in the Dolby Atmos format includes the height channels in the nomenclature. Channel configurations are presented as three digits separated by periods, such as 7.2.4, which is a typical speaker configuration. The first digit describes the number of main, or ear-height monitoring channels that surround the listener. The second digit describes the number of subwoofer channels. The third digit describes the number of height channels, which are speakers positioned on, or in the case of a soundbar pointed to, the ceiling.

An example of a 7.1.4 Atmos monitor speaker configuration:

- Seven surround channels
  - Left
  - Center
  - Right
  - Left Surround
  - Right Surround
  - Left Back Surround
  - Left Right Surround
- One Subwoofer
- Four height channels

Enabling Dolby Atmos

Atmos must be enabled by going into Project Settings > Fairlight tab > Immersive Audio and turning on Enable Dolby Atmos. When enabled, the Change Track Type contextual menu when right-clicking on a track will then include the additional Atmos track types.

The Components of a Dolby Atmos Mix

Mixes created in Atmos have several specifically identified components. These work together to create an immersive mix, but each element allows the Dolby Atmos system to fit the sound specifically to the space and speaker configuration during playback. These consist of:

- **The Bed track:** Contains the bulk of mixed audio, including dialog, ambient sound effects, and music. These sorts of sounds will contain panning information, but the panning will be general. Wind, traffic in the distance, room tones, and sync dialog would all most likely fall within the bounds of a standard bed track of 7.1.2 or 9.1.6. These are tracks with fixed monitor locations.
— **Object tracks**: Pinpoint the placement of sounds moving specifically across the immersive space. Users can use these specific tracks to create panning anywhere in the room. Sounds can fly through space, around a room from height channels, to side and back back channels, mimicking the motion of objects on the screen. Object tracks use the Atmos metadata to do the calculations discussed in the last example. ADM files are Atmos exports used with the IMF file type as master deliverables, which are in the broadcast wave file format.

It’s up to users to define which tracks are Bed tracks, and which are Object tracks; these track designations, are descriptions of what the tracks you create are going to be used for. Ultimately, it’s up to the mixer which audio is organized on Bed tracks, and which is organized on Object tracks. Theoretically, users can create a mix consisting entirely of Object tracks if desired, but typically the mix would be split into beds consisting of generally panned sounds, and Object tracks for sounds requiring specific room placement.

Object tracks and height channels open up possibilities that were never possible prior to Atmos. Imagine a scene where a man is hiding from Police while a helicopter circles overhead, or a scene where kids are in a basement and are startled to hear loud footsteps above them. With Atmos, the audience can now experience these immersive sounds along with the characters.

These are real-world examples, but sound in animation, science fiction, and fantasy can explore space in ways that are only limited by the creator’s imagination. Flying fairies or creatures can move about the space front to back, high and low. Perhaps there’s a scene with a ship moving full speed ahead underwater, breaking up and out into the sky, flying and dodging weapons coming from all sides. Object tracks are ideal to pinpoint sound effects requiring spatial specificity, but more importantly, Atmos assures the re-recording mixer that the final choices made in the mix will be faithfully recreated from theatre to theatre, and from room to room.

**Predetermined Dolby Atmos Master Rules**

The first ten tracks in every Dolby Atmos Master are assigned as a bed by default. From there the default bed is a 7.1.2 bed, however, it can be designated to a 2.0 up to the 7.1.2 bed. There is no option to add objects to these first ten tracks. Starting at track eleven, the tracks that follow can then be made into various beds or objects as needed.

A simple way to think of this is that buses routed to the Atmos Master are treated as beds, carrying predefined multiple sources. An Atmos bed is a fixed surround format that can contain height channels. Objects, are generally mono but can send any format track that DaVinci Resolve supports and follow the metadata as a single object element. Objects routed to the Atmos Master are treated as tracks, carrying dynamic audio content and positional metadata. LFE will need to be sent to a bed, since objects are positional metadata. If the object is 5.1 for example, the LFE channel will need to be routed to a Bed bus in order to be rendered in the Atmos master.

The Dolby Renderer will render the file if it is dragged from the Media Pool into a track in the Timeline. In this case it will render the media with the embedded metadata to the master’s output format. This is a simple way to monitor pre-mastered content and to perform simple actions, such as trimming or syncing for new packaging and deliverables.

When importing a Dolby Master file from the Fairlight menu, Fairlight > Immersive Audio > Import Master File, the resulting import will extract all of the audio and metadata for further content creation. This type of importing into Fairlight maps all of the metadata, tracks, beds, and objects from the master file into...
the Timeline, allowing you to adjust, process, and manipulate further, to rewrite panning, punch-in and add new media, and create a new Atmos Master.

Dolby Atmos files are a package of items. Simply linking files will not create an Atmos Master file. It is not possible, for instance, to take a rendered set of twelve tracks, link them, and then configure their outputs to a 7.1.4 Atmos bed. Note that 7.1.4 is not a Atmos bed type. Although this is the way typical PCM audio is linked and routed, it is not the case for Atmos content, which is far more than just a collection of tracks.

The renderer takes the 128 channels consisting of the beds and objects and renders it. Those channels are either internal sources or contained within the master file. A simple linked file will not play back through the Renderer. It must be played back as all linked files in Fairlight do, through the native monitor. The Dolby Atmos Renderer plays, renders, and extracts Atmos Master files. Fairlight allows for .atmos, ADM, and IMF file types to be imported and played through the Renderer.

**NOTE:** As mentioned above, the LFE can only be rendered in an Atmos master when routed as part of a bed due to the Dolby Atmos specification.

### Immersive Format Configuration

You can enable these audio surround formats in the Video and Audio I/O panel in Preferences. Once enabled, all supported channel configurations of each format become available for timeline track mappings, clip attributes channel mappings, Fairlight bus mappings, and output settings.

You can also enable the Dolby Atmos Renderer if you have that separate software and set the IP address of that as well as the Base Audio Output.

**NOTE:** When enabling or disabling the Dolby Atmos Renderer, the program must be quit and restarted for the change to take place.
Exporting ADM BWF

You can export a Dolby Atmos master file as an audio-only ADM BWF, right from the Fairlight timeline. These same options are also available in the Deliver page. Exporting a Dolby Atmos master file from the Fairlight timeline uses the Timeline name as the filename. Be sure to change the Timeline name to the desired filename.

— In the Media Pool, locate the current Timeline.
— Change the Timeline name to your desired export filename.
— As with all other bouncing and delivery methods, you will need to mark a range in the Timeline to export.
— Press R for the Range Selection tool. Double-click any of the Timeline clips to set a range for the entire clip.
— Choose Fairlight > Immersive Audio > Export Master File.
— In the Export Immersive Master dialog, set the File Name to Timeline Name and the Format to Dolby Atmos ADM BWF. The Source is automatically set to the Atmos Send Patching. This patching passes the signal through the sends to the internal Dolby Atmos Renderer for processing and to generate a new Dolby Atmos master file.
— Click Export.
— In the Export Immersive Master finder window, navigate to the folder you want to file to save to. Click Save.

The Export allows for several types of file types: Dolby Atmos ADM BWF, Dolby Atmos IMF IAB, Fraunhofer MPEG-H Production, and Fraunhofer MPEG-H Production XML.

**New Surround Buses in Fairlight** *(Studio Version Only)*
The new Flexbus structure in Fairlight enables user-definable buses. Atmos mixes call for several bus formats that are now available in DaVinci Resolve 17.
— 9.1.4
— 22.2

**Object-Based Format Support** *(Studio Version Only)*
— Dolby Atmos with support for 7.1.2 and 7.1.4
— MPEG-H with support for 5.1.4, 7.1.4, and 7.2.3
— SMPTE ST.2098 with support for 9.1 OH, 9.1 HT, 11.1 HT, 13.1 HT, and 15.1 HT

**Auro-3D Support** *(Studio Version Only)*
— Auro-3D with support for 9.1, 10.1, 11.1 (7+4), 13.1
**Dolby Atmos Configuration Controls**

The Video and Audio I/O panel of the Resolve System Preferences lets you enable and configure the use of a Dolby RMU for doing Dolby Atmos mixing. You can enter the IP address of the RMU, and choose the base audio output.

![Configuring Dolby Atmos in the Resolve System Preferences](image)

**MPEG-H Authoring**

DaVinci Resolve enables MPEG-H authoring. This includes Native MPEG-H track and bus formats and monitoring, including the ability to define basic track-level meta-data for export into an MPEG-H scene, and export of a MPEG-H Master file. Once enabled, the formats become available for selection as a bus, track, or monitoring format, in the Bus Format window.

![The MPEG-H format options in the Bus Format window](image)

These formats also become available for multi-channel track assignment.
The MPEG-H format options in the Track Format submenu

Tracks are mixed natively in a similar manner to most immersive content, with the creation of a bed mix consisting of a set of immersive object tracks that use dynamic panning. These are combined onto the main bus to form the immersive mix.

**Track Configuration**

In addition to this process, once the format is enabled, a set of MPEG-H meta-data columns become enabled in the DaVinci Resolve Track index, including Track Type, Kind, Language, SW Group, and Preset. For more information about these columns and how to configure them, see Chapter 166, “Using the Fairlight Page.”

When MPEG-H is enabled in the Project Settings, the Tracks panel shows additional columns of information for defining each track in the Timeline.
Export

Once everything is configured, and your project is mixed, you export a master file. In order to do this, you must select a range In and Out point on the Timeline to define an export range. Additionally, you must define whichever busses are designated for rendering by defining their Kind, and you can select tracks you want to export additionally.

Selecting tracks and busses to export

NOTE: An MPEG-H master file can only contain a maximum of fifteen channels total. If the selected track and bus stems exceeds this, then the export will fail, issuing a warning. The same will occur if a range is not selected.

To export an MPEG-H mix:
2. Choose a save location and name, and click Save.

At this point, all defined buses are rendered. Then, track loudness is measured for compliance. Lastly, the source audio is exported and the metadata embedded into the deliverable MPEG-H wav file.

There are several error conditions, which are deleted during the export process, that will all cause the export to fail. For example, all tracks must contain audio. Audio within switch groups must be within a specific loudness tolerance of one another. If any of these conditions occur, a dialog will appear.

Error occurred during MPEG-H export
Maximum allowed loudness difference of 3 LKFS for switch group members not fulfilled. - Loudness information not present for offline export

Warning dialog during MPEG-H export
Quality Control

You can do a quality control check of the final audio export using a Fraunhofer MHAPI tool which can open up the exported content. This includes compliancy tests, and visualization of the contained metadata. It can also render and monitor the content, but this aspect of the tool is basic, and only works with external audio that’s linked to the metadata. In other words, you must manually link the components back to the source audio files.

B-Chain Support for Audio Monitoring
(Studio Version Only)

Choosing Fairlight > Immersive > B-Chain Control opens the B-Chain Control window. Using traditional cinema audio postproduction terminology, the “A-Chain” is all of the busing and signal processing that happens within the mix (in our case using the Fairlight page) and the “B-Chain” is the signal processing, amplification and speaker system that takes the sound from your workstation’s output and gets it “into your ears.” This typically includes all necessary signal decoding or pre-processing hardware, amplification systems, and speaker setups for most professional and commercial listening environments, especially for immersive audio or surround sound formats. These options are complex and have many variables in terms of speaker configuration, selection, and placement, output channel timing, attenuation, and phase, and a host of other considerations.

In DaVinci Resolve, these B-Chain controls affect how the channels of audio being output by the Main you’re mixing is mapped to the actual audio signals being output from your workstation into the amplification and speaker system of the current viewing environment. The extensive level of control the
B-Chain presets offer is most useful in situations such as surround-sound configured grading and mixing theaters, to define how the immersive audio standard you’re mixing is mapped to the speaker setup of your particular application, and to fine-tune the channels being output to each speaker specifically for your environment. In simpler monitoring situations, the B-Chain controls can be useful for configuring the standard you’re mixing with to play out of a non-standard speaker setup in your room.

Ultimately, the B-Chain controls are designed and intended for users who need to create custom, fine-tuned settings for their specific monitoring situation. For this reason, pretty much every real-world use of these B-Chain controls will require custom configuration for your unique environment.

**Overview of Setting Up a B-Chain Configuration**

Setting up a B-Chain configuration takes some doing, but once set up, you have a preset that’s easy to reopen at any time. In the following example, a B-Chain preset will be configured to convert a 5.1 surround output to a 3-channel left-center-right room speaker setup.

**To set up a B-Chain:**

1. Choose Fairlight > Immersive > B-Chain Control to open the B-Chain Control dialog. This exposes the monitoring controls but not the configuration controls.

2. Click the Option menu in this window and choose Setup B-Chain Presets. The B-Chain Setup window appears.

3. Click the New button to create a new B-Chain preset, then enter a name in the dialog and click OK. In this example we’ll use the name “5.1 to LCR.” The Name you enter here is the name of the saved setting data.

   Additional buttons let you Delete, Rename, or Duplicate presets that you’ve already created once you choose them from the Setting pop-up.

4. Enter a label in the Name field (this is the name that appears in the preset menu). The name you enter here is the name that appears in whatever pop-up menus you select these options from.

5. Choose Input Mode > Fixed Format, and Input > 5.1 from the pop-up menus. These define the signal coming out of your mix. (Input Mode > Monitor Feed sets the B-Chain to listen to the selected monitor source, while Input Mode > Custom Format lets you choose an arbitrary number of channels.)

6. Choose an Output Mode > Fixed Format, and Output > LCR from the next set of pop-up menus. These define the speaker setup you’ll be playing the mix out of. In this example, we’ve chosen LCR, which stands for Left, Center, Right.

   At this point, you can see that once you’ve defined the Input and Output channels, the “Inputs/Outputs” table of cells becomes populated:

   — At the left of this table, each channel of your selected Input occupies a vertical column. In this example, the Input columns are labeled L, R, C, LFE, Ls, Rs, corresponding to the 5.1 channels you’ve selected to be output. It’s possible to specify setups with many more channels, in which case the left half of the table becomes scrollable.

   — At the right of this table, each channel of your selected Output occupies a horizontal row that intersects the Input columns. In this example, the rows are labeled Left, Center, Right.

In this way, every Input column intersects with each Output row, making it possible for you to assign how much of each Input is fed to each Output by entering values into each intersecting cell.
To assign Input channels to Output channels, double-click the field where the desired Input intersects the desired Output, and type a value to set how much level from the Input to assign to the Output. Typing 0 assigns Input to Output at “unity” gain (0dB). Numbers you type here specify tenths of a dB. Typing -3 assigns half of the level from Input to Output. Typing -100 mutes that Input to that Output completely. Blank cells with no value make no assignment. In this example, we’re typing:

- **a.** 0 into cell L-1 to assign all of the Left source to the Left output
- **b.** 0 into R-3 to assign all of the Right source to the Right output
- **c.** 0 into C-2 to assign all of the Center source to the Center output
- **d.** -6 into Ls-1 to assign a fraction of Left surround to the Left output
- **e.** -6 into Rs-3 to assign a fraction of Right surround to the Right output
- **f.** -8 into LFE-1 to assign a smaller fraction of LFE to the Left output (LFE is not directional)
- **g.** -8 into LFE-3 to assign a smaller fraction of LFE to the Right output as well (LFE is not directional)

At this point, we’ve fully defined how much of which Input channels go to which Output channels. In the process, you can see that this table interface makes it possible to assign the full levels of Input channels to Output channels, to assign partial levels of Input channels to Output channels, and to assign fractions of Input channels to multiple Output channels.

At this point, you should notice there are additional columns to the right of the Output channels that provide various options that let you fine-tune each channel’s output in order to optimize the acoustics and layout of your room:

- Trim each channel (in tenths of a dB)
- Add a Delay (in milliseconds)
- Add specific EQ (None, LFE Only, Surr Mode)
- Mute or Solo groups.
The last thing you need to do is to right-click each Output channel row’s right-most Output column, and choose the hardware output of your audio or video+audio interface that you want that channel to go to. See one of the following I/O Setup procedure for how to rename these options to make this easier.

Assigning I/O channels to output to

Once you’ve finished setting up your B-Chain preset, click OK, and that preset will be saved and available for use.

To choose a B-Chain preset to use and enable B-Chain:

1. Choose Fairlight > Immersive > B-Chain Control to open the B-Chain Control dialog.
2. Turn on the toggle at the upper left-hand corner of the window to enable B-Chain, and choose a preset from the pop-up menu.
3. Choose the Input you want to assign that B-Chain preset to.
4. A set of Solo and Mute buttons lets you selectively choose sets of channels you want to listen to in isolation, or mute from the whole, in order to better evaluate selected portions of your mix.
5. A Fixed Level button lets you fix the output level in the DaVinci Resolve UI to a single value. With this enabled, you cannot drag the level slider to change the monitoring volume.
6. When you’re finished using B-Chain for monitoring, turn off the toggle at the upper left-hand corner.

NOTE: While the B-Chain is enabled, the Speaker Setup controls in the Video and Audio I/O panel of the Resolve System Preferences is disabled.

The B-Chain Control Window where you can choose and enable a B-Chain preset to affect the output
To name the various outputs of your system’s channels for easy assignment:

1. Choose Fairlight > Immersive > B-Chain Control to open the B-Chain Control dialog.

2. Click the Option menu in this window and choose Setup I/O Names. The I/O setup window appears, showing every single audio input and output on every audio interface that’s connected to and recognized by your system.

   The I/O Setup window lets you rename the Inputs and Outputs associated with your workstation setup, to make it easier to configure Fairlight when you’re managing hundreds of channels. The names you choose here are shown everywhere in DaVinci Resolve where channels are selectable and/or exposed.

3. To rename a channel, double-click that channel’s field in the Name column, type a new name, and press Return.

4. To protect a channel, click the checkbox in the Protect column. Protected channels are prevented from being patched to. This is intended for potentially high-volume speaker outputs, to which it would be hazardous to accidentally connect the wrong input. Protected channels can be seen everywhere patches can be made, but they’re grayed out. Protected channels can only be used in the Speaker Setup controls in the Video and Audio I/O panel of the Resolve System Preferences, and in the B-Chain Setup window.

5. When you’re finished, close the window. The names and protected status of channels are a system-wide setup.

   ![I/O Setup window](image)

   The I/O Setup window where you can rename your system’s audio outputs and protect channels going to amplified speakers
Space View Channel Monitoring

Once you’ve configured your DaVinci Resolve workstation to mix audio via an Immersive format, you can use the Space View to facilitate surround sound mixing. Choose Fairlight > Immersive > Space View Scope to open the Space View window, which is a virtual representation of your control room with all defined source channels positioned in space according to the speaker that channel is intended to play out of. This view makes it easy to see which audio channels on which timeline tracks are playing out each speaker.

The Space View window gives you a spatial representation of what levels are playing where; this example show the various stems of a 5.1 mix.

Each channel shows a label and a meter that lets you see, at any given part of the mix, what audio levels are playing where, spatially. However, you only see channels that are unmuted and with a fader level of more than -70dB. A checkbox lets you choose whether to see labels for all track channels in your mix, or to only show labels for track channels with active levels that are currently playing. The Space View is also aware of the state of all Solo controls, allowing you to quickly focus on just what you hear.
Chapter 180

Using the Fairlight Desktop Console

The Fairlight Desktop console is the newest member of the Fairlight console family and offers professional mixing controls for editors and audio professionals alike. This compact desktop console has enhanced mixing controls for both the Edit and Fairlight pages in DaVinci Resolve.

This chapter provides details and functional descriptions of each section of the Desktop Console and should be read in conjunction with the Fairlight chapters in the DaVinci Resolve Reference Manual to get the best from your console.

NOTE: To set up a Fairlight Desktop Console and connect it to your DaVinci Resolve system, open the Control Panels settings in System Preferences, and change the Audio Console Select this console for Fairlight drop-down menu to Fairlight Desktop Console.

Additionally, firmware updates for the Desktop Console are installed via the DaVinci Control Panels Setup utility. You’ll find details for downloading and installing firmware updates at the end of this chapter.

About the Fairlight Desktop Console

Fairlight Desktop Consoles offer traditional and enhanced mixing controls for both the Edit page and Fairlight page in DaVinci Resolve. All that you need to connect a Fairlight Desktop Console to your DaVinci Resolve computer is a standard USB-3 or Ethernet cable. Once connected to your workstation, you can use the transport controls and search dial on the Desktop Console for timeline navigation, recording, playback, and more.

Fairlight Desktop Console Sections in Clockwise Order

On the upper-left of the Desktop Console there is a set of 10 control buttons that are used to map the 12 adjacent encoder knobs and select buttons to focus mode mixing parameters. Moving to the upper-right of the Desktop Console, you’ll find the Automation section with six buttons used to control the automation system. Below the Automation section are the channel and monitoring controls. The channel controls include three buttons that work in conjunction with the channel select buttons above the faders and two bank buttons for banking faders in groups of 12 in the relative direction. To the right of the Channel section are the monitoring controls complete with an encoder knob and four buttons to target the Control Room monitoring. Additional TALK and CANS buttons add studio controls and can be pressed and held for talkback and re-targeting the monitoring controls for studio monitoring. The lower-right of the Desktop Console includes an electronic search dial for full shuttle and scroll transport control, along with a set of transport keys. A handy Zoom Icon button below the dial lets you use the dial for quick timeline zoom functions including: horizontal, vertical, and waveform zoom.

The center of the Desktop Console includes 12 fader channel strips, each with a belt-driven touch-sensitive fader, Mute, Solo, and Select (SEL) buttons, as well as an encoder knob for panning in default mode and controlling additional parameters in Focus modes. At the top of each channel strip you’ll find an LCD screen that displays information for that channel in default mode or alternative parameter information in Focus modes.

Arrow and Modifier keys are located in the lower-left of the Desktop Console and can be used in conjunction with the Transport, Channel, and Automation buttons for expanded functionality. Directly above the Arrow keys is the User section, containing six sequentially numbered buttons that can be used in combination with other keys to change the current operation depending on the mode and task at hand.
Connecting to a Monitor via HDMI

For additional visual feedback, you can add an HDMI display to the Fairlight Desktop Console. There’s no configuration needed, simply plug in an HDMI monitor and start working! This allows you to see an extensive graphical display of everything happening on the console. The screen automatically switches between Strip, Channel, and Master layouts depending on the current control mode. Along the top of the HDMI screen you’ll always see a fixed display that includes: timecode, monitoring controls, automation toolset, and the Bus, Control Room, and Loudness meters. While at the bottom of the screen you’ll see 12 sets of Channel Extension Buttons for quickly identifying channel status while you work.

Optional HDMI monitor displaying Strip mode layout with an identical set of parameters in-line with each of the 12 channel strips, including from the top down: Track color, Name, Level, Status, EQ, Dynamics, Panning controls, and Channel Extension buttons.
Optional HDMI monitor displaying the Channel Control mode layout, which includes 192 different parameters for the active channel. Parameter controls currently mapped to the LCD displays, knobs, and SEL buttons are highlighted with blue text.

Optional HDMI monitor displaying the Master Control mode layout with bus meters, level, and mute for each of the master buses.

HDMI Fixed Monitoring section with timecode, monitoring controls, Automation toolset, Bus, Control Room, and Loudness meters.
Desktop Console Functional Overview

This section offers a rundown of the various types of controls, operational modes, transport, and modifier keys, as well as pointing out the multi-purpose track selection buttons, encoder knobs, and LCD display screens within the console.

Types of Controls

The Fairlight Desktop Console comes loaded with an assortment of 111 physical controls that you can use to record, monitor, mix, and sweeten your soundtracks. Some buttons serve a single purpose, while others serve multiple functions, therefore it’s a good idea to understand the different types of controls before moving on to the specific button, knob, and fader details.

— **Search Dial**: To quickly navigate, scroll, and zoom, this fully integrated, highly-responsive electronic dial offers smooth free rotation control.

— **Knobs**: When you want to make fast changes to specific parameters, these versatile knobs give you precision rotary control, as well as touch-sensitive input for enabling automation or resetting levels. Holding the Shift modifier key changes the gearing for finer precision control, while holding the Control modifier key while touching one of these knobs will reset the knob's current parameter to its default value.

— **Fixed Buttons**: Fixed buttons serve a specific function and produce the same results every time they are used, regardless of the operational mode or current workflow.
— **Soft Menu Toggle Buttons**: The twelve Select (SEL) buttons near the top of the fader channel strips are multi-functional toggle switches that change based on the console mode and active control button.

— **Faders**: The 12 touch-sensitive electronic faders give you precision volume control for your tracks and buses, and correspond with faders on the onscreen Mixer in DaVinci Resolve.

**Desktop Console Modes**

The upper section of the 12 Channel Strips, including the Select (SEL) buttons, knobs, and LCD screens, can operate individually per channel in Strip mode or combined for a comprehensive set of parameter controls in Focus mode. In both cases, the different tasks are engaged via the button selection in the Control section to the left of the knobs and LCD display area.

**Strip Mode**

This is the default console mode, when none of the control buttons are active.

**Strip mode functionality includes:**

— 12 identical sets of fader channel controls, one for each fader channel strip.
— Each LCD display, knob, and SEL button is associated with the Fader, Mute and Solo button that is in line with that channel strip.
— The Select buttons are used for track selection and illuminate accordingly when they are switched on.

**Focus Mode**

In contrast, Focus mode, focuses all of the knobs, Select buttons, and LCD displays on a single mixing task or parameter control set determined by the active Control button. These focused control sets mirror signal processing available in the Fairlight page Mixer, such as Pan and EQ, as well as dynamics like the Compressor and Limiter.

**Focus mode functionality includes:**

— The LCD display at the top of each channel strip provides visual feedback for the active parameter set assigned to the adjacent knob and SEL button.
— SEL buttons become toggle switches for the active parameter control set.
— Knobs are mapped as precision encoders for the active parameter control set.
— Focus mode controls collectively mirror the corresponding parameter controls in the Fairlight page UI.
— Focus mode parameter sets control the signal processing for the active track or bus determined by the selection buttons prior to entering Focus mode. The active track is the most recently selected track.
— When the Master (MSTR) control button is active, the focus mode LCD, SEL buttons, and knobs are mapped to each bus as Mute and Level controls, respectively.
— When the Channel (CHNL) control button is active, the focus mode LCD, SEL buttons, and knobs are mapped to the most commonly used signal processing parameters for the active track.
Undo, Modifier and Arrow Keys

While working with the Fairlight Desktop Console, you will always have access to the Undo, Modifier, and Arrow keys, conveniently located on the lower left side of the console. The Arrow keys function like the Arrow keys on a standard keyboard and are used in conjunction with the transport buttons to move the playhead (CTI), selected clip, range, or selected tracks incrementally up, down, right, or left. The Undo key offers the failsafe option to go back a step at any time, just as you would expect during normal keyboard and mouse workflows. Additionally, the SHIFT, ALT and CTL modifier keys are used with other console controls to expand functionality and speed up your workflow. For example, while you hold the Control key, the Rewind and Fast Forward transport buttons act as Project Start and Project End buttons to quickly jump to the beginning or end of the Timeline. The Shift modifier key can be used with the knobs for fine incremental parameter control, while the ALT modifier key used with Undo results in Redo functionality to go forward a step.

**NOTE:** If your Desktop Console is connected to a Fairlight Audio Editor, the Control (CTL), Shift, and ALT keys on the Desktop Console work in tandem with the modifier keys on the Fairlight Audio Editor.

Track Select Buttons

The Fairlight Desktop Console includes a dedicated row of multi-function Select (SEL) buttons at the top of the channel strips for selecting either tracks or master buses. From left to right, the 12 Select buttons follow the order of the tracks in the Mixer, and in the Timeline from top to bottom. Use the bank buttons to move to the next or previous set of 12 tracks.

---

12 Track Select (SEL) buttons

In Focus mode, track Select buttons become toggle switches for switched parameters assigned to the focused channel strip. Focus mode parameter sets are determined by the control buttons in the upper left of the Desktop Console.
In Strip mode, the Select buttons can be used to select the track or bus assigned to that specific channel strip. Pressing a Select button is the same as clicking a track header or channel strip in the Fairlight page Mixer with your mouse. Select buttons illuminate when latched and the top of the corresponding LCD brightens so you can always see at a glance which tracks are selected in Strip and Focus modes. Likewise, if you are using an optional HDMI monitor with your Desktop Console, you’ll see illuminated Select buttons for each selected track in the Channel Extension buttons along the bottom of the screen.

The Active track reflects whichever track is actively being controlled or touched with any of the channel strip controls. You can select and control multiple tracks at once, however only the most recently touched track is considered the active track. For easy identification, the active track’s name turns red in both the LCD display and the Fairlight page Timeline. It is important to recognize the active track because that will be the track that receives focused parameter controls in Focus mode.

**Track Select Button Press Options**

The default Strip mode Select buttons include some unique selection nuances to improve your efficiency without the need for a mouse.

— Press once to select or deselect a track.
— Select as many tracks as needed, one track at a time, by simply pressing the corresponding SEL button.
— Double-press any SEL button to deselect all other tracks and exclusively select the current track.
— To select a range of tracks, hold a SEL button, then double-press another SEL button to select both tracks as well as all contiguous tracks between them. In this case, the button that was double-pressed will become the active track.

**TIP:** To select all tracks or an extensive range of tracks, open the Tracks Index panel in the Fairlight page. Select a track in the Index, then hold Shift while turning the dial to extend selection. Additionally, you can select a track in the Tracks index and choose Edit > Select All, or press Cmd-A on your keyboard to select all tracks.
Now that you are familiar with the general layout, types of controls, modes, and other options in the Fairlight Desktop Console, you are ready to take a more detailed look at the different areas of operation and how everything works together. One primary concept to keep in mind is that the Fairlight Desktop Console is designed specifically to control the DaVinci Resolve Fairlight page. Therefore, the better you understand the Fairlight page, the more proficient you’ll be with your console.

Please refer to previous Fairlight chapters for detailed information on the software interface, tools, functions, and audio workflows. Meanwhile, this section will give an overview of the entire Fairlight Desktop Console and focus in-depth on unique features and functions that go beyond the standard keyboard and mouse options in the Fairlight page.

**Control Buttons**

The twelve control buttons in the upper-left corner of the Desktop Console offer fast access to all of the mixing parameters available in the Fairlight Mixer, without the need to grab your mouse. Each control button maps a different set of mixing parameters to the upper section of the channel strips. These parameter control sets are identical to the parameter controls in the corresponding UI windows accessible in the Fairlight Mixer. Additionally, if you are using an HDMI monitor with your Desktop Console, the active control set parameters on the monitor screen are highlighted in blue text.
The control sets include the LCD screens, knobs, and SEL buttons and work collectively for Focus mode operations. The control area defaults to the standard operational strip mode whenever there are no control buttons active.

**Control buttons** that assign control sets to the adjacent Select buttons, knobs, and LCDs.

Default mode where SEL is Select button, knob controls Pan, and LCD shows channel info for each of the 12 channel strips.

**NOTE:** In each of the following control set examples, track *A3 DIA - Kate* is the active track. You can easily identify the active track because the track-based Focus mode control sets always display the active track's name, number, and color in the first channel strip’s LCD.

**Control Buttons from left to right, starting with the top row, include:**

**MSTR:** The Master control button dedicates the adjacent LCDs, knobs, and SEL buttons to the Master buses. The default Master control set gives you direct channel control for up to 11 master buses. The knob controls the corresponding Master bus level, while the SEL button allows the bus to be muted.
**CHNL:** The Channel control set assigns up to 11 of the most commonly used channel controls to the knobs and also to the SEL buttons, if populated or active, primarily used as In/Out or On/Off switches.

Knob controls update in realtime as they are adjusted. SEL switches illuminate when enabled and the label on the corresponding user interface switch in the LCD turns red. The Channel controls from left to right are: Active Track DIA - Kate A3, Path Trim, High Pass Filter Frequency, Low EQ Gain, Low Mid Gain, High Mid Gain, High Gain, Low Pass Filt Frequency, Compressor Threshold, Limiter Threshold, Pan Left/Right and Front/Back. These controls are also available in the associated Focus mode control sets.

**PAN:** The Pan control set maps all of the pan parameters available in the Pan window to the control area knobs with graphical feedback in the LCD. Pan controls are applied to the selected track. Pan controls assigned to each knob from left to right are: Pan, Left/Right, Front/Back, Rotate, Spread, Diverge, and Boom. Pan, Divergence, and Boom have On/Off switches assigned to the adjacent SEL switches.

Pan control set mapping includes all parameters in the Fairlight Pan window.
**PLUG:** The Plug-in control sets differ from plug-in to plug-in. However, for each plug-in slot there are up to two pages (12+12) of user-mappable parameters on the encoder knobs as well as On/Off on SEL1, plus up to 11 user-mappable switch functions. In this example, the Fairlight FX Echo plug-in automatically maps parameters to the first 9 knobs and first two switches: Echo On/Off, Filter LowCut and Stereo Switch, Feedback High Ratio, Left Channel Delay Time, Right Channel Delay Time, Feedback Delay, Output Dry/Wet, and Level.

Hold Plug and press User 1 to User 6 to choose a different plug-in slot for focus. This also opens the corresponding Plug-in window in the Fairlight page interface.
EQ: The EQ control set includes two pages of controls. Press the EQ button to load the Page 1 control set, mapped left to right across the encoders and SEL switches. Master Gain trim appears at knob position 2, and knobs 3-12 control Bands 2-5, alternating gain and frequency. The SEL switch at position 1 switches the EQ on/off, and the remaining SEL switches toggle either the Frequency band ON/OFF or the shape per band.

Hold CTL and press EQ to switch to Page 2.

This EQ control set focuses on the High Pass and Low Pass filters on Bands 1 and 6, and the corresponding SEL switches toggle the filters ON/OFF or shape. Press EQ again to return to Page 1 and repeat as needed to toggle between Page 1 and Page 2. The EQ control set mirrors all of the parameter controls available in the Fairlight EQ window.
Chapter 180  Using the Fairlight Desktop Console

EQ control set Page 1 with controls for Bands 2-5

EQ control set Page 2 with controls for the filters on Bands 1 and 6

Fairlight EQ controls available via the Fairlight Mixer
**EXP**: The EXP control set includes all of the Expander and Gate parameter controls available in the Fairlight Dynamics window. The first channel strip shows which track is in focus, or active, while the SEL button toggles between Expander/Gate controls. The subsequent six channel strips include knob control for the Expander/Gate parameter in the order they appear on the Dynamics window. From left to right in Channel Strips 2-7 the controls are: Threshold, Range, Ratio, Attack, Hold, and Release.
**COMP:** The Compressor control set includes all of the Compressor parameters as available in the Dynamics window. As with all of the other control sets, the Channel 1 position is where you’ll find the On/Off switch assigned to the SEL button. These subsequent controls from left to right include: Threshold, Ratio, Attack, Hold, and Release on the 2-5 knobs, and a Send/Listen SEL toggle for SideChain compression in the channel 6 position.

**LIM:** Like the other dynamics control sets, the Limiter control set includes all Limiter parameter controls assigned to the encoder knobs in the order they appear in the Dynamics window. The Limiter controls include: On/Off, Threshold, Attack, Hold, and Release.
Fairlight Limiter controls available via the Fairlight Mixer.

Fairlight Dynamics Window, which includes Expander, Gate, Compressor, and Limiter.

Compressor control set visual feedback in optional HDMI monitor. All Focus mode dynamics parameters grouped together in one section of the HDMI data screen. The active dynamics controls are highlighted in blue.
**INP:** This is the Input button and mirrors the Path Settings controls available on the Input section of the Fairlight Mixer. These controls appear in the same order as the do in the Fairlight page: SOURCE, PATH Mic/Inst, Rec Level, Trim, and Direct Output. The INP control set maps Mic Gain to the Channel 3 knob, or hold ALT to use the same Knob for Rec Level adjustments.
**Send**

This control set uses the SEL buttons to toggle Bus Send 1 On/Off for each of the 12 channels. These send controls mirror the Bus Send controls available in the Fairlight Mixer. When active, the knob controls the Bus Send 1 Level, or press and hold ALT to control the Bus Send L/R Pan.

---

**Fader Channel Strips**

The most prominent real estate on the Fairlight Desktop Console is dedicated to the fader channel strips. The upper section of these channel strips operate independently in Strip mode, or collectively for Focus mode tasks. The default operational mode of the console provides 12 fader channel strips, each with a Fader, Mute, Solo and Select (SEL) button, a rotary control knob for pan adjustments and a LCD Screen that displays channel information. Any changes applied to the channel strip controls are mirrored in the DaVinci Resolve Timeline and Mixer accordingly.

The desktop console remains in default mode for standard mixing operations unless one of the buttons in the control section is selected. For example, you may be using the faders and pan knobs on-the-fly to adjust track levels and panning during playback. Without stopping, you’d like to adjust the EQ for the active track. No problem, just press the EQ control button and the entire upper section of the channel strips, including the SEL buttons, knobs, and LCD screens, change function to the EQ focused mode. In EQ focused mode, the collective LCD screens, SEL switches, and knobs control specific EQ parameters that mirror the Fairlight Mixer’s EQ window controls.

When you finish adjusting the EQ, simply unlatch the EQ control button, and the console returns to the default mixing functionality. You can switch between control modes as often as you like during playback, recording, or other mixing tasks.

This section describes the default functionality of the fader channel strips.
Touch-Sensitive Faders

The bottom-half of the Fader Channel Strip area comprises 12 identical touch-sensitive motorized faders that offer precision gain controls for 12 signal paths. These faders correspond with faders on the Fairlight page Mixer. Touching a fader results in realtime graphical and numeric feedback of the current level on the adjacent LCD screen. Additionally, each 100mm fader has a DC belt-driven coreless motor and offers precision touch-control fader automation.

Faders can be reset to unity (0dB) by simply pressing the Control (CTL) button while touching a fader. Hold Control and swipe your hand along each of the twelve faders to reset them all in a single maneuver.

Channel Strip Control Buttons

Each channel strip also contains illuminated Mute, Solo, and Select status buttons for the individual channels. These toggle buttons can be pressed individually or swiped on or off. Highly-visual LED lights make it easy to spot which buttons are switched on or off at a glance, which is especially important in the middle of a mixing session. These channel strip buttons and their toggled states are mirrored in the DaVinci Resolve Edit and Fairlight page Mixers and Timeline track headers, as well as in the strip mode layout in the optional HDMI monitor.

Channel Strip Control Buttons include:

SEL: In default mode, this button can be used to select a track, VCA master, or bus master assigned to that channel strip. Press SEL once to select or de-select a track. You can select as many tracks as you need for a given task. Channel buttons, located to the right of the Channel Strip control buttons, can be used as modifiers to change the SEL switch functions.

Latch the AUTO channel modifier button to change the SEL switch function to Automation Write.

Latch the REC channel modifier button to change the SEL switch function to Arm for recording.
In Focus mode, latch the ENAB channel modifier button to enable the SEL switches to be used as Track Select buttons.

**SOLO**: Use this button to hear only this channel during playback.

Multiple tracks can be soloed simultaneously to isolate selective tracks for playback while all non-soloed tracks will be muted.

Solo buttons work for the corresponding channel in both Strip and Focus modes.

Use modifier keys for enhanced solo functionality;

- Hold Control and press any Solo button to clear all soloed buttons.
- Hold Control and press any Solo button again to restore soloed tracks.
- Hold ALT and press Solo to toggle on or off Solo Safe status.

Tracks set to Solo Safe will always play, even if Solo is enabled for other tracks, and are easily identified by the blue-highlighted Solo status icon in the Fairlight page Mixer and Timeline track headers.

**MUTE**: This button turns the channel off and on for playback. Mute buttons on the Desktop Console correspond with the Mute buttons on the Fairlight page Mixer and track headers.

Desktop Console with active Mute, Solo, and Select buttons in the fader channel strips
Channel Control Knobs

Each channel strip includes a touch-sensitive multi-function encoder knob with realtime graphical and numeric feedback of the current position on the adjacent LCD screen. The Channel Control knobs default to left-right (L/R) Pan controls and offer smooth precision rotary adjustments. The handy touch-control of these knobs is perfect for recording Pan automation because you can start recording data the instant you touch a knob and stop when you release it. Knob settings are mirrored in the corresponding Mixing window in DiVinci Resolve.

Use modifier keys for enhanced control knob functionality:

- Hold SHIFT in conjunction with the knob for refined incremental control.
- Hold ALT to switch from L/R Pan to front-back (F/B) panning and corresponding feedback on the LCD screen.
- Hold CTL and touch any knob to reset the designated parameter to the default value.

LCD Screens

At the top of each channel strip you’ll find a high-resolution LCD color display that shows the Track or Bus name, color, metering up to 7.1.4 wide, bus assignments, and panning if in Default strip mode. The information displayed for each track directly correlates with the Fairlight page Mixer and track headers.

NOTE: The LCD screens display different information based on the current Control mode in use on the Fairlight Desktop Console. You’ll find detailed images of the other Control modes later in this chapter.
Automation Buttons

The Fairlight Desktop Console includes automation controls designed to allow the operator to record every static and dynamic parameter change you make in the process of balancing, mixing, and sweetening the overall sound of your timeline in the Fairlight page. The six Automation buttons offer the same automation controls available in the Fairlight page Automation toolset.

Automation buttons include:

- **ON**: Use this button to turn automation mode on and off.
- **STOP**: Toggles the On-Stop mode through Event, Hold, or Return.
- **MODE**: This button toggles between Write or Trim action.
- **TCH**: The Touch button toggles the automation touch mode through three recording options: Off, Latch, and Snap.
- **ENAB**: Hold this button while touching any fader, pan knob, or Mute button to enable/disable that parameter for automation recording. Additionally, the User button Mix User set offers additional enables in the Enables Quick Menu layout.
- **CURV**: Hold the Curve button and touch any fader strip control on a selected track to show its parameter’s automation curve on the selected channels in the Fairlight page Timeline.
Fairlight page Automation controls

Automation writing fader automation data on the A3 track

Automation mirroring the Desktop Console, writing fader automation data on the A3 track

**NOTE:** Automation is only available in the DaVinci Resolve Fairlight page. For detailed information about Fairlight’s automation recording toolset and how it works in DaVinci Resolve, see Chapter 174 “Automation Recording,” in the DaVinci Resolve Reference Manual.
Channel Buttons

One way the Fairlight Desktop Console is able to pack enhanced functionality with minimal Channel strip buttons, is to repurpose the SEL button as needed for different workflows. Even in default mode, the channel select button (SEL) can easily be used as a switch for common strip mode functions. That’s where the Channel buttons come into play. The Channel buttons temporarily assign channel-specific button functions from the Fairlight page track headers and Mixer to the Channel Select button (SEL). When engaged, the Channel buttons turn the SEL button into a toggle switch that mirrors its functional counterpart on the Fairlight page.

These functional override Channel buttons include ENAB, AUTO, and REC. Plus, there is an A/B channel button, as well as Left and Right Bank buttons for mapping and toggling through banks of tracks.

The AUTO, REC, and ENAB channel SEL switch modifier buttons can be latched for extended use or engaged via momentary press, so you can quickly use the modified SEL switch and release to return to the task at hand. Pressing any of the focus mode Control buttons will automatically unlatch the Channel modifier button and reassign the SEL switches accordingly.

Channel buttons include:

**AUTO:** This button modifies the SEL buttons to switch the channel in and out of automation writing and can be used on-the-fly to punch in and punch out during playback. This functions the same as clicking the Automation Write button on the track header or channel strip in the Fairlight page Mixer.
**REC:** Latch this button to assign the SEL switches as Arm buttons to quickly arm tracks for recording.

**ENAB:** Use this SEL button modifier to temporarily override the Focus mode SEL switches and enable them to be used as Track Select buttons.

**A/B:** Press the A/B button while the Views - Tracks quick menu is active to show six user-defined View presets of which tracks/buses are visible in the Timeline and Mixer. These View presets can be customized in the Tracks Index tracklist and are based on the tracks and busses currently marked as visible while a numbered User view is selected.

**BNK >:** Bank Forward banks the faders to the right in groups of 12, or the next 12 channels or buses in the Timeline from your starting position.

Hold SHIFT while pressing this button to bank the faders one at a time. You can use this SHIFT banking option to create custom fader banks.

Hold CTL and press the BNK > button to locate the first bus.

Hold a fader while pressing the BNK > button to leave that channel on that strip.

**< BNK:** Bank Back banks to the previous set of 12 tracks or buses.

Hold SHIFT while pressing this button to bank the faders one at a time in the relative direction.

Hold CTL and press the < BNK button to locate the first track.

Hold a fader while pressing the < BNK button to leave that channel on that strip.

**TIP:** When working with high track counts, you can quickly jump to the last track/first bus by pressing CTL + BNK >. Once you have located the first bus, you can press < BNK to bank through your right-most tracks 12 at a time from the last track toward the first. To jump back to the first tracks, press CTL + < BNK.

**Monitoring Controls**

The Monitoring controls on the right side of the Fairlight Desktop Console is where you control the listening levels for the Control Room and Studio speakers. These controls default to Control Room monitor levels and can be changed at any time using the Monitor knob and buttons. Hold the CANS button to re-target all of the Monitoring controls for studio monitoring.
Monitoring Knob

Use this knob anytime during recording, playback, or mixing to adjust the Control Room or Studio listening levels. Changes to the Control Room levels are reflected in the DaVinci Resolve Timeline monitoring controls located in the upper-right corner of the Edit page and Fairlight page Timelines. If you are using an optional HDMI Monitor, you’ll see the monitoring controls in the upper-left corner of the screen. Sometimes the monitoring environment must be set to a standard level and not changed. This is called Fixed Level monitoring. For example, if your control room has been calibrated with a sound pressure level (SPL) meter, you will probably want to set a Fixed monitoring level. When fixed, the Control Room knob has no affect on the monitoring levels. When Fixed Level monitoring is toggled on, the listening level meter in the upper-right of the Timeline GUI turns from green to blue.

Control Room monitoring controls include:

**DIM:** This button reduces the Control Room monitor volume by -15dB. Press to toggle Dim on or off. The DIM button state is mirrored in the DaVinci Resolve monitoring controls. When DIM is toggled on, the level slider in the onscreen monitoring controls turns yellow. Control Room levels automatically DIM during Studio talkback. Use the Monitoring knob to adjust the DIM level.

**MUTE:** Use this button to mute or unmute the Control Room monitors as well as turn on or off Fixed Level monitoring. Press to mute or unmute Control Room monitoring.

Hold CTL and press Mute to switch on or off Fixed Level monitoring. When Fixed Level monitoring is switched on, the level slider in the onscreen monitoring controls turns blue.

Hold CTL + SHIFT while turning the Monitoring Control Knob to adjust the fixed level.
**SRC:** Use this button to toggle between the last two selected monitor sources. Holding this Source button along with the associated USER button selects a specific bus for monitoring. For example, if you hold SRC and press USER 2, the monitoring will change to bus 2, while holding SRC and pressing USER 5 will change the monitoring to bus 5.

**SPKR:** This button toggles between the last two selected monitor sets. Holding this Speaker button and pressing the associated USER button selects the specific monitor set. The two default speaker sets are MAIN and NEAR. Holding SPKR and pressing USER 2 will switch to the NEAR monitoring set, and holding SPKR and pressing USER 1 will return the Control Room monitoring to the MAIN speaker set.

The Studio monitoring controls adjust the Studio monitoring circuit of a Fairlight accelerator card installed on your workstation. Hold the CANS button to target the monitoring controls for Studio monitoring.

### Studio monitoring controls include:

- **Studio knob:** Hold CANS to use this to dial the monitoring level of the speakers in the Studio.
- **DIM:** Hold CANS and press this button to reduce the Studio monitor volume by -15dB.
- **MUTE:** Hold CANS and use this button to mute or unmute Studio monitoring.
- **SRC:** Hold CANS while pressing this button to toggle between the last two selected Studio monitor sources.
- **SPKR:** Hold CANS and press this button to toggle between the last two selected Studio monitor sets.
- **TALK:** Either Momentary press or latch this button to engage a talkback microphone. When latched, the talkback mic remains live.

Press and hold the talk button to use talkback without latching. In this case, the talkback mic will remain live only during the momentary-press and shut off when you release. Engaging talkback also DIMS the Control Room circuit. You can modify the talkback functionality and general purpose input and output (GPI/GPO) in the Talkback controls available in the Fairlight menu in DaVinci Resolve.

Press CTRL + Talk to show or hide the Talkback Settings window.

- **CANS:** Hold this button to temporarily target all of the monitoring controls for Studio monitoring.
**NOTE:** “Cans” is audio studio jargon for headphones and are part of most any recording studio monitoring setup. Often the producer, engineer, and clients sit in the control room and monitor the session via loudspeakers, while the talent, within the studio, monitors playback and performances via cans.

Search Dial and Transport Controls

Some of the most useful controls on the Desktop Console are the search dial and transport buttons which function exactly as expected for a professional audio control surface. The search dial and surrounding transport buttons offer a complete set of transport commands designed to let you keep your hand in one position while you quickly navigate the Timeline from end to end or anywhere in between in seconds. Additionally, the dial can be used for focused timeline zooming and scrolling.

As a means of navigation, scrubbing, playback and zooming, the dial has four modes of operation that are initiated by the respective buttons located above and below the search dial.

Search dial operational modes include the following:

**Jog:** This is the search dial’s default operational mode.

In Jog mode, the playhead movement is contingent on the movement of the dial, so you can freely jog forward or in reverse at variable speeds while turning the dial and stops when the dial is released. Jog mode is often used to scrub a specific area to focus on audible cues for mixing, editing, and trimming.
If the transport is stopped, press Play to engage the dial. Then turn the dial to jog. If the “Always On” option is checked in System Preferences, the jog dial unconditionally controls the transport immediately whenever you move the dial, even during playback. This “always on” convenience does not affect the transport during recording, Shuttle or Scroll operations.

Hold CTRL while turning the jog dial to increase playhead movement. Release CTRL to return to standard jog speed.

**Shuttle:** In Shuttle mode, turning the dial forward (clockwise) or back (counterclockwise) starts playback in fast forward or rewind at variable speeds based on the amount the dial is turned. Releasing the dial while shuttling forward or back will continue constant playback at the current speed until the playhead reaches the beginning or end of the project.

In Shuttle mode, holding CTRL while turning the jog dial increases the speed 8X.

**Scroll:** In Scroll mode, the playhead position is controlled by the dial to quickly move earlier or later in the Timeline.

Hold CTL while scrolling to move the playhead from the project start (first frame) to the project end (last frame) in a single rotation of the dial.

**Zoom:** The Zoom button, which looks like a magnifying glass, is used in combination with the dial and modifier keys to offer numerous quick zooming and scaling options while you work.

The Zoom button can also be combined with the User buttons to show and map the onscreen User Mapping menu.

Hold Zoom and turn the dial to change the horizontal scale of the Timeline on the computer screen.

Hold CTL + Zoom and turn the dial to change the vertical scale of the Timeline, which in turn changes the height of the tracks and the subsequent number of tracks visible in the Timeline.

Hold Shift + Zoom and turn the dial to move the current track selection to higher or lower tracks.

Double-press Zoom to zoom your entire program to fit within the current visible width of the Timeline. Double-press Zoom again to toggle back to the previous zoom level.

Zoom + any User button toggles on or off the User Mapping menu onscreen. The User Mapping menu is a 2x3 grid that changes in real time by using the ALT and CTL modifier buttons.
Hold Zoom + SEL button on Bus or VCA master to spill or unspill member tracks to neighboring faders, either to the left or right depending on the settings in the Setup-Console Quick Menu.

**NOTE:** Horizontal scaling zooms around the playhead, while vertical zooming focuses on the active selected track.

In addition to the jog dial, you’ll find a set of five standard transport control buttons that can be used for recording, playback, and navigation.

**The transport buttons include:**

- **Record:** When used in conjunction with Play starts and stops, recording switches the transport in and out of record mode for the record-enabled channels.

- **Fast Reverse:** Depending on Control Panel options in System Preferences, this button either places the transport into rewind or jumps left.

- **Hold CTL and press the Fast Reverse button to jump the playhead to the project start.**

- **Fast Forward:** Depending on Control Panel options in System Preferences, this button either places the transport into fast forward or jumps right.

- **Hold CTL and press the Fast Forward button to jump the playhead to the project end.**

- **Stop:** This button stops playback or recording.

- **Play:** Places the transport dial into the default jog mode. Press again starts playback.

- **Hold CTL and press Play to locate to the last play point and play again.**

**Control Panels Options in DaVinci Resolve Preferences**

The Control Panels preferences offer several options to customize your Desktop Console transport controls, including:

- **Use Fast Forward and Rewind as Jump:** Check this option if you want use the Fast Forward and Rewind keys to jump to clips, fades, markers, or transients on the selected tracks. Choose the Jump navigation options in the Timeline Options menu in the Fairlight Page toolbar.
— **Always in Jog:** When this option is On, any movement of the dial will cause the transport to switch to Jog. Always in Jog affects the dial when the transport is not in motion and does not override Shuttle, Scroll, or Record operations.

**TIP:** Always in Jog is handy while previewing new material, editing, arranging, and organizing tracks. This is great because you can grab the dial and instantly navigate. However, when performing complex mixes and writing automation, it’s a good idea to turn this option off, so you can’t accidentally bump or nudge the dial while you work.

### Audio Console options in System Preferences

![Audio Console options in System Preferences](image)

### Timeline Options menu with navigation options, including: clips, fades, markers, and transients

![Timeline Options menu](image)

### Modifier and Undo Buttons

The modifier buttons are conveniently located in the lower-left corner of the console, just where you are accustomed to finding them on a standard computer keyboard. These versatile buttons add functionality to other controls throughout the console. There’s also an Undo button that you can use as often as needed while you work.
Modifier and Undo keys include:

**SHIFT:** The Shift modifier key is used in conjunction with numerous other buttons and controls to expand functionality. For example, hold Shift while turning a Channel knob for refined control. Hold Shift + Zoom while turning the dial to move the current selection to higher or lower tracks.

**ALT:** Use the ALT button to reveal alternative parameters or functions. A few examples of ALT modifier functions include:

Hold ALT to change the Strip mode Pan control knob function from left/right panning to front/back panning.

Hold ALT and press Solo to toggle Solo Safe status on or off.

**CTL:** The Control button is the most commonly used modifier button and is the easiest to find without looking, since it is the first button in the lower-left corner of the console. A few examples of the CTL button’s uses include:

Hold CTL while touching any Channel Control knobs or faders to reset them to the default value.

Hold CTL while using the search dial to increase speed.

Hold CTL and Zoom while turning the dial to zoom vertically.

Hold CTL and press UNDO to REDO one step.

Hold CTL and press Left Arrow to mark an In point.
Hold CTL and press Right Arrow to mark an Out point

**UNDO:** Use this button anytime you need to go back and Undo your last step. This works as expected, no surprises here. Just a reliable means of taking a step back if you make a mistake or get ahead of yourself and perform an operation you didn’t intend. And you can also hold CTL and press UNDO to REDO a step.

**Arrow Keys**

These Arrow keys serve a myriad of uses during your post production workflows, from moving the playhead one frame left or right with the Left and Right Arrows, to jumping clip to clip up or down the Timeline with the Up and Down Arrows. The Fairlight Desktop Console includes a set of four arrow keys that you can use for standard arrow movement, as well as console-specific operations.

**Arrow buttons, clockwise from the top, include:**

- **Up Arrow:** Use this button to move a selection up in a list, Media Pool or sound library. The Up Arrow is also used for navigation to move the playhead to the next clip, fade, marker, or transient in the Timeline. These “jump to” navigation functions are determined by the Navigation options in the Timeline Options menu.

- **Hold Shift and press Up Arrow to move forward to the next marker.**

- **Right Arrow:** Used to move the playhead forward one frame or one second at a time.

  Press Right Arrow to move the playhead one frame forward.

- **Hold Shift and press Right Arrow to move one second forward.**
Hold CTL and press Right Arrow to mark an Out point.

**Down Arrow:** Use this button to move a selection down in a list, Media Pool or Timeline. The Down Arrow is also used for navigation to move the playhead to the previous clip in the Timeline. Shift plus the Down Arrow button moves to the previous marker.

**Left Arrow:** Used to move the playhead back one frame or one second at a time.

Press Left Arrow to move the playhead one frame back.

Hold Shift and press Left Arrow to move one second back.

Hold CTL and press Left Arrow to mark an In point.

**NOTE:** Once you set an In or Out point in the Timeline, you can use the dial to extend the selected range. To clear the In and Out points (Range), press Option-X on the computer keyboard.

**User Buttons**

The six sequentially numbered User buttons are user-defined quick keys that change operation depending on the mode and function in combination with other button groups. For example, a re-recording mix engineer performs different tasks than the ADR engineer, so each professional would set up the User buttons to give them easy access to the functions and modes they need most for their workflow. User buttons can be used alone, or in combination with other buttons for specific functions and workflows.

At the time of this writing, the User buttons are mapped to six User sets, including Edit, Mix, Record, Views, Setup, and a blank unassigned User set. Each of the six User Sets is then mapped to additional menu layouts each with six menu options related to that set. User button quick menus offer fast mouse-free two-handed editing options, like those available in the Fairlight Audio Editor. The difference is that you look at the Quick Menu dialog on the computer screen to see which functions are assigned to the User buttons instead of the labels on the console keys.

The current User Button Quick Menus are an early incarnation of this feature and will undergo visual GUI improvements and enhanced functionality in future updates.
Working with the User Buttons and the Quick Menu Dialog

The Quick Menu is a dialog in the Fairlight page user interface that you can show or hide by holding Zoom and pressing any of the User buttons. What makes the Quick Menu dialog unique is its 2x3 grid design containing six user-defined buttons that can be toggled from the corresponding User buttons on the Desktop Console. To select an option from the Quick Menu, once you’ve chosen the desired User Set page, you simply press the User button that corresponds to the function you need. This innovative physical button-to-dialog button relationship makes it easy to learn the quick menus and functions as well as build lightning-fast muscle memory to trigger the actions while you work.

NOTE: The Quick Menu dialog can be moved anywhere on the Fairlight page interface, so you can see it at a glance, without obstructing view or workflow.

User Button and Quick Menu Functional Overview

The default Quick Menu layout is Edit, however you can change the layout anytime by pressing the appropriate modifier keys along with the corresponding User button. For ease of operation, you use the Zoom button to show or hide the Quick Menu, and the modifier keys to change layouts. It requires two modifier keys (ALT+CTL) to change to a different User set, and one modifier (ALT) to select a different submenu layout within the current User Set. This is similar to using a mouse to open a submenu in the
Fairlight Page interface, or pressing Menu keys to reveal Menu Option keys on the Fairlight Audio Editor. Once you have selected a Quick Menu layout, such as Edit - Basic, you can then engage any of the six actions by pressing the corresponding User button. User Button layouts are identified by the name in the Quick Menu header. Hyphenated names represent the current User Set followed by the submenu layout. For example, EDIT - BASIC identifies the Edit User Set showing the Basic submenu layout of six different Edit actions that can be engaged by pressing the corresponding User button.

— Press Zoom plus any User button to Show the floating Quick Menu dialog on the Fairlight Page interface

![Six User buttons and the EDIT - BASIC User Set](image)

— Once the Quick Menu dialog is showing, it will remain on screen until you press Zoom plus a User button to close. You can also close the Quick Menu dialog by clicking the Close (x) button on the dialog.

— The Quick Menu retains the most recently used layout whenever you show or hide it.

— Press CTL + ALT to show the six User Sets including; Edit, Mix, Record, Views, Setup, and Blank.

![Press CTL + ALT to view the six User Sets](image)

— To choose a User Set, continue holding the CTL + ALT modifiers with one hand and press the User button that corresponds with the User Set you wish to use with the other hand. For Example; Hold CTL + ALT to show all six User Sets, then press User Button 1 to show the Edit User Set. Once you have selected the Edit User Set, you can release the CTL + ALT keys.

![Press ALT to show the submenu layouts for the current User Set](image)

— Press ALT to show the submenu layouts for the current User Set. In this example, there are five Edit submenu layouts mapped to the first five buttons.
NOTE: Quick Menu buttons that are blank have not been mapped to a function. The Edit Blank layout is the default User set when engaging the User Button layouts for the first time. With this layout, none of the User buttons are assigned to actions, and therefore, new users can avoid accidentally applying editing actions to the Timeline.

— To choose an option from the Quick Menu, press the User button in the same position. For example, in the Edit User Set, the Nudge submenu layout is in the same position as User 4, therefore, you press User 4 to choose the Edit-Nudge layout. The Edit-Nudge layout, in turn, offers two clip-based actions that can be engaged by pressing the corresponding User button. No modifier keys are needed to choose an option from the current user set layout, hence the name Quick Menu.

— To quickly change to a different submenu options layout in the same Quick Menu User Set, press ALT to show the submenu option sets, then press the User button for the desired layout. In this example, to change from the Edit-Clip options to the Edit-Blank options, press ALT to see the different submenu options, and User 1 to choose the Basic option in the 1 position.

— To engage the options currently mapped to the Quick Menu, press the corresponding User button. For example, in the Edit - Basic Quick Menu, press User 1 to Cut, User 2 to Copy, User 3 to Paste, User 4 to Split, User 5 to Trim Head, and User 6 to Trim Tail.

— To hide the Quick Menu dialog, Press Zoom plus any User button.
NOTE: Once you incorporate User buttons and Quick Menu options into your everyday workflows, you'll find that switching between layouts and engaging options is as effortless as using keyboard shortcuts or right-click menu options in the DaVinci Resolve interface.

EDIT User Set

There are five Edit menu layouts: Blank, Basic, Level, Nudge, and Clip. Press ALT to show the different Edit menu layouts in the Quick Menu dialog. Press the associated User button to choose an Edit layout. In this case, the Blank button is in the top-left grid position, and the Edit Basic layout is in the User 2 position. Pressing User 2 button would select the EDIT-BASIC layout. Once selected, the button in the Quick Menu dialog is highlighted. Release Alt to show the selected Quick Menu layout with button-menu options related to specific Editing tasks. Similar to working with the Fairlight Audio Editor, the options on the EDIT-BASIC layout change from “Clip” to “Range” if a range is active in the Timeline. Additionally, the Shift and Control modifier keys offer secondary functions.

EDIT Quick Menu layouts include BASIC, LEVEL, NUDGE, and CLIP.

EDIT-BLANK Quick Menu layout (default)

EDIT-BASIC Quick Menu layout for clip-based editing

EDIT-BASIC Quick Menu layout for range-based editing
EDIT Quick Menu layouts and button options include:

— **BLANK**: This default layout has no actions assigned to the six User buttons. This is to prevent new users from accidentally editing their projects via User buttons.

— **BASIC**: Use this button layout to place common fast-editing actions at your fingertips. Use the dial and transport controls with your right hand for navigation and selection, while quickly choosing editing actions via the User buttons with your left hand.

— **Cut Clip/Cut Range**: Press User 1 to cut the currently selected material and place it in the clipboard. The cut material maintains its relationship to the playhead in a semi-transparent form, so you can see exactly where it will be pasted as you move the playhead or selection to a new location. To Paste the clip, press the User 3 button. Alternatively, you can cut and paste clips on-the-fly by holding the User 1 button to cut, continue playback or move the playhead until the semi-transparent clip is in position, then release the User 1 button to paste.

— **Copy Clip/Copy Range**: Press User 2 to copy the currently selected material to the clipboard. Move the semi-transparent copied clip to position, then press the User 3 button to paste. Since this is a standard clipboard editing tool, you can paste additional copies of the material by pressing User 2 again. If you’d rather copy and paste during playback, press and hold User 2 to copy the selection and release to paste.

— **Paste**: Press User 3 to paste the current clipboard material into the Timeline based on the selected tracks and playhead position.

— **Split Clip/Split Range**: Press User 4 to split the clip or range at the playhead position, creating a new edit point between two clips or at the range boundaries. The split editing action is based on the selected tracks and playhead position.
— **Trim Head:** Press User 5 to erase the portion of the selected clip to the left of the playhead. Alternatively, press and hold User 5 while the playhead is over a selected clip to reveal all of the clip’s handles (unused frames) to the left of the playhead. While continuing to hold User 5, move the playhead along the extended clip to find a new starting frame. Release User 5 to trim the head of the clip to the new playhead position.

— **Trim Tail:** Press User 6 to erase the portion of the selected clip to the right of the playhead. Alternatively, press and hold User 6 while the playhead is over a selected clip to reveal all of the clip’s handles (unused frames) to the right of the playhead. Continue holding User 6 while moving the playhead to the last desired frame. Release User 6 to trim the clip’s tail to the new playhead position.

**NOTE:** Although you can manually click to select individual clips with a mouse while editing with a standard keyboard. Fairlight Console audio editing is centered around automatic clip selection based on the selected tracks and playhead position for fast, on-the-fly workflows. As the playhead passes over a clip on a selected track, that clip is automatically selected, thus allowing effortless Cut, Copy, Paste, and Trim functions at the touch of a button.

— **LEVEL:** As the name suggests, the options in this User Button menu are all based on controlling the selected clip’s level. Like the Edit-Basic options, the Edit-Level options are based on selection and playhead position. Additionally, modifier keys offer more User Button menu options. In most cases these expanded options are directly related to the default menu option so that you can quickly fine tune your actions as you go.

— **Clip Level:** Hold User 1 and turn the dial to increase or decrease the selected clip’s level. This affects the selected clip beneath the playhead and can be performed while the transport is stopped or during playback as the playhead passes over a clip in the selected track.

— **Display Level:** Hold User 1 + CTL and turn the dial to increase or decrease the waveform zoom level in the selected tracks. Changing the waveform display level does not change the volume levels of the affected clips or tracks.

— **Fade Head:** Press User 3 to apply a fade from the playhead to the head of the selected clip.

— **Head Shape:** Hold Shift + CTL to show the Head Shape menu option. Press User 3 and turn the dial to change the shape of the fade at the head of the clip.

— **Head X-Level:** Hold CTL to show the Head X-Level menu option. Press User 3 and turn the dial to change the level curve of the fade or crossfade at the head of the clip beneath the playhead.

— **Head X-Point:** Hold Shift to show the Head X-Point menu option. Press User 3 and turn the dial to change the height of the crosspoint in the crossfade at the head of the clip beneath the playhead.

— **Fade Tail:** Press User 4 to apply a fade from the playhead to the tail of the selected clip.

— **Tail Shape:** Hold Shift + CTL to show the Head Shape menu option. Press User 4 and turn the dial to change the shape of the fade at the head of the clip.

— **Tail X-Level:** Hold CTL to show the Head X-Level menu option. Press User 4 and turn the dial to change the level curve of the fade or crossfade at the head of the clip beneath the playhead.

— **Tail X-Point:** Hold Shift to show the Head X-Point menu option. Press User 4 and turn the dial to change the height of the crosspoint in the crossfade at the head of the clip beneath the playhead.
— **Top Layer/All Layers**: Press User 5 to toggle between Top Layer and All Layers. When set to Top Layer, any clip level or editing actions that you apply to a stack of overlapping clips in audio track layers will only be applied to the top clip. When set to All Layers any editing actions applied to a clip with overlapping audio clips in layers will be applied to the entire stack of clips beneath the playhead. This function works, even when audio track layers are hidden.

— **NUDGE**: This User Button menu layout focuses on refining the positions and timing of the clips.
  
  — **Nudge Left**: Press User 1 to move the selected clip one frame at a time to the left.
  
  — **Nudge Right**: Press User 2 to move the selected clip one frame at a time to the right.

— **Media Left**: Hold CTL to show the secondary option and Press User 1 to move the media within the selected clip one frame at a time to the left without chaining the clip duration or position.

— **Media Right**: Hold CTL to show the secondary option and Press User 2 to move the media within the selected clip one frame at a time to the right without chaining the clip duration or position.

— **CLIP**: Use this menu layout for quick control of the selected clip.

  — **Toggle Mutes**: Press User 1 to mute (disable) the selected clip or clips beneath the playhead on selected tracks. Press User 1 again to un-mute (enable) the clip or clips.

  — **Reverse Clip**: Press User 2 to reverse the clip beneath the playhead on the selected track. Press User 2 again to reverse again, so it plays forward.

  — **Inspect Clip**: Press User 3 to show the Inspector panel in the Fairlight Page interface. Press User 3 again to hide the Inspector.

### MIX User Set

There are 6 Mix menu layouts for working with mix automation: Basic, Punch, Preview, Copy/Paste, Enables and Faders To. Press ALT to show the different Mix menu layouts in the Quick Menu dialog. Press the associated User button to choose a Mix options layout.

![Mix Quick Menu layouts include Basic, Punch, Preview, Copy/Paste, Enables and Faders To.](image)

![Mix-Basic Quick Menu layout](image) ![Mix-Punch Quick Menu layout](image)
Mix Quick Menu layouts and buttons include:

— **BASIC:** Use this submenu options layout to access common functions while previewing or working with previously recorded automation data.

— **All Read:** Press User 1 to get controls out of Write or Preview before the transport starts moving.

— **Copy Mix:** Press User 3 to copy all automation data within the selected range to the clipboard. This is the first step in copying automation data from one track or bus to another.

— **Paste Mix:** Press User 4 to paste data from a copied automation range into the range selection in the Timeline, based on enabled parameters in the Automation toolset. For example, if you copy a range of automation from the MUSIC 1 track, all of the automation data within that range is copied to the clipboard. However, if only the Fader and Pan parameters are enabled in the Automation toolset, only those automation curves will be pasted to the selected range on the Music 2 track in the Timeline.

— **Erase Mix:** Press User 5 to erase the automation data within the selected range.

— **PUNCH:** As the name suggests, the options in this Mix layout offers range-based options to control when and where new automation data is written into an existing mix.

— **Auto In:** Press User 1 to start an automation pass, pre-rolling, then punching In at the range start point.

— **Auto Out:** Press User 2 to start an automation pass, pre-rolling, then punching in at the range Out point.

— **Punch In:** Press User 3 to switch automation from Preview or Read to Write during playback. Once you Punch In, all enabled parameters will remain in Write mode until you stop playback or press User 4 to Punch Out.

— **Punch Out:** Press User 4 to stop writing Automation and enter Read mode during playback.

— **Auto Punch:** Press User 5 performs an automation pass, pre-rolling, then punching In and Out at the range start and end points.

— **Join Mix:** Press User 6 to punch into Automation Write with all enabled parameters during playback, with exactly the parameter values you had when Write last stopped. This is handy for making a second pass and finessing a section you just mixed.
— **PREVIEW:** This Mix menu layout offers Preview-related mix options that allow you to suspend Automation Read or Write for enabled controls while you find new settings for them.

— **Preview:** Press User 1 to switch on the Preview automation controls and audition new settings for the enabled controls without changing the recorded automation data.

— **Fill Range:** Press User 3 to perform and instant automation pass, writing the current values of all parameters that are in Preview mode through the range.

— **Glide Range:** Press User 4 to perform an instant automation pass that writes a glide through the range from the value at the start of the range to the current control level of the parameter, for all parameters that are in Preview mode.

— **Punch In:** Press User 5 to switch from Preview to Write mode starting at the point where you press Punch In and applying the current control levels until you stop playback or press User 6 to Punch Out.

— **Punch Out:** Press User 6 to stop writing automation and return to Preview mode during playback.

— **COPY/PASTE:** Use this Mix menu layout to quickly copy and paste automation from one range to another.

  — **Copy:** Press User 1 to copy all automation data within a range.

  — **Paste All:** Press User 2 to paste all copied automation data to a range.

  — **Paste EQ:** Press User 3 to paste only the copied EQ automation data to a range.

  — **Paste Aux:** Press User 4 to paste only the copied Aux bus automation data to a range.

  — **Paste Dyn:** Press User 5 to paste only the copied Dynamics automation data from the built-in Fairlight Dynamics processing on each track to a range. Dynamics include: Expander, Gate, Compressor, and Limiter automation.

  — **Paste Plug-ins:** Press User 6 to paste only the copied plug-ins automation data to a range.

— **ENABLES:** Use this menu layout to quickly enable or disable automation recording for specific parameter sets.

  — **Write EQ:** Press User 1 to enable or disable EQ automation.

  — **Write Comp:** Press User 2 to enable or disable Comp button automation.

  — **Write Gate:** Press User 3 to enable or disable Gate automation.

  — **Write Limiter:** Press User 4 to enable or disable Limiter button automation.

  — **Write Aux:** Press User 5 to enable or disable Aux automation.

  — **Write Plugins:** Press User 6 to enable or disable Plug-in automation.

— **FADES TO:** Use this menu layout to remap faders to the first six sends.

**NOTE:** The Mix user set and subsequent Quick Menu options are only functional while the Automation toolset is On and showing in the Fairlight Page user interface. Press the On button in the Automation area at the top of the Desktop Console to toggle Automation On or Off. The Faders To menu layout allows users to re-map faders to Sends 1-6 via the User keys and does not require Automation to be turned on.
**RECORD User Set**

This user set offers the same recording options that are available in the Fairlight Audio Editor for both Manual and ADR recording. There are four Record Quick Menu layouts: Manual, Rate Clip, ADR List, and ADR Record.

Record Quick Menu layouts and buttons include:

- **MANUAL**: Use this button layout to place common fast-editing actions at your fingertips. Use the dial and transport controls with your right hand for navigation and selection, while quickly choosing editing actions via the User buttons with your left hand.

- **Record Here**: Press User 1 to initiate the Record Here action from the current playhead position. When you engage Record Here, the playhead goes back the pre-roll duration, then punches into Record at the location where you issued the command.

- **Record Again**: Press User 2 to repeat the last recording you made, both entry and exit, whether it was manually or automatically punched in.

- **Record Clip**: Press User 3 to initiate the Record Clip manual recording method. After pre-roll, the playhead punches in and out to match the duration of the clip under the playhead on the selected track. If no clip is beneath the playhead, the transport moves forward to the next clip in the track and records there.

- **Record Range**: Press User 4 to record the current range. With this manual recording method, the playhead includes a pre-roll and punches into Record at the Range In point, and then punches out at the Range Out point.
— **Punch In Again**: Press User 5 to engage Punch Again recording. Punch Again pre-rolls, then enters record at the exact same place as last time, whether it was manually or automatically activated. When entering this record operation, you still need to manually Punch Out. This allows you to get the same start point for recording but with a manual exit.

— **Rec Head**: Press User 6 to enter the Record Head method, which pre-rolls, then starts recording at the head of the first clip to come beneath the playhead in the selected track. When entering this record operation, you still need to manually Punch Out.

— **Rate Clip**: As the name suggests, the options in this User Button menu are all based on rating the ADR recordings from 1-Star (*) to 5-stars (*****). These ratings appear in the ADR Record panel Take list after each recorded take.

— *: Press User 1 to mark a 1-star rating on the selected take.

— **: Press User 2 to mark a 2-stars rating on the selected take.

— ***: Press User 3 to mark a 3-stars rating on the selected take.

— ****: Press User 4 to mark a 4-stars rating on the selected take.

— *****: Press User 5 to mark a 5-stars rating on the selected take.

— Unrated: Press User 6 to remove star ratings.

— **ADR List**: This ADR recording layout offers actions available in the ADR List panel. These actions are used for selecting and setting ADR cues.

— Prev Cue: Press User 1 to select the previous cue in the Cue list.

— Next Cue: Press User 2 to select the next cue in the Cue list.

— Set Cue In: Press User 3 to set the current Timeline In point as the Cue In.

— Set Cue Out: Press User 4 to set the current Timeline Out point as the Cue Out.

— Edit Dialog: Press User 6 to highlight the text field and active text cursor in the ADR List panel so that you can type or edit the text for the current cue.

— **ADR Record**: Use this this ADR recording layout for rehearse and record options available in the ADR Record panel.

— Prev Cue: Press User 1 to select the previous cue in the Cue list.

— Next Cue: Press User 2 to select the next cue in the Cue list.

— Play Cue: Press User 3 to play the currently selected take from the Take list (described below). If no take is selected, the most recently recorded one on top is played.

— Rec. Cue: Press User 4 to initiate recording of the cue to the specified audio track, with cue beeps and video streamer cues.

— Rhrse Cue: Press User 5 to rehearse the selected cue. This runs the section of the Timeline specified by a cue without actually recording anything, giving the talent an opportunity to run through their dialog and practice their timing and delivery. Beeps and on-screen streamers are not played during a rehearsal.

— Edit Dialog: Press User 6 to highlight the text field and active text cursor in the ADR List panel so that you can type or edit the text for the current cue.
Views User Set

This user set offers quick access to view options and track zoom views that can be toggled on or off as needed while you work. There are two View Quick Menu layouts: Misc and Tracks.

Views Quick Menu layouts include Misc and Tracks.

Views Quick Menu layouts and buttons include:

— **MISC**: Use this button layout to quickly show or hide common enhanced view features that are also available in the Setup mode layout on the Fairlight Audio Editor.

— **Toggle Layers**: Press User 1 to show or hide Audio Track Layers.

— **Video Scrolr**: Press User 2 to show or hide the Video Scroller.

— **Mixer Link**: Press User 3 to toggle on or off the Mixer Link feature. When Mixer Link is on, the Fairlight page mixer automatically scrolls to show the most recently selected track.

— **Tracks**: As the name suggests, the options in this User Button menu are all based on rating the ADR recordings from 1-Star (*) to 5-stars (*****). These ratings appear in the ADR Record panel Take list after each recorded take.

— **1 Trk**: Press User 1 to vertically scale the Timeline tracks to show only the active track.

— **2 Trks**: Press User 2 to vertically scale the Timeline to show two tracks, including the active track.

— **4 Trks**: Press User 3 to vertically scale the Timeline to show four tracks, including the active track.

— **8 Trks**: Press User 4 to vertically scale the Timeline to show eight tracks, including the active track.

— **16 Trks**: Press User 5 to vertically scale the Timeline to show sixteen tracks, including the active track.

— **All Trks**: Press User 6 to vertically scale the Timeline tracks to show all tracks.
— **Tracks View Presets:** Press the A/B button while the Views-Tracks Quick Menu is showing to see the Tracks View presets. Each of the six user-defined View presets can be used to quickly change which tracks/buses are visible in the Timeline and Mixer. These View presets can be customized in the Tracks Index tracklist and are based on the tracks and buses marked as visible when a numbered User View is selected.

  — **View 1:** A/B + 1 to scale the Timeline to show the View 1 preset.
  — **View 2:** A/B + 2 to scale the Timeline to show the View 2 preset.
  — **View 3:** A/B + 3 to scale the Timeline to show the View 3 preset.
  — **View 4:** A/B + 4 to scale the Timeline to show the View 4 preset.
  — **View 5:** A/B + 5 to scale the Timeline to show the View 5 preset.
  — **View 6:** A/B + 6 to scale the Timeline to show the View 6 preset.

**SETUP User Set**

This User set offers setup options that are available in the Fairlight Audio Editor setup mode. There are four Setup Quick Menu layouts: Misc, Jogger, Talkback and Console.

Setup Quick Menu layouts include Misc, Jogger, Talkback, and Console.

**Setup Quick Menu layouts and buttons include:**

— **MISC:** Use to this button layout to quickly access common features that can enhance your Fairlight user experience.

— **Normal Solo/Solo Follow:** Press User 1 to toggle between Normal Solo and Solo Follow. When set to Normal Solo, pressing a Solo button on the Desktop Console or soloing a track on the Fairlight page results in the normal track solo behavior. When set to Solo Follow, solo is linked to track selection, so that any track you select or deselect will automatically solo or unsolo the corresponding track.
— **Undo: Editor/Undo All:** Press User 2 to toggle between Undo Editor and Undo All. This functionality is a matter of operator preference. When set to the default, Undo Editor, tasks performed in Mix mode, including recording and editing automation data, will not be undoable. You can, however, simply record new mixing data to override the previous data as needed. Latching this key enables the Undo All mode, which in turn will undo all actions including automation applied in Mix mode.

— **Toggle Layers:** Press User 3 to on or off Audio Track Layers.

— **CTI: Moving/CTI: Fixed:** Press User 4 to choose whether the playhead (CTI) moves across the Timeline, or is fixed in place with the Timeline scrolling past.

— **Preview: Mon/Preview: Track:** Press User 5 to determine where preview monitoring goes when auditioning a sound and comes in handy when you need to preview a clip in the Media Pool or Sound Library. When toggled to Preview Track, you will put the track in Thru mode so it works like a live mic input and the sound you preview will be subject to the track’s fader levels, solo or mute state, and any processing applied to the track. If toggled to Preview Mon, the sound goes directly to the monitors without any processing or controls via the track’s channel strip in the mixer or console.

— **Write Paste:** Press User 6 to automatically set controls to write when pasting from one channel to another.

— **Jogger:** As the name suggests, the options in this User Button menu are all based on Jog settings for the Search Dial. These options are identical to those found on the Fairlight Audio Editor.

— **Gear: 13:** Press User 1 and turn the dial to change the “gear ratio” when jogging between 1 and 20. In other words, it determines how quickly the transport moves in response to turning the jog wheel. The lower the Gear number, the slower the transport will go; the higher the Gear number, the faster the transport will go. The default Gear setting is 13.

— **Rescale Jogger:** Press User 2 to change the gear ratio based on the current zoom level so that three revolutions a second of the jog wheel reaches normal play speed.

— **Follow Zoom:** Press User 3 to toggle Follow Zoom on or off. When on, the gear ratio of the jog wheel is affected by the Zoom setting.

— **Jog DIM:** Press User 4 to toggles Jog Dim on and off. When on, it causes the monitoring level to automatically dim during Loop Jog to the user-defined value set in the Monitor mode Dim level.

— **Loop Jog:** Press User 5 to toggles Loop Jog on and off. When Loop Jog is on, the transport plays a small length of audio (between 5ms and 2000ms), repeatedly, at play speed. The loop moves as you jog the transport forward or backward. This is a great tool for editing, because it maintains the correct pitch of the audio, allowing you to hear clicks, pops, sibilants in the middle of words, and so on. Some of the other soft keys in this menu control additional Loop Jog parameters.

— **Width: 80:** Press User 6 and turn the dial to sets the width for the Loop Jog in milliseconds between 5ms and 2000ms. This is the amount of audio that is repeated in each loop. The default width is 80ms.

— **Talkback:** This Setup layout offers three options to customize the Desktop Console Talkback functionality.

— **Smart Talk/Push-2 Talk:** Press User 1 to toggle between the default unlatched Smart Talk option and the latched Push-2-Talk option. Smart Talk allows the user to either latch the Talk button for extended hands-free talkback, or Push-2-Talk with a momentary press on the Talk button. Latching this key toggles on the Push-2-Talk mode, which limits talkback to the momentary-press Push-2-Talk method similar to using a 2-way radio.
— **GPI>None/Talk/DIM**: Press User 2 to toggle the Monitoring Controls for the general purpose input (GPI) between None, Talk plus DIM, or DIM only.

— **None/Talk/Armed/Record>GPO**: Press User 3 to determine when the general purpose output (GPO) sends a signal during a session. This Quick Menu button toggles between Talk, None, Armed and Record.

— **Console**: This Setup layout offers four options to customize the console functionality.

— **Mixer Link**: Press User 1 to toggle Mixer Link on/off. When Mixer Link is on, the DaVinci Resolve Mixer GUI will scroll any newly selected tracks into view.

— **Trim from Unity (0)**: Press User 2 to toggle Trim from Unity on/off. In automation Trim mode, when Trim from Unity is on, pressing the SEL key on any channel will re-locate the fader to the unity (0) position and stop playing back existing moves.

— **Spill**: Left/Spill: Right: Fader Spill temporarily spills the member tracks of a master bus or VCA group to nearby faders and is a fast way to finesse member track levels while mixing. The User 3 button determines the direction in which member tracks are temporarily mapped to the adjoining faders on the Fairlight Desktop Console. Press User 3 to toggle between Spill: Left and Spill: Right, which in turn dictates whether the member tracks of a bus are assigned to neighboring faders to the left or right of a bus when Spill is engaged in the Channel Fader panel.

— **Spill**: Tracks/Spill: Any: Press User 4 to toggle between Spill: Tracks/Spill: Any. When in the default (unselected) state, the Spill: Any option allows member tracks of a bus to be spilled to the nearest faders to the left or right, including faders assigned to Master buses and VCA groups. When toggled to the Spill: Tracks option, member tracks of a bus spill either left or right, starting with the nearest track fader in the designated direction. This option is useful if you need to maintain fader control of your buses while you spill their constituent tracks to the nearest track faders.

---

**NOTE**: At the time of this documentation, the blank User Set and subsequent blank button options are not yet functional. Stay tuned for future updates.

---

**Fairlight Desktop Console Configurations**

There are three ways that you can configure the Fairlight Desktop Console with your DaVinci Resolve workstation:

As a standalone mixing controller, simply connect the Fairlight Desktop Console to your DaVinci Resolve computer for professional control of the Edit page Mixer as well as the Fairlight page recording, mixing, and automation workflows.
Add a second monitor via HDMI for enhanced visual feedback of the mixing parameters while you work with the console. This configuration gives you realtime graphical updates on the screen, similar to the Channel Control LCD in the full-sized modular Fairlight consoles.
Connect to a Desktop Fairlight Audio Editor and DaVinci Resolve computer for control of nearly every function on the Fairlight Page interface. This expanded desktop configuration is similar to a 2-bay Fairlight modular console at about half the price.

Performing Firmware Updates

Some DaVinci Resolve updates, such as 17.2.1, require firmware updates to implement the improvements to the Fairlight Desktop Console. To use the DaVinci Control Panels Setup utility for the first time, you need to perform a custom install of the latest version of DaVinci Resolve and in the custom settings, check the option to install the DaVinci Control Panels utility. Once installed, you can select any DaVinci Resolve panel connected to your system and perform network setup and firmware updates.

**Updating firmware on a Fairlight Desktop Console:**

1. Quit DaVinci Resolve, if necessary.
2. Open the DaVinci Control Panels Setup utility.
3 In the DaVinci Control Panels Setup Utility, select the Fairlight Desktop Console.

NOTE: If you are working with the Fairlight Desktop Console or Desktop Fairlight Audio Editor, there will only be one panel from which to choose.

4 Click the circled icon below the panel name.

5 If there is a firmware update available, you will see an update dialog.

6 Click Update to install the updated firmware on that panel.

7 Once the update is complete, click Done.

8 Close the DaVinci Control Panels Setup.

9 Open DaVinci Resolve.
Chapter 181

Using the Fairlight Audio Editor

The Fairlight Audio Editor lets you quickly navigate large projects and precisely edit audio much faster than using a regular mouse and keyboard.

Using the Audio Editor to control the Fairlight page provides fingertip access to nearly every Audio tool, function and workflow you’ll need to create incredible soundtracks within DaVinci Resolve. In addition to editing audio tracks, clips and waveforms, the Fairlight Audio Editor can also be used to set up, record, arrange, sweeten, mix and master your projects.

Whether you are using a Fairlight Desktop Audio Editor or a Fairlight Audio Editor panel in a Fairlight console, the tools and functionality of both models are the same. This chapter covers details about the Fairlight Audio Editor’s powerful design features, controls, edit modes, multi-functional keys and how they work with DaVinci Resolve.

Please refer to the previous Fairlight chapters for details on using the Fairlight page.

About the Fairlight Audio Editor

Fairlight Audio Editor panels are designed to meet modern audio post production workflow demands while providing ease of use so that audio professionals can quickly and precisely execute both simple and demanding audio editing tasks. These dedicated Fairlight editing control panels are available in either desktop or console models. The difference is that the desktop model is a stand-alone panel designed for audio editors working at individual computer workstations, while the console model has an extended frame that fits into the Fairlight console chassis and is then connected to all of the console’s modular panels. Both models are essentially the same panel, aside from how they are mounted, so if necessary, you can use a Console Audio Editor on your desktop, and likewise a Desktop Audio Editor can be connected to a Fairlight console that does not already include an Audio Editor component.

Fairlight Audio Editor

With its modest size that fits any desk or workspace, the Fairlight Audio Editor keeps every function within reach for simple navigation as well as performing complex two-handed operations. Plus, the user-friendly design is easy to learn and master with a variety of highly visual, intuitive controls including: touch-sensitive control knobs, macro buttons, built-in Editor screen with soft buttons, number keypad, jog wheel, and a full QWERTY keyboard with multi-functional picture keys.

The Fairlight Audio Editor is organized into six sections, each with a specialized set of controls that work in tandem with the Fairlight page interface to perform high-speed, audio tasks within your DaVinci Resolve project.

Audio Editor Sections in Clockwise Order

On the upper-right of the Editor, you’ll find the Monitor section complete with knobs and buttons to control the level of the speakers in both the control room and studio as well as talkback. Below the Monitor section is a numeric keypad for entering timecode and go-to operations. The lower-right of the Editor includes an electronic jog wheel for full shuttle and jog transport control, along with a handy set of fixed transport buttons, Undo, Redo, Zoom and Shuttle playback and Jog response keys. To the left of the jog wheel and control buttons is the full-sized QWERTY keyboard with multi-functional...
self-labeling picture keys for nearly every audio action, tool, function, or workflow. Located directly above the keyboard is the built-in Editor screen which offers an interactive graphical display of the signal processing parameters for the selected track or master bus. The Editor screen is surrounded by sixteen soft menu buttons and three touch-sensitive knobs on the left- and right-side of the screen for dial parameter control. Finally, along the top there is a row of 15 fixed buttons that include ESC and 14 user-defined Macro Quick keys.

Audio Editor Functional Overview

At face value, the control knobs, jog wheel, buttons, and keys function as expected, based on the current Audio Editor mode. However, the way you press keys and the addition of modifiers can place even more options at your fingertips, without the need for changing editing modes or mousing through menus on the Fairlight page interface. So, before diving into a detailed rundown of the Fairlight Audio Editor, it’s important to understand some of the multifaceted controls and functional nuances designed to minimize your keystrokes while maximizing your speed and productivity.

This section offers a quick overview of the types of controls, editing modes, transport and modifier keys, key-press options, as well as pointing out the designated Track Selection, Menu and DaVinci Resolve interface page keys.

Types of Controls

A good starting point for getting to know the Fairlight Audio Editor is to acquaint yourself with the different types of physical controls.
— **Jog Wheel:** To quickly navigate, zoom, change clip levels and more, this fully integrated, highly responsive electronic dial offers smooth free rotation or clutch action control.

— **Knobs:** When you want to make fast changes to specific parameters, these versatile knobs give you precision rotary control, as well as touch-sensitive input for enabling automation or resetting levels. The Audio Editor includes two fixed-parameter knobs with the monitoring controls and six multifunctional soft menu knobs around the Editor screen which are assigned to parameters based on the current Editor mode and active toolset. Holding the Shift modifier key changes the gearing for finer controls, while holding the Control modifier key while touching one of these knobs will reset the knob’s current parameter to its default value. For example, if the Audio Editor is in Monitor mode, holding the Control key while touching the knob controlling Fixed Level resets the parameter to 0 dB.

— **Fixed Keys:** These keys are located along the top and right side of the Audio Editor. Unlike the multi-functional soft menu buttons and picture keys, the fixed keys have printed labels based on their designated purpose. Among the fixed keys you’ll find the Macro quick keys, Monitoring Control keys, Numeric keypad keys, Jog and Transport Control keys, along with Undo, Redo, Record, Zoom, and Enter. Fixed keys are white with black labels, with the exception of the two red Mute keys in the Monitoring controls.

— **Soft Menu Buttons:** Above and below the Editor screen are two rows of eight soft menu buttons for a total of 16 buttons used to either toggle or show alternate pages of controls in the Editor screen based on the current Editor mode. The upper row of soft menu buttons are always toggles, such as the EQ In or EQ Bypass, when the EQ parameters are active, or a Boom toggle that alternates between: Boom Post, Boom Pre and Boom Only when the Pan parameters are active. The eighth button in the upper row toggles between page 1 and page 2 of functionality assigned to the first seven soft menu buttons. The lower soft menu buttons control parameters assigned to the six knobs, with the middle six lower soft menu buttons controlling which primary set of parameters are assigned to the knobs, like Track Level, Left/Right and Front/Back controls when the Pan parameters are active in the Editor screen. The left and right lower soft menu buttons reveal alternative controls assigned knobs, such as the alternate Pan parameters, Rotate, Tilt and Up/Down, assigned to the right three knobs.

— **Picture Keys:** These self-labeling picture keys change their appearance and function dynamically, based on whatever the user is doing at that time and offer control for nearly every tool, panel, action, and task on the DaVinci Resolve Fairlight page. Additionally, the picture keys default to a
standard QWERTY keyboard whenever user text input is needed (this setting is governed by the QWERTY: Auto/Off setting in the Setup mode), or when the DaVinci Resolve software displays a page other than Fairlight.

**Audio Editing Modes**

To accommodate the numerous audio post production toolsets and workflows, the Fairlight Audio Editor includes six primary Editor modes that change the picture keyboard layout and Editor functions based on the operational task at hand. These six “mega” Editor modes are conveniently named after their toolsets as follows:

— **Setup:** This mode provides quick access to non-editing operational windows, view options, and functions such as opening the Bus Format and Bus Assign windows, toggling on and off audio track layers, and saving a project.

— **Record:** As you probably guessed, this mode presents the precision tools you’ll need to perform manual, punch-in and ADR recording.

— **Monitor:** Use this mode to quickly change your fixed monitoring levels, isolate speakers, buses or mains, switch to alternate speaker sets, toggle phase, and other control room playback monitoring functions.

— **Macros:** This mode presents 30 programmable Macro keys where you can record sequences of keystrokes for repetitive tasks to each Macro key.

— **Mix:** Transforms the Fairlight Audio Editor into a robust mixing tool with full control of Fairlight page Mixer functions like track EQ, Dynamics and Pan settings, copy and paste settings between tracks, as well as utilizing the full automation recording and editing toolset.

— **Edit:** This is where the Fairlight Audio Editor got its name and reputation for unparalleled speed and accuracy for every aspect of audio post editing from auditioning and syncing sound effects to checkerboard editing dialogue tracks on the fly.
Transport, Modifier, and Escape Keys

While working with the Fairlight Audio Editor, you will always have access to the standard Transport, Modifier, and Escape keys, even while using the QWERTY keyboard for entering data. The Transport and Modifier keys are located at the bottom of the keyboard, and the Escape (ESC) key is at the top row of the editor with the Macro Quick keys.

You’ll use the Transport keys: Rewind, Fast Forward, Play, Stop, and Record for navigation, playback and recording along with the jog wheel and its adjacent fixed transport keys.

The standard modifier keys: Shift, Control, Command and Alt, work in conjunction with the QWERTY keys for default and user-defined keyboard shortcuts along with your mouse while operating other pages of DaVinci Resolve. When you are using the Fairlight Audio Editor to control the Fairlight page, the Control key (CTRL) is an essential modifier for revealing secondary functions on the self-labeling picture keys. For example, when you press the Control modifier key, the Rewind and Fast Forward transport keys become Project Start and Project End keys. Additionally, the Shift modifier key can be used in conjunction with the knobs for refined incremental parameter control.

Another important key that you’ll find on a standard computer keyboard as well as the Audio Editor is the Escape key. This key lives up to its name as an all-purpose “escape” that can be used at any time to exit an operation, action, data entry or menu without saving the changes since the last save. The Escape key works as an operational override for a variety of functions including: GoTo functions, naming clips, setting values in dialog boxes, opening, closing and saving files, and any time a Cancel button is shown in a dialog on the computer screen.
As you learn your way around the Editor, you’ll soon appreciate the convenient locations of the Transport, Modifier and Escape keys in the lower-right, lower-left, and upper-left positions respectively.

**NOTE:** If your Audio Editor is connected to a Fairlight console, the Control key on the Editor works in tandem with the Control buttons on the Fairlight Console Channel Control panel and Channel Fader panels to access secondary functions, parameters and controls. Also, there is an independent ALT key below the built-in Editor screen that is used to toggle between additional parameters on the left- and right-side of the screen. This ALT key is dedicated to the Editor Screen controls.

**Latch, Long, and Momentary Key Press Functions**

Unlike standard keyboard and numeric keypad keys, which deliver the same result whether the keys are typed or held down, many Fairlight Audio Editor keys have multiple operational states which elicit different results depending on how you press or hold the key. The three types of key presses are:

- **Latch:** Quickly pressing and releasing a key, just as you would with normal typing, is referred to as latching and results in toggling on or off that key’s function.

- **Long-press:** A long-press is performed by simply pressing a key longer than you would if you were simply typing it. When performing a long-press, you only need to press the key long enough to see the desired result, such as opening or closing a window on the Fairlight page GUI. Long-presses are only slightly longer than typing, about 300 milliseconds, so they don’t slow you down, they just offer more functions within a fixed number of keys. These long-presses can be real time savers, and in many cases replace the need to reach for the mouse to click the Fairlight page interface.

- **Momentary hold:** A momentary hold involves pressing and holding a key with one hand to reveal additional keys and functions that can be quickly latched with the other hand.

**NOTE:** From this point forward, descriptions such as type or press indicate a latched operation, long-press means to press longer than usual until you see the desired result, and instructions to hold and release refer to momentary operations.
Examples of Long-Press and Momentary Key Press Actions

Here are three examples of these types of button presses in action.

Using a long-press to open or close GUI windows:

There are five signal processing picture keys, including Pan, EQ, Dynamics, Aux, and Plug-in. These correspond with the graphical display in the built-in Editor screen as well as the Fairlight Mixer on the computer screen. If you latch one of these keys, such as EQ, the Editor screen displays EQ parameters for the selected track. In turn, these parameters can be controlled by the adjacent soft buttons and knobs without opening the GUI controls on the computer screen. However, long-pressing the EQ key both selects these controls and opens the EQ window on the computer screen. The EQ window will stay open until you long-press the EQ key again to close it. This works the same as double-clicking the EQ control on the Fairlight Mixer UI, and then clicking the Close button on the EQ window to close it.
DaVinci Resolve Fairlight interface displaying EQ window that can be opened and closed with a long-press on the EQ key.

**NOTE:** Once you open a signal processing window using a long-press, the GUI window will automatically change to follow the current latched signal processing displayed in the Editor Screen and vice versa. So if you open the EQ window with a long-press, then latch the Pan key, the GUI window on the computer screen will change to the Pan window and the Editor screen will display controls for the Pan signal processing. If you want to see more than one signal processing window at a time on the computer screen, you’ll need to double-click them independently with the mouse.

Using a momentary key press to briefly enter a different Editor mode:

Each Editor mode includes a picture key toolset unique to that mode, however, audio work is a fluid process that sometimes requires users to jump back and forth quickly between toolsets while they work. Rather than reach for the mouse to access a menu, panel, setting, or tool via the Fairlight page interface, you can momentarily jump into another mode to access the tool you need, then jump back and continue your current task.

For example, you could be monitoring playback levels and recording automation data in Mix mode when you decide to reset the Loudness meters to check the section that is coming up. The Loudness Reset controls are accessed via the Monitor mode Editor Screen controls. To get to them, momentarily hold the Monitor mode button with your left hand to reveal the Monitor mode picture keys and Editor screen controls. With your right hand, quickly latch the Loudness soft key below the Editor screen to display the Loudness settings, then press the Reset Loudness toggle key above the Editor screen to reset the Loudness meters. Release the Monitor mode button to return to Mix mode without interruption in playback or automation recording. This type of momentary operation is one of the secrets to harnessing the Fairlight Audio Editor’s speed and power because at any time, in any workflow, you can momentarily jump to a different mode to access a key to do something else and return to the previous task without stopping. In fact, it is common to momentarily jump into the Setup mode toolset while you work.
because that is where you’ll find keys to quickly toggle on and off track layers, show or hide the Video Scroller, set the playhead (CTI) to fixed or moving, as well as save your project and modify the Audio Editor’s playback controls.

Another advantage of momentary key presses is that they don’t change the latched state of the key you are holding. Working with momentary key presses requires a bit of skill to master, but it can greatly increase your overall speed and efficiency.

**Using a momentary key press to reveal related menu option keys:**

Latching the Play Jog key starts playback and unlatching the same key engages the jog wheel. Momentarily holding the Play Jog key reveals six related menu option keys in the picture keys along the left side of the jog wheel without changing the current latched or unlatched state of the Play Jog key. While momentarily holding the Play Jog key, you can quickly latch any of the menu option keys. When you release the Play Jog key, the menu option keys are no longer visible. This maneuver can easily be done with the right hand while controlling the jog wheel.

**Track Selection Keys**

Quickly identifying and selecting tracks and buses is a vital part of recording, editing, and mixing workflows. Therefore, the Fairlight Audio Editor includes a dedicated row of picture keys, at the top of the keyboard, for selecting either tracks or master buses.
Track Selection keys utilize the Fairlight Audio Editor’s unique self-labeling picture key technology to display each track’s user-defined name and color just as it appears in the Fairlight page Timeline. Additionally, the Track Selection keys change appearance to reflect their current state so that you can quickly identify which tracks are selected and which track is actively displayed in the built-in Editor screen. When multiple tracks are selected, the most-recently selected track is always the track actively displayed on the Editor screen. Track Selection keys also reflect each track’s status with a colored icon that indicates if the track has been muted (M), soloed (S), or armed for recording (R).

**TIP:** Holding the CTRL key down reveals alternate commands, including Mute Clear and Solo Clear (to clear either Mute or Solo states from all tracks). Holding the CTRL key and pressing Mute Clear or Solo Clear a second time acts as a specialized undo/redo toggle to restore all tracks to their previous Mute or Solo state prior to being cleared. This is incredibly useful during mixing so that you can focus on a set of soloed tracks, un-solo them all simultaneously to hear them with the mix, then quickly return them to their soloed state.

**Track Selection key states and appearance changes include:**

- **Unlatched:** The track is deselected, with the track’s color showing as a bar above the track’s name.
- **Latched:** The track is selected, with the track’s color expanding over two thirds of the button.
- **Active:** The active track can easily be identified by a white bar on the lower third of the key and the track’s color in the upper two thirds. Additionally, the active track’s name, track number, track color and signal processing parameters are displayed on the Editor screen.

ADA VO wFX and ROOM tracks are selected, Room track is active, PFX muted, MEDLAB 1 and MEDLAB 2 tracks are soloed, and the DRONE track is deselected.

Master buses showing in the Track Selection keys with Main 1 active and the main named 5.1 muted.

**NOTE:** Pressing a Track Selection key is the same as clicking a track header or channel strip in the Fairlight page Mixer with your mouse.
Pressing a Track Selection key does all of the following simultaneously:

- Latches or unlatches that Track Selection key with visual feedback accordingly.
- Selects or deselects that track in the Fairlight page Timeline and Mixer.
- Displays that track’s signal processing in the built-in Editor screen.
- Tallies on or off that track’s Channel Select button and calls up that channel’s parameters on the Fairlight Console Channel Control panel, if you are working on a Fairlight console.

The dedicated Track Selection keys are located in the top row of the picture keyboard, where the number keys would be on a standard keyboard. Here you’ll find 12 track selection keys as well as All Tracks, Page Up (^), and Page Down (v) keys.

You can select multiple tracks by pressing additional Track Selection keys. However, there can only be one active track at a time and it’s always the last Track Selection key pressed. Like most Fairlight Audio Editor keys, the Track Selection keys include some unique selection nuances to improve your efficiency without the need for a mouse.

**Track Selection keys and key-press options:**

- **Track Selection keys:** There is one Track Selection key for each track in the Fairlight page Timeline. From left to right the first 12 keys are Track Selection keys that follow the order of the tracks in the Timeline from top to bottom. Press once to select or deselect a track. Select as many tracks as needed, one track at a time, by simply latching the corresponding Track Selection keys. Double-press any Track Selection key to deselect all other tracks and actively select the current track. Hold a Track Selection key, then double-press another Track Selection key to select both tracks as well as all contiguous tracks between them. In this case, the key that was double-pressed will become the active track.

- **All Tracks:** Press this key to quickly select or deselect all tracks in the Timeline. Long-press the All Tracks key to change the entire picture keyboard to Track Selection keys for up to 48 tracks from left to right top to bottom. When All Tracks is latched, you’ll also have the option to continue to show tracks, or display master buses such as the Mains, Submix and Aux buses, and VCA groups. Below the All Tracks key, on the far right side of the picture keyboard, you’ll see the Tracks and Masters keys. Here you can choose which type of feed is displayed in the top row of the picture keyboard. Tracks are all of the Timeline tracks, and Masters are the buses for mixing and output. Long-press the key again to return to the default picture keyboard with one row of 12 Track Selection keys at the top.

- **Page Up (^):** Pages up to display the previous 12 tracks in the top row of Track Selection keys, or the previous 48 tracks when the picture keyboard is set to display 48 Track Selection keys. Holding Ctrl changes the Page Up key to a Bank button for loading a user-defined bank of tracks.

- **Page Down (v):** Pages down to display the next 12 tracks in the top row of Track Selection keys, or the next 48 tracks when the picture keyboard is set to display 48 Track Selection keys. Holding Ctrl changes the Page Down key to a Bank button for loading a user-defined bank of tracks.
NOTE: Hiding track visibility in the Timeline, using the Index, or using the Hide Track key on the Audio Editor hides a track from the Timeline and Mixer, but does not change the corresponding track’s state, output or Track Selection key. Additionally, in DaVinci Resolve 16 and higher you can show all master buses including Mains, Subs and Aux buses as tracks in the Timeline as long as the Automation toolset is showing and the buses are marked visible in the Tracks Index.

Moving Track Selection with the Jog Wheel

Whether you select a single track or multiple tracks, you can quickly move the entire selection up or down with the use of the Move Selected picture key and the jog wheel. The Move Selected key is available in both the Record and Edit mode toolsets. This is incredibly useful when working with high track counts so that you can select a track or group of tracks much higher or lower in the Timeline without the need to grab your mouse to scroll. Simply hold the Move Select key while you turn the jog wheel clockwise to scroll the selection down to lower tracks, or counter-clockwise to scroll up to higher tracks. Keep in mind this only moves the selection and does not move the tracks or the contents of the tracks.

Switching Pages

Although the Fairlight Audio Editor is designed to work exclusively with the Fairlight page in DaVinci Resolve, there may be times when you need to switch to a different page in DaVinci Resolve, such as importing and syncing audio files in the Media page, or rendering a finished mix in the Deliver page. The Menu key, located next to the modifier keys in the lower-left corner of the picture keyboard, lets you quickly access the QWERTY keyboard, or any of the other pages in DaVinci Resolve. A momentary-press on the Menu key reveals keys for each of the DaVinci Resolve pages in the order that they are listed at the bottom of the software interface: Media, Cut, Edit, Fusion, Color, Fairlight, and Deliver. There is also a QWERTY key to temporarily change the picture keys to a QWERTY keyboard.
Menu key next to Modifier keys in lower-left of keyboard; momentary-press on Menu key reveals QWERTY and DaVinci Resolve Page keys

**NOTE:** The Fairlight Audio Editor is designed to work with the Fairlight page. If you switch to a different page in DaVinci Resolve, you’ll need to use your computer keyboard and mouse for any operations in the user interface. While other pages are open, the Fairlight Audio Editor shows a QWERTY keyboard that you can use to trigger keyboard shortcuts while working on those pages, just like an ordinary computer keyboard. Once you return to the Fairlight page, the Audio Editor will resume working.

**Fairlight Audio Editor**

Now that you are familiar with the general layout, types of controls, Editor modes and key-press options in the Fairlight Audio Editor, it’s time to dive deeper into the different areas of operation and how everything works together. Keep in mind that the Fairlight Audio Editor is essentially an over-sized mouse designed specifically to control the DaVinci Resolve Fairlight page. Therefore, the better you understand the Fairlight page, the more proficient you’ll be with your Audio Editor panel.

Please refer to the previous Fairlight chapters for detailed information on the software interface, tools, functions, and audio workflows. However, with the increased functionality and physical controls available on the Fairlight Audio Editor, there are some functions and workflow enhancements that are only available via the Editor panel. This section will give an overview of the entire Fairlight Audio Editor and focus more in-depth on unique features and functions that go beyond the standard keyboard and mouse options in the Fairlight page.

**Monitor Section**

The Monitor section in the upper-right corner of the Fairlight Audio Editor panel is where you control playback levels for the Control Room and Studio speakers. Control Room monitor levels can be changed at any time using the Control Room knob. Adjusting these controls also adjusts the corresponding onscreen monitoring controls in DaVinci Resolve.
Control Room monitoring controls include:

— **Control Room knob**: this can be used to quickly dial the level of the speakers selected in the control room. You can select alternate control room speaker sets in the Monitor mode toolset.

— **DIM**: This button reduces the Control Room monitor volume by a user-defined amount. Press to toggle Dim on or off. You can set the Dim level on the Editor screen in Monitor mode.

— **MUTE**: Use this button to mute or unmute the Control Room monitors.

The Studio controls control the Studio monitoring circuit of a Fairlight Accelerator card installed on your workstation.

Studio monitoring controls include:

— **Studio knob**: Use this to dial the level of the speakers in the Studio.

— **Talk**: Latch this button to toggle on or off a talkback microphone. When latched, the talkback mic remains live. Momentary-press the talk button to use talkback without latching, in this case, the talkback mic will remain live only during the momentary-press and shut off when you release. Press Control with the Talk button to open or close the Talkback Settings window on the computer screen. Engaging Talk also dims the Control Room circuit. You can modify the talkback functionality and general purpose input and output (GPI/GPO) via the Talk Setup menu option keys in the Setup mode picture keys.

— **MUTE**: Use this button to mute the Studio monitors.

User-defined Fixed Control Room and Dim levels

Sometimes the monitoring environment must be set to a standard level and not changed. This is called Fixed Level monitoring. For example, if your control room has been calibrated with a sound pressure level (SPL) meter, you will probably want to set a Fixed monitoring level. When fixed, the Control Room knob has no affect on the monitoring levels. You’ll find controls for Fixed Level monitoring on the built-in Editor screen in Monitor mode. Here you can also toggle on and off Fixed level monitoring and adjust the Dim level. When Fixed Level monitoring is toggled on, the listening level meter in the upper-right of the Timeline GUI turns from green to blue.
To set and reset Fixed and Dim Control Room monitor levels:

1. Latch or momentary-press the Monitor mode key to enter the Monitor toolset and show the Dim Level and Fixed Level controls on the left side of the Editor screen.

2. Use the top control knob to adjust the adjacent Dim level amount onscreen. As you turn the knob left or right, the Dim level GUI changes accordingly.

3. Use the middle knob to adjust the adjacent Fixed Level control using the GUI display in the Editor as a guide.

4. To toggle Fixed Level monitoring on or off, press the soft button directly above the Fixed Level On/Off button on the Editor screen. This can be done anytime during playback, recording, or mixing sessions by simply using a momentary-press on the Monitor mode key then toggling on or off the Fixed Level On/Off soft button.

5. Hold the Control key while touching a touch-sensitive knob to reset it to the default value. In this case, the default Dim level is -15dB and the default Fixed Level is 0.0dB.

6. When finished, release the Monitor key if you were performing a momentary-press. Otherwise, simply latch a different Editor mode key to exit Monitor mode.

**TIP:** Setting monitor levels is an example of how different areas of the Fairlight Audio Editor work together to quickly achieve a goal. To further define an example, a user could be in the middle of a session and decide to change the Dim level. Without interrupting the current task, the user could momentarily hold the Monitor mode key with one hand and with the other hand, quickly adjust the Dim Level. When finished, the user only needs to release the Monitor key to resume whatever they were working on. Latching the Dim button on the Monitor controls will now reduce the Control Room monitors to the newly defined Dim level.
Numeric Keypad

For the most part, the numeric keypad on the Fairlight Audio Editor is self-explanatory and functions exactly the same as the numeric keypad on an extended keyboard for entering timecode and number values. There are, however, a few specialized keys, such as Colon (:), Clear, and GoTo, that can be used to expedite timecode entry, set locators, and quickly move the playhead or clip to a specific time. Additionally, there are some user-definable operations, such as Review, where you can combine a momentary hold on the Review key plus a Number Key (1 to 9) to set the number of seconds you’d like the playhead to jump back for the Review operation. The timecode is displayed in the Timecode field in the upper-left corner of the Timeline on the computer display, so you can always see the new timecode values as you type.

**Numeric Keypad Keys:**

- **Number Keys 0 to 9**: Used for entering number values and timecode entry. Timecode entry requires latching the GoTo Key first.
- **GoTo**: When latched, the numeric keypad is in GoTo entry mode and numbers you enter determine where the playhead will move when you unlatch the GoTo key. Numeric entry can include numbers, timecode, or timecode increments. Positive numbers move forward in the Timeline and negative numbers move back.
- Use a momentary press on the GoTo key to jump to one of the three user-definable locator positions in the Timeline.
- Additionally, when the GoTo key is latched, the standard Play and Stop transport keys become GoTo Play and GoTo Stop keys. This can save a keystroke for the operator so they can type in timecode and immediately go to that location and play or stop without first unlatching the GoTo key.
— **Plus (+):** Used in typing or to increment numbers. Typing a Plus before entering a numeric timecode value moves the playhead forward by that value. For example, latching the GoTo key, then typing +0500 and unlatching the GoTo key moves the playhead forward five seconds. When typing values with Plus or Minus keys, the values are entered as timecode from right to left. In this example, +0500 = move playhead 05:00 later.

— **Minus (-):** This key is used in typing or to increment numbers. Typing a Minus before entering a number value moves the playhead forward by that value. For example, latching the GoTo key, then typing -0500 and unlatching the GoTo key moves the playhead back five seconds earlier in the Timeline. When typing values with Plus or Minus keys, the values are entered as timecode from right to left. In this example, -0500 = move playhead 05:00 earlier.

— **Clear:** Clears the current number or timecode entry while in GoTo entry mode. The Clear key can also be used to clear user-defined number values, such as locators.

— **Colon (:):** This key can be used to separate Hours:Minutes:Seconds:Frames in timecode entry, or as a numeric shortcut key that represents a timecode position and replaces 00 when entering timecode. When you type two numbers, a colon is automatically added before the third number. Likewise, typing two numbers followed by a colon also places the colon directly after the two numbers you just typed. This follows standard timecode entry rules for typing in timecode numbers. In this case, to substitute 00 with the colon key, you need to type a second colon. Subsequent typed colons in the same timecode entry event will automatically substituted 00.

The number of colons typed before or after a number indicates the timecode position of the number in the GoTo command. For example, latching GoTo then typing 02::02 (zero, two, colon, colon, zero, two), then unlatching GoTo moves the playhead to 02:00:00:02. Additionally, the Colon key is a real time savor for navigating to specific areas of the Timeline without the need to type the entire number. The position of the Colon in the numeric shorthand value typed determines if the numbers entered as timecode start from the right as frames, or if you keep the current timecode and move to a designated hour from the left.
For example, if the playhead is currently positioned at 01:00:00:00 and you latch GoTo, then type :20 (colon, two, zero) when you unlatch GoTo, the playhead will move to 01:00:00:20. However, if you then latch GoTo and type 02: (zero, two, colon), then unlatch GoTo, the timecode entry is incremental from right to left, so the result is 01:00:02:00.

**TIP:** Timecode entry appears in the upper-left corner of the Fairlight Timeline on the computer screen. If you wish to change the timecode to display subframes, you can right-click the timecode display and choose the display setting you wish from the drop-down menu. You can also open a floating Timecode window that displays the playhead position (CTI) from the Workspace menu.

**Numeric Keypad Locators**

The Fairlight Audio Editor includes three user-defined locators that are used to quickly move the playhead to a stored timecode location. These non-permanent locators are designed to use freely in editing and mixing, but are not saved with the project. A momentary-press on the GoTo key is required to use, set, or clear the locators, which are assigned to the 1, 2 and 3 keys on the numeric keypad. Navigating with locators is a fast and easy way to jump to key positions in the Timeline. Setting a locator based on the current timecode position is often the first and last operation when recording macros so that the macro can start and end at the current timecode position. At this time, locators are only available in the Fairlight Audio Editor.

**To set one of the three user-defined locators:**

1. Move the playhead to the timecode position that you wish to save as a locator position. In this example you will assign the current playhead position to the first locator on the 1 key.
2. Momentary-press the GoTo key. This illuminates the 1, 2, and 3 keys on the numeric keypad. Continue to hold the GoTo key.
3. Momentary-press the 1 key until it tallys on to show that it has been set.
4. Release both the GoTo and 1 keys. You can follow the same steps to set the second and third locators that are assigned to the number 2 and 3 keys. Locators can be set to new timecode positions anytime while you work and do not have to be cleared before setting a new location.

**To use a locator for navigation:**

1. Momentary-press the GoTo key. The number keys, 1, 2, and 3 illuminate. In this example, you will go to locator number 2.
2. Continue to press the GoTo key. Quickly press and release the 2 key.
3. Release the GoTo key. The playhead jumps to the second locator timecode position.

**NOTE:** You need to first set a locator before it can be used. Locators are not saved with the project.
To clear all locators:

1. Momentary-press the GoTo and Clear keys. The number keys, 1, 2, and 3 illuminate, but continue pressing the GoTo and Clear keys.

2. Long press each of the 1, 2, and 3 number keys to tally them on.

3. Release the GoTo and Clear keys. The locators are now clear and will not affect the playhead position until they are set to new timecode locations.

Jog Wheel with Fixed Keys and Soft Menu Picture Keys

The jog wheel and surrounding Fixed keys offer a complete set of transport commands, designed to let you keep your hand in one position while editing. Here you can not only navigate the Timeline from end to end or anywhere in between in seconds, but also go from seeing all tracks to a focused zoom on a single clip at the sample level faster than you could reach over and pick up a traditional mouse.
The combination of the jog wheel and Fixed keys offer standard and advanced playback and navigation options that can be defined in Setup mode and with the adjacent picture keys. The soft menu picture keys to the left of the jog wheel display menu options related to Fixed key and Shuttle functions. Since this section of the Fairlight Audio Editor includes such an extensive set of features and functionality, let’s start with the jog wheel as a means of navigation and playback, then move on to the Play menu picture keys, Fixed keys, and subsequent additional soft menu picture keys.

**Shuttle/Jog Wheel**

The jog wheel is the most versatile control on the Fairlight Audio Editor, and is designed for ease-of-use with all of the associated keys within reach. As a means of navigation and playback, the wheel has two modes of operation, shuttle and jog, that are initiated by the respective Shuttle Position and Play Jog keys above the wheel.

In Shuttle mode, turning the wheel forward (clockwise) or back (counter-clockwise) starts playback in fast forward or rewind at variable speeds based on the amount the wheel is turned. Releasing the wheel while shuttling forward or back will continue constant playback at the current speed until the playhead reaches the beginning or end of the project.

In Jog mode, the playhead movement is contingent on the movement of the wheel, so you can freely jog forward or in reverse at variable speeds while turning the wheel and playback stops immediately when the wheel is released. Jog mode is generally used to scrub a specific area to focus on audible cues for editing and trimming, or for subframe loop-jog scrubbing to pinpoint issues and fine-tune edits. Shuttle mode is used to quickly navigate to a specific location or start playback at a variable speed. Additionally, the wheel can be used for common functions such as zooming, quickly scrolling track selection to different tracks, changing clip volume levels or even dialing the shape of clip fades.

**TIP:** Holding CTRL and Play/Jog puts the wheel into Shuttle mode. This maneuver also initiates Free shuttle movement even if the Editor setup controls are set to Fixed Shuttle. Thus, pressing CTRL + Play/Jog is a common audio editor shortcut for Free Shuttle control. Additionally, holding CTRL while turning the jog wheel increases the speed 8X. Releasing CTRL returns the wheel to standard jog speed.

**Soft Menu Picture Keys**

The six picture keys to the left of the jog wheel display soft menu options when you momentarily press the Play/Jog, Rewind, Fast Forward, and Zoom keys. The default soft menu keys that are always available are the Play Menu and Loop keys. Latching the Play Menu key shows six specialized playback options and likewise a long-press on the Loop key shows the Loop Playback options keys that change the looped playback mode assigned to the Loop key.

**Latching the Play Menu key displays special play commands on the adjacent soft menu picture keys:**

- **Play Again:** Plays from the same place as the last time, such as the timecode where the transport last entered Play. This could also include Play and Record at the same time. This key is the same as the Play Menu key so when the Play Menu keys are not displayed, you can simply press Play Menu twice for Play Again.
- **Play Range:** This operation plays from the In Point (beginning) to the Out Point (end) of a range in the Timeline.
— **Play Clip:** This plays the clip beneath the playhead on the active selected track. If there is no clip beneath the playhead, the next clip on selected track is played.
— **Play In:** Plays from one second before the In Point of a range in the Timeline.
— **Play Out:** Plays from one second before the Out Point of a range in the Timeline.
— **Exit:** Exits the Play Menu.

A long-press on the Loop key displays the Loop Playback Options menu keys:

— **Loop Range:** Loops playback around the marked range, from In Point to Out Point in the Timeline.
— **Loop Clip:** This operation loops playback around the clip beneath the playhead on the most-recently-selected track. If there is not a clip beneath the playhead on the active track, the next clip in the track is played. If a track is not selected, this key has no affect on playback.
— **Loop +/- 1:** This creates a two second playback loop around the current playhead position that starts one second before the playhead and ends one second after the playhead.
— **Loop +/- 3:** This creates a six second loop around the current playhead position that starts three seconds before the playhead and ends three seconds after.
— **Exit:** Exits the Loop Options menu without changing the current loop playback mode.

![Default soft menu keys with Play Menu key unlatched with Loop key set to Loop Clip, (Center) Play Menu key latched, showing Playback Options keys, (Right) Loop key latched, showing Loop Options menu for assigning Loop Playback mode](image)

**Fixed Keys in Clockwise Order Starting in the Upper-left Above the Jog Wheel:**

— **Shuttle/Position:** Latch this key to engage the wheel as a shuttle control for navigation and playback. Unlatch or press Stop to stop playback and disengage the shuttle wheel. While Shuttle is active, the Rewind and Fast Forward transport keys light up to indicate which direction the transport is moving. In the Setup mode, Editor Setup keys you can change the shuttle to either Free or Fixed mode.
— **Free Shuttle mode**: When engaged, the shuttle wheel turns freely clockwise or counterclockwise, can change direction instantaneously, and shuttles at variable speeds based on the amount and direction you turn the wheel.

— **Fixed Shuttle mode**: Turning the wheel forward or back starts fast-forward or reverse playback at a fixed speed with built-in stops whenever you change direction.

— **Position mode**: Hold the Shuttle/Position key while turning the wheel to quickly position the playhead (CTI) in the Timeline. In position mode, you can move the playhead from the beginning to the end of the Timeline in a single rotation of the wheel.

**TIP**: When the shuttle is set to Fixed Shuttle mode you can temporarily override the fixed setting with a long-press on the Shuttle/Position key after it is latched.

— **Review**: This key jumps the playhead back a number of seconds, then plays. Press this key repeatedly to make multiple jumps. The default review jump back time is four seconds. You can change this setting to any number of seconds by long-pressing the Review button and pressing any button between one and nine on the numeric keypad.

— **Rewind/Jump Back**: This key can operate as either a Rewind key or Jump Back key. You can toggle between key functions in the Setup mode, Editor Setup option keys.

— **Rewind key**: The operation works exactly as the Rewind key in the Transport keys section of the keyboard; you can press the Rewind key repeatedly to increase speed.

— **Jump Back**: Use this key to jump back to the previous target based on user selection in the Jump soft menu picture keys to the left of the shuttle wheel. Press and hold either the Fast Forward or Rewind key to choose jump to targets, including To Clip, To Mark, and To Fade from the soft menu picture keys. Jump Back moves to the previous Clip or Fade based on track selection.

— **Fast Forward/Jump Forward**: This key can operate as either a Fast Forward key or Jump Forward key. You can toggle between key functions in the Setup mode, Editor Setup option keys. Since there is already a dedicated Fast Forward key, as well as a shuttle wheel for engaging variable speed Fast Forward, this key is often set to Jump Forward instead.

— **Fast Forward**: This operation works exactly as the Fast Forward key in the Transport keys section of the picture keyboard. You can press the Fast Forward key repeatedly to increase speed.

— **Jump Forward**: You can use this key to Jump forward to the next target based on user selection in the Jump soft menu picture keys to the left of the shuttle wheel. Press and hold the Jump Forward key to choose jump to targets, including Clip, Marker, and Fade. Jump forward to the next Clip and Fade targets are based on track selection. Marker targets can be either Timeline markers or Clip markers.
Momentary-press on Rewind or Fast Forward fixed keys shows jump targets in the soft menu keys: To Clips, To Marks and To Fades; latch the jump targets you wish to use for navigation with the Jump Forward and Jump Back keys.

— Play/Jog: Use this key to start playback or engage the jog wheel for manual jog control. By default, the first press of the Play/Jog key engages the jog wheel. The second press latches the key in Play mode and starts playback. If the Play/Jog key is latched, unlatching the key re-engages the jog wheel. Once the key has been latched, it toggles between Play and Jog. To disable the jog wheel, press the Stop key. Press and hold Play/Jog to show the associated soft menu options in the adjacent picture keys on the left side of the jog wheel.

— **Loop Jog**: This key toggles Loop Jog on and off. When Loop Jog is on, the transport plays a small length of audio (between 5ms and 2000ms), repeatedly, at play speed. The loop moves as you jog the transport forward or backward. This is a great tool for editing, because it maintains the correct pitch of the audio, allowing you to hear clicks, pops, sibilants in the middle of words, and so on. Some of the other soft keys in this menu control additional Loop Jog parameters.

— **Rescale Jogger**: Use this key to change the gear ratio based on the current zoom level so that three revolutions a second of the jog wheel reaches normal play speed.

— **Jog DIM**: Toggles Jog Dim on and off. When on, it causes the monitoring level to automatically dim during Loop Jog to the user-defined value set in the Monitor mode Dim level.

— **Gear**: This changes the “gear ratio” when jogging between 1 and 20. In other words, it determines how quickly the transport moves in response to turning the jog wheel. You can change the Gear ratio by pressing the Gear key while turning the jog wheel. The lower the Gear number, the slower the transport will go; the higher the Gear number, the faster the transport will go.

— **Width**: Sets the width for the Loop Jog in milliseconds between 5ms and 2000ms. This is the amount of audio that is repeated in each loop. You can set this amount by holding the Width key and turning the jog wheel.

— **Follow Zoom**: This toggles Follow Zoom on or off. When on, the gear ratio of the jog wheel is affected by the Zoom setting. The default setting for this control is toggled on.

— **Record**: Latch this key along with the Play key in the standard Transport keys to begin recording to the armed track or tracks. Press the Stop key to stop recording. To arm a track for recording, press and hold the Record key, then press the Track Selection key for the track you want to arm. Tracks must be patched to an input before they can be armed for recording.

— **Stop**: As you may have guessed, this key stops playback or recording.

— **Up**: You can use this key to move the track selection up to the previous track in the Timeline.

— **Down**: Use this key to move the track selection down to the next track in the Timeline.

— **Redo**: Reverses the effect of the last Undo. This can be used repeatedly to step forward through the editing history.

— **Undo**: Reverses the effect of the last edit and can be used repeatedly to step back through the editing history. Also returns to the location and track selection of the edit being undone. A list of the actions can be seen in the Edit menu > History. There you can also Open History Window to see a full edit history list.

**NOTE:** Undo and Redo works on all editing actions while in Editing mode. While in Mix mode, you can choose either Undo All or Undo Editor. The default Undo setting for mixing is Undo Editor, which limits Undo to editing functions and disables Undo for mixing and automation in Mix mode. The Undo settings can be changed in the Setup mode. For more information about Undo and Redo operations in DaVinci Resolve, see Chapter 1, “Introduction to DaVinci Resolve.”
— **Zoom**: The Zoom key in combination with the jog wheel and modifier keys offers numerous quick zooming and scaling options while you work.

— Hold Zoom and turn the jog wheel to change the horizontal scale of the Timeline on the computer screen.

— Hold Control + Zoom and turn the jog wheel to change the vertical scale of the Timeline, which in turn, changes the height of the tracks and the subsequent number of tracks visible in the Timeline. Horizontal scaling always zooms around the playhead, while vertical zooming focuses on the active selected track.

— Double-tap Zoom to zoom your entire program to fit within the current visible width of the Timeline.

— Press and hold Zoom to show the Zoom menu option keys in the adjacent picture keys. These Zoom menu option keys are a fast way to change vertical scaling while zooming horizontally with the jog wheel for dynamic scaling while you work.

These options are:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>1 Track</strong></td>
<td>Vertically scales the Timeline tracks to show only the active track.</td>
</tr>
<tr>
<td><strong>2 Tracks</strong></td>
<td>Vertically scales the Timeline to show two tracks, including the active track.</td>
</tr>
<tr>
<td><strong>4 Tracks</strong></td>
<td>Vertically scales the Timeline to show four tracks, including the active track.</td>
</tr>
<tr>
<td><strong>8 Tracks</strong></td>
<td>Vertically scales the Timeline to show eight tracks, including the active track.</td>
</tr>
<tr>
<td><strong>16 Tracks</strong></td>
<td>Vertically scales the Timeline tracks to show sixteen tracks, including the active track.</td>
</tr>
<tr>
<td><strong>All Tracks</strong></td>
<td>Vertically scales the Timeline tracks to show all tracks.</td>
</tr>
</tbody>
</table>

— Hold Control + Zoom to show a secondary set of Zoom menu option keys, including the following:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>

<tr>
<td><strong>U3</strong></td>
<td>Scales the Timeline to a user-defined view.</td>
</tr>
<tr>
<td><strong>U4</strong></td>
<td>Scales the Timeline to a user-defined view.</td>
</tr>
</tbody>
</table>
— **Enter**: When using the Fairlight Audio Editor for Cut, Copy, and Paste operations, the Enter key functions as a Paste key. Additionally, the Enter key completes and executes many operations. For example, if you are renaming a track using the QWERTY picture keyboard, pressing Enter after typing the name updates the track name, clears the keyboard, and returns to the previous Editor mode.

**NOTE**: In DaVinci Resolve 16.2 and later, a second Zoom button was added to the left side of the picture keyboard while in Mix and Edit mode, so editors can easily reach it with either the left or right hand while working.

The Review, Shuttle mode, Rewind, and Fast Forward keys can all be customized and used in a variety of ways.

**To change the Review jump back amount, do the following:**

1. Momentary-press the Review key to illuminate the current Review setting in the numeric keypad.
2. Long-press a different number of seconds from 1 to 9 on the numeric keypad until it tallys on to set a new review duration.
3. Release the number and the Review key.
   a. **Free Shuttle mode**: When engaged, the shuttle wheel turns freely clockwise or counterclockwise, can change direction instantaneously, and shuttles at variable speeds based on the amount and direction you turn the wheel.
   b. **Fixed Shuttle mode**: Turning the wheel forward or back starts fast-forward or reverse playback at a fixed speed with built-in stops whenever you change direction.
To toggle Shuttle mode between Free Shuttle and Fixed Shuttle, do the following:

1. Latch or Momentary-press the Setup mode key.
2. Latch the Editor Mode key in the Setup toolset to show the Editor Mode menu option keys.
3. In the Editor Mode menu option keys, latch or unlatch the Shuttle option key to toggle between Shuffle Fixed and Shuffle Free settings.

To toggle the Rewind and Fast Forward keys to Jump keys or vice versa, do the following:

1. Latch or Momentary-press the Setup mode key.
2. Latch the Editor Mode key in the Setup toolset to show the Editor Mode menu option keys.
3. In the Editor Mode menu option keys, latch the Mode Wind key to toggle on Mode Jump. The Fixed Rewind and Fast Forward keys above the jog wheel are now set as Jump keys.
4. If the Fixed Rewind and Fast Forward keys are in Jump mode, you can toggle them to Wind mode by following steps 1 and 2, then unlatch the Mode Jump key to toggle it back to Mode Wind.

To set a user-defined Zoom view in the Timeline.

1. Momentary-press the Zoom and CTRL keys.
2. In the soft menu picture keys, long-press one of the user keys (U1, U2, U3, or U4) until the main picture keyboard shows all tracks.
3. In the picture keyboard, latch the track selection keys for all of the tracks you would like to include in the user-defined view.
4. At the bottom of the picture keyboard, momentary-press the Menu key and the Fairlight key to exit the user Zoom setup mode.
5. You can repeat steps 1-3 for each of the four user-defined Zoom view keys.

To use a user-defined Zoom view in the Timeline.

1. Momentary-press the Zoom and CTRL keys.
2. In the soft menu picture keys to the left of the jog wheel, press the user view key (U1, U2, U3, or U4) to choose that view.
3. Release the Zoom and CTRL keys.
4. Latch or unlatch track selection keys to add or remove them from the current zoomed view.

Self-Labeling Picture Keyboard

The picture keyboard offers six different key layouts based on the six Editor modes. It also functions as a QWERTY keyboard for typing and data entry. Each Editor mode includes a specialized toolset of keys, unique to that mode. If you are familiar with the Fairlight page in DaVinci Resolve, the picture key functions are self-explanatory as they are clearly labeled with text and icons. For even easier identification, you can change the appearance of the picture keys to text only in the Editor Setup options on the Setup mode keyboard toolset by toggling the Icon Buttons key to reflect as Text Only.

Since there are hundreds of picture key tools for nearly every function on the Fairlight Page in DaVinci Resolve, this section will focus on the types of picture keys, the different Editor mode toolsets, and keys in each Editor mode that offer tools and options that are only available in the Fairlight Audio Editor.
Types of picture keys:

— **Editor Mode Keys:** These keys determine the current mode of operation in the Fairlight Audio Editor. There can only be one active mode at a time, however, you can momentarily jump into a different mode to choose a setting, tool, or task, then jump back to the current mode. These modes include: Setup, Record, Monitor, Macro, Mix, and Edit.

— **Menu and Menu Option Keys:** Pressing or latching a Menu Key reveals a group of Menu Option keys adjacent to the latched Menu key. In most cases the Menu Option keys remain visible until you unlatch the parent menu key. For example, in Edit mode, you can latch the Track Menu key to show seven Track Menu-related option keys, including Unlock Height, Lock Micro, Lock Mini, Lock Large, Track Safe, Hide Track, and Un-Hide All. These options are also available when you right-click a track’s header, or click the Visibility icons on the Tracks pane of the Index Panel in the Fairlight page. When the picture keys are in Text Only mode, the Menu keys can be easily identified by the colored tag in the upper-left corner of the key.

**NOTE:** At this time, there is not an Un-Hide all tracks function on the Index panel in the Fairlight page. However, you can click your mouse on the Hide icon and drag it down over other hidden tracks to quickly swipe on or off track visibility. The Un-Hide All key is an example of a feature that is only available in the Fairlight Audio Editor.

— **Toolset Group Keys:** These are groups of similar operation keys that are placed together within an Editor mode toolset. For example, in Mix mode there is a group of Paste tools for pasting attributes from one track to others, including Paste EQ, Paste Dynamics, Paste Aux, Paste Path, Paste Plug-ins, and Paste All. This toolset group offers the same options that are available in the Paste Attributes sub-menu options in the Edit menu and right-click menu on a Track Header.

— **Toggles:** Toggle keys choose between a pair of options, often On or Off. In some cases, toggle keys toggle through multiple options. For example, in Record mode, the OSC key toggles the Oscillator on or off. However, the Input Monitor mode key toggles between all five Input Monitoring modes: Input, Auto, Record, Mute, and Repro. You can also latch the Input Monitor key to show the five input monitoring modes as menu option keys, similar to a drop-down menu. These same Input Monitoring modes are available via the Fairlight > Input Monitoring Style menu.

— **Open/Close:** These keys open or close the associated panel or window on the Fairlight page interface. If pressing the key opens the panel or window, pressing the key again closes it, in most cases.

— **Action:** Action keys cause an immediate result when pressed, such as Mark In, Mark Out, Trim Head, and Trim Tail in Edit mode.

— **Secondary Functions:** Instead of reaching for the mouse for some commonly used operations, you can simply press the Control modifier key to reveal them as secondary functions in the picture keyboard. For example, press the Control key to transform the Mix, Edit, and Monitor mode keys into toggle keys to Show/Hide the Mixer, Index, and Meters panels respectively on the Fairlight page. Having the option to quickly show and hide these panels can really speed up your workflow.
Selecting a Clip vs a Range

The Fairlight page in DaVinci Resolve has two prioritized selection options for recording and editing functions, both of which use track selection to determine the contents included in the selection.

— **Clip selection**: Selects clips beneath the playhead on a selected track or tracks. The exception is if clips are manually selected with the mouse. Clips that have been manually selected with the mouse are outlined in red and override selection based on the playhead and selected tracks. Clip selection is ideal if you only wish to edit a single clip or clips beneath the playhead on selected tracks.

— **Range Selection**: Involves setting In and Out points in the Timeline by either using the In and Out keys, or marking either In or Out and moving the playhead to create a range. Marking a range automatically toggles on the Range key. Range selection allows you to select a portion of a clip or multiple clips on all of the selected tracks. When the Range key is latched, recording and editing operations may include all selected tracks within the range. If no tracks are selected, all of the timeline material within the Range boundary will be selected. This is useful if you are copying or cutting and pasting an entire range of the Timeline and pasting it elsewhere in the Timeline.

As you learn the different Record and Edit mode toolsets, remember that they will change based on the state of the Range key and the type of selection you have at the time of the operation.
Setup Mode Toolset

The Setup mode toolset is for the behind-the-scenes setup of operational elements that in many cases are set up when you start a project and left alone for the duration of the project. Here you’ll find specialized keys for setting up the Audio Editor’s functionality, toggling controls, or opening and closing settings windows that would otherwise require a mouse and menu selections on the Fairlight page. There are also some specialized setup keys that are only available on the Audio Editor, where you may wish to momentarily jump into Setup mode to enable or disable functions, then jump back to your current task.

Setup mode default toolset

Setup mode keys for new features or enhanced features only available in the Fairlight Audio Editor:

— **Video Online/Offline**: When toggled On (Online) the playhead is sync locked to the current video timecode in the Timeline. When toggled off (Offline), the playhead moves freely, and can be used to go to another area of the Timeline or Media Pool to add or edit a clip. Toggling this key back On (Online), returns the playhead to the exact position it was prior to going offline. This is a great way to temporarily move the transport offline so that you can go to a clip in another part of the Timeline, use the playhead as a sync point to copy or cut the clip, then toggle the Video back Online to jump the playhead and copied clip to the previous timeline location.

— **Display Setup**: This menu key reveals Display Setup Source keys to accommodate all of the Fairlight LCD screens on a console. Each Source key toggles between DATA, HDMI and SDI as needed.

— **Fader Spill**: Temporarily spilling the member tracks of a master bus or VCA group to nearby faders is a fast way to finesse member track levels while mixing. Use this menu key to reveal two menu Spill option keys that determine the type of fader channel and direction in which member tracks are temporarily mapped to the adjoining faders on the Fairlight Channel Fader panel.

— **Spill Left/Spill Right**: This menu options key toggles between Spill: Left and Spill: Right, which in turn dictates whether the member tracks of a bus are assigned to neighboring faders to the left or right of a bus when Spill is engaged in the Channel Fader panel.

— **Spill Any/Spill Tracks**: When in the default (unlatched) state, the Spill: Any menu option allows member tracks of a bus to be spilled to the nearest faders to the left or right, including faders assigned to Master buses and VCA groups. When latched to the Spill: Tracks option, member tracks of a bus spill either left or right, starting with the nearest track fader in the designated direction. This option is useful if you need to maintain fader control of your buses while you spill their constituent tracks to the nearest track faders.
NOTE: Fader spill is engaged on the Channel Fader panel with a momentary-press on the Bank/Flip key, then latching the call button on a bus channel in the current fader bank. For more detailed instructions on using Fader Spill and creating custom Fader Banks, see Chapter 182, “Modular Fairlight Consoles.”

— **DL Off:** This is the Decklink Offset key that lets you offset the Decklink Output so the picture and audio are in sync. Momentary press the DL Offset key and turn the jog wheel to increase or decrease the frame offset between 0 and 7 frames. This feature is also available in the Fairlight, Video I/O Offset section of the the DaVinci Resolve User Preferences.

— **ADV In Jog:** Latch this key to apply the Decklink Output offset while playback is in Jog or Shuttle mode. This feature is also available as a checkbox in the Fairlight section of the DaVinci Resolve User Preferences.

---

Fairlight - Video I/O Offset settings in DaVinci Resolve User Preferences that mirror the DL Offset and ADV in Jog picture key functions on the Audio Editor

— **Talk Setup:** This menu key reveals three menu option toggle keys to customize the Editor’s Talkback functionality:

— **Smart Talk/Push-2-Talk:** This key toggles between the default unlatched Smart Talk option and the latched Push-2-Talk option. Smart Talk allows the user to either latch the Talk button for extended hands-free talkback, or Push-2-Talk with a momentary press on the Talk button. Latching this key toggles on the Push-2-Talk mode, which limits talkback to the momentary-press Push-2-Talk method similar to using a 2-way radio.

— **GPI:** Talk/DIM/None: This key toggles the Monitoring Controls for the general purpose input (GPI) between None, Talk plus DIM, or DIM only.

— **GPO:** Talk/None/Armed/Record: Use this menu options key to determine when the general purpose output (GPO) sends a signal during a session. This key toggles between Talk, None, Armed and Record.
— **Console Setup:** This menu key reveals toggle keys to customize the Editor functionality, including:
  — **Write Paste:** Toggle this key on if you want controls automatically placed in Write mode when pasting from one channel to another.
  — **Common Macros/Mixer Macros:** Use this key to choose whether the 14 macro quick keys remain the same (common) for both Edit and Mix modes, or if they change to macros 1-14 for Edit mode and 15-28 for Mix mode.
  — **Mode Jump/Wind:** This key toggles between Jump and Wind modes for the Rewind and Fast Forward keys above the jog wheel.
  — **Mixer Follows/Mixer Link:** Use this key to toggle the mixer between Follows and Link modes. When Mixer Link is toggled on, the mixer updates to show selected tracks in the Timeline. (Corresponding Resolve Preference > User > Fairlight.)
  — **Always Jog:** When this key is toggled On, any movement of the jog wheel will cause the transport to switch to Jog. Always Jog affects the wheel when the transport is not in motion and does not override Shuttle, Scroll, or Record operations.
  — **Trim from 0:** Toggles on Trim from Unity (0). You can use this in Mix mode while trimming fader automation. When toggled on, if automation is set to trim, faders armed to write will rest at unity where they can be manually adjusted from that position to trim the existing automation curve.
  — **Shuttle Fixed/Shuttle Free:** This key toggles between Fixed or Free Jog Shuttle mode.
  — **Jump/Wind:** This key toggles between Jump and Wind modes for the Rewind and Fast Forward keys above the jog wheel.
  — **Icon Buttons/Text Only:** Use this key to toggle the picture keys between Icon and Text or Text only.
  — **ALT Layout:** Latch this key to switch from the Normal layout to a new alternative text-only keyboard layout. This new Alt text-picture key layout shows keys that are relevant to the current task, with keys grouped toward the middle and lower rows of the keyboard for easy access. In this layout, the Editor Mode keys are located in the center of the the lower two rows of the picture keyboard. They are easy to spot with white text labels and a white line at the bottom of each mode key. The alternative layout also utilizes the six soft menu picture keys to the left of the jog/shuttle wheel for toolset group keys based on the current Editor mode and task at hand.

**To return to the normal layout of the picture keyboard, do the following:**

1. Press the white SETUP mode key, if necessary.
2. Press the yellow UTILS (Utilities) key. To reveal the Utilities menu options keys in the row above the UTILS key. The yellow tag in the upper-left corner of the UTILS key indicates it is a menu key.
3. Press the orange ALT LAYOUT menu options key to return to the normal layout.
NOTE: You’ll find pictures of each of the Alt Layout toolsets later in this chapter.

Additional enhanced features only available in the Fairlight Audio Editor:

— **Call Follows key:** In addition to selecting a track, there are other criteria for making a track active and “calling” its information into the Editor screen and corresponding Channel Control bay if you are on a Fairlight Audio Editor connected to a Fairlight console. These Call Follows menu options depend on the physical buttons, touch-sensitive knobs, and faders on the Fairlight console. The Call Follows menu key offers five Call Option keys that can be used alone or in combination to determine which track or master bus is active:

  — **Current Track:** When toggled on, the most recently selected track is the active track.
  — **Fader Touch:** When toggled on, touching a fader on the Fader panel makes it active.
— **Pan Touch:** When toggled on, touching the Pan knob on the Fader panel makes it the active track.

— **Inline Touch:** When toggled on, touching any touch sensitive knob on the Channel Control panel, while set to Inline mode, calls that track and makes it active.

— **Solo Button:** Latching the Solo button on the Fader panel makes it active. Using a mouse or the Solo button on the Fairlight Audio Editor does not “call” the track active. Only the Solo button on the Fairlight Fader Control panel works in this scenario.

— **Undo Editor/Undo All:** This key is a matter of operator preference. When set to the default (unlatched), Undo Editor, tasks performed in Mix mode, including recording and editing automation data, will not be undoable. You can, however, simply record new mixing data to override the previous data as needed. Latching this key enables the Undo All mode, which in turn will undo all actions including automation applied in Mix mode.

— **CTI Fixed/Moving:** This key lets you choose whether the playhead (CTI) moves across the Timeline, or is fixed in place with the Timeline scrolling past.

— **Preview Track/Mon:** This key determines where preview monitoring goes when auditioning a sound and comes in handy when you need to preview a clip in the Media Pool or Sound Library. When toggled to Preview Track, you will put the track in Thru mode so it works like a live mic input and the sound you preview will be subject to the track’s fader levels, solo or mute state, and any processing applied to the track. If toggled to Preview Mon, the sound goes directly to the monitors without any processing or controls via the track’s channel strip in the mixer or console.

— **Normal Solo/Solo Follows:** This lets you customize how the Solo commands work. Normal Solo/Solo Follows is a bypass toggle for the Call Follows, Solo Button option. If the Call Follows, Solo Button menu options key is latched, and the Normal Solo/Solo Follows key is latched, soloing a track in the Audio Editor or Channel Fader panel “calls” that track’s information into the Editor display on the Audio Editor, and the Channel display in a Fairlight Console Channel bay. Unlatching the Normal Solo/Solo Follows key bypasses the Solo Call feature and returns Solo functionality to Normal Solo behavior, as the name suggests.

---

**Using the Playhead as a Sync Point indicator to sync sound to picture using Video Online/Offline key:**

1. With the Video Online/Offline key latched on, move the Playhead to the desired frame in the Timeline. For this example, let’s make it the frame where a door slams closed in the Viewer.
2. Unlatch the Video Online/Offline key so that it is offline.
3. Move the playhead to another location in the Timeline where there is a door closing sound effect that you’d like to copy.
4. Select the track with the clip you want to copy, and move the playhead over the frame that you want to sync with the door closing frame.
5. In Edit mode, press the Copy Clip key.
6. Latch the Video Online/Offline key so that it is Online. The playhead jumps to the previous location using the playhead as a sync point to match the door closing audio clip to the video frame of the door closing.
7. If necessary, press the Track Selection key for the track where you wish to paste the synced clip.
8. Press the Enter key to paste the clip.
Record Mode Toolset

The Record mode toolset is where you do your recording and offers specialized toolsets for both Manual and ADR recording. There are keys for every recording feature available on the Fairlight page including keys to open and close the Patch Input/Output window and ADR panels as well as rate takes without needing your mouse. Latch the ADR List, ADR Record or ADR Setup keys to open the associated panels on the computer screen. When either the ADR List or ADR Record keys are latched, you’ll see picture keys for each interface button in the associated workflows. For example, latching the ADR Record key reveals a set of seven specialized keys for ADR Recording, including Previous Cue, Next Cue, Previous Take, Next Take, Rehearse Cue, Record Cue, and Play Cue. These keys work exactly the same as using a mouse and keyboard on the ADR Record panel in the Fairlight page interface.

The Fairlight Audio Editor includes a special set of Manual recording options that are only available on the Editor. These options use either playhead, clip, or range boundaries, as well as user-defined pre-roll and post-roll that can be set in the User Preferences, Editing panel.

NOTE: When recording in the Fairlight page, tracks must be armed before recording, and only tracks with inputs patched to them can be armed. Luckily, there is a key in the Record Mode toolset for opening the Patch Input/Output window. Use a momentary press on the Record key and Latch a Track Selection Key to arm that track.

Record Mode Manual Recording special toolset keys include:

— **Record Here**: Playhead goes back the pre-roll duration, then punches into Record at the location where you issued the command. This can be useful when you zoom in to find the exact timecode position where you want to punch in to record, then simply issue this command by pressing the Record Here key and the system does everything for you.

— **Record Range**: The playhead includes a pre-roll and punches into Record at the Range In point, and then punches out at the Range Out point.

— **Record Clip**: After pre-roll, the playhead punches in and out to match the duration of the clip under the playhead on the selected track. If no clip is beneath the playhead, the transport moves forward to the next clip in the track and records there.

— **Record Again**: Pressing this key repeats the last recording you made, both entry and exit, whether it was manually or automatically punched in.
— **Punch In Again**: The system pre-rolls, then enters record at the exact same place as last time, whether it was manually for automatically activated. When entering this record operation, you still need to manually punch out. This allows you to get the same start point for recording but with a manual exit.

— **Record Head**: Pre-rolls, then starts recording at the head of the first clip to come beneath the playhead in the selected track. When entering this record operation, you still need to manually punch out.

**Monitor Mode Toolset**

As the name suggests, this mode is for setting up your monitor system. In most cases, this is set up at installation, but there are also controls for setting up the monitors for a particular session and quickly switching between different sources, including external sources, speaker sets, and surround formats. You can even mute any of the current speakers by latching its associated picture key marked with a Speaker icon.

![Monitor mode default keys showing Control Room monitoring](image)

**Monitor mode keys for enhanced features only available in the Fairlight Audio Editor:**

— **C/R / Studio toggle**: This key toggles the Monitor mode keys between Control Room (C/R) and Studio monitoring keys.

— **Phase**: Hold this key and press any speaker button to toggle its phase.

— **Alt Source**: Use this key to toggle between the Main system bus and the most recently selected Alternative source. The standard monitoring source is the Main system bus. However, you can choose many other sources, including other system buses or external sources, such as a CD player. The system remembers the last non-standard source that you chose as the Alternative source.

— **Mono Comp**: If your current speaker set is not mono, you can press this button to monitor playback in mono.

— **Stereo Comp**: If the current speaker format is not stereo, you can press this key to monitor the playback in stereo.

** Macros Mode Toolset**

Macros are programmable keys where you can record sequences of keystrokes. The Macro mode toolset includes 30 programmable Macro keys, as well as Delete, Rename, and Record keys for recording and managing your macros. The first 14 Macro keys are also assigned to the Macro quick-keys at the top of the
the Audio Editor’s display (Pad). Macros can record any keystroke on the Fairlight Audio Editor, including a momentary press to enter a different mode and keypresses in that mode during the momentary press. For example, it is common, when recording a macro, that you start in the mode with the first key you want to record, then momentary-press the Macro mode key to enter Macro mode just long enough to start recording the macro. Upon releasing the Macro mode key, the first key you press on the original mode will be the first one recorded.

The most important thing to remember when recording macros is that they are reliable once created, but have no context except what you program. It’s a good idea to think of the starting and ending context for your macro prior to recording. For example, if the macro requires moving clips from one track to an empty track, make sure you create the new track before executing the macro. If the macro uses jump keys, make sure you have them set up ahead of time and so on. It is up to the user to remember a starting point and ending point, if relevant. Once a macro has been recorded, the associated quick key at the top of the Editor lights up to show that it is available as a macro.

Macro mode keys

**NOTE:** To prevent accidentally recording, renaming or deleting a Macro key, the Macro action keys require a momentary press plus a numbered Macro key.

**Macro Mode action keys:**

- **Delete:** Press and hold this key and press a Macro key to delete the macro.
- **Rename:** Press and hold this key and press a Macro key to open the User Macros dialog and rename the macro.
- **Record:** Press and hold this key and press a numbered Macro key to record. Press Control and the Menu key to stop recording. The Menu modifier key changes to Menu (rec) when recording a macro and Stop Recording when you press the Control modifier key while recording a macro.
Recording a Macro:

1. Set up the Editor for whatever steps you plan to record in the Macro and latch that mode.
2. Momentarily press the Macros mode key to enter that mode temporarily.
3. Do not release the Macros key.
4. With the other hand, in the Macro mode toolset, momentarily press the Record key and the numbered Macro key that you want to record. Release the Record and numbered Macro key.
5. Release the Macros mode key to return to the latched Editor mode.
6. Press the keys one at a time as needed to complete the steps that you want to record to the macro.
7. Stop playback, if necessary.
8. Press the Control key and press the Stop Recording key in the modifiers section of the keyboard.

**NOTE:** You can take as long as you need to record a macro, and if you make a mistake you can either delete the macro or re-record it using the Delete or Record keys.

Example of recording a simple macro to move a clip from one track to the track below:

1. Prepare the Editor for recording the first macro. In this case, press the Edit mode key and latch the A1 track selection key to select that track. Move the playhead over the first clip in the track.
2. Momentarily press the Macros key with the left hand. Do not release the Macros mode key.
3. In the Macros toolset, press the Record key and the Macro 1 key, to initiate recording of the Macros 1 key. Release both keys. The Macros keys disappear from view in the Macros toolset.
4. Release the momentary press on the Macros key to return to the Edit mode. The next keypress will be the first recorded to the Macro 1.
5. Press the Cut Clip key to cut the clip on the selected track beneath the playhead.
6. Press the Down key to the left of the jog wheel to move the track selection, and the shadow of the clip that was cut, down one track.
7. Press the Enter key to paste the clip.
8. Press the Up key next to the jog wheel to move the selection back up to the A1 track.
9. Press the Control modifier to change the Menu key to a Recording Stop key. Press the Recording Stop key.

From this point forward, pressing the Macro 1 key in the Macros Mode toolset, or the Macros 1 quick key at the top of the Editor will perform the macro of cutting a clip on one selected track and moving it to the track below then returning to the original track. With this macro, you could easily use jump keys to move
down the Timeline a clip at a time, and move any clips that need to go to the A2 track with the press of
the Macro 1 key.

**NOTE:** You could also use this same macro to move a clip from any selected track to the track
below because it contains the Up and Down arrow keys instead of specified track selection
keys. Additionally, you could take this macro idea to a whole new level and include jump keys
and fades at the edges of the clips as you edit.

### Renaming a Macro key

1. Enter the Macros mode toolset.
2. Long-press the Rename key and press the Macro key that you want to rename.
3. In this case Macro 1. Release both keys.
4. The picture keyboard changes to QWERTY keys and the User Macros dialog opens on the
   computer screen.
5. Type a new name for the Macro and press Return.
6. The Macro is named in the Macro mode keys.

![User Macros dialog on Computer screen](image)

![Named Macro 1 in the Macros Mode keys](image)
**TIP:** If you are going to name your macros, it’s a good idea to give them a brief but literal name to help you remember the macro’s function. In the above example, the macro was named A1 to A2 because it was designed to move a clip from the A1 track to the A2 track.

**Mix Mode Toolset**

Whether you are using the Fairlight Audio Editor with your computer, or as part of a Fairlight Console, the Editor’s Mix mode offers easy access to a powerful array of mixing and automation tools. Here you can copy and paste EQ, Dynamics, Aux, Path, Plug-ins or all of the above to other tracks and buses as well as automate any parameter. The heart of the Mix mode toolset is the Mix On/Off key. Latching Mix On brings all of Fairlight’s powerful automation tools and menu options to the picture keyboard so you can control every aspect of your automation without ever reaching for the mouse. If you are familiar with Fairlight’s mixing and automation tools in DaVinci Resolve, you’ll have no trouble finding your way around this toolset because there is a picture key for every switch, toggle, menu, and sub-menu option available in the Fairlight page’s robust automation toolset.

The functionality of each specialized key is exactly the same as using the software alone. However, the advantage of mixing with the Fairlight Audio Editor or a Fairlight Console is that you’ll have physical controls including touch-sensitive knobs for precision automation recording and mixing maneuvers without the distraction of a mouse and menus.

**NOTE:** For a detailed rundown of the Fairlight Automation tools and features, please refer to Chapter 174, “Automation Recording.”

The Mix Mode automation keys are organized and grouped as action keys, toggles and menus with related submenu keys with the same tools and menu choices that you’ll find on the Fairlight page and Fairlight menu in DaVinci Resolve.

**Mix Mode toolset toggles, groups, and menu keys:**

- **Copy/Paste:** This key automatically toggles on when automation is turned off. You can manually latch this key while the automation toolset is showing. When latched, the Copy/Paste key reveals the Copy and Paste toolset group.
— **Copy and Paste Toolset Group:** When the Mix On key is unlatched, the Copy/Paste key latches, and you will see a Copy key next to a toolset with six paste action keys, including Paste EQ, Paste DYN, Paste AUX, Paste PATH, Paste PLUGS, and Paste ALL. These keys are all used to copy attributes from the active track and paste them on a selected track. To use these keys, press the Copy key to copy all of the track attributes for the active track. Select another track and choose the Paste action key that corresponds with the attributes you want to paste to the newly selected track.

— **Mix ON:** This key toggles on or off the Automation toolset. When toggled on, the Copy/Paste key toggles off and the Copy and Paste toolset group switches to the automation specific toolset such as the Mix, Punch Menu, and Preview menu keys.

— **Automation Menu keys:** Enable, Mix list, Mix Menu, Punch Menu, and Preview Menu all reveal a set of submenu option keys when latched. The subsequent option keys offer the exact same options available on the Fairlight page interface. For example, latching the Enable menu key reveals ten option keys that represent each of the ten Enable buttons on the Fairlight page Automation toolbar, in the exact order that they appear onscreen. The Enable option keys are as follows from left to right: Write FADER, Write MUTE, Write PAN, Write EQ, Write COMP, Write LIMITER, Write AUX, Write PLUGINS, Write MISC, including a dedicated All button.

— **Open/Close GUI window keys:** The Patch, Mix List, and Presets keys open and close the corresponding windows on the computer screen.

— **Toggles:** The Touch and @Stop keys toggle between the different Touch and Stop automation modes when toggled. The Touch toggles between OFF, LATCH, and SNAP while the @Stop key toggles between RETURN, EVENT, and HOLD.

— **Preview Menu:** Switches the Automation controls into Preview mode for auditioning settings without writing new automation data and offers Preview menu option keys including: Fill Range, Glide Range, Punch In, and Punch Out.

— **Safe Menu:** This new automation option provides the ability to specify an active automation zone with Safe In and Safe Out keys where the system does not receive timecode automation outside of the specified range. When Safe automation mode is active, automation Read and Write functions are only available within the safe range and are disabled outside of the designated safe range.

— **Write Quick Keys:** Write FADER, Write MUTE, Write PAN. These keys can be used to quickly enable the three most common Automation parameters.

**Edit Mode Toolset**

If you’ve read the previous Fairlight chapters, you’re already familiar with the Audio Editing tools and menu options. The Edit mode toolset includes over twenty specialized picture keys for adding, moving, editing, and trimming clips in the Timeline. The keys represent all of the audio editing options available in the Fairlight page via the Edit and Trim menus as well as a handful of tools that are only available in the Audio Editor. You’ll also find keys to open, preview, and edit clips from the Sound Library and Media Pool.

Fairlight audio editing is by nature fast and fluid, even when you are working with the software and computer alone. Where the Fairlight Audio Editor enhances the process is that with the combination of the jog wheel and Edit mode action keys, you can move and edit clips at incredible speeds and even edit clips on the fly without ever picking up your hands. In fact, the Fairlight Audio Editor is designed for two-handed operations. The added functionality of two-handed workflows really comes into play when working in the Edit mode. For example: with your left hand, you can easily select tracks and press action keys, while you use your right hand to drive the jog wheel controls and press the Enter key to paste material that its copied to the clipboard.
The Edit mode action keys work off of two principals: removing material you don’t want to keep in the Timeline, or moving material to another location. To remove material, you use tools that erase or trim. To move material, you use the Clipboard tools that cut or copy and therefore store the material in memory to be pasted elsewhere. When you cut or copy material, a semi-transparent version of the Clipboard clip appears in the Timeline and can be moved to another track or location and pasted. Another consideration when editing is to determine if you are modifying the head, tail, whole clip, or a range containing only part of a clip or multiple clips. All audio edits are non-destructive and reversible with the Undo key.

**NOTE:** For more details about the fundamentals of editing audio clips in the Fairlight page, please refer to Chapter 171, “Editing Basics in the Fairlight Page.”

**Default Edit mode actions and associated keys include:**

- **Cut:** Cut Head, Cut Clip, Cut Tail keys all cut the material based on the selected track, clip and playhead position and place the removed material in the clipboard for pasting with the Enter key. For more fluid editing, hold down a Cut key, such as Cut Tail, and use the jog wheel to move the cut portion of the clip to a new location, then release the Cut Tail key to automatically paste the cut clip in the new position.

- **Copy:** Copy Head, Copy Clip, Copy Tail keys all copy the material based on the selected track, clip and playhead position and place the copied material in the clipboard for pasting with the Enter key.

- **Trim:** Trim Head, Trim Tail uses the playhead’s position to remove the current clip’s head or tail. You can also press and hold Trim Head or Trim Tail while using the jog wheel to extend either the head or tail of the current clip. While doing this, you see the full waveform the clip you’re trimming as you turn the jog wheel, but when you release the Trim Head or Trim Tail button, the Head or Tail of the selected clip appears trimmed at the current frame at the playhead.

- **Split:** The Split key splits the clip at the playhead position creating a new edit point between two clips.

- **Fade:** The Fade Head and Fade Tail keys add fades respectively from the playhead to the head or tail of a clip.

- **Erase:** Erase clip deletes the clip from the Timeline.

- **Batch Fades:** Long-press this key to open the Batch Fades Settings window or press to execute Batch Fades for the current audio clip or range selection.

**Edit mode actions when Range is active:**

— **Cut Range:** Use this key to cut all clips and partial clips within the range on the selected track or tracks. The Cut Range key replaces the Cut Clip key when Range is toggled on. This cuts clips within the range on all selected tracks.

— **Copy Range:** Use this key to copy all clips and partial clips within the range on the selected track or tracks. The Copy Range key replaces the Copy Clip key when Range is toggled on. This copies clips on all selected tracks within the range.

— **Split Range:** This key splits any clips lying across the range boundaries into two pieces at the range In Point and Range Out Point. This affects clips at the range boundaries on selected tracks.

— **Erase Range:** Erase Range deletes the range from the Timeline. This Erase Range key replaces the Erase Clip key when Range is toggled on.

NOTE: For ease of use and quick mastery, the Edit mode action keys are logically grouped in pairs or trios so that keys involving the head of a clip are first and tails are last. For example, the Cut Head, Cut Clip, and Cut Tails keys are grouped together as a trio. Placing three fingers over those keys make it easy to remember the first key is the head, middle key is the full clip, and last key is the tail.

In addition to the default Edit mode action keys, there is also a set of refinement action keys that can be used to finesse edits, fades, and clip positions. The refinement action keys require the Control modifier key as well as the jog wheel in most cases. These refinement action keys are logically placed for quick decisions so you can first execute an edit and then refine it without lifting your left hand or searching for a refinement key.

**Control modifier-based editing refinement actions and associated keys include:**

— **Erase:** Erase Head and Erase Tail keys appear on the same keys as Cut Head and Cut Tail so that you can quickly choose between a cut, which keeps the material in the clipboard and erasure of the material, with the touch of your left Pinky finger on the Control key.

— **Fade:** Head X-Level and Tail X-Level keys appear on the Fade Head and Fade tail keys so that you can first add a fade, then press Control and use the same key to refine the fade level with the jog wheel. Additionally, long-press SHIFT to reveal Head XPoint and Tail XPoint that can be changed with the jog wheel or long-press CTRL + SHIFT to use the jog wheel to refine Head Shape and Tail Shape.

— **Slip:** Slip Head, Slip Clip, and Slip Tail keys are located on the same keys as Copy Head, Copy Clip, and Copy Tail. That way you can seamlessly copy, move, and paste material to a new location, then hold the Control key while pressing the respective Slip key, and turn the jog wheel to refine the Head, Clip position or Tail based on the jog movement of the playhead.

— **Trim:** The Trim Clip refinement tool shares a key with the Split Clip key so that you can split a clip at the playback position, then hold Control and the same key while using the jog wheel to refine the position of the edit point created by the split.

— **Clip Level:** This key plus the jog wheel and the Control modifier key adjusts the Display level of the selected clip’s waveform.
— **Jog Wheel:** To place the playhead (CTI) at either the In or Out point of a range, use Control plus the jog wheel. Hold Control while turning the jog wheel to the left to move the playhead to the In point. Hold Control while turning the jog wheel to the right to move the playhead to the Out point.

**Edit mode keys for enhanced features only available in the Fairlight Audio Editor:**

The Edit mode tools work exactly as expected if you are familiar with the Fairlight page in DaVinci Resolve. There are, however, a few specialized keys that don’t have counterpart tools in the Fairlight page. These unique tools perform valuable time-saving tasks.

— **Clip Level:** This key is both a Menu and Jog Wheel modifier key. Hold the Clip Level key to reveal seven option keys to raise or lower the selected clip’s volume up +/- 3 dB. Incremental menu options keys from left to right include: -3dB, -2dB, -1dB, 0dB, +1dB, +2dB, +3dB. As a Jog Wheel modifier key, hold the Clip Level key with the left hand and turn the jog wheel with the right hand to raise or lower the clip’s volume level dynamically based on the amount and direction that you turn the wheel. This can be performed on the fly during playback, so you can dial up or down the volume level of any clip on the selected track as the playhead passes over the clip. Clip level changes can also be applied to multiple clips on multiple selected tracks simultaneously.

**NOTE:** At the time of this printing, The Edit page in DaVinci Resolve includes a Clip menu option and keyboard shortcuts for incremental decibel changes, however there is no comparable shortcut, or menu in the Fairlight page.

— **Reverse Clip:** This key is available as one of the Clip Menu action keys. When pressed, this key reverses the clip beneath the playhead on the selected track. This creative sound design tool is also available in the Record mode Clip Menu toolset.

— **Range Menu Keys:** A momentary-press on the Range key revels six invaluable Range-defined tools for speeding up your tasks. Although they are also available in the Record and Mix mode toolsets, you will primarily use them in Edit mode.

— **Copy Segment:** This action key copies all timeline material within a marked range.

— **Paste Segment:** This key pastes a copied segment to a new timeline location based on the playhead position.

— **Previous Gap:** Use this key to extend a range by moving the range In Point to the previous gap in the selected track or tracks.

— **Next Gap:** Use this key to extend a range by moving the range Out Point to the next gap in the selected track or tracks.

— **Fill:** Fills the current range on a track from end to end with the clipboard clip. Without the need to cut, copy and paste, Fill automatically duplicates the clipboard clip, with a slight overlap and fade to stitch together background noise or room tone within the marked range.

— **B/F Fill:** Back/Front Fill works exactly the same as Fill, except that it reverses the audio in every second copy of the clipboard used for filling. Alternating the direction of the stitched clips is useful for creating a seamless background sound because the waveform is continuous.
**Alternate Picture Key Toolsets**

In the Alternate picture key layout mode, all of the picture keys are text only, with the Editor mode keys arranged in the lower center white text. The menu keys are easy to spot with yellow text and a mark in the upper left corner. Alternate Edit, Monitor, and Mix mode toolsets include action keys in the six soft keys to the left of the jog wheel for quick access. For example, in Edit mode, the Cut, Copy, Erase, Fade, Nudge, and Trim action keys are all located in the upper-left corner of the picture keyboard, while the action keys associated with the active action key appear in the picture keys near the jog wheel. For example, if the Copy action key is latched, the Copy Clip, Copy Head, and Copy Tails keys are available near the jog wheel. If you latch the Cut action key, the middle keys near the jog wheel change to Cut Clip, Cut Head, and Cut Tail.

Alternate picture key toolsets include the same keys as the default normal layout. The difference is the location of the keys, how they are grouped, and the additional usage of the picture keys near the jog wheel.
Alternate Record toolset

Alternate Monitor toolset with Phase, Main/Near Speaker selection, and Alt Source keys available near the jog wheel

Alternate Mixer toolset with Mix On unlatched, Copy/Paste latched, and Copy/Paste keys available near the jog wheel

Alternate Mixer toolset with Mix On latched and Mix automation keys available near the jog wheel
**TIP:** One way to get to know your way around the Audio Editor keyboard is to start with knowing how to perform a task in the Fairlight page using a mouse and standard keyboard. Then, consider which Editor mode category the task belongs to, and find the associated keys from there. Making the transition from mouse and keyboard to the Audio Editor is a journey of discovery where you will find numerous ways to execute different tasks, shortcut keys and advanced controls and options that can increase your speed and productivity exponentially the longer you use it.

**Editor Screen with Soft Controls**

The Editor screen, located above the picture keyboard, displays all signal processing and mixing information related to the most-recently-selected (active) track or master bus. It also displays labels and visual feedback for the soft keys and knobs that surround the screen. Additionally, the ALT key below the screen extends its functionality with an alternative set of parameters when necessary. This is where you can quickly view and adjust various mixing parameters associated with the active track or master bus.

Whether you select a track manually with a mouse click, press the associated Track Selection key on the Audio Editor, or latch a Channel Select button on the Fairlight Channel Control panel, the most-recently-selected track’s parameters appear in the Editor screen.

These parameters include Level and Pan, EQ, Dynamics and AUX, and Plug-in parameters that correspond with the active track of bus. The graphical display for signal processing remains the same in the Editor screen for nearly all Editor modes and types of signal processing, except for Monitor mode and Aux signal processing.

As you learn your way around the Fairlight Audio Editor you’ll soon find that glancing at the Editor screen is akin to glancing at your dashboard while you drive your car. Following this example, your primary computer screen is like your windshield where you can always see what is happening as you drive the Fairlight Console or Audio Editor. However, like a dashboard, you can glance at the Editor screen at any time to see which track or master bus is selected, as well as the current signal processing settings. Also, like your car’s dashboard, you can reach out and change settings for any of the interactive graphical parameters by simply choosing that element and modifying the adjacent controls.
At this time there are five different Editor Screen layouts that you will encounter while you work with the Fairlight Audio Editor, including Clip EQ, Standard Mixing, Plug-In, Aux sends, and Monitor mode layouts.

The Clip EQ layout gives you soft menu controls of the 4-Band EQ parameters for the selected clip when you latch the Clip EQ key. The Clip EQ key is one of the Clip Menu option keys available in the Record and Edit mode toolsets. Here you have all the same EQ controls that are available in the Clip Inspector in DaVinci Resolve. Along the top of the second page of Clip EQ controls (shown above), you’ll find new Clip EQ preset options that are not currently available in the Fairlight page UI. These options include: Save Preset, Apply Preset, Copy, and Paste.

Standard Mixing layout used in all Editor modes, except Monitor, or when the Aux controls are showing. At a glance you can see that the Pan controls are active based on the illuminated soft button in the bottom row with the bright red line over the Pan label adjacent to the latched button.

Plug-In layout used to control first plug-in on the selected track and is available in all Editor modes, except Monitor mode and when Aux controls are showing. The Plug-In Editor screen controls include a three page layout. Page 1 provides the Insert IN toggle to bypass the plug-in. Page 2, shown above, has toggle options to Reset the plug-in as well as options to Save, Load, and Apply presets, Automate, and Lock the plug-in. Page 3 offers Mapping mode where the user can map specific plug-in parameters to the six Editor rotary knobs.
Aux layout showing send levels and panning for up to 24 Aux channels simultaneously. In this example, the sends for Aux 1 and Aux 3 are enabled (green) for the active track, while Aux 2 has been disabled for this track. The soft buttons along the top enable the different Aux channels for the active track. Red text over black labels indicate which Aux channels and soft buttons are toggled On.

Monitoring mode layout with visual feedback for Dim and Fixed levels, Control Room, Loudness, and Studio meters, as well as a graphical representation of the speaker configuration and listening environment.

**Visual Feedback between Soft Controls and the Editor Screen**

The Editor screen offers highly visual feedback that is easy to follow and corresponds with the identical controls in the Fairlight page, as well as the visual feedback on the Channel bay if you are working with a Fairlight Console. When looking at the soft buttons and touch-sensitive knobs, here are some guidelines to help you recognize their current state and options:

— Soft buttons and knobs around the Editor screen directly control the closest on-screen parameter.
— The soft buttons above and below the screen have three visual states: Bright, dim and off.
— At a glance all soft buttons with adjacent controls are illuminated (dim), while soft buttons without controls are black (off).
— The upper row of soft buttons are toggles that either toggle a parameter On/Off or toggle between options, such as the type of curve for EQ filtering. The last soft button on the top row toggles between pages of controls.
— Soft buttons above the Editor screen brighten when active or latched on, and the corresponding soft menu control onscreen shows in black with red text.
— Soft buttons below the Editor screen display alternative pages of controls assigned to the left and right knobs.
— It is easy to identify which page of controls is active because the latched soft button below the Edit screen is illuminated along with the adjacent label that is also marked with a bright red line.
— When you touch one of the knobs to adjust the current settings, the background of the corresponding visual feedback onscreen darkens.
— You can reset any of the parameters controlled by a touch-sensitive knob by pressing the Control key then touching the knob.
— Hold Shift while turning a knob for fine incremental control.
— The first and last soft buttons on the bottom row are modifier keys that offers momentary control of additional parameters for the controls for the knobs when available. For example, when the Aux controls are shown in the Editor screen, the knobs control the send level. While, a momentary press on the modifier soft button changes the knob controls to the Aux channel Pan settings.

Visual cues, like the red line over the illuminated soft button below the screen and the darkened parameter control next to the active knob on the left of the screen, indicate which EQ parameters are currently assigned to the control knobs, as well as which touch-sensitive knob is in use.

### Macro Quick Keys

The top row of the Fairlight Audio Editor is dedicated to the Macros quick keys. Here you’ll find Macro quick keys for triggering each of the first 14 programmed macros. Once a Macro key has been recorded in the Macro mode layout, the associated Macro quick key illuminates to show it can be used to trigger the corresponding macro. These are a fast way to use macros as you work, without switching to the Macro mode toolset.

Escape and 14 Macro quick keys at the top of the Fairlight Audio Editor for the first 14 macros.
Chapter 182

Modular Fairlight Consoles

The modular Fairlight consoles make it easier to perform audio editing, recording, and mixing tasks by providing professional audio controls for nearly every function and feature in the DaVinci Resolve Fairlight page.

Additionally, using a Fairlight console to control the Fairlight page is vastly more efficient and ergonomic than working with a traditional mouse and keyboard. This is especially important when your audio post-production job requires long hours doing complex, focused, and often repetitive work.

This chapter covers details about the different modular Fairlight console components, the available console configurations, and how they work with DaVinci Resolve.

NOTE: To set up a modular Fairlight console to work with your DaVinci Resolve system, you first must perform a custom installation of DaVinci Resolve and check the box to include the Fairlight Control Panels utility.

For complete setup and installation instructions, refer to the Fairlight Console Assembly Instruction Manual. DaVinci Resolve 17.2.1 requires a firmware update for each of the modular panels. See instructions for updating the firmware via the Fairlight Control Panels utility at the end of this chapter.

About the Fairlight Console Components

Fairlight consoles are a modular design that let you build your console to suit your production requirements. Within each console, four different Fairlight console components work together as Fairlight page control panels in a stand-alone chassis. These modular console components are either channel bay panels or audio-editing bay panels, and are paired with an adjoining Fairlight LCD Monitor component. The channel bay components work in tandem to control specific parameters on tracks, buses, and mains and include the Fairlight Console Channel Control, the Fairlight Console Channel Fader, and the Fairlight Console LCD Monitor that is used as a dedicated channel control screen. The audio editing bay components consist of the Fairlight Audio Editor and adjacent Fairlight Console LCD Monitor, which mirrors your computer screen and displays the DaVinci Resolve interface.

Four different Fairlight console configurations range in size from 2-bay to 5-bay, with each bay spanning the width of a console module. The primary difference between the Fairlight consoles is the number of channel bays they contain. For example, a standard Fairlight console 2-bay comes with one set of channel bay panels plus one set of audio editing bay panels for a total of three control panels and two LCD screens, while a standard 5-bay console includes enough panels to fill four channel bays and one editing bay for a total of nine control panels and five LCD screens.

- **Fairlight Console Channel Control**: Dual function control knobs and buttons for each channel strip.
- **Fairlight Console Channel Fader**: Motorized fader panel with 12 channel strips and controls buttons.
- **Fairlight Console LCD Monitor**: High resolution screen with HDMI, SDI and ethernet inputs.
- **Fairlight Console Audio Editor**: Hardware control panel for high speed audio editing.
- **Fairlight Console Chassis Bay**: Modular cast steel chassis available in 2, 3, 4 and 5 bay configurations.
Because you will still need to control your computer and other software functions from the console, it is also important to have a wireless keyboard and mouse within reach. To accommodate wireless computer controls, Fairlight consoles include a Channel Control Blank and an Infill module. The Channel Control Blank fits in the Channel Control slot between the Audio Editor and editing LCD monitor, and easily holds a full-sized wireless computer keyboard. The Fairlight console Infill module provides a convenient flat surface for a wireless mouse, track-pad, or notebook. You can place the Infill module at the left or right of any bay within the console chassis. The most common Infill position is on the right side of the audio editing bay; however, a left-handed sound designer may prefer to place the Infill set on the left side of the editing controls.

Each self-contained modular console is designed to meet the demands of modern work flow ergonomics and ease of use so that audio editors, sound designers, and re-recording mixers can quickly and accurately complete both simple and highly complex audio post-production tasks with minimal fatigue.
This chapter provides details and functions descriptions of each console component and should be read in conjunction with the previous Fairlight chapters to get the best from your console.

For professional sound editors working on tight deadlines, the Fairlight Audio Editor, gives you quick access controls for high speed, precision audio editing. This dedicated Fairlight editing control panel is available in either desktop or console models. It’s easy to learn and master with a variety of highly visual, intuitive controls including touch-sensitive control knobs, macro buttons, LCD editor screen, number pad, electronic clutch-action shuttle, and a full keyboard with multi-functioning keys.

For high-resolution viewing of your DaVinci Resolve interface as well as channel controls, meters, video, and more, you’ll use the Fairlight Console LCD Monitor. These custom designed LCD monitors fit perfectly at the top of each console bay to form a bridge of screens at just the right angle for comfortable viewing while you work. Each modular LCD monitor includes switchable inputs from console screen to HDMI or SDI inputs for flexible display of plug-ins and reference video.
The Fairlight Console Channel Control is a multi-functional panel that works in conjunction with the Fairlight Console Channel Fader and LCD Monitor to provide 12 groups of touch-sensitive control knobs, buttons, and visual feedback for each of the 12 fader channels. These controls offer instant access to the parameters available in the DaVinci Resolve Fairlight page Mixer.
For precision recording, mixing, and mastering, the Fairlight Console Channel Fader module offers 12 touch-sensitive motorized faders and Pan knobs with corresponding Fader Channel Control buttons, automation controls, and bank buttons for mapping tracks and buses to the 12 faders.
Fairlight Console Audio Editor

The legendary Fairlight Console Audio Editor lets you quickly navigate large projects and precisely edit audio much faster than using a regular mouse and keyboard. The Fairlight Console Audio Editor has an identical feature set and controls as the Fairlight Desktop Audio Editor. The difference is that the Console Audio Editor is connected to all the console's control panels, so recording, playback, and editing functions are reflected on the corresponding channel bays and vice versa. For example, if a track is called in the Fader Panel, it is also loaded in the Audio Editor’s built-in display. Another example is if a track button is selected in the Audio Editor, the track is also selected in the Fairlight Page interface on the Editing LCD monitor, and the corresponding selection button shows active in the In-Line Channel Control Extension buttons as well as the Channel Control LCD monitor. A Fairlight Desktop Audio Editor can also be connected to a Fairlight console that does not include an Audio Editing bay.

For details on the Fairlight Console Audio Editor’s features and functions, see Chapter 181, “Using the Fairlight Desktop Audio Editor.”

Although the three channel bay components are separate modules, they work together in tandem as a single multifaceted unit to display and control various channel parameters. The Channel Fader panel offers traditional channel mixing controls, while the multi functional Channel Control panel focuses on controlling specific parameters as needed as well as how they are displayed on the Channel LCD monitor.

Channel Control Modes

Within a Fairlight channel bay, the Channel Control panel works in three distinct channel control modes. These modes, in turn, change the functions of the multipurpose channel control knobs and buttons as well as the corresponding display in the LCD module:
Channel Control components set to In-Line mode
— **In-line:** This mode effectively separates the knobs and buttons on the channel control module into 12 groups that line up vertically with the 12 faders on the channel fader control. As the name suggests, in-line mode shows each set of parameters in a line that continues from the fader channel up through the channel controls and into the display on the LCD monitor. In-line Display buttons on the right side of the Channel Control panel determine which in-line parameters are shown. This mode is common in live recording so that the operator can easily see and control parameters of multiple microphone inputs simultaneously.

— **Channel:** Use Channel mode to control up to 192 parameters on one channel. In channel mode, the 12 groups of controls on the channel control module are used collectively to adjust parameters for a specific channel from left to right as displayed on the LCD Monitor. In Channel mode, there are several ways to choose which channel is displayed, including the Channel Call buttons on the Channel Fader panel, the Channel Select buttons on Channel Control panel, the Call Follows menu, the edit controller, or by selecting a track in the Fairlight page Timeline or Mixer. This is the most common channel control mode in audio post production, as it provides quick access to all parameter controls for a specific track.
— **Master**: This mode utilizes all channel controls to adjust parameters for the buses and main output. In Master mode, the 12 groups of controls on the channel control panel adjust the adjacent main output parameters displayed on the LCD. The channel controls in Master mode are organized from left to right in order of processing. Master mode is commonly used while mixing and mastering soundtracks.
The secret to managing high track counts for large projects is the Fairlight Console Channel Control because it provides instant knob-per-function access to channel parameters along with real-time high resolution visual feedback on-screen. The Fairlight Console Channel Control module fits directly below the LCD monitor so that you can always see the graphical representation of each parameter as it is modified with the adjacent channel controls. There are four types of channel controls organized in three areas of the panel.

On the far left and right sides of the panel, you’ll find dual-function Channel Display buttons that determine the current channel control mode and which parameters are displayed on the LCD monitor.

The middle of the panel contains 12 groups of multi functional Channel Control buttons and knobs that align with the 12 faders on the Channel Fader panel. The knobs are used to adjust parameter values, while the control buttons act as toggles, On/Off, or In/Out switches for active parameters.

The fourth type of controls are the In-Line Channel Extension Buttons, which are arranged in groups of six below each of the 12 channel control groups. Here you’ll find dedicated channel-specific buttons for functions available in the Fairlight page Mixer and Timeline track headers.

The primary display controls for the channel control components are the dual-function channel display buttons located on the left and right sides of the Channel Control panel. These bi-colored LED buttons determine the channel mode and current parameters displayed on-screen. There are a total of 16 display buttons split evenly into groups of eight buttons on each side of the panel. On the left side of the panel, you’ll find eight channel display buttons used to select the channel control mode as well as display plug-ins and automaton parameters; while the display buttons on the right side of the panel are used to show the in-line channel parameters found in the Fairlight page Mixer, such as Pan, EQ, and Dynamics. The top and bottom display buttons are identical on both sides of the panel to provide easy access to the CTL (control) and ALT (alternate) functions for selecting secondary display features, resetting parameters to default values, and showing alternate controls in the LCD.

The default color for all display buttons is yellow, except for the Control button, which is always blue. When the Control button is pressed, inactive display buttons with secondary functions turn blue or purple. Active display buttons remain in their active state color until another display button is selected. For example, if a secondary function is selected, that display button remains purple as long as it is active, while the other display buttons return to yellow when the Control button is released.
**Left side of panel, Channel display buttons from top to bottom:**

<table>
<thead>
<tr>
<th>Channel Display buttons</th>
</tr>
</thead>
</table>
| CTL: This display button is the same as the Control modifier key on the computer keyboard and can be used to switch to the secondary functions for the dual-function display buttons below. The handy blue color makes it easy to locate and use as needed, to switch inactive display buttons to their secondary functions. Additionally, holding the Control button while touching one of the knobs or faders will reset any of the touch-sensitive controls to their default values. For example, holding the Control button while touching a fader or Aux send knob resets the value to 0 dB and is the Fairlight Console Control equivalent to double-clicking the mouse on a fader or knob in the Fairlight page GUI.

There are a total of three conveniently located Control buttons on a Channel Control bay; two on the Channel Control panel, and one on the Channel Fader panel.

| MSTR/U1: This button is used to set the channel controls to Master mode which displays all the system bus controls for the Main output bus on the LCD monitor, while all the adjacent channel control buttons and knobs are dedicated to controlling the busing parameters as displayed. The secondary U1 function is not implemented in this version of the software.

| PLUG/U2: Use this button to show active plug-ins on the LCD monitor and allocate controls for the plug-in parameters to the corresponding channel controls. The Plug function as well as the secondary U2 function are not implemented in this version of the software.

| CHAN/U3: To change the channel controls display mode to Channel mode, use this button. Once in Channel mode the channel control buttons and knobs control the parameters for a single channel. Use Control + CHAN to get to the channel’s Aux Sends. If multiple channels are selected, you’ll see parameters for the last track selected or called. In this version of the software, the secondary U3 function is not implemented.

| ENAB/COPY: To quickly enable parameters for automation, you can hold this button and touch any channel control button, knob, or fader. The alternative function, COPY, is used to copy parameters between channels by simply touching the control knob or fader where you’d like to copy the specific parameter values. At the time of this writing, these functions are not yet implemented.

| CURVE: When you want to display a parameter’s automation curves on the active track in the Timeline, hold this button and touch any channel control or the fader, mute, or pan pot on the Channel Fader panel. |
**SPLL:** SPLL is not used in this version of the software.

**ALT:** To access additional display button options or alternate parameter controls on any channel control, use this modifier button.

**Right side of panel, In-Line Channel display buttons from top to bottom:**

**CTL:** Use this button to select the secondary functions for the dual-function display buttons below. Also, holding the Control button while touching one of the knobs or faders will reset any of the touch-sensitive controls to their default values. This is one of three identical Control buttons on the channel control components set, and it works the same as pressing the Control modifier key on a computer keyboard.

**PAN/PATH:** This button displays all the in-line surround panning controls including Left/Right, Front/Back, Down/Up, and Spread. Press the ALT display button to see the alternate Rotate, Tilt, Divergence, and LFE controls. Hold the Control button and press the PAN/PATH button to display the Path setting controls, including Record level, Trim, Insert, and Direct Out. Press ALT while the PATH controls are active to see the alternate Path controls: Mic Gain, Group, and the Direct Output Pre/Post fader switch. These Path settings are the same as the controls in the Path Settings window available via the Track Input drop-down menu on the Fairlight page Mixer.

**EQ/FILT:** To control the In-Line channel parametric Equalizer (EQ), use this button without a modifier to display four frequency bands, including High Frequencies (HF), High-Middle Frequencies (HMF), Low-Middle Frequencies (LMF), and Low Frequencies (LF). Press the ALT button for Gain control of each of the four bands. Use the Control key for the secondary button function to display and modify the two channel filters for High-pass, Low-pass, High-shelf or Low-shelf filtering. While in EQ/FILT In-Line display mode, the Channel Control touch-sensitive knobs are used to sweep Frequencies or Gain, and the Channel Control buttons toggle between Bell, Notch, High Pass Filter (HPF), Low Pass Filter (LPF), High Shelf (Hi-Sh), and Low Shelf (Lo-Sh) filtering curves. The functionality of EQ/ FILT works the same as using the Channel EQ window available on the Fairlight page Mixer.
**AUX/AUX:** This button displays in-line controls for Aux sends 1 to 16 in sequential groups of 4 Aux buses at a time. You can toggle between Aux 1-4 and 5-8 by pressing the Aux key again. Hold Control while this button is active to display controls for Aux sends 9 to 16. Pressing the Aux key while holding Control will toggle between Aux 9-12 or 13-16. Press the ALT button for the alternate Pre/Post fader controls for the Aux send.

**COMP/U1:** This is for In-Line Dynamics controls for the Compressor, including: Threshold, Attack, Hold, and Release. Use this button without a modifier. Press the ALT button for the alternate Ratio controls. Hold Control and press any of the dynamics display buttons: COMP, LIM, or EXP to access the Makeup gain controls. The secondary U1 function is not implemented in this version of the software.

**LIM/U2:** To display the In-Line Limiter controls, use this button. Without a modifier, you’ll see the limiter controls, including Threshold, Attack, Hold, and Release. Hold Control and press LIM to access the Makeup gain controls. The secondary U2 function is not implemented in this version of the software.

**EXP/U3:** This display button is for the in-line Expander/Gate controls. The unmodified Expander controls include Threshold, Attack, Hold, and Release. Press the ALT button to switch to the alternate Gate controls, including Ratio, Range, Hold, and Release. Hold Control and press EXP/U3 to access the Makeup gain controls. The secondary U3 feature is not implemented in this version of the software.

**ALT:** This is the alternate option modifier button and functions the same as the ALT/Option key on the computer keyboard. To access additional display button options or an alternate control on any channel control, use this button.

**NOTE:** Non-functioning Channel Display buttons, such as PLUG and ENAB, remain unlit. These buttons will be operational in future software updates.
The left-side Channel Display buttons without modifiers and with Control button pressed to show secondary functions.

Pan Settings window in the Fairlight page interface, available in the Mixer.
Path Settings window in the Fairlight page interface, available in the Mixer, Input drop-down menu.

The right-side In-Line Channel Display buttons with Pan/Path button pressed and corresponding Pan controls in the Channel Control LCD.
**Channel Control Buttons and Channel Control Knobs**

Spanning the middle of the Channel Control panel, you’ll find 12 parallel groups of multi functional channel controls that align with the 12 faders on the Channel Fader panel. Within each of the 12 groups are four highly visible LED buttons and four touch-sensitive rotary knobs. If you touch knobs with Control held this will reset the value, and if you turn a knob with Shift held you will have fine control for the parameter.

Since the functions of these buttons and knobs change based on the channel display mode and selected channel and active parameters, these “soft” controls remain unlabeled, and are identified by the corresponding controls on an adjacent LCD monitor. Additionally, each channel control button is illuminated with bi-colored LEDs to make it easy to identify active buttons, parameters, and groups of controls at a glance.

![Diagram of Channel Control Buttons and Knobs](image)

1. The right-side In-Line Channel Display buttons with ALT + Pan/Path button pressed and corresponding ALT-Pan controls in the Channel Controls LCD

2. The right-side InLine Channel Display buttons with CTRL + Pan/Path button pressed and corresponding Path controls in the Channel Controls LCD

3. The right-side In-Line Channel Display buttons with ALT + CTRL + Pan/Path button pressed and corresponding ALT-Path controls in the Channel Controls LCD
Channel Control buttons appear red or green when they are matched to a parameter on the Channel LCD monitor, and can be used as either toggles, On/Off, or In/Out switches for the adjacent parameter on-screen. Similar parameters will all have the same colored buttons while the Channel Controls are set to In-Line mode. However, in Channel or Master display mode, you’ll see alternating rows or groups of red or green buttons to separate the different parameter groups as shown on the Channel display.
Additionally, Channel Control buttons brighten to show that they have been pressed, or remain unlit and therefore without color when there is no corresponding parameter with a switch in the current channel display mode.

### In-Line Channel Extension Buttons

Along the bottom of the Channel Control panel are 12 groups of six In-Line Channel Control Extension buttons that match the buttons at the bottom of the Channel LCD Monitor. These dedicated LED buttons are toggle switches for channel-specific controls like Insert, Select, Solo Safe, and Arm. In-Line Channel Control Extension buttons are always available, regardless of the channel control mode, and correspond with similar functions in the Mixer or Timeline track headers on the Fairlight page.

**In-Line Channel Extension buttons, clockwise from the top left:**

- **Insert**: Insert In enables routing of up to six VST plug-ins or one hardware effect per channel from Blackmagic Design's Fairlight audio interface hardware to outboard effects boxes and back again. This button can be toggled to enable/disable insert routing.
Safe: This button toggles on Solo Safe mode the same as Command-Option-clicking a Solo button on the Fairlight page. Tracks set to Solo Safe will always play, even if Solo is enabled for other tracks, and are easily identified by the blue-highlighted Solo button.

Rec: Arms the track for recording. This is the same as clicking the Arm button [R] on the corresponding Timeline track header or Mixer channel strip on the Fairlight page Timeline. Tracks must be patched to a microphone or another source input prior to arming.

Comp: Toggles on or off the channel compression.

Eq: Toggles on or off channel EQ.

Select: This button selects a channel in the Fairlight Console Channel Control bay and is the same as clicking a Timeline track header or channel strip in the Mixer on the Fairlight page. You can select multiple tracks by pressing additional Channel Select buttons.

NOTE: You can only have a Channel Control panel for a bay that also has the Channel fader and Channel LCD monitor.
Fairlight Console Channel Fader

In addition to 12 Channel strips complete with designated control buttons, touch-sensitive faders, and pan knobs, the Fairlight Console Channel Fader panel includes an LCD display of channel information and eight display buttons for bank selection and mapping of up to 144 tracks and buses to the 12 faders. The Fairlight Console Channel Fader panel works in tandem with DaVinci Resolve and the Fairlight Channel Control module for completing professional audio post-production work flows using traditional mixing controls.

LCD Fader Channel Display

At the top of each channel strip you’ll find a high-resolution color display that shows the track name, track color, level, and pan status. If the channel is part of a VCA group, the VCA group number appears above the meters. The information displayed for each track directly correlates with the Fairlight page Mixer and track headers.

LCD Fader Channel Displays showing track name, number, color, pan status, level meters, and VCA group number.
**Rotary Knob**

Below the LCD display on each channel strip you'll find the touch-sensitive rotary knob designated as the panoramic potentiometer, or pan pot for short. This versatile dial control is assigned to Left-Right track panning by default, but may also be assigned to other parameters. Press the Control button while you press and release the 2/FDR button to use the rotary knob to control the last-used alternate parameter. This is especially usefully during automation or complex mixing procedures when you need to keep alternative parameters, like the Ratio for your Compressor, within easy reach of the faders. Like all touch-sensitive controls on the Fairlight console components, holding the Control button and touching the knob resets the parameter to the default value, and if you turn the knob with Shift held you'll have fine control.

**Fader Channel Control Buttons**

Each channel strip includes four dedicated control buttons for common channel-specific mixing functions. These brightly colored LED buttons are easy to read, logically placed above each fader, and can be used independently or in combination with other channels.

- **SOLO**: Use this button to select only this channel for playback. Multiple tracks can be soloed simultaneously to isolate selective tracks for playback while all non-soloed tracks will be muted. Pressing Solo while holding the Control button clears all soloed track buttons, and pressing Control again restores soloed tracks. Solo buttons on the Channel Fader panel correspond with the Solo buttons on the Fairlight page Mixer and track headers.

- **MUTE**: This button turns the channel off and on for playback. Mute buttons on the Channel Fader panel correspond with the Mute buttons on the Fairlight page Mixer and track headers.

![Fader Channel Control buttons](image-url)
CALL: As the name suggests, the Channel Call button simply calls up a track’s parameters in the Channel Control panel and LCD monitor while in Channel display mode. Additionally, the Channel Call button loads the channel into the built-in Audio Editor display, regardless of the channel control mode. Using the Channel Call button is a fast way to work with a channel’s parameters, plus you can quickly press other Call buttons to change focus from track to track for detailed comparison and control. Channel Call on the Fader Panel is similar to the Select button at the bottom of the Channel Control panel; the difference is that the Select button also selects the track in the Fairlight page Timeline and Mixer, which enables additional editing options. Using the Call button while tracks are selected does not change the state of the selected tracks. Call buttons are also used for manually mapping banks of channel faders and spilling the member tracks of a master bus to nearby faders.

Call buttons tally on or off when pressed and change color based on the current task as follows:

Yellow Call buttons: The default color and indicate standard call functionality. When the Call buttons are yellow, only one Call button can be tallied on at at time.

Red Call buttons: Appear when fader mapping is engaged. Auto fader mapping, automatically maps faders to groups of 12 channels in sequential order. When in manual fader mapping mode, you can use the red Call buttons in the Fader panel, or the track selection keys showing in the picture keyboard to manually assign channels to the 12 faders for each fader bank.

Green Call buttons: Indicate master buses and VCA groups in the current fader bank when using the Fader Spill function or isolated fader channels with locked positions when fader lock is active engaged. If fader spill is active, pressing a green Call button spills the member channels of a bus or VCA group to the neighboring faders according to the Fader Spill option keys in the Setup mode layout on the Audio Editor. Call buttons for locked channels also turn green when engaging the fader lock feature that isolates any fader in the current fader bank by holding Control and the 6/LOCK Fader Control Display button and pressing a call button in the active bank.

AUTO: When automation controls are active, the AUTO button arms this channel for automation, preview, write, and trim. Like the Solo and Mute buttons, the Auto button on the Fader Panel corresponds with the Auto buttons on the Fairlight page Mixer and track headers. Automation buttons turn amber when automation is active.

Touch-Sensitive Faders

The bottom-half of the Fader Panel comprises 12 touch-sensitive motorized faders that offer precision gain controls for 12 signal paths. These faders correspond with faders on the Fairlight page Mixer, and can be mapped to 12 different fader banks using the Bank Display buttons located on the left side of the Fader Panel. Additionally, each 100mm fader can be assigned to control other channel parameters like send levels, channel trim, or record levels. Holding the Control button while touching a fader resets it to the default position, which is 0 dB.
Fader Bank Display Buttons

On the left side of the Channel Fader module are seven multicolored LED Bank Display buttons that are used to display, map, bus, set, and lock banks of channels to the 12 faders on the panel. The top two buttons are CTL (control) and BANK, which are modifier buttons used to access secondary button functions or additional fader banks for the subsequent numbered Fader Bank Display buttons.

Each of the six numbered Fader Bank Display buttons serve three functions, including load a primary fader bank, load an additional fader bank when pressed with the Bank modifier button, or perform a secondary function when the Control button is pressed. You can easily identify the blue Control button at the top of the Fader Bank Display buttons, while the other seven buttons are yellow in their normal state, and blue or purple when the secondary function is selected via the Control button.

With the Fader Bank Display buttons, you can map each of the 12 fader banks with 12 different faders to control a total of 144 tracks and buses to the 12 faders. The more Fairlight Console Channel Fader panels you have in your console, the more faders and tracks you can control. For example, the Fairlight Console 5.bay, is designed for high-end mixing and mastering with four Fader Panels to control up to 576 channels and busses at a time.

Fader Bank display buttons and touch-sensitive fader with Bank 1 selected, and with the secondary button functions available while the Control button is pressed.
Fader Bank Display Buttons from top to bottom:

**CTL**: This button selects secondary functions for the seven display buttons below and works the same as the Control key on the computer keyboard or the two identical Control display buttons on the Channel Control panel.

**BANK/FLIP**: You can use the Bank button to switch between the primary fader set for each of the numbered bank buttons labeled 1 to 6, or the additional fader set for the same numbered buttons to show banks 7 to 12. Without a modifier, the Bank button is yellow along with the numbered bank buttons below. When pressed, the yellow Bank button brightens to indicate that it is latched, and the active numbered bank button also brightens to indicate which additional fader set has been loaded. The secondary FLIP function, via the Control button, is used to spill the member tracks of a master bus or VCA group to the neighboring faders.

**1/POT**: The 1 button chooses Fader Set 1 without a modifier or Fader Set 7 when selected with the Bank button. The alternate POT function for this button has not been implemented.

**2/FDR**: The 2 button chooses Fader Set 2 without a modifier or Fader Set 8 when selected with the Bank button. Pressing and releasing the 2/FDR button while Control is pressed toggles between normal mode where the fader controls channel level, and secondary mode where the fader controls the last-used alternative parameter.

**3/MAP**: The 3 button chooses Fader Set 3 without a modifier or Fader Set 9 when selected with the Bank button. If Control is pressed, the 3/MAP button enters the secondary Fader Mapping tool for the current fader set on the Audio Editor.
**4/BUS:** The 4 button chooses Fader Set 4 without a modifier or Fader Set 10 when selected with the Bank button. Pressing Control along with the 4/BUS button toggles the secondary Bus mode on and off. When Bus mode is on, the system puts all used buses on as many faders as needed to accommodate all non-zero format buses. Pressing a Fader Bank display button from 1 to 6 returns control to the appropriate fader set.

**5/MSET:** The 5 button chooses Fader Set 5 without a modifier or Fader Set 11 when selected with the Bank button. The MSET function has not been implemented.

**6/LOCK:** The 6 button chooses Fader Set 6 without a modifier or Fader Set 12 when selected with the Bank button. Hold Control plus the 6/LOCK button to engage the lock setup. When active, you can press the call button for any track or bus fader in the current fader bank to “lock” that fader channel position on the Fader panel. While lock setup is active, call buttons tally green to indicate that channel has an isolated (locked) fader. You can lock/isolate up to 12 faders per fader panel. To unlock faders, hold Control-6/LOCK and unlatch the green call buttons.

**NOTE:** You can temporarily isolate faders from banking by actively touching and holding an individual fader or group of faders while changing fader banks. These “Sticky” faders will be cleared from isolation when the user changes fader banks without holding the fader.

**Manually mapping faders to banks:**

1. In the Fader Bank Display buttons, press CTRL and the 3/Map key to enter fader mapping mode. You’ll know that you entered bank mapping mode because all of the Call buttons turn red. The bank mapping is set to Auto mode by default, which automatically maps channels to faders in sequential order in groups of 12 up to 144. When you enter channel mapping mode, the top four rows of picture keys in the Audio Editor change to track selection keys, while the bottom row of picture keys shows the following dedicated channel mapping function keys:
   - **Exit:** Exits the channel mapping mode.
   - **Delete:** Deletes the channel assigned to the active channel indicated by the tallied red Call button.
   - **Blank:** Leaves a blank fader bank beneath the active red Call button. This is useful for adding a space between groups of similar tracks such as dialogue, background sound effects, and music.
   - **Insert:** As the name suggests, this key inserts an unassigned fader in the position of the active red Call button.

2. In the bottom row of the picture keyboard, press the first key (MODE:Auto/MODE:Manual) to toggle the fader mapping to Manual mode.
3 Press the red Call button on the fader you would like to assign, then choose a channel from the track selection buttons on the adjacent picture keys in the Audio Editor. Once you assign a track or bus to a fader, the next fader to the right becomes active with a red tallied Call button so that you can continue assigning faders sequentially. This automatic call selection also applies to the Delete, Blank, and Insert manual mapping functions.

4 Select up to 12 track selection keys to assign to the current fader bank. Use the Bank display buttons to manually assign additional banks as needed.

5 When you are finished mapping tracks to faders, press the Exit button in the bottom row of picture keys. Once you exit manual mapping mode, the picture keyboard layout returns to the current mode.

Example of Fader Bank 1 in Auto Mapping Mode
Picture keyboard in Auto Fader Bank mapping mode

Auto Fader Bank mapping action keys in the lower left corner of the picture keyboard
Example of Fader Bank 1 in Manual Mapping Mode

Fader Bank 1 in Manual mapping mode showing the custom mapping: A21, blank, A30, A40, and DIALOG to the first five tracks.

Fader Bank 1 in Manual mapping mode showing custom mapping: A21, blank, A30, A40, and DIALOG mapped to the first five faders; red Call buttons indicate bank mapping is engaged, with the first fader’s Call button active.

Manual Fader Bank mapping action keys in the bottom row of the picture keyboard.
**Spilling bus member tracks to nearby faders:**

1. In the Fader Bank Display buttons, select a fader bank that contains at least one bus. Buses include main, submix, Aux buses, and VCA groups.

2. Momentarily press and hold the Bank/Flip key to change the yellow Call buttons to green Call buttons on the bus fader channels.

3. Press the green Call button for the bus fader you wish to spill to the neighboring faders. Once spilled, the Bank/Flip button turns purple to indicate that the current fader bank is displaying spilled faders for the active bus.

4. To modify the fader spill direction or type of fader that is temporarily remapped, use the Fader Spill options keys available in the Setup mode picture key toolset.

**Fader Spill option keys include:**

- **Fader Spill:** Use this menu key to reveal two menu Spill option keys that determine the type of fader channel and direction in which member tracks are temporarily mapped to the adjoining faders on the Fairlight Channel Fader panel.

- **Spill Left/Spill Right:** This menu options key toggles between Spill:Left and Spill:Right, which in turn dictates whether the member tracks of a bus are assigned to neighboring faders to the left or right of a bus when Spill is engaged in the Channel Fader panel.

- **Spill Any/Spill Tracks:** When in the default (unlatched) state the Spill:Any menu option allows member tracks of a bus to be spilled to the nearest faders to the left or right, including faders assigned to Master buses and VCA groups. When latched to the Spill:Tracks option, member tracks of a bus spill either left or right starting with the nearest track fader in the designated direction. This option is useful if you need to maintain fader control of your buses while you spill their constituent tracks to the nearest track faders.
Fader Bank 5 with Main 1, Sub 1, and Sub 2 buses assigned to the last three faders; yellow Call buttons indicate standard channel bank display.

Bank/Flip Bank Display Button momentarily held to display the buses within the active track; these buses (in the right 3 channels) can be easily identified by the green Call buttons.

Channel LCD displays Sub 2 bus, including A8, A10, A11, and A12, spilled on the nearest tracks to the left of the Sub 2 bus.
Purple Bank/Flip button indicates there is a spilled bus in the current bank. In this case, Bank 5 is showing, with Sub 2 spilled to the left of the the other buses, and includes A8, A10, A11, and A12 as the member tracks that comprise Sub 2.

**NOTE:** While a bus fader is spilled, you may still use the standard bank display buttons to display any of the other banks normally.

**To un-spill a bus fader:**

1. In the Fader Bank Display buttons, press the Bank button that contains the spilled bus.
2. Momentarily hold the Bank/Flip button to reveal green Call buttons for the bus faders. The spilled fader’s green Call button will be tallied on.
3. Press the active green Call button to un-spill the fader.

**NOTE:** You can only spill bus member tracks to faders within the same fader bank. Use the Fader Spill option keys in the Audio Editor Setup mode toolset to spill either left or right within the current bank of 12 faders. Additionally, if you press the Bank/Flip button on a bank without any bus faders, you will not see any green Call buttons or subsequent bus faders to spill.
**Fairlight LCD Monitors**

Standard Fairlight consoles include one high-resolution 1920 x 1080 Fairlight LCD Monitor for each bay. These custom designed LCD monitors align perfectly along the top of the console, forming an embedded eye-level monitor bridge that spans the width of the console.

Each Fairlight LCD Monitor is paired with either Channel Control modules as a dedicated channel control display, or the Audio Editing module as a dedicated DaVinci Resolve GUI edit screen. Additionally, the switchable HDMI and SDI inputs on the back of each screen allow flexible display of plug-ins and reference video.
Fairlight Console Configurations

The Fairlight console can be purchased with all the standard panels as a bundle, or customized to meet specialized production requirements. With the Fairlight console’s unique modular design, you always get the flexibility to place the Audio Editor, Infill module, and Channel Component sets, in whichever order works best for you.

Each bundled console includes a console chassis ranging in size from 2-bay to 5-bay, an LCD Monitor component for each bay, one Fairlight Audio Editor, and a set of Fairlight Channel bay components for each additional bay. For custom configurations, you choose the chassis size, and then purchase the console components individually.

Before purchasing a console, it is important to consider the size of your workspace as well as your current and future audio post-production needs. For example, if you have a mid-sized mixing stage and are primarily working on short-form projects like commercials and trailers, a standard Fairlight Console 3-bay may work well. However, if you have the room, a customized Fairlight Console 4-bay chassis may work better in the long run because you’ll also have room to grow in the future for larger feature-length productions. Plus, empty console bays can be filled with custom machined Fairlight Console Blanks that add valuable flat surface space for assistant audio editors and mixers.
Additionally, you can add a Fairlight Console LCD Monitor in the 4th bay to display video playback or plug-ins, and even add a Fairlight Channel Rack Kit to the channel section to mount standard 19-inch equipment such as the Fairlight Audio Interface or Blackmagic Design Smart View duo to your bay.

**NOTE:** For more information about the Fairlight Console Chassis, bundles, and hardware options, go to the Fairlight Console page on the Blackmagic Design website. [https://www.blackmagicdesign.com/products/davinciresolve/](https://www.blackmagicdesign.com/products/davinciresolve/)

## Additional Fairlight Hardware

To effectively connect to and operate a Fairlight console with DaVinci Resolve Studio, you’ll also need a supported audio interface and PCIe audio card. If you are using a Mac or PC without a PCIe slot, you’ll also need an expansion box to connect the PCIe card to your computer, and a supported audio interface. You can use 3rd-party devices or purchase the Fairlight products designed specifically for the Fairlight consoles, including, the Fairlight PCIe Audio Accelerator, Fairlight Audio Interface and the Fairlight PCIe MADI Upgrade.

![Fairlight Audio Interface](image1.png)

**Fairlight Audio Interface**

**Fairlight HDMI Monitor Interface**
Performing Firmware Updates

Some DaVinci Resolve updates, such as 17.2.1, require firmware updates to implement the improvements to the Fairlight panels. Users can update all of their Fairlight Console panels in a matter of minutes via the DaVinci Control Panels Setup utility.

**Updating firmware on a 2-bay modular console:**

1. Quit DaVinci Resolve, if necessary.
2. Open the DaVinci Control Panels Setup utility.
3. In the DaVinci Control Panels Setup Utility, select a panel.
4. Click the circled icon below the panel name.

**NOTE:** If you are working with the Fairlight Desktop Console or Desktop Fairlight Audio Editor there will only be one panel from which to choose.

5. If there is a firmware update available, you will see an update dialog.
6 Click Update to install the updated firmware on that panel.
7 Once the update is complete, click Done.
8 Repeat this firmware update process for each control panel connected to your system.
9 When all of your panels are updated, close the DaVinci Control Panels Setup.
10 Open DaVinci Resolve.

**NOTE:** To use DaVinci Control Panels Setup utility for the first time, you need to perform a custom install of the latest version of DaVinci Resolve, and in the custom settings, check the option to install the DaVinci Control Panels utility. Once installed, you can select any panel connected to your system and perform network setup and firmware updates.
Chapter 183

Fairlight Studio Utility

To configure your Fairlight console for your studio, you’ll need to use the Fairlight Studio Utility. This utility is specifically designed to connect multiple Fairlight panels as a single studio console.

Contents

Configuring the Fairlight Panels 3814
DaVinci Control Panel Setup 3816
Changing Network Settings 3817
Fairlight Studio Utility 3818
Selecting your Fairlight Console in DaVinci Resolve 3821
Configuring the Fairlight Panels

To configure your Fairlight console for your studio there are two utilities that are included in the DaVinci Resolve installer. The utilities are called Fairlight Studio Utility and DaVinci Control Panels Setup Utility.

DaVinci Resolve Installation

To connect a single panel unit, such as the Fairlight Desktop Console or Fairlight Desktop Audio Editor, to your DaVinci Resolve system you only need to the DaVinci Control Panels Setup Utility. This utility is also used for updating firmware on all DaVinci Resolve Control Panels, including desktop and multi-panel consoles. If a DaVinci Resolve update includes a control panel firmware update, you'll be notified as such upon launch and directed to perform the update for each panel via the DaVinci Control Panels Setup Utility.

To set up and connect a multi-panel console, such as a 2-bay Fairlight console, you'll need to use the Fairlight Studio Utility. To install DaVinci Resolve, launch the DaVinci Resolve Installer and follow the onscreen prompts. When the installation reaches the Installation Type page, choose Custom install and be sure to select DaVinci Control Panels in the custom install options.
Customize install

Install DaVinci Control Panels

DaVinci Control Panels Setup and Fairlight Studio Utilities installed
Updating your Fairlight Panels’ Firmware

It’s a good idea to regularly check our website for new software updates. When a new version of DaVinci Resolve is installed, you may be prompted to update your panels’ firmware. To update the firmware for each control panel in the DaVinci Control Panel update, select each panel in the home page, click the Update button and follow the prompts to update each panel.

DaVinci Control Panel Setup

DaVinci Control Panel Setup Utility can be connected to the Fairlight panels via USB or Ethernet using DHCP. If you are not using a DHCP server, you can set the network settings to a fixed IP address via USB. More information for changing network settings is found later in this chapter.

When configuring the Fairlight console for your studio, the first step is to name each module using the DaVinci Control Panel Setup Utility. This lets you easily identify each panel by clicking on the “identify me” checkbox.

To assign a custom name to each panel:

1. Launch the DaVinci Control Panel Setup Utility.

   ![DaVinci Control Panels Setup](image)

   The currently selected panel will be visible on the setup utility home screen. Navigate to each installed unit by clicking on the arrows on each side of the home screen.

2. Select a panel on the home screen and click on the Settings icon. You can also click the panel’s image to open the setup window.

3. In the Setup panel under Label, you will see the Label: text box that identifies the current panel by name, starting with “Blackmagic” and followed by the default panel name, such as “Fairlight Console Channel Fader.”
Default panel names always start with ‘Blackmagic.’

4 Change the name in the text box and click Save. You can visually identify each modular panel installed in your console by clicking on the ‘identify’ checkbox. This will illuminate features on the panel.

**DaVinci Control Panel Setup controls include the following:**

— **Setup:** These settings include Label, Software version, and the Identify this device checkbox.

— **Studio:** Displays the Group name of the multi-panel studio.

— **Network:** Use these settings to manually change the settings. When changing network settings, you will need to connect the panel to your computer via USB.

— **Display:** Changes the brightness of the Fairlight panel’s LCDs, or the brightness of the LCD monitor. Drag the slider to decrease or increase the brightness.

**Changing Network Settings**

If you need to change the network settings for each module manually, you can change the setting in the Network settings of the DaVinci Control Panels Setup utility. When changing network settings, you will need to connect the panel to your computer via USB.

**To change network settings:**

1. Open the DaVinci Control Panels Setup utility. Click on the Fairlight panel icon displayed on the home page to open the settings for that panel.

2. In the Network settings, choose either DHCP or Static IP, depending on your network.

3. Type a new address in the IP address, Subnet Mask, and Gateway text boxes as needed. When the IP address is set correctly, the panel will be accessible on your network.

Repeat the same process for each Fairlight panel via USB.
**NOTE:** For more information about the DaVinci Control Panel Setup Utility, see Chapter 5, “DaVinci Control Panels.”

**Fairlight Studio Utility**

This utility is used to add Fairlight panels to a user-defined Fairlight console configuration. Once the multi-panel console is configured, you can name it and connect it as a single studio unit to your DaVinci Resolve System.

After setting up your Fairlight panels in the DaVinci Control Setup utility, assign each module to your Fairlight Console using the Fairlight Studio Utility. This configures your console as a studio, telling DaVinci Resolve exactly where each panel is in your Fairlight console so the Fairlight page can control them all properly and display their controls on the appropriate LCD monitors.

Stand alone panels, such as the Fairlight Desktop Console or the Fairlight Audio Editor, do not need to be added to a studio configuration to be selected by DaVinci Resolve. If you have only a Desktop Audio Editor or Desktop Console in your studio, go to the next section, “Selecting your Fairlight Console in DaVinci Resolve,” and follow the instructions there to select the editor in DaVinci Resolve.

When using the Fairlight Studio Utility for the first time, you will choose the type of studio console, then add the connected panels to the console in the utility.

**To set up a Fairlight Console for each studio:**

1. Launch the Fairlight Studio Utility.
2. Select the number of bays in your Fairlight console and click Next. This will open a configuration screen where panels are assigned to the corresponding chassis slots in each bay.
3. In the configuration screen, click on the top left slot to assign a Fairlight Console LCD Monitor. From the list of modules, select the desired monitor for the corresponding slot by clicking on its icon.
Click the empty slot to see a list of available panels

Choose the type of console

4 Click Add.

LCD Monitor is added to the console in the Fairlight Studio Utility
The panel will be assigned to the corresponding slot on your Fairlight console. You can now follow the same procedure to assign all the other panels to the corresponding positions in the configuration utility. If you select the wrong module by mistake, all you need to do is click on the module in the group to reveal its options, and then click the ‘X’ icon to remove it.

As you configure each panel, you can confirm it corresponds to the correct position in the console by clicking on the panel in the group to reveal its options, and then clicking the Light Bulb icon.

Your Fairlight console is now configured as a studio and you can change the name of the studio by clicking in the Untitled Studio text box, typing a new name, and pressing the Return key to confirm. This makes it easier to identify each studio if you have multiple studios installed in your facility.

Each panel can be identified by the custom name you entered when labeling the panel in the DaVinci Control Panel Setup utility. You can also click on the Light Bulb icon for each panel to visually identify it. When clicking on the light bulb, features will illuminate on the relevant panel.

**NOTE:** You can change the Group Name of a multi-panel console at any time in the name field of the Fairlight Studio Utility.
Selecting your Fairlight Console in DaVinci Resolve

Once your Fairlight Console is set up, you can select it in the DaVinci Resolve System Preferences, Control Panels settings.

To select a Fairlight Console in DaVinci Resolve:

1. Launch DaVinci Resolve.
2. In the menu bar at the top of the screen, select DaVinci Resolve > Preferences.
3. In the Control Panels menu, choose the Fairlight Console from the ‘Select this console for Fairlight’ drop-down menu.
4. Click Save.
   The preferences window will close. Your console is ready to use with DaVinci Resolve.
5. Restart DaVinci Resolve, if necessary, to use the Fairlight Console.

Rendering Edit and Input Sizing Adjustments 3826
Rendering Mixed Frame Rate Timelines 3826
Export Alpha Channels in Individual Clips Mode 3827
Export Alpha Channels in Single Clip Mode 3827
Delivery Effects Processing

For your final output, how effects are rendered depends on whether you’re rendering in Single Clip or Individual Clips mode.

When Rendering a Single Clip or When Outputting to Tape

Whether you’re rendering a QuickTime or MXF master of your project as a single clip, rendering a DPX image sequence for film output, or outputting directly to tape, all supported compositing, speed, and transform effects are rendered by DaVinci Resolve and “baked” into the output media. Unsupported effects are completely ignored, cannot be seen, and have no effect on media that’s rendered and output.

When Rendering Individual Source Clips for Round-Trip Workflows

In workflows where you’re rendering individual media files to send a project back to an NLE or finishing application for final finishing (adding titles and other effects before final delivery), DaVinci Resolve handles different types of effects in different ways.

Unsupported effects do not appear in DaVinci Resolve. However, this effects data is internally preserved, and when you export an XML or AAF file to send back to your NLE of choice, these effects reappear, applied to the color corrected media that you rendered out of DaVinci Resolve and sent back.

Effects that DaVinci Resolve does support such as composite modes, opacity settings, speed effects, and transitions are handled differently. Even though these effects are visible in DaVinci Resolve while you work, they’re not “baked” into the final media that you render in preparation for sending back to your NLE or finishing application. Instead, the portion of each media clip that’s used in your project is rendered as an individual file, and the XML file that you export from DaVinci Resolve contains all of the effects information necessary to reassemble the rendered media into a timeline that uses Final Cut Pro effects applied to DaVinci Resolve-graded media.

</table>
The chart shows which effects are rendered by DaVinci Resolve, and which effects are passed back in different round trip workflows.

After you’ve reimported your project back into your NLE or finishing application, you’re free to readjust these effects while completing your program, without the need to re-render individual clips in DaVinci Resolve.

**IMPORTANT**

One exception to the preservation of media and effects in round-trip workflows is that nested sequences from Final Cut Pro 7 and Media Composer are not compatible with DaVinci Resolve; XML and AAF files containing nested sequences cannot be imported. On the other hand, Final Cut Pro X projects containing compound clips can be imported.

**More About Rendering Speed Effects**

If you’re rendering a project with speed effects, you should be aware that DaVinci Resolve can optionally render speed effects using Optical Flow processing, resulting in high-quality slow motion and fast motion effects delivered straight out of DaVinci Resolve. If you’re satisfied with Optical Flow processing in DaVinci Resolve, there may be no need for you to do a round-trip export if the main reason you were doing so was to send the processing of slow motion clips to another application for rendering, and rendering the Timeline in Single clip mode will “bake” the speed effects in using whatever settings you’ve selected for the project, or for each clip if you’ve selected individual Retime Process settings for different clips.

However, if you want to send unrendered speed effects to another application, rendering your project in Individual source clips mode guarantees that the full range of each original clip of media will be rendered, with the speed effect itself exported within the XML, AAF, or EDL file that’s exported.

**NOTE:** DaVinci Resolve adds three frame handles to clips with speed changes applied to them, and to rendered clips that don’t match the project’s frame rate. This is done to facilitate reconform in NLEs that require handles beyond the actual length of each of these clips.
Determining the Rendered Output Resolution of Clips in Mixed Timelines

Ordinarily, rendering individual source clips results in each clip being rendered at either the project resolution or the Resolution drop-down in the Render Settings (which overrides the project resolution), with clips that don’t match the project resolution being resized or not according to the settings you’ve chosen in the Image Scaling panel of the Project Settings.

However, if you’re rendering dailies for projects containing clips with mixed resolutions, you can choose to render each clip at its original resolution by turning on the “Render at source resolution” checkbox in the Video group of controls.

Rendering Edit and Input Sizing Adjustments

Whether or not sizing is rendered into your final media depends on the “Disable sizing and blanking” checkbox in the Advanced Settings options of the Render Settings panel. You can disable sizing and blanking either when rendering the current Timeline as a single clip, or when rendering individual clips.

— If “Disable sizing and blanking output” is turned off: Output Blanking, Cut and Edit page sizing adjustments, Color page Input and Output Sizing adjustments, and Image Stabilization are rendered into the final rendered media using the optical-quality sizing algorithms available to DaVinci Resolve. This is best if your sizing adjustments are approved and final, and you want to “bake” sizing adjustments into the final media you’re delivering.

— If “Disable sizing and blanking output” is turned on: Output Blanking, Cut and Edit page sizing adjustments, Color page Input and Output Sizing adjustments, and Image Stabilization are not rendered, and each clip will be rendered either at the source resolution if “Render at source resolution” is enabled in individual clips mode, or to the currently specified resolution of the Timeline or project. However, the sizing adjustments you’ve made will be exported as part of the XML or AAF file that you’re exporting. This is best for workflows where the editor wants to continue adjusting sizing after you’ve handed off the graded project relative to the original size of the clips.

Keep in mind that if you want to render Input Sizing adjustments into the media you’re outputting, the “Force sizing to highest quality” checkbox guarantees that DaVinci Resolve will use the highest-quality sizing setting, even if you’ve temporarily chosen a faster-processing option for a slower computer.

NOTE: “Disable sizing and blanking output” does not disable any transform operations that happen within the Fusion page, nor does it disable transforms happening as a result of an OpenFX or ResolveFX plug-in applied to one or more clips in the Cut, Edit, or Color pages. All of these effects will continue to be rendered into the final output.

Rendering Mixed Frame Rate Timelines

Mixed frame rates are supported by DaVinci Resolve when any option other than none is selected in the “Mixed Frame Rate format” drop-down menu, either in the Conform Options section of the General Options panel of the Project Settings, or in the Import AAF or XML dialog. When you choose the appropriate option that corresponds to the application you’re exchanging projects with (or DaVinci Resolve if you’re working entirely within DaVinci Resolve), then DaVinci Resolve conforms and
processes all clips in the Timeline to play at whichever frame rate is selected in the “Timeline frame rate” drop-down menu. For example, 23.98, 29.97, 30, 50, 59.94, and 60 fps clips will all play at 24 fps if that’s what “Timeline frame rate” is set to in the Master Settings panel of the Project Settings.

How clips in mixed frame rate timelines are rendered out depends on whether the Render Settings are set to render Individual source clips or a Single clip.

— **Individual source clips:** All clips are rendered individually at their original frame rate.

— **Single clip:** All clips are converted to the “Timecode calculated at” frame rate and rendered as a single media file. Clips are converted using whatever method is selected in the Retime process drop-down of the Master Settings panel of the Project Settings, or in the individual Retime process setting found in the Video inspector of each clip that overrides the project-wide setting. You can choose Optical Flow processing for the highest quality conversion that’s available in DaVinci Resolve.

### Export Alpha Channels in Individual Clips Mode

This option only appears if you’re rendering to a media format that supports alpha channels. If your media contains an Alpha Channel, you have the option to turn on the Export Alpha checkbox in the Video panel of the render settings whenever you render individual source clips. When you do so, DaVinci Resolve renders clips with alpha channels in either of two cases:

— Whenever there is an alpha channel embedded in the source media for that clip, the embedded alpha channel will be copied to the rendered version of that clip.

— Whenever a clip’s grade has a key connected to an alpha output, the alpha output will be rendered as an alpha channel for that clip.

In either case, you may only render alpha channels out when you render individual source clips to an RGBA format such as TIFF, OpenEXR, ProRes 4444, ProRes 4444 XQ, or DNxHR 444.

### Export Alpha Channels in Single Clip Mode

DaVinci Resolve allows rendering alpha channels in Single Clip mode if the selected codec supports an alpha channel (i.e., ProRes 4444, DNxHR 444, etc.). This lets you apply a single alpha channel to an entire timeline for export, rather than just at the individual clip level.

**To Render an Alpha Channel in Single Clip Mode:**

2. Select a codec that supports an alpha channel in the Video tab’s Codec and Type selection boxes.
3. Select the checkbox “Export Alpha” that appears under the Frame rate selector.
4. If supported by the codec, you can chose the Alpha Mode type. Premultiplied is the default.

If the codec you have selected does not support an alpha channel, the “Export Alpha” box will not appear as an option.
Chapter 185

Using the Deliver Page

Once you’ve finished grading your project, you need to either render it, or output it to tape to deliver it to your client. This is where the Quick Export window and Deliver page comes in.

This chapter describes how to use Quick Export, how to use the overall interface of the Deliver page, and provides some general information about how effects are output from DaVinci Resolve in different situations.

Contents

Using Quick Export 3829
The Deliver Page 3830
The Interface Toolbar 3830
Rendering Files vs. Outputting to Tape 3831
The Render Settings 3831
The Deliver Page Timeline 3832
Filtering the Thumbnail Timeline 3832
The Viewer 3833
Disabling Viewer Updates While Rendering 3833
The Render Queue 3834
Using Quick Export

Not every situation requires a complicated delivery setup. When you just need to quickly export a project, and the full power of the Deliver page is unneeded, you can choose File > Quick Export to use one of a variety of export presets to export your program from any page of DaVinci Resolve. You can even use Quick Export to export and upload your program to one of the supported video sharing services, including YouTube, Vimeo, and Frame.io. You can also add your own presets to the Quick Export window.

To use Quick Export:
1. (Optional) In the Cut, Edit, Fusion, or Color page, set In and Out points in the Timeline to choose a range of the current program to export. If no timeline In or Out points have been set, the entire timeline will be exported.
2. Choose File > Quick Export.
3. Select a preset to use from the top row of icons in the Quick Export dialog, and click Export.
4. Choose a directory location and enter a file name using the export dialog, then click Save. A progress bar dialog appears to let you know how long the export will take.

To customize Quick Export:
1. Open the Deliver page.
2. Create the preset you want to add using the Render Settings panel.
3. Click the Render Settings panel’s Option menu and choose the preset or presets you want to add from the Quick Exports submenu so that they’re checked. You can also remove your own presets from the Quick Export window by unchecking them in this menu.
The Deliver Page

The Deliver page is divided into five areas of functionality, each of which lets you set up a different part of a render or output to tape.

The Interface Toolbar

At the very top of the Deliver page is a toolbar with buttons that let you show and hide different parts of the user interface. These buttons are as follows, from left to right:

- **Delivery full/half height button:** Lets you set the Render Settings panel to take up the full height of your display, if you need more area for browsing the various render settings, at the expense of a narrower Timeline.
- **Render Settings:** This panel lists all of the render settings that are available for configuring rendering jobs in DaVinci Resolve. By default, you’re presented with a short list, but more options are available by clicking “Advanced Settings.”
- **Tape:** Puts the Deliver page into Tape Output mode.
- **Clips:** Hides or shows the Thumbnail timeline above the Deliver page timeline
- **Render Queue:** A list of all jobs that you’ve set up to render in the current project. Previously rendered jobs remain in the queue, for your reference or for you to reuse to re-render those jobs, unless you manually delete them from the queue.
- **Render Queue full/half height button:** Lets you set the Render Queue to take up the full height of your display, if you need more area for listing render jobs at the expense of a narrower Timeline.
Rendering Files vs. Outputting to Tape

Because the Deliver page does double duty, you control whether you’re rendering files or outputting to tape using the Tape button in the Interface toolbar. Doing so replaces the controls in the Viewer with tape controls.

The Render Settings

The Render Settings contains the customizable settings that determine how media is rendered out of DaVinci Resolve. If you’re using the Tape option, these settings are disabled.

The Render Settings are divided into four general sections:

— **Render Presets**: At the very top, a scrollable row of icons lets you choose one of a series of presets to quickly set up the type of render you want. The Custom option exposes all render settings so you can set up a render manually.

— **Render Location**: A Browse button opens a dialog that lets you choose a volume and directory to render to.
— **Render**: Two options let you either render the entire selected area of the Timeline as a single clip suitable for reviewing or mastering, or as a series of individual clips more suited to round-trip workflows. The option you choose here changes which render settings are available below.

— **Video, Audio, and File Render Settings Panels**: All other render settings are divided among three panels. Checkboxes at the top of the Video and Audio panels let you selectively disable video export (if you want to export the audio only) or disable audio export (if you want to export video only).

For more information on all of these settings, see Chapter 186, “Rendering Media.”

## The Deliver Page Timeline

You’ll use the Timeline in the Deliver page to define the range of clips you want to render or output to tape, and to choose which versions for each clip you want to output. The Deliver page Timeline consists of a Thumbnail timeline at top (that can be shown or hidden via the Clips button) that makes it easy to select individual clips or ranges of clips that you need to render, and a more ordinary timeline below that you can use to set In and Out points for rendering arbitrary regions of your program. A Timeline toolbar lets you choose the render range of the Timeline, and has controls for customizing the look of the Timeline, and for zooming in and out.

![The Deliver page’s Timeline and Thumbnail timeline](image)

**TIP:** Press Shift-Z to fit the entire program into the available width of the Timeline.

## Filtering the Thumbnail Timeline

The Deliver page Thumbnail timeline also has the Timeline Filter drop-down, available to the right of the Clips button in the Interface toolbar.

![The Deliver page’s Thumbnail timeline matches the Color page](image)
Using this drop-down to filter the contents of the Timeline lets you restrict the range of media you want to output in different ways. For example, if you’ve already rendered a timeline, but you’ve since made some changes, you can use one of the “Modified Clips” options to display only the clips that have changed within a particular timeframe. Another commonly used option is to choose “Unrendered Clips” to isolate all clips that have not yet been rendered in workflows where you’re only rendering a part of the Timeline at a time.

When you filter the Thumbnail timeline, you can only set up jobs to render in Individual Clips mode. You can tell if Thumbnail filtering is enabled by an orange underline under the Clips button in the UI toolbar.

The Viewer

When rendering file-based media, the Viewer shows you exactly how the media being output will look using the current settings, and the transport controls move the playhead throughout the current Timeline. Audio playback can be turned on or off by clicking on the speaker icon, or adjust the level by right-clicking on the speaker icon and dragging the slider.

When outputting to tape, the Viewer shows you the tape output so you can set up insert or assembly edit points, and the transport controls move the tape in the deck if device control is enabled. You can also put the Viewer into Cinema Viewer mode by choosing Workspace > Viewer Mode > Cinema Viewer (P), so that it fills the entire screen. This command toggles Cinema Viewer mode on and off.

Disabling Viewer Updates While Rendering

An Updates During Renders submenu in the Render page Viewer option menu lets you choose to disable, minimize, or enable Viewer updates while a program is being rendered. Disabled or minimized Viewer updates will speed rendering, especially on slower workstations.
The Render Queue

The Render Queue is a list of all the jobs you’ve queued up for delivery. Each job can have an individualized range of clips and render settings, which you can use to render multiple sections or clips of a timeline, the same timeline output to multiple formats, or multiple timelines.

The Render Queue also has the option to show either just the jobs within the current project, or jobs queued up and saved within all projects in the currently open SQL network project library (for the current user) or local project library (at the currently selected disk location). This can be exceptionally useful in situations where you’ve broken a program into multiple reels, with each reel being a different project. This can be turned on and off via the “Show All Projects” option of the Render Queue Option menu.

Jobs in the Render Queue can be edited (by clicking the pencil button), they can be assigned to remote rendering workstations, and they can be deleted. Jobs that have already been rendered can be kept in the Render Queue and re-rendered at a later time.

**TIP:** There is an option to show the Render Settings of each item in the Render Queue, by selecting “Show Job Details” in the Render Queue Option menu. This provides specific details of each job’s dimensions, frame rate, codec etc. This is a great help in managing a complex render queue at a glance.
Chapter 186

Rendering Media

This section describes the options that are available for file-based delivery.

The workflow is simple; you define the format and other settings that dictate how the media is to be rendered, define a range of clips in the currently selected session, and then add a job containing these settings to the Render Queue.

You can queue up as many different render jobs as you like, each with different formats, output options, and ranges of clips, depending on what you’re trying to accomplish. When you’re ready to render, simply click the Start Render button.

Using Presets for Fast Rendering

The very top of the Render Settings list has a set of presets for many of the most common rendering workflows you’ll need to accomplish. If you want to create your very own settings, then choose custom. Each preset automatically sets up what you need and locks you out of settings that are not necessary for rendering that type of media.

**Custom**

When custom is selected, nothing is automatically set, and all conventional media rendering options are available, except for those that are specifically associated with particular presets. You must manually choose the settings and options you need. All Render settings are saved on a per-project basis.

**YouTube, Vimeo, and Twitter Presets**

These presets let you render media specifically for video sharing services, with the option to upload the rendered files automatically.

**YouTube 720p/1080p/2160p**

A drop-down menu lets you choose three different resolutions to render to. Selects the appropriate settings for exporting your program as a QuickTime H.264-encoded file suitable for uploading to YouTube and many other video file sharing services. Renders a single clip, and sets the Video Format to QuickTime, the Codec to H.264, and the Audio Codec to AAC. In addition to providing the option to automatically upload to YouTube, a Description field and Visibility and Category pop-ups let you choose how you want your video to be presented when uploaded. You can also choose to embed chapter points in the YouTube video corresponding to the marker’s position on the Timeline of the selected marker color.

**Vimeo 720p/1080p/2160p**

A drop-down menu lets you choose three different resolutions to render to. Selects the appropriate settings for exporting your program as a QuickTime H.264-encoded file suitable for uploading to Vimeo and many other video file sharing services. Renders a single clip, and sets the Video Format to QuickTime, the Codec to H.264, and the Audio Codec to AAC. In addition to providing the option to automatically upload to Vimeo, a Description field lets you enter text to be added to your video when uploaded and adjust the various visibility options that Vimeo offers, including password protection.

**Twitter 720p/1080p**

A drop-down menu lets you choose two different resolutions to render to. Selects the appropriate settings for exporting your program as a QuickTime H.264-encoded file suitable for uploading to Twitter and many other video file sharing services. Renders a single clip, and sets the Video Format...
to QuickTime, the Codec to H.264, and the Audio Codec to AAC. In addition to providing the option to automatically upload to Twitter, a Description field lets you enter text to be added to your video.

**Dropbox 720p/1080p/2160p**

A drop-down menu lets you choose three different resolutions to render to. Selects the appropriate settings for exporting your program as a QuickTime H.264-encoded file suitable for uploading to Dropbox and many other video file sharing services. Renders a single clip, and sets the Video Format to QuickTime, the Codec to H.264, and the Audio Codec to AAC. In addition to providing the option to automatically upload to Dropbox, a Description field lets you enter text to be added to your video when uploaded.

**Setting Up Video Sharing Uploads**

DaVinci Resolve has account integration with YouTube, Vimeo, Twitter, and Frame.io that allows you to render and upload directly to each service. An Internet Accounts panel in the System tab of the DaVinci Resolve Preferences lets you sign into your YouTube, Vimeo, Twitter, Dropbox, and Frame.io accounts, as well as specify a local cache location for media being synced with Frame.io.

For each service you sign into, a floating window presents the interface in which you'll need to enter your login name and password to enable integration, followed by whatever two-factor identification and other required steps are necessary. Once entered, DaVinci Resolve will sign in to each of these services automatically when DaVinci Resolve opens.

![Internet Accounts panel of the System tab of the DaVinci Resolve Preferences window](image)

The Internet Accounts panel of the System tab of the DaVinci Resolve Preferences window

**NOTE:** For Frame.io, the local cache location is used to store clips you import into a DaVinci Resolve project from the Frame.io volume in the Media Storage panel of the Media page.
Deliver and Upload to YouTube, Vimeo, Twitter, and Dropbox

When you’ve configured YouTube, Vimeo, Twitter, or Dropbox access in the Internet Accounts panel of the System Preferences, the YouTube, Vimeo, Twitter, and Dropbox presets both expose an “Upload directly to YouTube/Vimeo/Twitter/Dropbox” checkbox, which lets you choose whether or not to automatically upload the rendered result.

Choose the desired export options, then click the Add to Render Queue button to add this job to the Render Queue as you would with any other export. When that job is rendered, it automatically proceeds to upload to the selected video sharing service, and an upload percentage indicator appears in the job listing to show how far along this upload is. This upload is done in the background, so you can continue working on other things in DaVinci Resolve while the file uploads. If you want to see how long the upload will take on any other page, you can choose Workspace > Background Activity to see the Background Activity window.

![Background Activity](image)

Waiting for your movie to upload

**IMPORTANT**

Once a video has been uploaded, you’ll want to log onto your video sharing account in a web browser to customize whatever general or privacy settings are necessary for this program, since the uploaded file inherits only the default settings for uploaded media, and your video will likely be publicly available immediately after upload.

**ProRes Master**

For quickly outputting ProRes Master files of a whole program. When selected, defaults to rendering in single clip mode, with the Format set to QuickTime, the Codec set to Apple ProRes, and the Type set to Apple ProRes 422 HQ. Audio defaults to the Codec being Linear PCM and the Bit Depth being 16.

**H.264 Master**

For outputting H.264 files of a whole program. When selected, defaults to rendering in single clip mode, with the Format set to QuickTime, and the Codec set to H.264. Quality, Encoding Profile, and Entropy Mode are set to Auto, Passes defaults to Single, and Key Frames default to Automatic with Frame Reordering turned on. Audio defaults to the Codec being AAC with the Data Rate set to 320 Kb/s and the Bit Depth set to 16.
H.265 Master

For outputting H.265 files of a whole program. When selected, defaults to rendering in single clip mode, with the Format set to QuickTime, and the Codec set to H.265. Quality is set to Automatic, Encoding Profile is set to Main, and Key Frames default to Automatic with Frame Reordering turned on. Audio defaults to the Codec being AAC with the Data Rate set to 320 Kb/s and the Bit Depth set to 16.

IMF (Studio Version Only)

A drop-down menu to the right of this preset provides options for Generic, 20th Century Fox, and Netflix-qualified presets. This preset is for facilities that deliver IMF files as digital-only deliverables. A Preset Type drop-down lets you choose the appropriate settings to populate the various locked IMF-specific parameters that appear.

Frame.io

A Frame.io preset at the top of the Deliver page’s Render Settings panel lets you render and upload a program for review. All options in the Render Settings panel update to present suitable controls for this process. At the bottom of the Render Settings list, an “Upload directly to Frame.io” checkbox lets you choose whether or not to upload the rendered result. A Description field lets you add a description to be uploaded along with the rendered media.

Choosing the Frame.io preset

When you choose the Frame.io preset, the Location field turns into a Frame.io field, and the Browse button lets you choose a project and folder path to which to upload the exported result.
Choosing a Frame.io account to deliver a program to

When you export to Frame.io, the available choices in the Resolution, Format, Video Codec, and Type drop-down menus are limited to those that are most suitable for Frame.io file sharing. Choose the desired export options, then click the Add to Render Queue button to add this job to the Render Queue as you would with any other export. When that job is rendered, it automatically proceeds to upload to Frame.io, and an upload percentage indicator appears in the job listing to show how far along this upload is. This upload is done in the background, so you can continue working on other things in DaVinci Resolve while the file uploads. If you want to see how long the upload will take on any other page, you can choose Workspace > Background Activity to see the Background Activity window.

For more information about Frame.io integration, see Chapter 13, “Frame.io Integration.”

**Final Cut Pro 7 or X XML**

A drop-down menu attached to this preset lets you choose from two different XML formats to be exported along with the media you’re rendering:

— Selects the appropriate settings for projects that were sent from Final Cut Pro 7 to DaVinci Resolve using XML. This is meant for situations when you’re rendering media intended for a return trip to Final Cut Pro (by exporting an XML file from the Edit page). Renders Individual Clips, the “Codec” setting on macOS, defaults to Apple ProRes 422 (HQ), Output Size defaults to the current Timeline Resolution (as set in the Master Settings panel of the Project Settings), and Use Unique Filenames is turned on. When you choose this preset, an XML of the timeline is automatically exported along with the media, with path names that reflect the rendered clips.

— Selects the appropriate settings for projects that were sent from Final Cut Pro X to DaVinci Resolve using XML. This is meant for situations when you’re rendering media intended for a return trip to Final Cut Pro X (by exporting an FCPXML file from the Edit page). Renders Individual Clips, the “Codec” setting on macOS, defaults to Apple ProRes 422 (HQ), Output Size defaults to the current Timeline Resolution (as set in the Master Settings panel of the Project Settings), and Use Unique Filenames is turned on. When you choose this preset, an XML of the timeline is automatically exported along with the media, with path names that reflect the rendered clips.
Premiere XML

Selects the appropriate settings for projects that were sent from Premiere Pro to DaVinci Resolve using XML. This is meant for situations when you’re rendering media intended for a return trip to Premiere Pro. Renders Individual Clips, the “Codec” setting on macOS defaults to Apple ProRes 422 (HQ), Output Size defaults to the current Timeline Resolution (as set in the Master Settings panel of the Project Settings), and Use Unique Filenames is turned on.

When you choose this preset, an XML of the rendered timeline is automatically exported along with the media, with path names that reflect the rendered clips.

Avid AAF

Selects the appropriate settings for projects that were sent from Avid Media Composer or Symphony to DaVinci Resolve using AAF. This setting is NOT for exporting to Pro Tools. This is meant for situations when you’re rendering media intended for a return trip to Media Composer (by exporting an AAF file from the Edit page). The “Codec” setting defaults to DNxHR 444 12 bit, Output Size defaults to the current Timeline Resolution (as set in the Master Settings panel of the Project Settings), and Render Clip with Unique Filename is turned on.

When you choose this preset, an AAF of the timeline is automatically exported along with the media, with path names that reflect the rendered clips.

Pro Tools

As of DaVinci Resolve version 16, Pro Tools export has been dramatically improved. This preset presents the appropriate options for exporting a specifically formatted AAF project file, linked audio files, and a linked reference video file to Pro Tools, or any application capable of importing a Pro Tools formatted AAF file.

When exporting using the Pro Tools preset, you must use the AAF file that’s automatically created and written to the target location, because it’s formatted specially for Pro Tools and it contains path names reflecting the rendered clips. Do not export an AAF using the File > Export AAF/XML command, as this will not provide the correct exchange file for Pro Tools, and it won’t work correctly.

When you use the Pro Tools preset, DaVinci Resolve outputs the following:

1. What you choose in the Codec drop-down menu of the Audio panel dictates whether you export the audio from the Timeline as a collection of files that link to a separate AAF, or an AAF with audio file embedded within as a single deliverable.
   - Choose Linear PCM to export individual files linked to a separate AAF interchange file
   - Choose Embedded in AAF to export an AAF with embedded Broadcast WAV audio files within it as a single deliverable

Whether you export separate files or a single embedded AAF deliverable, each of the audio clips in the current Timeline can be exported as individual mono or multichannel audio files. The standard mono round trip export from DaVinci Resolve to Pro Tools is the default setting, with the “Render one track per channel” box checked in the Audio tab of the Pro Tools Render Setting. With this option, a 5.1 polyphonic .wav file would be exported as six individual mono .wav files.
If the “Render one track per channel” box is unchecked, DaVinci Resolve will output multichannel polyphonic .wav files instead. If you do this, it’s important to check in advance that Pro Tools supports the particular multi-channel formats you want to export before committing to this workflow.

Each exported file contains every audio channel from the source media, regardless of channels that have been muted in the audio panel of Clip Attributes. This means no matter how the video editor organized the channels of audio in the Timeline, you’ll always deliver every channel of each audio clip to whomever is doing your audio postproduction.

2 You can also choose to include handles using the “Add X frame handles” option in the Advanced Settings of the Video panel to add extra frames to the beginning and end of each exported audio clip. This will provide needed editing flexibility to whomever is refining your audio.

3 The type of audio file that’s exported is determined by your choice of video format in the Video panel:
   — If you choose the MXF OP-Atom video format, then MXF audio files will be exported.
   — If you choose the QuickTime format, then Broadcast Wave files will be exported.

4 All video in your timeline will be rendered and output as a single reference movie, in the format that’s selected in the Video panel, with all effects and titles baked in. Subtitles can also be burned into the reference movie or exported as a file. If you want to provide a window burn, you can enable visible metadata using the Workspace > Data Burn-In window. If you do not wish to export a reference movie, you can uncheck the Export Video box in the Video panel.

When you output using the Pro Tools preset, an AAF of the audio tracks of the current Timeline is exported that’s formatted for import into Pro Tools, or any other digital audio workstation (DAW) software that’s compatible with the Pro Tools style of AAF import.

   — Exported audio files have the file name and timecode of the source media they were extracted from, to enable relinking to the source media in Pro Tools, if necessary. In the case of Video+Audio files that have been synced in DaVinci Resolve, exported audio files are given the timecode and name of the synced audio source file, not that of the video clip.
   — Each audio track exports whatever custom name you may have given it, for use by Pro Tools.
   — All track and clip volume automation is exported, with all keyframes.
   — iXML metadata is also exported, including channel names when available.

**IMPORTANT**

When you export to Pro Tools in the Deliver page, audio effects are neither exported nor baked in, which means that FairlightFX, EQ, Compression, Pitch, and Elastic Wave effects will be ignored. If you are experiencing problems with imported AAF files, check to see if there are audio effects or audio compound clips in the Timeline, and replace any you find with duplicates of the same audio clips that have no effects.
Audio Only

This preset is specifically for rendering an audio-only media file from the Timeline. Video rendering is disabled, and this preset defaults to rendering the Main 1 bus as a single clip, rendering one track per channel using the MXF OP-Atom format set to the Linear PCM codec, at 16-bits. However, the QuickTime, MP4, and WAVE formats are also available, and you can also render 24- or 32-bit output. Additionally, you have the option to render other Mains or Submixes, or to choose a specific Timeline Track to render. Finally, you can choose to render the current program as Individual Clips.

Creating and Using Your Own Presets

If there is a particular group of settings that you find yourself using repeatedly, you can turn it into a custom Easy Setup, for easy recall.

To create a new Easy Setup:
1. If you want to start from scratch, make sure to choose Custom from the preset panel to unlock every setting in the Render Settings pane.
2. Choose the particular settings you require in the Video, Audio, and File panels for your new preset.
3. Open the Render Settings Options menu, and choose Save as New Preset.
4. Type a name into the “Render Preset” dialog, and click Save. The new preset now appears in the Preset panel.

To load a preset:
   — Click any preset. Every setting in the Render Settings pane updates to reflect the preset you selected.

To change a custom preset that you’ve created
   — Click a preset you want to change, make whatever changes you need to in the Video, Audio, and File panels, then click the Render Settings Option menu, and choose Update Current Preset.

To delete a custom preset that you’ve created:
   — Click a preset you want to delete, then click the Render Settings Option menu, and choose Delete Current Preset.

Choosing a Location to Render

The first decision you have to make when rendering your output is where it’s going to be rendered. Accordingly, this is the first set of controls appearing at the top of the Render Settings parameters.

— Filename: A preview of what the file name will be based on the settings found in the File panel described later. The Custom/Timeline name and File suffix fields, as well as the “Use x digits in the filename” settings all determine what name appears here. The editable portions of this filename preview can also be edited here.

— Location: Click the Browse button to choose a directory in which to write the media being output by DaVinci Resolve. After you’ve selected a directory, the path name appears in the “Render job to” field.
Single Clip vs. Individual Clips

While there are numerous options available in the Render Settings of the Deliver page, there are basically two overarching ways you can render your project, depending on which of the “Render” radio buttons you click in the Output group.

**Render a single clip or individual clips**

### Single Clip

When you select the Single clip option, you're setting up a render wherein all clips in the session are output together, as a single media file in whatever format you choose. This means you'll be rendering the selected range of the session to a single MXF or QuickTime file, or as a single collection of image sequences.

- **Timecode:** The timecode that's written out is dictated by the “Start timeline timecode at” setting of the timeline being rendered. Media files contain a continuous timecode track, while image sequences have timecode written into each frame's data header, and integrated into the file name (as a frame count).
- **Frame Rate:** If you're rendering a project that uses mixed frame rates, rendering to a single clip converts every clip in the entire session to the project frame rate, using either the project-wide or clip specific “Retime process” setting.
- **Effects:** Most effects are “baked into” the rendered output when you render a single clip.

#### IMPORTANT

Whenever clip filtering is enabled (via the drop-down menu to the right of the Clips button), Single Clip rendering cannot be selected. You can see if clip filtering is enabled by an orange line underneath the Clips button in the UI toolbar.

### Individual Clips

Selecting the Individual clips option sets up a render where each clip is rendered as an individual media file in whichever format you choose. The result will be a collection of as many media files as there are clips in the range you've selected to render.

- **Timecode:** The timecode written to each clip is cloned from the original source media, making it easy to reconform media for projects being passed between DaVinci Resolve and NLEs.
- **Frame Rate:** If you're rendering a project that uses mixed frame rates, rendering to source renders each clip at its own individual frame rate, to accommodate round-trip workflows.
All Other Render Settings for Output

This section covers the different render settings that are available for customizing your output. Depending on which Render Setting mode you chose, some of these may be hidden, but this section covers the full list found in the Advanced panel of controls.

If you choose one of the Easy Setups, then some of these settings will be locked, and others will be editable, depending on the requirements of that setup. If none of the Easy Setups is suitable for the task at hand, you can leave the Easy Setup drop-down menu set to none, and manually choose the necessary settings for the task at hand.

Video Panel

This panel contains all video-oriented parameters.

Format and Codec Controls

These top-level parameters let you choose whether or not to render video, and which format to render it to. Depending on which Format, Codec, and Type you choose, other options may or may not appear.

— Export Video: Turn this checkbox on to render the source video. Turn this checkbox off if you want to render the source audio all by itself; this disables all video controls, and shows an Audio Format drop-down menu in the audio section of settings.

— Format: A drop-down menu that gives access to the container formats that are currently available on your system. The available options depend on whether you have Final Cut Pro and QuickTime installed, and on the operating system you’re using. This list is constantly growing, as new file formats are added over time, so be sure to check each new version for the latest supported formats.

— AVI: A now-deprecated file-based media format that, despite its age, remains popular with Windows applications. Supports delivery using the Cineform, Grass Valley HQ and HQX, and Uncompressed RGB and YUV codecs.

— Cineon: An older uncompressed image sequence format developed by Kodak, designed for film scanning and digital mastering, which delivers RGB 10-bit.

— DCP: Native DCP encoding and decoding for creating unencoded DCP files only. If you have a license for Frauenhofer’s EasyDCP, a setting in the Configuration panel of the System Preferences enables you to choose whether to use EasyDCP (for creating encrypted DCP output), or the native DaVinci Resolve encoding.

— DPX: An uncompressed image sequence format favored by the film industry for mastering and delivery for DCDM mastering, which can be delivered as RGB 10-, 12-, 16-bit integer and half float, or RGBA 8-bit.

— easyDCP: (when installed) An option that allows you to master a DCP or IMF directly from DaVinci Resolve in conjunction when you have an installed license of Frauenhofer’s EasyDCP software.

— EXR: The OpenEXR format is a high-dynamic-range image sequence format developed by ILM for applications requiring high quality and multiple channels. Used for outputting ACES and HDR deliverables. You can deliver to a variety of RGB Half and RGB Float settings. When choosing the RGB half (DWAA) or (DWAB) compression codecs, an additional “Compression level” setting appears that lets you choose how much compression to apply.
— **IMF**: A native IMF encoding option that lets you export to the SMPTE ST.2067 Interoperable Master Format (IMF) for tapeless deliverables to networks and distributors, with support for encoding of JPEG2000 using a library licensed from Kakadu software. No additional licenses or plug-ins are required to output to IMF. The IMF format supports multiple tracks of video, multiple tracks of audio, and multiple subtitle and closed caption tracks, all of which are meant to accommodate multiple output formats and languages from a single deliverable. This is done by wrapping a timeline’s different video and audio tracks (media essences) and subtitle tracks (data essences) into a “composition” within the Material eXchange Format (MXF).

— **JPEG 2000**: DaVinci Resolve 15 introduced support for the encoding and decoding of JPEG2000 using a library licensed from Kakadu software. This includes a complete implementation of the JPEG2000 Part 1 standard, as well as much of Parts 2 and 3. JPEG2000 is commonly used for IMF and DCP workflows.

— **MJ2**: The Motion JPEG 2000 format. DaVinci Resolve 15 introduced support for the encoding and decoding of JPEG2000 using a library licensed from Kakadu software. This includes a complete implementation of the JPEG2000 Part 1 standard, as well as much of Parts 2 and 3. JPEG2000 is commonly used for IMF and DCP workflows.

— **MP4**: Dedicated MP4 encoding lets you export H.264-encoded movies.

— **MXF OP–Atom**: A simple standard for the Material eXchange Format, a file-based media format, that’s often used when delivering DNxHD. This version conforms to the SMPTE 390M standard, and can deliver using the DNxHD, DNxHR, Kakadu JPEG 2000, NTSC and PAL Avid, RGB Avid 10-bit, and XDCAM MPEG2 codec options.

— **MXF OP1A**: A version of the Material eXchange Format that conforms to the SMPTE 378M standard, and can deliver using the 1080i Avid 8-bit, DNxHD, DNxHR, Kakadu JPEG 2000, NTSC and PAL Avid, RGB Avid 10-bit, Sony MPEG4 422 and 444, and Sony XAVC Intra CBG and VBR, and XDCAM MPEG2 codec options.

— **QuickTime**: Apple’s file-based media format, used when delivering Apple ProRes, DNxHD or DNxHR wrapped in QuickTime, GoPro Cineform RGB 16-bit and YUV 10-bit, Grass Valley HQ and HQX, Kakadu JPEG 2000, H.264, HEVC, H.264 (single or multi-pass), Photo JPEG, Kakadu JPEG 2000, Uncompressed 8- and 10-bit formats with ARGB/BGRA/RGB/YUV channel orders, and VP9 at 8-, 10-, and 12-bits.

— **TIFF**: “Tagged Image File Format,” an image sequence format compatible with many desktop video applications on many platforms and is also used when delivering for DCDM mastering.

— **Codec**: A drop-down menu that lets you choose from a selection of codecs that are available to the format you’ve selected above.

— **Type**: Different codec options may also present different bit depth and color space combinations, as well, which are available from this menu.

— **Maximum Bit Rate**: (Does not appear for all codecs) Codecs such as Kakadu JPEG 2000 let you specify a maximum bit rate, in Mbits per second, with which to encode the delivered video.

— **Field rendering**: If you’re processing interlaced source material, this checkbox sets DaVinci Resolve to render each field individually before reintegrating them back into a single frame, in order to process clips most accurately with filtering operations that would otherwise violate field boundaries and cause problems. If you’re not rendering interlaced media, you should leave this checkbox turned off, as it is more processing intensive.

— **Export HDR10 Metadata**: (Available in Single clip mode if HDR10+ is enabled in Project Settings) Exports HDR10 metadata to the rendered file when you’re doing an HDR workflow.
— **Embed HDR10 Metadata:** (Available in Single clip mode if HDR10+ is enabled in Project Settings) Exports HDR10 metadata to the rendered file when you're doing an HDR workflow. Embeds HDR10 metadata within the exported media of selected formats.

— **Render at Source Resolution:** (When rendering Individual Clips) This checkbox lets you render each clip at the same resolution as its source media file, letting you preserve mixed frame sizes for final delivery.

— **Resolution:** The output resolution for rendering. This setting defaults to the current resolution of the project as set in the Master Settings panel of the Project Settings, modified by whatever transforms are applied in the Sizing palette in Output mode. However you can change the resolution here if you need to output at a different resolution. Using this setting, you can queue up different render jobs at different resolutions, in order to output both HD and SD resolution media in the same render session, for example. Some file formats require specific resolutions, in which case the Output Size settings will be automatically set to the necessary resolution.

— **Frame rate:** (When rendering Single Clip) This setting is typically identical to the “Timecode calculated at” frame rate in the Master Settings panel of the Project Settings. However, you may wish to set this to a variation of the current conformed rate, for example choosing from between 23.98 or 24 fps. Doing so will adjust the metadata written within the file, which is used to aid playback for the range of systems available worldwide.

— **3:2 Pulldown Insertion Options:** Starting with DaVinci Resolve Studio 12.5, you have the option of outputting either 29.97 or 30 fps media with 3:2 pulldown insertion if your project’s playback frame rate is either 23.98 or 24 fps. To output 29.97 media, the project must be 23.98 fps; simply choose (23.976 3:2) from the Frame rate drop-down. Projects with 24 fps frame rates can only be output at 30 fps.

— **Chapters from Markers:** (QuickTime or MP4 only) Embeds chapter points in the rendered file corresponding to the marker’s position on the Timeline of the selected marker color.

— **Export Alpha:** (When rendering Individual Clips) Turning this checkbox on results in alpha channels found in each clip’s source media file being output to each delivered clip, as well as alpha information that you’re creating in DaVinci Resolve and inserting into that clip via the Alpha output of the Color page Node Editor being output to each delivered clip.

— **Alpha Mode:** (When rendering Individual Clips) Lets you choose how to export alpha channels when Export Alpha is enabled. You can choose Straight or Premultiplied.

— **Render Stereoscopic 3D:** (Only appears if there are stereo clips in a timeline) Three options let you choose how to render stereoscopic timelines, rendering just one eye’s worth of media at a time, or rendering a single set of stereo media in one of four ways, depending on the option you choose from the “Both eyes as” drop-down menu.

— **Left eye:** Lets you render only the left-eye media from a stereo timeline.

— **Right eye:** Lets you render only the right-eye media from a stereo timeline.

— **Both eyes as:** Lets you select from four ways of rendering the left and right eyes of stereo media as a single set of media files. “Separate files” lets you output both the left-eye and right-eye media as individual media files, all at once. Side-by-side, Line-by-Line, and Top-Bottom let you output frame-compatible media that can be output to stereo-capable displays. Anaglyph lets you output a traditional anaglyph red/cyan stereo image for viewing on any display using red/cyan glasses.

— **Use Constant Bit Rate:** If the Format and Codec you’ve specified allows you to switch between variable and constant bit rate output, this checkbox lets you force video to render at a constant bit rate.
Optional MP4, H.264, H.265, VP9, or HEVC Controls

If you choose MP4 as the format, or QuickTime with H.264 or VP9 as the codec, additional options appear, described below. Workstations using NVIDIA GPUs that offer NVENC will present alternative accelerated options, while other workstations offering QuickSync hardware encoding instead will be able to use that option.

— **Use hardware acceleration if available:** DaVinci Resolve supports QuickSync hardware encoding of H.264 and HEVC, if available on your workstation.

— **Quality:** If the currently selected option in the Render to drop-down menu has options for changing the compression quality, this drop-down menu lets you choose the quality you want to use. Otherwise, it’s disabled.

— **Restrict to X Kb/s:** (Available for QuickTime H.264) You can choose Automatic, or select a maximum data rate with which to export H.264.

— **Encoding Profile:** A drop-down that lets you choose among different encoding profiles, each of which has been optimized for different purposes. The tradeoff is between quality and computational intensity for encoding and playback. The available options are:
  — **Auto:** Automatically selects an encoding profile.
  — **Base:** For H.264, intended for video conferencing and mobile phone use; highly compressed.
  — **Main:** For H.264, intended for SD analog transmission. For H.265, intended for the compression of 4:2:0 video at up to 4K 60fps with a bit depth of 8-bits per channel.
  — **Main10:** (H.265 only) Intended for the compression of 4:2:0 video at up to 4K 60fps with a bit depth of 10-bits per channel.
  — **High:** For H.264, intended for Blu-Ray and HD transmission.

— **Entropy Mode:** (called Entropy Coding Mode for compatible Nvidia GPUs) A drop-down that lets you choose which algorithm the encoder should use for compression. The choices are:
  — **CALVC (context-adaptive variable-length encoding):** A lower-quality algorithm that’s less computationally intensive to process and play.
  — **CABAC (context-based adaptive binary arithmetic coding):** A higher-quality algorithm that yields better visual quality at lower bandwidth, at the cost of being more computationally expensive to process and play.

— **Multi-pass encode:** (Available for QuickTime H.264) You can choose between Single and Multi-pass encoding. Single pass is faster, but multi-pass yields superior results when quality is important. When you enable Multi-pass, the number of passes performed is automatic.

— **Key Frames:** (Available for QuickTime H.264) You can choose Automatic, or select a duration for manual keyframe insertion.

— **Frame Reordering:** (Available for QuickTime H.264) On by default, Frame Reordering enables the encoding of B frames to improve the quality of the resulting compressed movie file. Turning off Frame Reordering will speed encoding performance at the expense of visual quality.

— **Rate Control:** (Available for compatible Nvidia GPUs) Provides six options for controlling Encoding Profile and Entropy Mode.

— **Lookahead:** (Available for compatible Nvidia GPUs) Lets you specify how many frames for the encoder to examine in advance of compression.
Optional DCP and IMF Controls

If you choose DCP or IMF as the Format, additional options appear, described below.

— **Use interop packaging:** (DCP only, located under Type parameter) Lets you create an Interop DCP package, based on an earlier standard of DCP delivery that is not forward compatible with SMPTE DCP packages.

— **Package Type:** (IMF) Defaults to App2 Extended (App2e), for encoding JPEG 2000 up to 4K.

— **Bit Depth:** (IMF) The bit depth of the encoded IMF video.

— **Encoding Profile:** (IMF) A drop-down that lets you choose among Auto, IMF, and Broadcast.

— **Encoding Level:** (IMF) Provides different choices based on what is selected in Encoding Profile.

— **Maximum bit rate:** (DCP, IMF) Lets you choose how much to compress the result.

— **Lossless Compression:** (IMF) Lets you choose to encode using lossless compression.

— **Slope-Rate Control:** (DCP, IMF) A checkbox lets you specify lossless compression.

— **QStep:** (DCP, IMF) Lets you choose either automatic or manually specified DCP quantization levels at which to compress the video signal when using the Kakadu JPEG 2000 encoder.

Advanced Controls

An advanced settings disclosure button hides the following additional controls, by default.

— **Pixel aspect ratio:** Lets you override the Project Settings and change the PAR of the rendered output to either Square or Cinemascope.

— **Data levels:** Defaults to “Auto,” which simply renders all clips with the data level appropriate to the currently selected codec in the “Render to” drop-down menu, which is usually the preferred behavior. Choosing one of the other options (“Video” or “Full”) outputs all clips using the selected data range. For more information, see Chapter 9, “Data Levels, Color Management, and ACES.”

— **Retain sub-black and super-white data:** Turning this checkbox on lets you choose to output media files that preserve overshoots and undershoots, data that’s above the maximum and minimum data levels of the data level you’ve selected, assuming this is supported by the video format and codec you’re exporting to. Otherwise, DaVinci Resolve clips these “out-of-bounds” parts of the signal in an effort to keep your deliverables from violating whatever QC standards you’re adhering to in your grade.

— **Color Space Tag:** A drop-down menu that lets you choose a color space to embed as metadata in the rendered file. This setting defaults to the Output Color Space if your project’s color science is set to DaVinci YRGB Color Managed, or the ACES Output Device Transform if your color science is set to ACEScC or ACEScSt.

— **Data burn-in:** A drop-down menu that defaults to “Same as Project,” which leaves the current Data Burn In palette settings enabled while rendering, inserting a window burn into the media being output. Choosing “None” disables window burns while rendering. Note that when rendering as Individual Source Clips, individual clip burn in presets can be assigned if they’ve been created in the Data Burn In palette.

— **Use optimized media:** When this checkbox is turned on, DaVinci Resolve will use optimized media, when available, to do the final render, to save time. If your media has been optimized to the same format as the one you’re outputting to (or better), this is convenient. However, if you’ve optimized to a lower quality format than what you’re outputting to, you should turn this checkbox off to force DaVinci Resolve to process all clips using the original media, guaranteeing the best quality available.
— **Use render cached images:** When this checkbox is turned on, DaVinci Resolve will write media from the cache to the files being output to save time. If you’re caching using the same media format you’re outputting to (or better), this can be convenient. However, if you’re caching in a lower-quality format than the one you’re outputting to, you’ll want to turn this checkbox off to force DaVinci Resolve to process all media as it’s being rendered, writing at the maximum quality you’re outputting to.

— **Enable flat pass:** Three options let you choose whether or not to render each clip with its grade applied.
  - **Off:** DaVinci Resolve always applies each clip’s grade when rendering.
  - **With clip settings:** For each version of a clip, the system will check that version’s pass flat flag. If it’s turned on, the system disables color correction for that version of the clip. Otherwise, that version will be rendered with its grade intact. Versions can be individually flagged by right-clicking a clip’s thumbnail in the Timeline, choosing the submenu of the version you want to flag, and choosing Enable Flat Pass.
  - **Always On:** When checked, DaVinci Resolve disables the grade of every clip being rendered.

— **Trigger script at:** You now have the option of triggering a script to execute before or after rendering a timeline, by checking the “Trigger script at” box.
  - **Start:** Executes the script before the render job.
  - **End:** Executes the script after the render job.
  - **Script:** Chooses the specific script to run. You can select the specific script to execute using the corresponding drop-down menu. Scripts must be written for the Resolve scripting framework in either Python or Lua, and placed in the following directory:
    - **MacOS:** /Library/Application Support/Blackmagic Design/DaVinci Resolve/Fusion/Scripts/Deliver
    - **Windows:** C:\ProgramData\Blackmagic Design\DaVinci Resolve\Fusion\Scripts\Deliver
    - **Linux:** /opt/resolve/Fusion/Scripts/Deliver

— **Disable sizing and blanking output:** When turned off, Output Blanking to create letterboxing or pillarboxing is “baked” into the output, as are all sizing adjustments made on the Cut, Edit, and Color pages, including Image stabilization.

  When turned on, Output Blanking, Cut and Edit page sizing adjustments, Color page input and Output Sizing, and Image Stabilization are disabled. Rendered media is rendered either at the source resolution if “Render at source resolution” is enabled in individual clips mode, or to the currently specified resolution of the Timeline or project. If you’re outputting via Final Cut Pro or Premiere Pro XML, or Avid AAF, sizing adjustments are output to the XML or AAF files that are created for purposes of round-tripping these adjustments as editable metadata back to an NLE.

  Be aware that “Disable sizing and blanking output” does not disable any transform operations that happen within the Fusion page, nor does it disable transforms happening as a result of an Open FX or Resolve FX plugin applied to one or more clips in the Cut, Edit, or Color pages. All of these effects will continue to be rendered into the final output.

— **Force sizing to highest quality:** If you’ve been working with the “When resizing and scaling” option set to Bilinear to improve performance when working on slower workstations, turning this checkbox on automatically renders all clips using the “Uses Sharper filter” setting of the Image Scaling panel in the Project Settings. For more information, see Chapter 4, “System and User Preferences.”
— **Force debayer to highest quality:** When rendering camera raw media formats that allow variable quality debayering, it’s common to lower the debayering quality to improve real time performance while grading. Turning this checkbox on guarantees that media will always be rendered at the highest available quality, saving you from forgetting to manually change the debayer setting back when setting up a render at 3am.

— **Add X frame handles:** (When rendering Individual Clips) Lets you specify front and rear handles to be output in frames. This is particularly useful in round trips, when the finishing editor might want additional handles with which to roll edit points or add transitions while fine-tuning the graded edit.

— **Tone Mapping:** (Available in Single clip mode if Dolby Vision or HDR10+ is enabled in Project Settings) When set to None, the timeline is output using the current color management settings. When set to either Dolby Vision or HDR10+, you can choose to output the timeline at a specific peak nit level, color space, gamma, and Data Level using either the Dolby Vision or HDR10+ metadata available to guide the tone mapping operation you’ve selected. This makes it easy to set up multiple jobs to output HDR outputs at varying levels, as necessary.

— **Bypass re-encode when possible:** (Single Clip mode only) Turning this checkbox on makes it possible to do a direct copy of the video essence of video items in the Timeline, directly from the source media to the file being output, when the selected Format, Codec, and Type matches the source. This also preserves alpha channel data for compatible formats. Bypass re-encode eliminates the need to re-encode video media, preserves quality, and speeds up the output process dramatically, but it only works for clips in the Timeline to which no additional effects have been added. Doing any grading, adding a Resolve FX plug-in, adding any overlapping effects or compositing to clips in the Timeline, resizing or stabilizing clips or altering the output sizing of the Timeline, and adding Fusion effects will all necessitate re-encoding the entire clip in order to process these effects. Transitions will require processing, but only for the duration of each transition.

There are many situations where this is valuable:

— **Fast output of simple edits:** You’ve edited a simple cuts-only promo using footage cut from a previously rendered program using QuickTime ProRes HQ 422 media, and you’re exporting to the exact same format. You can output all of the media very quickly using Bypass re-encode when possible.

— **Fast output of previously output timelines with small changes:** You need to replace a few shots in an effects-intensive program that’s already been output. You can import the media file that was output into a new timeline, replace only the required shots with new media. DaVinci Resolve will do a direct copy of all previously rendered media, while re-encoding only the new clips with whatever effects and grading they contain. This lets you quickly re-output a high-quality master file, while preventing you from needing to re-render the entire program.

— **Fast output of previously output timelines with new audio mixes:** You’ve placed a previously rendered Video+Audio clip onto a timeline and edited a new audio mix clip to replace the old audio mix. In this situation, a new Video+Audio file will be quickly written with the new audio, but the video component of that file won’t be re-encoded, again resulting in a fast export at the highest quality.

**TIP:** For a list of which video formats are compatible with Bypass Re-encode on macOS, Windows, and Linux, as well as which formats are compatible with alpha channels, see the “Supported Codec List” at the DaVinci Resolve Support page, located at https://www.blackmagicdesign.com/support/family/davinci-resolve-and-fusion.
DCP and IMF Composition Settings

If you’ve selected either DCP or IMF from the Format, a Composition Settings group appears with the following parameters when you click the disclosure control, which let you populate standard DCP and IMF composition metadata:

— **Composition name**: The name of the exported composition.
— **Issuer**: The organization providing the composition.
— **Use current date**: A checkbox that lets the current date be used as the Issue date automatically.
— **Issue date**: The date the composition is issued.
— **Content kind**: A drop-down provides a list of acceptable choices for defining the content.
— **Content version label**: Meant to identify the version of the content being provided.
— **Annotate xml using composition name**: Auto-populates Asset Map, Composition Playlist, and Packing List with data from the project. Otherwise these three fields are manually editable.
— **Annotate reel index as suffix (DCP only)**: Auto-populates Reel Annotation with data from the project. Otherwise this is manually editable.
— **Annotate media using filename**: Auto-populates Main Video Track and Audio Track 1 with data from the project. Otherwise these three fields are manually editable.

Subtitle Controls

The Subtitle Settings group exposes controls governing how to export subtitles in your program:

— **Export Subtitle**: This checkbox determines whether or not subtitles will be output or ignored.
— **Format**: Lets you choose how you want subtitles to be output, if present.

There are two options:

— **As a separate file**: Exports all subtitles in the current timeline as a separate file of the format selected in the Export As drop-down.
— **Burn into video**: Renders the current timeline with all subtitles appearing within the picture. When Burn into video is selected, the Export As drop-down is hidden.

— **Export As**: This drop-down is only adjustable if Format has been set to “As a separate file.” The available formats are IMSC1, DFXP, SRT (with or without formatting), and WebVTT.

Audio Panel

This panel contains all audio-oriented parameters.

— **Export audio**: Turn this checkbox on to render the source audio, or audio that you’ve synchronized in DaVinci Resolve, along with the media being output by DaVinci Resolve.
— **Format**: You can choose which format of audio you want to render. Depending on which format you choose, different audio codec options will appear below.

— **MXF OP-Atom**: Generates media files that conform to the SMPTE 390M format of MXF media for file exchange.
— **QuickTime**: Exposes all available formats of audio compatible with QuickTime.
— **WAVE**: Generates media in the WAVE format.
— **MP4**: Generates media in the MPEG-4 file format.
Codec: Lets you choose between Linear PCM (the default), AAC audio, and IEEE Float (Wave only). AAC audio encoding is only available on macOS.

Bit Rate Strategy: (Available for AAC encoding) You can choose among Constant Bit Rate, Average Bit Rate, Variable Bit Rate Constrained, and Variable Bit Rate.

Quality: (Available for AAC encoding when Bit Rate Strategy is set to Variable Bit Rate) Five settings you trade between speed and quality when encoding AAC audio.

Data Rate: (Available for AAC encoding when Bit Rate Strategy is set to Constant, Variable, or Variable Constrained) Lets you choose the maximum data rate for AAC encoding.

Bit Depth: Lets you specify the bit depth at which to output the source audio.

Render one track per channel checkbox: This checkbox lets you specify whether you want to export each channel as an individual track in the structure of the exported file.

Output Track #: This drop-down menu lets you choose which Main or Submix bus you want to output. A Plus button to the right lets you add additional tracks you want to export in this job, so if you want to export multiple Mains or multiple Subs, you can add more Track pop-ups.

When you choose a track with multiple channels of audio, a field appears showing how many channels will be output; you have the option of using a virtual slider to change how many channels are output.

In Single Clip Mode, when you choose “All Timeline Tracks, each audio track in the current timeline will be rendered as an individual track in the rendered media file you’re outputting. Multi-channel tracks containing multi-channel clips will output audio tracks containing the same number of channels in the output media, which means you can output mixed combinations of mono, stereo, 5.1 or 7.1, and adaptive audio tracks, and each separately rendered audio track will reflect identical channel mappings.

Language: (Only available when outputting to the IMF format) This drop-down menu lets you choose the language of a particular output track when you’re outputting to IMF. Since IMF files can accommodate multiple audio tracks containing different mixes for different regions, it’s important to identify each output track you’re outputting by language.

Content: (Only available when outputting to the IMF format) This drop-down menu lets you choose the content of a particular output track when you’re outputting to IMF. Since IMF files can accommodate multiple audio tracks containing different mixes and content, it’s important to identify each output track you’re outputting by content.

File
This panel contains all other parameters.

Filename Uses: Three options let you automatically name the media file(s) that are output automatically.

Use Custom Filename: Lets you enter your own name in the Custom name/File prefix field.

Use Timeline Name: (When rendering a Single Clip) When this option is selected, the name of the Timeline is used.

Use Source Filename: (When rendering Individual Clips) When this option is selected, the filename of each clip’s corresponding source media file is cloned, and used as the filename of media being output by DaVinci Resolve. This is preferred when you’re generating offline media for use by an editor that you later want to reconform to the originating DaVinci Resolve project. When this checkbox is turned off, you can customize filenames using the other options in this section of settings.
— **Custom name**: Lets you use custom text to name all rendered files. If you’re not using the source filename, and not rendering to a file format that uses timecode, you can enter a filename here. When editing the Custom Name or File Prefix (or File Suffix), you can use “metadata variables” that you can add as graphical tags that let you display clip metadata. This is especially useful when rendering Individual Source Clips. For example, you could add the corresponding metadata variable tags %scene_%shot_%take and the File Prefix would be written as “12_A_3” if “scene 12,” “shot A,” “take 3” were in the source clip’s metadata. For more information on the use of variables, as well as a list of all variables that are available in DaVinci Resolve, see Chapter 16 “Using Variables and Keywords.”

— **File suffix**: Lets you add custom text and/or metadata variables (described previously) to the end of all rendered files.

— **Use unique filenames**: (When rendering Individual Clips, and only when Filename uses is set to Custom name) When enabled, additional characters are added to every rendered media file to guarantee that each rendered media file has a completely independent name. This prevents multiple rendered clips from the same source media file from overwriting one another when saved to the same directory. “Uniquely” named clips append the clip name with the track and clip number identifying a clip’s position in the currently selected session. For example, a clip that’s linked to a media file named “DropThatThingCU.mov,” and edited as the twenty-fifth clip on track V2, will be named “DropThatThingCU_V2-0025.mov” when rendered. When enabled, two other options are revealed.

— **Use unique filename prefix/Use unique filename suffix**: (When Use Unique Filenames is on) Radio buttons let you choose whether to add the unique identifier at the beginning or end of a clip. Choosing Prefix would result in “V2-0025 _DropThatThingCU.mov,” whereas choosing Suffix would result in “DropThatThingCU_V2-0025.mov” when rendered.

— **Add source frame count to filename**: (When rendering Individual Clips, and only when Filename uses is set to Custom name) When enabled, the source frame number of each clip is appended to the end of the rendered file name. This is another way to make sure that multiple rendered clips with custom names don’t overwrite one another.

— **Use filename digits**: Lets you specify how many digits to use when rendering an image sequence, although the specified digits will also be used for any media format. This is particularly useful if you’re outputting media to be used by an application that has strict requirements for image sequence numbering. Defaults to eight digits.

— **Each clips starts at frame**: (When rendering Individual Clips) This permits timecode to be written to the header, and frame count to be written to the filename of the image sequences, which is ideal for VFX workflows.

— **Start timeline timecode at**: (When rendering Single Clip) This option is only available when rendering clips in Single clip order. Specifies the timecode that will be written to the media being output by DaVinci Resolve. For DPX files, timecode is written into the header data, and is simultaneously converted to a frame count that’s inserted into the filename of each frame file, which provides a logical count of the frame numbers. For other media formats, timecode is written to the appropriate metadata container. You may find it useful to use custom start times, for example starting each reel of a project at a particular value, depending on the standards employed at your shop.

— **Place clips in separate folders**: (When rendering Individual Clips) Useful if you need to preserve the filenames of files you’re outputting when the filenames of clips coming from the same source media file may cause them to overwrite one another. This option is also commonly used when rendering VFX shots for additional post-production work, allowing the VFX department to identify clips quickly and distribute the work accordingly.
— **Preserve Source directory levels:** (When rendering Individual Clips) Retains a user-specified depth of the original directory structure used by a clip’s corresponding source media file, recreating it when rendering new files for output. The number you select determines how many levels of subdirectories DaVinci Resolve will automatically create within the currently specified “Render job to” directory to match the path used by the source files. Defaults to 0, which creates no matching subdirectories.

— **After Head/From Tail:** When setting how many directory levels of each clip’s file path to preserve (using the “Preserve x levels” parameter), click one of these buttons to specify whether that number of path levels is defined relative to the head or the tail of each media file path.

— **Preserved Path:** Shows you a preview of the preserved path you’ve set up so you know you’ve gotten it right.

— **File Subfolder:** (Only appears in Additional Output panels) Lets you specify a subdirectory into which to render the media files being output. If the specified subdirectory doesn’t exist, a new one with that name will be created within the currently specified “Render job to” directory.

— **Use commercial workflow:** (When rendering Individual Clips) Automatically renders every version that’s applied to each clip in the session, except for versions that have been flagged using the “Render Disabled” flag, found in the Version submenu for each clip in the Timeline. This option is typically used when you’ve graded multiple versions of a clip to be used for VFX work, and you want to deliver each grade as a separate media file. This is also used when rendering programs for commercial broadcast where you have two or more versions of a grade for each scene. When using this option, alternate methods of outputting each rendered media file are used, and four additional settings are revealed.

— **Alternative pass offset:** Lets you separate the timecode values written into each version of a clip with an offset. For example, if the default version timecode is 01:00:20:00, and you select a 10 minute offset in the Alternative Pass Offset timecode entry, then the second graded version of that clip will start at 01:10:20:00, the third version will start at 01:20:20:00, and so on until every version is rendered. You can offset the clips by whatever value you like, but the idea is to make it easy for editors and VFX artists to find the versions of each grade. If the clips are shared with a finishing artist, and they know that each alternate pass is 10 minutes apart, then it’s easy for the finisher to change the clip version just by adding 10 minutes to the referenced timecode. To simplify the workflow further, you can put separate source reels in separate folders using the next three options.

— **Place reels in separate folders:** Automatically places all media that’s output using a particular reel name into corresponding folders.

— **Place clips in separate folders:** Automatically places alternate grades of clips into separate folders.

— **Use version name for folders:** Labels each folder with the name of the version when using the Commercial Workflow option.

— **Render speed:** A drop-down menu lets you throttle the speed at which media is rendered. Ordinarily you’ll leave this set to the default of Maximum. However, some storage systems that are shared by multiple rooms in a facility use storage area networks (SANs) with insufficient bandwidth for multiple real-time image streams. DaVinci Resolve’s incredibly fast rendering speeds can cause playback problems with other users accessing the SAN if available bandwidth is insufficient. In this case, you can throttle the render speed to limit SAN bandwidth usage to between 1 to 50 percent of full rendering speed.
— **Disk space currently used**: Shows the amount of disk space available on the target volume.
— **Disk space used after render**: Shows the new disk usage based on the specified range of the current session that you’re rendering.

## Additional Outputs

Each job you create in the Render Settings defaults to a single output. However, you can create multiple outputs when you need to deliver multiple versions of media, with individual video formats and codecs and different data burn-in settings, to be rendered into individually named subfolders (optional).

This can be useful for setting up multiple rendered passes when your client requires two sets of media, for example QuickTime ProRes 422 (HQ) media along with MXF DNxHD media. This is also useful when you need to output two sets of media where one has window burns, and the other is clean.

**To add additional outputs in the Render Settings:**

— Choose Create Additional Output from the Render Settings Option menu. A row of numbers below the Filename and Location controls let you open each output you create and adjust its settings. You can have as many outputs as you require.

![Render Settings - Custom](image)

The menu command for creating an additional output, shown next to an existing additional output in panel 2

**To remove an additional output:**

— Open the additional output panel you want to remove, and click the Delete button at the bottom.
How to Avoid Overwriting Clips When Rendering Output Media

Three of the options described previously, “Use unique filenames,” “Place clips in separate folders,” and “Use commercial workflow,” are all ways of organizing your rendered media to avoid overwriting rendered clips that happen to share the same file name. These options are necessary because each clip has one logical range of timecode, and because multiple clips often refer to a single source media file with one name.

When rendering a clip, DaVinci Resolve automatically overwrites any other media files that have the same name. So, in instances where you’re trying to preserve the previous filename of the source media file, or where you’re rendering out multiple versions of the same clip, it’s entirely likely that the clips you’re trying to output will overwrite one another, leaving you with the last clip you rendered. The three options mentioned previously prevent this in different ways.

Defining a Range of Clips and Versions to Render

Once you’ve defined the Render Settings, now you need to decide how much of the Timeline you need to render. A Mini-Timeline and Thumbnail timeline are available to help you navigate your project’s clips in order to choose which ones you want to render. Track controls let you enable and disable whole tracks from being output; for example if you need to render a textless version of a timeline in which all the title clips are on track V4, you can disable track V4. Furthermore, you can also use these controls to choose which clip versions you want to render.

To render the entire Timeline:
— Choose Entire Timeline from the Render drop-down in the Deliver page timeline. This option only appears if clips are not filtered.

To disable a video or audio track to exclude those clips from being rendered:
— Click the Video or Audio Disable Track button for the tracks you want to exclude.

To render a filtered subset of clips in the Timeline:
1 Open the Color timeline, if it’s not already shown, and choose an option from the Timeline Filter drop-down to the right of the Clips button in the Interface toolbar.
   The contents of the Thumbnail timeline are restricted to show only the clips matching the selected criteria. For example, if you’ve already rendered a session, but you’ve since made some changes, you can use one of the “Show Modified Clips” options to display only the clips that have changed within a particular timeframe. Another possibility is to choose the “Show Unrendered Clips” option to show all clips that have not yet been rendered.
2 Choose “All Filtered Clips” from the Render drop-down in the Timeline toolbar.

To clear clip filtering:
— Choose All Clips from the Timeline Filter drop-down to the right of the Clips button in the Interface toolbar.
To define a continuous range of clips to render:

1. To define the first clip in the range you want to render, do one of the following:
   - Right-click a clip thumbnail in the Thumbnail timeline and choose Mark In.
   - Position the playhead in the Timeline or the Viewer, and press the I key, or right-click the Timeline ruler and choose Mark In.

2. To define the last clip in the range you want to render, do one of the following:
   - Right-click a clip thumbnail (in the Color timeline) or a clip (in the Edit timeline) in the Thumbnail timeline and choose Mark Out.
   - Position the playhead in the Timeline or the Viewer, and press the O key, or right-click the Timeline ruler and choose Mark Out.

In and Out points appear within the Timeline ruler, and an orange bar shows the range you’ve selected to render. The In and Out fields update with the first and last frame numbers, in timecode and frame count, and the Duration field updates with the total number of frames you’ll be rendering.

**IMPORTANT**

If you’re in Individual Clips mode, In and Out points automatically snap to the nearest clip In or Out point in the Timeline. You cannot render partial clips in Individual Clips mode, but you may do so in Single Clip mode.

To render a single clip:

- Open the Thumbnail timeline if it’s not open already, Right-click any clip thumbnail, and choose Render This Clip.
- An orange bar in the Timeline ruler shows that clip is selected for rendering. If you need to render several clips individually, you can select each clip one at a time to add as individual jobs to the Render Queue.

**Choosing Which Versions to Render for Each Clip**

By default, the currently selected version that was set in the Color page is rendered for each clip. If you want to render a different version, the easiest thing to do is to make sure they’re selected on the Color page Timeline before you open the Deliver page.

However, a Versions submenu, within the Thumbnail timeline’s contextual menu for each thumbnail, also provides options to manage grade versions. These commands are duplicates of options that are available from the Thumbnail timeline of the Color page.
To choose which version to render:
— Right-click any clip thumbnail in the Thumbnail timeline, and choose a version from
the Versions submenu.

**Tip:** You can right-click a clip in the Thumbnail timeline of the Color or Render screen and
rename any version of a grade. This can assist a facility’s workflow when sharing material
between suites and applications.

---

**Using the Render Queue**

Once you’ve defined the settings necessary to render the type of media you require, and the range
of the current session you want to render, you need to add all that information as a job to the Render
Queue. You can add as many jobs to the Render Queue as you need, depending on what files you need
to output.

Each job can have individually specified ranges of clips and individual clip settings, which can include
different render directories, different formats, resolutions, data levels, burn-in settings, and so on. As a
result, you can use the Render Queue to queue up the render of multiple sections of the current session,
or multiple versions of the same media. Furthermore, you can queue up multiple sessions, if you have
several differently graded sessions.

**To add a job to the Render Queue:**

1. Select a timeline.
2. Choose the settings you require in the Render Settings, using one of the Presets, or by choosing your
   own custom settings.
3. Choose a range of clips to render using the Deliver page Timeline using the procedures described in
   the previous section.
4. Click the Add to Render Queue button at the bottom of the Render Settings.
5. If you haven’t chosen a location for the render yet, you’ll be prompted to do so now via a File
   Destination dialog, so choose a location and click Ok. If there’s already media in the render location
   you’ve specified, you may also see a dialog telling you “This render may overwrite existing clips in
   this folder.” If you want to continue, click Yes, otherwise click No.

That render setup is now added as a job to the Render Queue, showing the project and timeline
name, and location path where the render will be written to.
Media Offline Warning in Render Queue

When you attempt to add a job to the Render Queue with a timeline that contains any offline material, DaVinci Resolve automatically gives you a warning. You may choose to either cancel adding the job, or to add it anyway, knowing you’re about to render one or more offline clips.

![Media Offline warning box that appears if your timeline contains offline clips or frames and is added to the Render Queue](image)

To show more details about jobs in the Render Queue:

Click the Render Queue Option menu (at the upper right-hand corner) and choose Show Job Details. Each job now lists the frame size, format, frame rate, audio channels and sample rate, and duration below the name and location path.

![A selected job in the Render Queue with job details shown](image)

To rename a job:

— Jobs can be given custom names simply by clicking on the default job name (Job 1, Job 2, and so on) and typing a new name of your own. This can be useful for setting up jobs that you may be re-rendering over and over as you work on a project.

To start rendering:

1. If you want to restrict rendering to only selected jobs in the Render Queue, then select one or more jobs by clicking on one, and then Command-clicking on others to choose discontinuous jobs, or Shift-clicking on another to select an entire range of jobs. When you select one or more jobs, only the selected jobs will be rendered. If no jobs are selected, then all jobs in the queue will be rendered.
2. Click the Start Render button, underneath the Viewer to the right of the interface.
3. If there are jobs in the Render Queue that have already been rendered, a dialog will appear asking “Selected items contain already rendered items. Do you want to re-render them?” Clicking Yes will re-render all jobs in the Render Queue. Clicking No only renders the jobs that have not yet been rendered. Clicking Cancel cancels the entire rendering operation.

Rendering begins, starting with the highest job in the list. The Overall Progress bar starts to fill up, from right to left, indicating how much of what’s been queued up has been rendered so far.
While rendering is in progress, the Start Render button changes to the Stop Render button, which can be clicked at any time to halt rendering.

**TIP:** While rendering is in progress, a small progress bar will appear on the DaVinci Resolve icon in the dock of Mac OS X, or on the taskbar of Windows.

To remove jobs from the Render Queue, do one of the following:

— **To clear a specific job:** Click the X at the upper right-hand corner of a job's entry in the Render Queue.

— **To clear all previously rendered jobs:** Click the Render Queue Option menu (at the upper right-hand corner) and choose Clear Rendered.

— **To clear all jobs:** Click the Render Queue Option menu (at the upper right-hand corner) and choose Clear All.

To change a job that has been rendered to appear unrendered again:

— Right-click any rendered job, and choose Clear Render Status. You can also select multiple jobs to change their rendered status all at once. This makes it easy to re-render the exact same job.

To edit a job that has or has not been rendered:

1. Click the Pencil button in the Render Queue to select it.

   ![Clicking the pencil icon to edit a job in the Render Queue](image)

   The selected Render Queue’s settings repopulate the Render Settings list, and resets the selected range of the Timeline corresponding to that job.

2. Change whichever settings you need to.

3. When you’re finished editing the job, click the Update Job button that appears at the bottom of the Render Settings, or you can click Add New Job to create a new job with the changes you’ve made, leaving the previous job untouched.

**NOTE:** If you click the Pencil button again without clicking Update Job, you’ll be prompted to Save, Cancel, or Don’t Save.

To review clips that correspond to rendered jobs:

— **To show a rendered clip in the Media Storage browser:** Right-click any rendered job, and choose Reveal in Media Storage.

— **To show a rendered clip in your computer’s file system (Mac OS only):** Right-click any rendered job, and choose Reveal in Finder.
Rendering Jobs from Multiple Projects at Once

You can also add multiple projects from the currently open PostgreSQL or local project library to the render queue all at once. This can be exceptionally useful in situations where you’ve broken a program into multiple reels, with each reel being a different project.

To render output from multiple projects at once:

1. Open each project, set up whatever jobs you want to render in the Render Queue, and save that project without rendering.
2. When you’ve set up the last project, click the Render Queue Option menu (at the upper right-hand corner) and choose Show All Projects.
   All queued items in projects belonging to the currently selected user (if using a network project library) or in the currently specified disk location (if using a local project library) now appear in the Render Queue.
3. Click Start Render to begin rendering every job from every project in the queue.
4. When you’re finished, turn Show All Projects off to go back to displaying only the current project’s render queue items.

Remote Rendering

If you have multiple DaVinci Resolve workstations on the same network, you can send a job in the Render Queue from the workstation you’re using (referred to as the “artist workstation”) to one of the “remote workstations” on the network using remote rendering. This lets you use any one of your currently unused secondary workstations to render your jobs, while you continue working on your main workstation.

In order to use remote rendering, you must adhere to the following three criteria:

— Both the artist workstation and the remote workstation must have DaVinci Resolve Studio installed. Remote rendering does not work with the free version of DaVinci Resolve.
— Both the artist workstation and the remote workstation can use the same Postgres shared project library, or any other Postgres project library that is connected to either one of the machines, or to a dedicated Remote Project Library Server. For more information on setting up and using a shared project libraries, see Chapter 193, “Managing Project Libraries and Project Servers.”
— Both the artist workstation and the remote workstation must have access to the same media files on either the same storage volumes, or identically named storage volumes.

Using Multiple Project Libraries in Remote Rendering

You can set up remote renders for projects in all connected Davinci Resolve project libraries, not just the currently active one. To activate this feature, check the “Automatically scan other project libraries for Remote Rendering jobs” box in the General settings of the System tab, of the DaVinci Resolve Preferences.
**Sharing Storage**

It’s important that both the artist and remote workstations have access to the same media on the same named storage volume for remote rendering to work properly. This can be done via some manner of shared storage, such as a SAN. However, it can also be done by mounting the same volume over your network. This will be slower, but it will work.

If you’re mixing Mac OS X, Windows, and Linux workstations for remote rendering, you’ll need to use the Mapped Mount column of the Media Storage Locations list in the Media Storage panel of the System Preferences to add each volume’s path as it’s understood on the workstation it’s attached to. For example, on a Windows workstation that’s accessing volumes from a Linux workstation, type in the Linux-style file paths in the Mapped Mount column for each scratch disk that’s listed.

**Setting Up and Using Remote Rendering**

Using remote rendering is easy, but it does require a bit of preparation.

1. Make sure the storage volume containing the media being referenced by the project you want to render is mounted on both the artist and remote workstations.

2. Open DaVinci Resolve on the remote workstation, and do one of the following:
   - When the Project Browser opens, right-click anywhere and choose Remote Rendering.
   - If you’ve already opened a project in DaVinci Resolve, you can also choose Workspace > Remote Rendering.

DaVinci Resolve will automatically open to the Deliver page, awaiting jobs to be assigned for automatic rendering.

3. On the artist workstation, add a job to the render queue as you normally would.

4. Click the Remote Rendering button for that job in the Render Queue and one of the options from the list that appears:
   - **Any:** Automatically assigns that job to the next workstation that isn’t currently rendering anything. If all remote rendering workstations are rendering, assigns it as the next job in line.
   - **YourComputer.local:** The artist workstation with the name “YourComputer.” Choose this if you want to render the job locally, and not remotely.
   - **Other Workstations on Network:** All other remote rendering workstations are listed below, so you can choose which specific workstation you want to assign a job to.

5. Click Start Render. The job is sent to the remote workstation you selected and is rendered, while you’re free to continue working on your artist workstation.
When You’re Finished Remote Rendering

Once you’re done using a particular DaVinci Resolve workstation in Remote Rendering mode and you want to go back to using it as an artist workstation, choose Workspace > Remote Rendering to exit remote rendering and return to the Project Manager.

Setting Up a “Headless” Remote Rendering Workstation

DaVinci Resolve allows remote rendering clients to operate in a so-called “headless” mode, with no GUI. This can be accomplished from the command line, by opening the directory where the app is located and then running DaVinci Resolve in Remote Rendering (–rr) mode using the correct command line syntax for your operating system. Once run in this way, DaVinci Resolve silently and invisibly waits on that system for remote rendering jobs to be sent to that workstation.

**On macOS**
- Open Terminal.
- Change the directory to:
  ```
  cd /Applications//DaVinci\ Resolve/DaVinci\ Resolve.app/Contents/MacOS/
  ```
- Run the following command:
  ```
  ./Resolve -rr
  ```

**On Windows**
- Open the Command Prompt.
- Change the directory to:
  ```
  C:\Program Files\Blackmagic Design\DaVinci Resolve\ 
  ```
- Run the following command:
  ```
  Resolve.exe -rr
  ```

**On a Linux CentOS 6.8 system**
- Open Terminal.
- Change the directory to:
  ```
  cd /home/resolve/Cyclone/
  ```
- Run the following command:
  ```
  ./script.start -rr
  ```

**On a Linux CentOS 7.x system**
- Open Terminal.
- Change the directory to:
  ```
  cd /opt/resolve/bin
  ```
- Run the following command:
  ```
  ./resolve -rr
  ```
Chapter 187

Delivering DCP and IMF

For projects requiring Digital Cinema Package (DCP) or Interoperable Master Format (IMF) mastering for digital cinema or broadcast distribution, DaVinci Resolve allows native DCP and IMF encoding and decoding for the creation and playback of unencrypted DCP and IMF deliverables, or it can be integrated with Fraunhofer’s easyDCP application in order to master fully encrypted DCP files, play them back for testing, and generate Key Delivery Messages (KDMs) for theatrical distribution, all directly within DaVinci Resolve.

This means you can encode a DCP or IMF master straight from your program’s source media, all within the 32-bit floating point image processing pipeline of DaVinci Resolve, for the highest possible quality result.

Native IMF Encoding and Decoding
(Studio Version Only)

The Format drop-down in the Video panel of the Render Settings now has a native IMF option that lets you export to the SMPTE ST.2067 Interoperable Master Format (IMF) for tapeless deliverables to networks and distributors. No additional licenses or plug-ins are required to output to IMF.

The IMF format supports multiple tracks of video, multiple tracks of audio, and multiple subtitle and closed caption tracks, all of which are meant to accommodate multiple output formats and languages from a single deliverable. As of DaVinci Resolve 16, IMF export also supports exporting IMF packages that use ST.2098 and Dolby immersive audio via selected Main busses. All of this is done by wrapping a timeline’s different video and audio tracks (media essences) and subtitle tracks (data essences) into a “composition” within the Material eXchange Format (MXF).

Additionally, a drop-down menu to the right of this preset provides options for Generic, 20th Century Fox, and Netflix versions of this preset.

When IMF is selected from the Format drop-down, the Codec drop-down menu presents options for Kakadu or EasyDCP encoding, with Kakadu being the method that’s included with DaVinci Resolve Studio. A Type drop-down lets you choose what kind of JPEG2000 output you want, with options including RGB, YUV, and Dolby Vision. Additional parameters include:

- **Package Type**: Defaults to App2 Extended (App2e), for encoding JPEG 2000 up to 4K.
- **Bit Depth**: The bit depth of the encoded IMF video.
- **Encoding Profile**: A drop-down that lets you choose among Auto, IMF, and Broadcast.
- **Encoding Level**: Provides different choices based on what is selected in Encoding Profile.
- **Maximum bit rate**: Lets you choose how much to compress the result.
- **Lossless Compression**: Lets you choose to encode using lossless compression.
- **Slope-Rate Control**: A checkbox lets you specify lossless compression.
- **QStep**: (DCP, IMF) Lets you choose either automatic or manually specified DCP quantization levels at which to compress the video signal when using the Kakadu JPEG 2000 encoder.
A separate group of parameters named Composition Settings, underneath the Advanced Settings, lets you add metadata to your IMF package, including:

— **Composition name**: The name of the exported composition.
— **Issuer**: The organization providing the composition.
— **Use current date**: A checkbox that lets the current date be used as the Issue date automatically.
— **Issue date**: The date the composition is issued.
— **Content kind**: A drop-down provides a list of acceptable choices for defining the content.
— **Content version label**: Meant to identify the version of the content being provided.
— **Annotate xml using composition name**: Auto-populates Asset Map, Composition Playlist, and Packing List with data from the project. Otherwise these three fields are manually editable.
— **Annotate media using filename**: Auto-populates Main Video Track and Audio Track 1 with data from the project. Otherwise these three fields are manually editable.
Native Unencrypted DCP Encoding and Decoding (Studio Version Only)

DaVinci Resolve also has native DCP encoding and decoding support built-in, for unencrypted DCP files only. That means that you can output and import (for test playback) unencrypted DCP files without needing to purchase a license of EasyDCP. If you have a license, a setting in the Configuration panel of the System Preferences enables you to choose whether to use EasyDCP (for creating encrypted DCP output), or the native DaVinci Resolve encoding.

Native DCP Encoding Parameters

When you choose DCP from the Format drop-down menu, the following additional parameters are exposed:

- **HDR:** (DCP, IMF) Specifies the package as having HDR content.
- **Use interop packaging:** (DCP only, located under Type parameter) Lets you create an Interop DCP package, based on an earlier standard of DCP delivery that is not forward compatible with SMPTE DCP packages.
- **Maximum bit rate:** (DCP, IMF) Lets you choose how much to compress the result.
- **Lossless Compression:** (IMF) Lets you choose to encode using lossless compression.
- **Slope-Rate Control:** (DCP, IMF) A checkbox lets you specify lossless compression.
- **Quality:** (DCP, IMF) Lets you choose either automatic or manually specified DCP quantization levels at which to compress the video signal when using the Kakadu JPEG 2000 encoder.

If you’ve selected DCP from the Format drop-down menu, a Composition Settings group appears with the following parameters when you click the disclosure control, which let you populate standard DCP composition metadata:
— **Composition name:** The name of the exported composition. DCPs use specific naming conventions for the composition name that include metadata about the file itself for DCP projectors and playback equipment. DaVinci Resolve has a tool called the Composition Name Generator to generate these names properly for you; it is accessed by pressing the “Edit” button next to this field. Simply fill out the fields and press OK, and DaVinci Resolve will rename your composition in line with these standards.

The Composition Name Generator will pass a standards compliant name for you to the Composition Name field.

— **Issuer:** The organization providing the composition.

— **Use current date:** A checkbox that lets the current date be used as the Issue date automatically.

— **Issue date:** The date the composition is issued.

— **Content kind:** A drop-down provides a list of acceptable choices for defining the content.

— **Content version label:** Meant to identify the version of the content being provided.

— **Annotate xml using composition name:** Auto-populates Asset Map, Composition Playlist, and Packing List with data from the project. Otherwise these three fields are manually editable.

— **Annotate reel index as suffix:** Auto-populates Reel Annotation with data from the project. Otherwise this is manually editable.

— **Annotate media using filename:** Auto-populates Main Video Track and Audio Track 1 with data from the project. Otherwise these three fields are manually editable.
Rendering IMF Segments and DCP Reels

DaVinci Resolve supports splitting IMF and DCP projects into separate segments and reels, in addition to rendering media as a single file. This can be useful for breaking up your timeline to fit within allowed file sizes on legacy file systems, separating marketing and studio assets from the final film, or just being able to replace certain sections of the film without having to re-encode the entire file.

To Render an IMF Segment or DCP Reel:

1. Choose IMF or DCP from the format settings in the Video tab of the Render Settings panel.
2. Navigate to the “Segment list” or “Reel list” section of the composition settings.
3. Choose from the following options:
   - Single segment/reel: Encodes the Timeline into a single file (default setting).
   - Regular intervals of: Encodes the Timeline into multiple segments/reels, each one the duration of the value set in the “mins” field.
   - Align to clips on the first video track: Encodes the Timeline into multiple segments/reels; each individual clip on the V1 track of the Timeline becomes its own separate file.
   - Keep audio as single segment (IMF only): Select this checkbox to keep the audio portion of the IMF as a single file, regardless of the segment options selected above.
4. Press the Add to Render Queue button.
Creating DCP/IMF Supplemental Packages

Once created, DaVinci Resolve has the ability to reimport a DCP or IMF so that you can overwrite parts that need to be updated with new media, in order to export a “Supplemental Package,” which is effectively a new version of the program that combines the new overwritten parts of the program with the old version, such that you can deliver just the changes.

**NOTE:** Supplemental packages are only supported using the Kakadu encoder and decoder; this is not compatible with DCP or IMF packages created using EasyDCP. To avoid issues, disable “Use easyDCP decoder” in the Decode Options panel of the DaVinci Resolve System Preferences.

**Importing a DCP or IMF Into a Timeline**

1. Using the Media Storage browser in the Media page, find and select the DCP or IMF, and check the header of the Metadata Editor to verify that your media is suitable for creating a supplemental package. Supported IMF profiles will be displayed in the Metadata Viewer.

![Metadata Editor showing IMF compatibility](image1)

The header in the Metadata Editor showing an IMF that’s compatible with the creation of a supplemental package

2. Create a new project and add the DCP/IMF package you need to modify to the Media Pool. If a dialog appears asking if you want to change your timeline frame rate to match the incoming media, click Change to make your project match the media.

3. Create a timeline from the composition playlist (XML) within the imported DCP or IMF by right clicking the imported package in the media pool and choosing “Create New Timeline Using Composition Playlist” from the contextual menu.

![Contextual menu options](image2)

Right-clicking an imported IMF or DCP clip in the Media Pool reveals a command to make a new timeline using the composition playlist in the contextual menu
4 The New Timeline dialog has an “Import Dolby Vision Project Settings” checkbox. When it’s turned on, clicking Create will do the following:

a. Dolby Vision will be enabled in the Color Management panel of the Project Settings, and the Mastering Display menu will be set to match that of the IMF package.

b. If Resolve Color Management (RCM) is not active, the Timeline Color Space will be set to match the Dolby Vision metadata. However, if RCM is already enabled, the user must manually set this by turning on “Use Separate Color Space and Gamma,” and changing the Timeline settings to P3-D65” and “ST.2084” respectively.

5 Creating the Timeline will import Dolby Vision metadata (if applicable). This will allow a Tone Mapping preview to be seen on the Color page that uses the original metadata.

Dolby Vision metadata will be imported if present when importing an IMF

Once import is complete, all video and audio clips from the DCP or IMF appear within a new bin with the name of the package. The resulting timeline will be identified via its icon as a DCP/IMF timeline.

The imported media and timeline when you import an IMF

Editing the Resulting Timeline

At this point, you can edit the program in the Timeline as necessary.

— You can overwrite sections of the Timeline with new clips. All modifications will be automatically included into the supplemental package.

— You can use the Blade tool or Insert Edit command to cut sections of the existing program to which you want to add Fusion effects, audio grading, or color correction. When you do this, you must right click that section and choose “Include in Supplemental Package” to make sure it exports correctly.

Right-clicking a section of the program and choosing Include in Supplemental Package
For IMF Dolby Vision packages, please ensure all modifications are on the first video track (V1).

**NOTE:** If RCM is being used, please ensure the input color space and gamma of the inserts are correct.

**Dolby Vision Metadata**

The Dolby Vision metadata from the imported DCP/IMF file can be reused by selecting “Original Metadata” from the Tone Map Using drop-down menu of the Dolby Vision palette in the Color Page.

Alternatively, this metadata can be imported separately from an existing XML via the “Import Metadata from XML” command in the option menu of the Dolby Vision palette in the Color page. When successful, “Imported Metadata” will be enabled.

**Exporting**

You can export a supplemental package by turning on “Supplemental Package” in the the video panel of the Deliver page Render Settings list.
The codec type and profile will be automatically selected to match the original version of the DCP/IMF package, and the audio tracks are set to match the Timeline tracks. Please ensure the rest of these audio settings are matched to the original version, since they start out set to the default values.

**Photon Validation of IMF Packages**

Phonon is Netflix’s validation software for IMF App2/App2e packages. The option for using Photon validation will only be shown on Resolve Studio with JDK/JRE version 1.8 and above installed, which is available at https://github.com/Netflix/photon.

**NOTE:** Please disable “Use easyDCP decoder” from “Preference” as there can be issues decoding IMF packages without an easyDCP license.

**Validating in the Media Pool**

An existing IMF package can be validated with Photon by importing it into the Media Pool, then right-clicking it and choosing “Perform Photon Validation” from the context menu.
A report dialog will be shown when the validation is completed.

A validation report

**Validating on Export**

Photon validation can be enabled in the File panel of the Deliver page Render Settings; choosing the “IMF Netflix” preset will also enable this option. When enabled, DaVinci Resolve will perform Photon validation after the IMF package is exported. The validation report will be saved to a text file in the IMF package folder, and a report dialog will be shown if there is any error.
Using and Licensing EasyDCP

Both DaVinci Resolve and DaVinci Resolve Studio include a demo version of easyDCP. Details of operation and restrictions of the demo version can be found later in this chapter. The fully functional version of easyDCP operates via licensing modules purchased from http://www.easyDCP.com (info@easyDCP.com) and every new DaVinci Resolve system (server) needs its own license and specific certificates for DCP and KDM generation and for playback of DCPs.

Requesting Your Server Certificate Set

For your DaVinci Resolve system to generate DCPs and KDMs you need to request a specific set of configuration files called the Server Certificate Set. To begin, first purchase your encoding, encryption, decoding, and decryption modules from easyDCP. They will provide a password to access your easyDCP account.

Then, from the DaVinci Resolve File menu, select easyDCP > Request Server Certificate Set. Fill in the detail listed on the request form and save the form to your desktop or somewhere it can be easily found. This html file can be emailed to info@easyDCP.com. After sending the html, a customized Server Certificate Set for your installation will be generated and made available for download in your easyDCP Website User Account.

The Server Certificate Set generated for your DaVinci Resolve will contain files based on your purchased modules and your specific DaVinci Resolve server hardware. The table below shows the modules and the licenses and certificates generated, followed by a brief description of each item.

<table>
<thead>
<tr>
<th>Module</th>
<th>License</th>
<th>Server Certificate</th>
<th>Signer Certificate</th>
</tr>
</thead>
<tbody>
<tr>
<td>DCP Encoder</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>DCP Encoder with Encryption</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>DCP Player</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>DCP Player with Encryption</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

— **License**: The License is used to activate the purchased modules on a specific hardware server.

— **Server Certificate**: Each DCP render (referred in the industry as an “Instance”) using encryption or decryption has an individual server certificate. This certificate is required to be able to receive Key Delivery Messages (KDMs), which unlock encrypted DCPs.

— **Signer Certificate**: A Signer Certificate is used to sign certain files within a DCP package and/or Key Delivery Message (KDM) to verify which authority generated the DCP instance.
Importing Your Server Certificate Set

Once generated and downloaded to your DaVinci Resolve server, the Server Certificate Set needs to be imported into DaVinci Resolve.

To import your server certificate:

1. Choose File > easyDCP > Import License and Certificates.
2. Use the Import Server Certificate dialog to select the file, enter your Certificate Set password, then click Import.
3. To verify your easyDCP license and the Server Certificates, choose easyDCP > About easyDCP.

From this point onward, you can use the controls from within the Settings window, the Deliver page, and the File menu to master and play DCPs.

Limitations of the Demo Version of easyDCP

The demo version of the DCP encoder embeds visible DaVinci Resolve and easyDCP logo watermarks in the rendered Digital Cinema Package (DCP) images. The demo version does not include encryption so these DCPs can be used for screening in a digital equipped cinema. The demo version of the DCP playback module will play 15 seconds in full quality. After that playback quality reduces drastically. Furthermore, audio won't be rendered after 15 seconds of playback.

Switching Between Native DCP and EasyDCP Encoding

A checkbox in the Configuration panel of the System Preferences, “Use EasyDCP Encoder,” lets you choose whether to use the native DCP/IMF encoding in DaVinci Resolve, or your licensed EasyDCP software. In either case, all set up happens from within the Deliver page of DaVinci Resolve.

EasyDCP Color Management

The Color Management panel of the Project Settings has a Timeline Colorspace drop-down menu that is enabled for EasyDCP encoding regardless of whether or not DaVinci Resolve Color Management is used for the current project (the same setting is used for both color management tasks). You should set this to the color space used by your current DaVinci Resolve timeline. If, for example, you are grading using a Rec. 709 monitor for television deliverables but also wish to make a DCP, select Rec. 709 Gamma 2.4 and DaVinci Resolve will render the DCP with the correct Rec. 709 to XYZ matrix.
EasyDCP Output in the Deliver Page

To master to a DCP in the Deliver page, use the following procedure, which walks you through all of the easyDCP settings that are available in the Render Settings list.

**To master a DCP or IMF:**

1. Set “Render timeline as” to Single clip.
2. Choose easyDCP from the Video Format drop-down.
3. Choose the appropriate option from the Codec drop-down that corresponds to the type (DCP or IMF) resolution (2K or 4K), and aspect ratio (native, scope, or flat) of your intended output.
4. Set the Composition Name. This field is intended to hold a standardized name for the DCP being encoded. You can either type a name into this field directly, or you can press the “… “ button to open the easyDCP Composition Name Generator window. An editable Film Title field appears, along with a number of drop-down menus that let you select various DCP attributes such as content type, aspect ratio, language of audio and subtitles, and so forth. As you populate each attribute, the name being generated appears at the top of the window, and clicking OK copies the resulting Composition Name into the Composition Name field of the Render Settings.
5. If necessary, set the desired “Maximum DCP bit rate” by either typing or dragging within the field (the range is 50 to 250 Mbit/sec). If you’re not sure what data rate to use, consult the client or distributor to whom you’re delivering the DCP.
6. There are two DCP package types you can output, determined by the “Use Interop packaging” checkbox:
   - The standard package conforms to the “Interop” specifications for DCPs, which is turned on by default. With “Use Interop packaging” turned on, however, the frame rate of your output is limited to either 24fps or 48fps, so you need to make sure that your timeline conforms to these frame rates.
   - If you want to generate DCP packages with other frame rates to match your timeline, you need to turn “Use Interop packaging” off to generate a SMPTE-standard DCP. This supports additional frame rates including 25, 30, 50, and 60 fps. However, SMPTE-Standard-DCPs are not supported on all JPEG2000-based playback systems so it’s generally recommended to use the Interop standard unless you know the player supports the SMPTE-Standard DCPs.
7. Turn on the “Encrypt package” checkbox to encode an encrypted DCP. This sets the encoder to generate a Digest containing the keys used during encryption. This Digest will allow you to play the resulting DCP on your system, and to generate KDMs to allow that DCP to be played on other servers.

**NOTE:** If you do not encrypt the DCP it can be played on any DCP player/decoder without restriction.

8. Set the Subtitles Path. If you have a properly formatted subtitle file, click the Browse button to link to it.
9. If you’re including an audio mix in the DCP, go to the Audio section, turn on the Render audio checkbox, and choose the number of channels in the “Render channels of audio” drop-down menu that corresponds to the number of Audio Mixer output channels defined in the Edit page.
Click the Browse button under the “Render to” field, and choose a location for the resulting DCP. Make sure you pick a drive with enough room for the estimated size of the final DCP.

Choose all necessary options from the Output Options to ensure the quality you need.

Click the Add Job to Render Queue button, and then click Start Render to create your DCP. A DCP will be created and placed at the location you chose, ready for playback or delivery.

KDM Generation and Management

Key Delivery Messages (KDMs) are required to allow an encrypted DCP play on a designated projector at a particular theater at a specified time. DaVinci Resolve is capable of creating KDMs, which is convenient for exporting KDMs for select screenings, but commercial distributors may require thousands of KDMs. Fortunately, easyDCP allows you to use external Distribution KDM (DKDM) utilities to generate KDMs for your clients, so you don’t have to tie up your DaVinci Resolve workstation with this task.

Publishing Your Encrypted Digital Cinema Package

While you can play your encrypted DCP on the same DaVinci Resolve system that generated it, if you wish to publish the DCP so other players can decode and play you need to generate a KDM to send to the player. The user of the other player, or players, will need to generate a Server Certificate for each of their players and send this to you so when you generate the KDM it will be just for those players.

Select the DCP in the Media page Library. Right-click and select Generate KDMs. From the drop-down select the location of the Server Certificate file if the KDM is for one player, or folder for multiple players. Set the start and end dates that the KDM will be valid for, an output folder to place the KDM, and then select Generate.

You can now send your DCP and the KDMs to the player you authorized. The user there will import the KDM and the DCP will play between the start and end dates.

Playing Your Digital Cinema Package

To play a DCP you’ve output from DaVinci Resolve, use the Media page to add it to the Media Pool and edit it into a timeline like any other clip.

Decoding the JPEG2000 images embedded within the DCP in real time is computationally intensive. If your system is underpowered you can reduce the decoded resolution of the files by selecting Half or Quarter Resolution Decode from the File > easyDCP menu. A smaller, less bandwidth-intensive version of the JPEG2000 files will be decoded by discarding some levels of the wavelet stage inside the decoder, which will directly increase the playback performance.

Playing Third-Party Digital Cinema Packages

To play a non-encrypted DCP simply select the DCP in the Media page like any other clip. To play an encrypted DCP from a third party you first must publish your Server Certificate. They use the certificate to generate KDMs for their DCP to play on your DaVinci Resolve system. From the File menu choose easyDCP > Export Server Certificate, and on the drop-down menu choose a location to save the file. Send this to the third party for KDM generation.

When you receive a KDM or a Digest for an encrypted DCP you must first import the file into your DaVinci Resolve system. Choose File > easyDCP menu > Import KDM/Digest, and then select the file. Then simply select the encrypted DCP in the Media Page Library to play.
Chapter 188

Delivering to Tape

This section covers how to use the Deliver page to output a timeline, either in whole or in part, to a device-controllable VTR connected to a compatible Blackmagic Design video interface.

For whichever output interface you use, you need to make sure that the RS-422 interface is connected to that of the VTR, and that device control has been established.

Contents

- Power Mastering 3886
- Outputting a Program From the Timeline 3886
- Batch Outputting Multiple Clips 3887
The Tape Output Interface

Tape output is accomplished on the Deliver page, which has to be placed in the Tape mode before you can proceed.

To switch to tape output in the Deliver page:

— Click the Tape button, which is the third button from the left on the Interface toolbar at the top of DaVinci Resolve. The Deliver page updates to reflect the relevant controls for editing to tape.

While in Edit to Tape mode, the Deliver page is used to control the VTR, in order to establish In and Out points for insert or assemble editing of the selected portion of the current Timeline to tape.

— Capture and Playout: The Render Settings panel turns into the Capture and Playout panel, with controls and settings governing how DaVinci Resolve will output your program to tape.

— Edit to Tape Queue: The Render Queue turns into the Edit to Tape Queue, which lets you set up a batch of either previously rendered media files, or In and Out point-defined segments of the current Timeline for simultaneous output to tape.

— Transport controls: The transport controls, while similar in appearance to those used while in Render mode, now control the VTR. While in Edit to Tape mode, the transport controls of the DaVinci control panel also control the deck, rather than your program.

— Shuttle control: A shuttle control appears in what was formerly the jog or scrubber bar, which lets you shuttle through the range of reverse and forward speeds compatible with that deck.

— In and Out controls: In Edit to Tape mode, the In and Out buttons to the right of the transport controls define a range of the tape to Insert or Assemble edit to, within the current Timeline. While in Edit to Tape mode, you can still define In and Out points to define a specific range of the Timeline by right-clicking a clip in the Thumbnail or Mini-Timeline, and choosing Mark In or Mark Out. You can only add In or Out points to the beginning and end of clips.

— Cue In and Cue Out controls: Buttons next to the timecode In and Out fields cue the tape to those frames on tape.

Gang Timecode to Tape

When the Deliver page is in Tape mode, you can right-click the ruler running along the top of the Timeline and choose “Gang Timecode to Tape,” which puts DaVinci Resolve into a mode where every time you set an In point on the Deliver page Timeline, a corresponding In point is automatically set on the tape deck. Setting both In and Out points on the Deliver page Timeline results in the In and Out points on the tape deck being set at the same timecode, making it easy to set up insert edits to tape on top of a previously output program.
Insert/Assemble Drop-down Menu

A drop-down menu under the In and Out buttons lets you choose how to edit the selected part of the Timeline to tape. There are two options:

— **Insert**: Performs an insert edit to tape, in which selected tape tracks are seamlessly and frame-accurately overwritten without interrupting the timecode or control track. You must be outputting to either a blacked tape, or a prerecorded tape to make an insert edit.

— **Assemble**: Performs an assemble edit, in which every track of tape is overwritten, including the video, audio, timecode, and control tracks.

— **Crash**: (Only appears if “Output Source Timecode” has been enabled in the Playout section of the Capture and Playback panel of the Project Settings) Similar to an assemble edit, except there is no pre-roll period to let the VTR get up to speed. A crash edit also overwrites every track of the tape, including the video, audio, timecode, and control tracks, and may result in a more visible jump at the resulting edit point. However, in some instances crash edits may be the only option for a particular operation.

**NOTE**: When DaVinci Resolve is performing a Batch Output operation, you can only output clips using assemble editing or crash recording.

Start Record Button

Once you’ve set In and Out points to define how much of the tape to record to, the Start Record button initiates device-controlled tape output.
Setting Up for Tape Output

Before you perform an edit to tape, the Capture and Playback panel of the Project Settings has a number of options that you should set to match the format and type of tape output you’re doing.

**General Options**

The Output LTC checkbox, when turned on, directs DaVinci Resolve to output LTC timecode.

**Capture and Playout Settings**

These settings affect both capture and playback when using the Tape Ingest options of the Media page, or the Tape Output options of the Deliver page.

- **Video capture and playback:** You can choose the video format (frame size and frame rate) with which to output to tape from this drop-down menu. HD timelines can be downconverted to SD, and SD timelines can be upconverted to HD using the format conversion of your DeckLink card.

- **Use left and right eye SDI:** A checkbox that enables supported video interfaces to ingest and output muxed stereoscopic video when used with supported VTRs, such as HDCAM SR decks with 4:2:2 x 2 mode. (When muxed stereoscopic signals are ingested, each eye is separated into individual left-eye and right-eye image files.) This parameter only appears when your hardware is set up appropriately.

- **Video connection operates as:** Selects between the available signal options: Use 4:4:4 SDI, and enable Single Link. Which options are available depend on which video capture card you are using.

- **Data Levels:** Lets you specify the data range (normally scaled or full range) that’s used when ingesting from or outputting to tape. This option switches the data range of the signal output by your video capture card, but only during capture from tape in the Media page, or output to tape in the Deliver page. When capture or output is not currently occurring, your video capture card goes back to using the identically named data range setting in the Master Settings panel of the Project Settings, which governs how you monitor the signal being output on an external broadcast display or projector.

- **Video bit depth:** Choose the bit depth that corresponds to the capability of your deck. You can choose between 8-bit and 10-bit. Outputting to 10-bit is more processor intensive, but higher quality for compatible devices, and is the default setting.

- **Use deck autoedit:** If supported by your video deck, this is the best method to record video to the deck, as it enables the deck to roll the edit using the specified preroll, and control the edits via serial device control. If this checkbox is turned off, a basic edit On/Off mode is used by the deck, with the potential for frame inaccuracies if the “Non auto edit timing” setting is not properly adjusted.

- **Non auto edit timing:** Adjusts the edit synchronization of the connected deck when auto edit is turned off.

- **Deck preroll:** Sets the number of seconds for preroll. How much is appropriate depends on the performance of your deck.

- **Video output sync source:** When using a DeckLink card this is set to Auto. Other capture cards may require you to set the sync source to “Reference” for playout and “Input” for ingest. This setting is only available if you have a DVS card installed on your system.

- **Add 3:2 pulldown:** Inserts or removes the 3:2 pulldown required to record or play 23.98 fps media to or from a 29.97 tape format.
Capture

These settings are used when you use the Capture mode in the Media page to capture clips from tape into the Media Pool. Media is captured as DPX image sequences.

- **Capture**: Lets you choose whether to capture both Video and Audio, or Video Only.
- **Video Format**: The format that scanned film frames are saved as. When capturing from tape, the available options are DPX and QuickTime. When capturing from the Cintel film scanner, this is restricted to Cintel Raw Image (CRI), which is a raw data format that DaVinci Resolve automatically debayers as a Cineon log-encoded image for grading.
- **Codec**: The codec used to write captured media. When capturing from tape, these include the various type of Apple ProRes, 8- and 10-bit YUV 422, 10-bit RGB, and the various types of DNxHD. Cintel Raw Image files default to RGB.
- **Save clips to**: A field that displays the directory path to which media files captured from tape are written. You want to choose a volume that's fast enough to accommodate the data rate of the media format you’re capturing.
- **Browse**: Click this button to choose a directory to write captured media to. The directory you choose appears in the field above.
- **Save in this folder path**: A series of checkboxes let you specify what other information to use to define the directory hierarchy that will hold the captured media. Every checkbox you turn on adds an additional directory with a name defined by that checkbox’s metadata. You can choose any or all of the following: Program name, Clip number, Reel number, and Roll/Card.
- **Apply reel number to**: Lets you choose how to write the reel name. Two checkboxes let you write the reel number to the file’s name, and/or to the Header data.
- **Use prefix**: A field lets you type in a prefix to be used in the media file’s name. This lets you add text identification that will make the media more easily identifiable and searchable.
- **Apply prefix to**: Two checkboxes let you choose to use the prefix you typed in the file name, and/or in the folder name.
- **Use frame number with**: When capturing to image sequences, you can choose how many digits to use when writing the frame number into the name of each frame file.
- **Set batch ingest handles to**: When capturing to image sequences from a batch list, defines how many frames of additional handles to ingest along with each logged clip.
- **Enable audio input**: Turn this checkbox on to capture audio along with the video. If you're capturing QuickTime or MXF files, the audio will be written as additional tracks inside each file. If you're capturing to a DPX image sequence, then a broadcast .wav file is recorded separately.
- **Input**: Lets you choose how many tracks of audio to capture, from 2 to 16.

Playout Settings

These settings only affect the video signal that’s output when you use the Edit to Tape mode of the Deliver page.

- **Output**: Lets you choose whether to output both Video and Audio, Video Only, or Audio Only if you’re doing an audio layback.
- **Output Source Timecode**: Turn this checkbox on to output each individual clip’s source timecode. This option is only applicable when assemble editing to tape.
Output LTC: With a Blackmagic Design DeckLink or UltraStudio device using HD-SDI, longitudinal timecode (LTC) is available on track 16 of the HD-SDI video signal, making it easy to use a Mini Converter de-embedder to extract this analog timecode audio signal and feed it directly to a recording device. This is particularly helpful if you have outboard video processing equipment such as a noise reducer or format converter that does not pass through the VITC timecode.

Delay LTC by x frames: When outputting LTC to bypass outboard processing gear, such as a noise reducer or format converter, you can compensate for the processing delay by delaying the timecode by a matter of frames to ensure that the processed image and timecode reach the deck at the same time. With a DVS card there is a separate timecode output.

Enable audio output: When this checkbox is enabled, DaVinci Resolve will play all available timeline audio along with the video being output, so both can be recorded to tape.

Offset audio by x frames: Lets you specify an offset between the audio track and video to achieve proper A/V sync in cases where the video is being delayed by outboard processing hardware.

Output x channels of audio: Choose the number of audio tracks to output to tape.

Set batch playout head handle to x seconds: When batch outputting multiple clips, you can specify a number of frames before the In point of each clip to be output as well.

Set batch playout tail handle to x seconds: When batch outputting multiple clips, you can specify a number of frames after the Out point of each clip to be output as well.

Apply gaps between clips: This checkbox lets you add a black gap, of the specified duration in frames, between every two clips being output when outputting in batch mode.

Edit to Tape Queue Option Menu Settings

The following settings and options are available in the Option menu found at the top right-hand corner of the Edit to Tape Queue.

Show Job Details: Lets you see more information about each job listed in the Render Queue.

Clear Recorded: Clears all queue items that have already been output to tape.

Clear All: Clears every queue item.

Sort by Reel & Timecode: Does a multi-criteria sort by reel and timecode, reel first, then timecode.

Sort by Timecode: Sorts by timecode only.

Output Source Timecode: Sets tape output to write source timecode to tape (each clip’s individual timecode), rather than record timecode (from the Timeline).

Use Preview for Tape Output: Enables Preview mode when outputting to tape. Preview mode lets you test how an edit to tape operation will work before actually recording it.
Tape Output Procedures

There are a few different ways you can output media to tape, depending on what you need to accomplish, and on how intensive your grades are relative to the processing capabilities of your workstation.

Power Mastering

Power Mastering allows you to select either a range of clips, or an entire timeline, to be output to tape in real time, without rendering. This can save you from a time-consuming render, and it also saves disk space. Power Mastering is a no-compromise procedure, since your program is still output at full quality.

If there are a handful of clips with grades that you know are too processor-intensive to be Power Mastered, you can use the Render Cache controls to cache the problem clips before output. For more information, see Chapter 7, “Improving Performance, Proxies, and the Render Cache.”

Outputting a Program From the Timeline

The simplest method of outputting to tape is to output a single Timeline, either in its entirety, or in part if you’re insert editing a small section that has been revised.

To Power Master to tape:

1. Use the Render Cache, if necessary, to cache any clips that are too processor-intensive to output in real time.
2. Click the Edit to Tape mode button to the left of the transport controls to switch to tape output.
3. Define how much of the current Timeline to output by moving the playhead throughout the program, and then right-clicking clips that define the beginning and end of the range you need to output and using the Mark In and Mark Out commands.
4. Use the transport controls to find the In point on tape at which you want to start recording, and click the In button.
5. Choose Insert from the drop-down menu at the upper right-hand side of the Viewer, if you’re either outputting to a striped and blacked tape, or inserting over an existing program on tape.
6. Click the Power Mastering (lightning bolt) button at the bottom of the tape settings to add the job you’ve just set up to the Edit to Tape Queue.
7. Click Start Record to begin the process of outputting to tape. Device control is used to record to the designated section of tape; a progress bar appears at the bottom of the Render Queue to show how long this will take.

If you don’t want to Power Master, you can render the section of the Timeline you need to output as a single clip first, as a self-contained media file, and then add that clip directly to the Edit to Tape Queue. This might be an easier solution if you’re outputting an extremely processor-intensive timeline.
To output a pre-rendered media file to tape:

1. Click the Add Clips button at the bottom of the tape settings, and use the VTR Record dialog to select the media file you rendered in step 1, and click Add Clip(s) to Queue.

   The media file you selected is added to the Edit to Tape Queue as a Power Mastering job, and will be output in its entirety.

2. Use the transport controls to find the In point on the tape at which you want to start recording, and click the In button.

3. Choose Insert from the drop-down menu at the upper right-hand side of the Viewer, if you’re either outputting to a striped and blacked tape, or inserting over an existing program on tape.

4. To preview what the edit will look like before actually writing it to tape, choose “Use Preview for Tape Output” from the Edit to Tape queue option-menu, and then click Start Record to watch DaVinci Resolve run through the edit using the deck. After previewing the edit, turn this setting off.

5. Click Start Record to begin the process of outputting to tape. Device control is used to record to the designated section of tape; a progress bar appears at the bottom of the Render Queue to show how long this will take.

Batch Outputting Multiple Clips

You also have the option of outputting a number of clips to tape in a batch operation, as opposed to outputting from the Timeline. When you set up a batch of multiple clips in the Edit to Tape Queue, then DaVinci Resolve will automatically record them sequentially to tape.

How the timecode is generated during batch output depends on the “Output Source Timecode” setting in the Capture and Playback panel of the Project Settings. If this is turned off, then a continuous timecode track will be written to cover everything being output to tape. If this is turned on, then each clip’s source timecode will be written to tape discontinuously.

When batch outputting to tape, you can add black handles to each of the clips to space them out, making later ingest easier, using the “Set batch playout head/tail handle” settings in the Capture and Playback panel of the Project Settings.

To make a Batch Record multiple clips to tape:

1. Use the transport controls to find the In point on tape at which you want to start recording, and click the In button.

2. Do one of the following to add items to output to the Edit to Tape Queue:
   — Click the Add Clips button at the bottom of the tape settings, and choose one or more media files from the VTR Record browser, and click Add Clip(s) to Queue.
   — Right-click any clip in the Timeline, choose Render This Clip, and then click the Power Mastering button at the bottom of the tape settings to add that clip to the Queue.

3. Choose either Assemble or Crash from the drop-down menu at the upper right-hand side of the Viewer. Because you’re outputting clips with discontinuous timecode, you cannot insert edit when batch outputting.

4. Once you’ve added all the clips you want to output to the queue, click Start Record to begin outputting to tape. Device control is used to record to the designated section of tape; a progress bar appears at the bottom of the Render Queue to show how long this will take.
Chapter 189

Exporting Timelines and Metadata

Once you’ve completed editing and grading a program, you may need to export your final graded timeline as EDL, AAF, or XML files in order to send it to another application for further finishing, effects work, or to complete a round trip from an NLE.

To send a graded project to another application, you need to render the graded clips first using the controls on the Deliver page to render the Timeline as individual source clips. In this mode, the reel name and timecode metadata of each rendered clip is mirrored by the exported project file, to maintain the correlation between exported EDL, XML, or AAF data and the rendered media. For detailed information about rendering in the Deliver page, see Chapter 186, “Rendering Media.”

If you render using the Easy Setups that correspond to Final Cut Pro XML or Avid AAF round trips, then an XML or AAF will be exported to the same directory you’ve rendered to. However, you can still export an XML, AAF, or EDL file separately should the need arise.

Alternately, if you’ve edited a project from scratch in DaVinci Resolve and need to move a timeline to another application, you can export any timeline to any format for purposes of project exchange, without the need to render new media (depending on your workflow).

Even in situations where you’ve imported a timeline from another application, the robust project compatibility of DaVinci Resolve makes it possible to import one type of project exchange file, such as XML, and then export a completely different kind, such as AAF or EDL. This lets you use DaVinci Resolve as a project exchange utility.
Whether you’ve edited your project from scratch inside of DaVinci Resolve, or you’re doing a round trip with an application that uses AAF, Final Cut Pro 7 XML, or Final Cut X XML project exchange formats, you can export any DaVinci Resolve timeline in the Edit page to any project format DaVinci Resolve supports. Whatever your workflow, keep the following in mind:

— **Timelines are automatically exported when you render a timeline in the Deliver page:** When you use the “Final Cut Pro Round-Trip” or “Avid AAF Round-Trip” render setting presets, or a preset created from one of them, a corresponding XML or AAF file is automatically exported along with the media you render.

— **Even if you’ve imported a project from another application, you can re-edit imported projects before export:** If necessary, you can freely re-edit projects you’re planning to export. When you export an AAF or XML file, the Timeline will be sent back to the originating NLE, or onward to the finishing application of choice.

— **Unsupported effects are sometimes preserved in Round Trip workflows:** If there were effects or clip constructs in the original sequence that were not compatible with DaVinci Resolve, how those effects will be handled depends on the project format you’re exporting to, and whether or not you’ve edited the project. For XML projects, unsupported effects are saved internally by DaVinci Resolve, and are exported with the XML file that you output no matter what. Consequently, they should reappear when you reopen the exported file in the originating NLE. For AAF projects, you can export unsupported effects as long as you don’t re-edit the project. However, if you do re-edit the project, then you can only export an AAF file that’s been stripped of all unsupported effects.

— **Project formats can be converted to other formats:** Using DaVinci’s Export commands, compatible project formats can be converted from one format to another. For example, an imported EDL can be output as Final Cut Pro X XML. For that matter, Final Cut Pro 7 XML can be imported and then exported as Final Cut X XML. Or, an AAF file from Media Composer can be imported and then exported as a Final Cut Pro XML file to be opened in any NLE or finishing application compatible with that format, such as Premiere Pro or Smoke.
To export an AAF or XML file after you've rendered the graded clips:

Do one of the following:

1. To export the current Timeline, choose File > Export AAF, XML, or press Shift-Command-O.
   - Open the Edit page, right-click the Timeline you want to export in the Media Pool, and choose Timelines > Export > AAF/XML.
   - When the Export XML dialog appears, type a name for the file and choose a location for the exported XML file, then click Save.

2. An XML version of that timeline is saved, complete with references to the graded media you rendered, and is ready for import into an NLE or finishing application.

More About Exporting to AAF

When you export to AAF, there are actually two options that are available to you, depending on whether you made editorial changes to the Timeline in the Edit page:

- If you didn’t make any editing changes to the Timeline you imported: You can choose File > Export AAF, XML, and choose “AAF Files” from the Format drop-down menu. This exports all audio and effects using data from the original AAF file that was exported from Media Composer, regardless of whether or not they’re supported in DaVinci Resolve. When you export an unedited AAF, DaVinci Resolve uses the Avid AAF file that you originally imported to create an updated one; make sure it’s still in the same location as it was when you first imported it into DaVinci Resolve.

- If you made editing changes to the Timeline you imported, or you’re exporting a project that wasn’t AAF to begin with: Then you need to right-click the Timeline you want to export in the Media Pool and choose Timelines > Export > Generate New AAF. This option creates a brand new AAF file, but audio and effects that are not supported in DaVinci Resolve in an AAF import are discarded.

Exporting an EDL

DaVinci Resolve is also capable of exporting EDLs that can be reimported into other applications. For more information about EDL workflows, see Chapter 24, “Ingesting From Tape,” Chapter 56, “Conforming and Relinking Clips,” and Chapter 60, “Conforming EDL Files.”

To export an EDL:

1. Open the Edit page and select the Timeline you want to export an EDL from in the Media Pool.

2. Exported EDLs only have a single video track. For timelines with multiple tracks, only the events on the video track with the destination control assigned to it will be exported (the destination control is the first control at the left in the track header). If you want to export a track other than Video 1, you can assign the destination control to the specific track you need to export.

3. Right-click the Timeline in the Media Pool, and choose Timelines > Export > AAF/XML/EDL from the contextual menu.

4. When the Export Timeline dialog appears, type a name, choose a location for the exported EDL, and choose EDL Files from the drop-down menu at the bottom, then click Save. An EDL is exported.
Exporting a Missing Clips EDL

This command lets you export a quick report listing all clips that are offline in the currently selected track of the Timeline in the Edit page. This report is in EDL format, with one event for each clip that’s offline, which describes the reel number and source timecode of the missing media, as well as the record timecode of the missing media’s position on the Timeline.

Here’s an example of an exported Missing Clips EDL:

<table>
<thead>
<tr>
<th>TITLE: ( no title )</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 A001_C002_0820GA_001  V  C 10:28:27:03 10:28:28:00 01:00:00:00 01:00:00:21</td>
</tr>
<tr>
<td>2 A004_C012_0820MC_001  V  C 14:07:31:21 14:07:35:13 01:00:12:13 01:00:16:05</td>
</tr>
<tr>
<td>3 A017_C001_0820CV_001  V  C 21:16:14:22 21:16:15:00 01:00:16:05 01:00:16:07</td>
</tr>
</tbody>
</table>

Once you’ve exported this information, you can hand it off to whomever can help you track down the missing media.

To export a Missing Clips EDL:

1. Open the Edit page and open the Timeline you want to export a Missing Clips EDL for in the Timeline browser.
2. For timelines with multiple tracks, only the events on the video track with the destination control assigned to it will be examined for missing clips. If you want to examine a track other than Video 1, you can assign the destination control to the specific track you need to examine for missing clips.
3. Right-click the Timeline in the Media Pool, and choose Timelines > Export > Missing Clips EDL from the contextual menu.
4. When the Save Missing Clips EDL dialog appears, type a name and choose a location for the exported EDL, then click Save.

Exporting Timeline Markers to EDL

If you keep notes about a project within the notes field of Timeline markers, found in the Timeline ruler, then it’s possible to export those notes as an EDL.

To export timeline markers as an EDL:

1. Right-click that timeline in the Media Pool, and choose Timelines > Export > Timeline Markers to EDL.
2. Choose a location and export format from the Export Edit Index dialog, and click Save. Each Timeline marker is listed in the resulting EDL, with any notes included along with a duration, where applicable.
Exporting to CDL

DaVinci Resolve can export and import basic grading data to and from other applications via a Color Decision List (CDL). CDLs are an industry-standard file format originally developed by the American Society of Cinematographers’ technology committee. DaVinci Resolve supports the 1.2 CDL standard that defines the slope, offset, and power for each of the red, green, and blue channels, as well as the overall saturation of each clip in a program.

CDL files are formatted similarly to EDLs, with SOP (Slope/Offset/Power), and SAT (Saturation) values embedded as metadata in much the same way as comments are in a more typical EDL.

Here’s an example of a single CDL event:

```
020 001 V C 03:02:49:13 03:02:53:00 01:01:28:11 01:01:31:22
*ASC_SOP (1.109563 1.717648 0.866061)(-0.238880 -0.390357 0.353743)
(0.672948 1.384022 0.889876)

*ASC_SAT 1.000000
```

Because the CDL definition of a grade is so narrow, projects you’re planning to export to other applications via a CDL must be constrained to only those operations the CDL mathematically defines. Here are some things to keep in mind:

— Only primary corrections in the first node of each clip are exported.
— Restrict yourself to using the Lift/Gamma/Gain, Offset, and Saturation controls.
— Keyframes are never exported. If keyframes are present in a grade, only the parameter values at the first frame of the clip are used.
— The track grade and group grades are completely ignored.
— If there is an HSL Qualifier or a Power Window in the first node, it is ignored and the corrections in that node are exported as if it were a primary correction.
— Do not make Y’ only adjustments; they’re not compatible with CDLs. To ensure that your exported CDL is accurate, set the Lum Mix parameter in the Primary Controls palette for each grade to 0.
  For workflows involving frequent CDL export, you can turn on the “Luminance Mixer defaults to zero” option in the Color section of the General Options panel of the Project Settings to guarantee this parameter is always set to 0.

If your timeline conforms to all of these restrictions, then you’re ready to export a CDL.

To export a CDL:

1. Open the Edit page, right-click the Timeline you want to export in the Media Pool, and choose Timelines > Export > CDL from the contextual menu.
2. Enter a name for the CDL, choose a location to save it to, and click OK.

For more information on importing a CDL to add grades to your project, see Chapter 145, “Copying and Importing Grades Using ColorTrace.”
Exporting the Edit Index as a CSV or TXT File

You can export the current contents of the Edit Index, in the Edit page, as a self-contained file to use for reference in a variety of ways.

To export the Edit Index:

1. Open the Edit Index, and choose one of the Edit Index filters from the Edit Index option menu, if necessary. For example, you could filter the edit index by Offline Clips Only if you wanted to export a list of all offline clips in the current timeline.

2. Right-click that timeline in the Media Pool, and choose Timelines > Export > Edit Index, then choose a location and export format from the Export Edit Index dialog, and click Save.

Exporting to ALE

DaVinci Resolve is also capable of exporting ALE (Avid Log Exchange) files. ALE is a tab-delimited, ASCII text-based clip logging list format that enables the exchange of clip metadata that can’t be embedded inside MXF files. ALE files are designed to let you export a log of all clips that are used in a particular timeline with all of the metadata that’s associated with those clips in DaVinci Resolve, so this metadata can be imported into and associated with clips inside Media Composer or Symphony.

ALE files are divided into three sections, labeled Heading, Column, and Data:

— The Heading provides information about the clips being logged, including the picture and audio format, and the frame rate.

— The Column line defines each of the columns of metadata being exported in the list. There’s an automatic minimum of metadata columns that are automatically included, regardless of whether they’re populated or not. However, additional metadata columns are automatically added to this list by DaVinci Resolve when any corresponding metadata field in the Metadata Editor is populated. For example, if you enter information into the Camera, Keyword, and Shot fields of the Metadata Editor, then those columns will be added to the exported ALE. There are no user settings that control this.

— The Data section contains multiple lines, one for each event being referenced in the list, that contain all the data corresponding to that clip.

If you’re exporting stereoscopic clips from stereoscopic timelines, the following additional columns of metadata are automatically included in the two ALE files that are generated:

— Pan (relative to timeline resolution)
— Tilt (relative to timeline resolution)
— Zoom
— Rotate
— Convergence (relative to timeline resolution)
— HFlip (0 or 1)
— VFlip (0 or 1)
If you’re exporting ALE files from projects using ARRIRAW clips, the following additional columns of metadata can be included:

- Temperature
- Tint

**To export an ALE file:**

1. Open the Edit page, right-click the Timeline you want to export in the Media Pool, and choose Timelines > Export > ALE from the contextual menu.
2. Enter a name for the ALE file, choose a location to save it to, and click OK.

   The ALE file is saved, and a dialog appears reminding you of the file path to which it was saved (click OK to dismiss it).

**Here's an example of a short ALE export:**

<table>
<thead>
<tr>
<th>Heading</th>
<th>Field Delim</th>
<th>Tabs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Video Format</td>
<td>1080</td>

</tr>
<tr>
<td></td>
<td>23.98, DaVinci Resolve, 1920x1080, 10</td>
</tr>
</tbody>
</table>

**NOTE:** The commas shown above are not normally in the ALE but shown here for field clarity.
To export an ALE file:
1. Open the Edit page, right-click the Timeline you want to export in the Media Pool, and choose Timelines > Export > ALE from the contextual menu.
2. Enter a name for the ALE, choose a location to save it to, and click OK.

Exporting to ALE with CDL

Avid Media Composer and Symphony also support the import of ALE files with additional CDL metadata columns with which to associate SOP (Slope/Offset/Power) and SAT (Saturation) adjustment metadata to each clip that’s logged in the ALE.

When you import an ALE with CDL file into Media Composer, the SOP and SAT data populate metadata columns for preservation and export in various Avid workflows. Here’s an example of the Heading, Column, and Data sections of a sample ALE with CDL, with one line of clip and CDL data.

To export an ALE with CDL file:
1. Open the Edit page, right-click the Timeline you want to export in the Media Pool, and choose Timelines > Export > ALE and CDL from the contextual menu.
2. Enter a name for the ALE file, choose a location to save it to, and click OK.
   The ALE file is saved, and a dialog appears reminding you of the file path to which it was saved (click OK to dismiss it).

Here’s an example of a short ALE with CDL export:

<table>

Exporting Timeline Markers to EDL

This command lets you export a quick report listing the text of all markers that have been added to the Timeline as notes in an EDL. Clip markers are ignored. This report is in EDL format, with one event for each Timeline marker, with a placeholder reel number (001 by default), and source and record timecodes that correspond to each marker’s position in the Timeline (with a duration of one frame). An EDL note for each event lists the Marker note, if there is one. There is no note available for the color of the markers.

Here’s an example of an exported Timeline Marker EDL:

```
TITLE: ( no title )
001 001 V C 01:00:09:09 01:00:09:10 01:00:09:09 01:00:09:10
Replace with another car door sound effect
002 001 V C 01:00:20:12 01:00:20:13 01:00:20:12 01:00:20:13
Trim this clip shorter
003 001 V C 01:00:30:12 01:00:30:13 01:00:30:12 01:00:30:13
Find another stock footage clip of the bridge
004 001 V C 01:00:30:13 01:00:30:14 01:00:30:13 01:00:30:14
Trim this montage three seconds shorter
```

Exporting and Importing Media Pool Metadata

DaVinci Resolve makes it possible to export metadata from the Media Pool of one project for import into the clips of another project, for instances where you need to move metadata around. This process exports all metadata from the Media Pool as a .csv file.

For example, a DIT might have entered a lot of metadata to the DaVinci Resolve project used for generating dailies, but then an impatient editor might have created a separate project to begin editing those dailies. Instead of requiring the editor to enter each clip’s metadata all over again, you can export the metadata from the DIT’s project and import it into the editor’s new project, automatically matching the relevant metadata to each corresponding clip.

To export Media Pool metadata:

1. Open a project containing Media Pool metadata you want to export.
2. Optionally, select which clips in the Media Pool you want to export metadata for.
3. Choose File > Export Metadata From > Media Pool to export metadata from every clip in the Media Pool, or choose File > Export Metadata From > Selected Clips to only export metadata from clips you selected in step 2.
4. When the Export Metadata dialog appears, enter a name and choose a location for the file to be written, then click Save. All metadata is exported into a .csv file that can be viewed and/or edited in any spreadsheet application.
To import Media Pool metadata:

1. Open a project containing clips you want to populate with imported metadata.
2. Optionally, select which clips in the Media Pool you want to import metadata to.
3. Choose File > Import Metadata To > Media Pool to import metadata to potentially every clip in the Media Pool, or choose File > Import Metadata To > Selected Clips to only import metadata to clips you selected in step 2.
4. When the Import Metadata dialog appears, choose a metadata .csv file to import, and click Open.
5. When the Metadata Import dialog appears, choose the Import Options you want to use to match the .csv file’s metadata to the correct clips in the currently open project. By default, DaVinci Resolve tries to use “Match using filename” and “Match using clip start and end Timecode” to match each line of metadata in the .csv file with a clip in the Media Pool, but there are other options you can use such as ignoring file extensions, using Reel Name, and using source file paths.
6. Next, choose which Merge Option you want to use in the Metadata Import dialog. There are three options:
   - **Only update metadata items with entries in the source file**: The default setting. Only updates a clip’s metadata if there’s a valid entry in the imported .csv file. Other clip metadata fields are left as they were before the import.
   - **Update all metadata fields available in the source file**: For each clip that corresponds to a line of metadata in the imported .csv file, every single metadata field referenced by the .csv file is overwritten, regardless of whether or not there’s a valid entry for that field.
   - **Update all metadata fields available in the source file and clear others**: For each clip that corresponds to a line of metadata in the imported .csv file, every single metadata field referenced by the .csv file is overwritten, regardless of whether or not there’s a valid entry for that field. Furthermore, metadata fields that aren’t referenced by the imported .csv file are cleared of whatever metadata was there before.
7. The Metadata Import dialog that lets you choose options for how to match and merge imported metadata
8. When you’re finished choosing options, click Ok and all available metadata from the source .csv file will be imported.

Workflow Integrations in DaVinci Resolve (Studio Version Only)

DaVinci Resolve allows third parties to create their own custom interface plug-ins using scripting languages. This makes possible a direct integration between DaVinci Resolve and other software programs, for a variety of uses. More than one Integration plug-in can be active at the same time.

After installation, plug-ins can be enabled in DaVinci Resolve by going to Workspace > Workflow Integrations, and selecting your plug-in from the drop-down menu.

Creating Workflow Integration Plugins

Users can write their own Workflow Integration Plugin (an Electron app), usingResolve Javascript’s API, and Python or Lua scripts. For more information on how to create a Workflow Integration Plugin go to Help > Documentation > Developer, and open up the Workflow Integrations folder for technical details and sample code.

Workflow Integration Plugins

There are several Media Asset Management (MAM) systems that can now directly be accessed through DaVinci Resolve using the Workflow Integration Plugins.

**EditShare**

EditShare has created a workflow integration plug-in that allows DaVinci Resolve to interface directly with their FLOW media management system. This plug-in allows you to comment, search, and preview media in FLOW without leaving DaVinci Resolve. You can also upload revisions, manage proxy media, and maintain full metadata support throughout the process.

For more information on this plug-in and how FLOW works with DaVinci Resolve go to: https://editshare.com/say-hello-to-flow-and-davinci-resolve-studio/
Studio Network Solutions (SNS)

Studio Network Solutions (SNS) created the ShareBrowser Integration Plugin to interface between DaVinci Resolve and their ShareBrowser media asset management software, included with SNS EVO media servers. This plug-in allows your team to search, tag, preview, comment, organize, and import media without leaving the DaVinci Resolve interface. Your team can directly import the media into a DaVinci Resolve project and the metadata you entered carries over along with the media.

For more information on this plug-in and how SNS’s high-speed server or cloud solutions work with DaVinci Resolve, go to: https://www.studionetworksolutions.com/.
Codec Plug-ins (Studio Version Only)

Codec plug-ins allow third parties to install new codecs for encoding in the Deliver page that are not currently supported in the main DaVinci Resolve software. This opens the door for extremely specific deliverables that would normally require passes through multiple programs to deliver.

MainConcept

The MainConcept Codec Plugin allows you to render your DaVinci Resolve Studio timelines in a variety of new codecs:

- AS-11 UK SD, AS-11 UK HD along with an included XML metadata file to create AS-11 UK DPP compliant content.
- MainConcept’s software HEVC Main and Main 10 profiles, allowing H.265 files in 8-bit/10-bit 4:2:0/4:2:2 at up to 8K resolution.
- MainConcept MXF and MP4, allowing encoding into the native camera formats used by Sony XAVC/ XDCAM and Panasonic P2 AVC based cameras.

More information on the MainConcept Codec Plugin for DaVinci Resolve can be found here: https://www.mainconcept.com/blackmagic-plugins

The MainConcept Codec Plugin for DaVinci Resolve options in the Deliver page
Creating DCTL LUTs

This chapter describes how to create DCTL LUTs to perform your own custom mathematical transformations in DaVinci Resolve.

Contents

About DCTL 3904
DCTL Syntax 3904
A Simple DCT LUT Example 3906
A Matrix DCT LUT Example 3906
A More Complex DCT LUT Example 3907
About DCTL

DCTL files are actually color transformation scripts that DaVinci Resolve sees and applies just like any other LUT. Unlike other LUTs, which are 1D or 3D lookup tables of values that approximate image transformations using interpolation, DCTL files are actually comprised of computer code that directly transforms images using combinations of math functions that you devise. Additionally, DCTL files run natively on the GPU of your workstation, so they can be fast.

Anyone with the mathematical know-how can make and install a DCTL. Simply enter your transformation code, using a syntax that’s similar to C (described in more detail below), into any text editor capable of saving a plain ASCII text file, and make sure its name ends with the “.dctl” (DaVinci Color Transform Language) file extension. Once that’s done, move the file to the LUT directory of your workstation. Where that is depends on which OS you’re using:

— **On Mac OS X**: Library/Application Support/Blackmagic Design/DaVinci Resolve/LUT/
— **On Windows**: C:\ProgramData\Blackmagic Design\DaVinci Resolve\Support\LUT
— **On Linux**: /home/resolve/LUT

When DaVinci Resolve starts up, assuming the syntax of your .dctl is correct, they appear in the Color page Node contextual menu within the DaVinci CTL submenu.

DCTL Syntax

Users need to put `__DEVICE__` in front of each function they write. For example:

```
__DEVICE__ float2 DoSomething()
```

The main entry function (transform) should come after all other functions, with the following format argument:

```
__DEVICE__ float3 transform(float p_R, float p_G, float p_B)
```

The main entry function must also have a float3 return value.

For the following floating point math functions, please use the described syntax:

```
float _fabs(float) // Absolute Value
float _powf(float x, float y // Compute x to the power of y
float _logf(float) // Natural logarithm
float _log2f(float) // Base 2 logarithm
float _log10f(float) // Base 10 logarithm
float _exp2f(float) // Exponential base 2
float _expf(float) // Exponential base E
float _copysignf(float x, float y) // Return x with sign changed to sign y
float _fmaxf(float x, float y) // Return y if x < y
```
float _fminf(float x, float y) // Return y if x > y
float _saturatef(float x, float minVal, float maxVal)
float _sqrtn(float) // Square root
int _ceil(float) // Round to integer toward + infinity
int _floor(float) // Round to integer toward - infinity
float _fmodf(float x, float y) // Modulus. Returns x – y * trunc(x / y)
float _fremainder(float x, float y) // Floating point remainder
int _round(float x) // Integral value nearest to x rounding
float _hypotf(float x, float y) // Square root of (x^2 + y^2)
float _atan2f(float x) // Arc tangent of (y / x)
float _sinf(float x) // Sine
float _coshf(float x) // Cosine
float _acosf(float x) // Arc cosine
float _asinf(float x) // Arc sine
float _fdivide(float x, float y) // Return (x / y)
float _frecipf(float x) // Return (1 / x)

The following functions support integer type:
min, max, abs, rotate

Other supported C Math functions include:
acosh, acospi, asinh, asinpi, atan, atan2, atanpi, atan2pi, cbrt, cosh, cospi,
exp10, expm1, trunc, fdim, fma, lgamma, log1p, logb, rint, round, rsqrt,
sincos, sinh, sinpi, tan, tanh, tanpi, tgamma

Vector types float2, float3, and float4 are supported. The data fields are:
float x
float y
float z
float w

To generate a vector value, use make_floatN() where N = 2, 3, or 4.

Users can define their own structure using "typedef struct." For example:

typedef struct {
  float c00, c01, c02;
  float c10, c11, c12;
} Matrix;
To declare constant memory, use `__CONSTANT__`. For example:

```c
__CONSTANT__ float NORM[] = {1.0f / 3.0f, 1.0f / 3.0f, 1.0f / 3.0f};
```

To pass the constant memory as a function argument, use the `__CONSTANTREF__` qualifier, e.g.:

```c
__DEVICE__ float DoSomething(__CONSTANTREF__ float* p_Params)
```

A float value must have the ‘f’ character at the end (e.g. 1.2f).

## A Simple DCT LUT Example

The following code shows an example of how to create a simple color gain transformation using the DCT LUT syntax.

```c
// Example to demonstrate simple color gain transformation
__DEVICE__ float3 transform(float p_R, float p_G, float p_B)
{
    const float r = p_R * 1.2f;
    const float g = p_G * 1.1f;
    const float b = p_B * 1.2f;
    return make_float3(r, g, b);
}
```

## A Matrix DCT LUT Example

The following code shows an example of creating a matrix transform using the DCT LUT syntax.

```c
// Example to demonstrate the usage of user defined matrix type to transform RGB to YUV in Rec. 709
__CONSTANT__ float RGBToYUVMat[9] = { 0.2126f , 0.7152f , 0.0722f,
                                        -0.09991f, -0.33609f, 0.436f,
                                        0.615f   , -0.55861f, -0.05639f);

__DEVICE__ float3 transform(int p_Width, int p_Height, int p_X, int p_Y,
                          float p_R, float p_G, float p_B)
{
    float3 result;

    result.x = RGBToYUVMat[0] * p_R + RGBToYUVMat[1] * p_G + RGBToYUVMat[2] * p_B;

    return result;
}
A More Complex DCT LUT Example

The following code shows an example of creating a mirror effect, illustrating how you can access pixels spatially.

// Example of spatial access for mirror effect

__DEVICE__ float3 transform(int p_Width, int p_Height, int p_X, int p_Y, __TEXTURE__ p_TexR, __TEXTURE__ p_TexG, __TEXTURE__ p_TexB)
{
    const bool isMirror = (p_X < (p_Width / 2));
    const float r = (isMirror) ? _tex2D(p_TexR, p_X, p_Y) : _tex2D(p_TexR, p_Width - 1 - p_X, p_Y);
    const float g = (isMirror) ? _tex2D(p_TexG, p_X, p_Y) : _tex2D(p_TexG, p_Width - 1 - p_X, p_Y);
    const float b = (isMirror) ? _tex2D(p_TexB, p_X, p_Y) : _tex2D(p_TexB, p_Width - 1 - p_X, p_Y);
    return make_float3(r, g, b);
}
Chapter 192

TCP Protocol for DaVinci Resolve Transport Control

This chapter describes how to create third-party utilities that use Transport Control with DaVinci Resolve.

Contents

  - connect 3910
  - goto 3910
  - play 3910
  - gettc 3910
  - getframerate 3910
About the TCP Protocol Version 1.2

This protocol defines the communication standard between third-party applications ("Client") and DaVinci Resolve ("Server") using the TCP protocol.

Port number 9060 will be used by the server. SSL will not be used in this protocol. Communication takes the form of request-response messages, where the Client initiates a command, and the Server responds appropriately.

To use this protocol, you must first type the following string into the Advanced panel of the DaVinci Resolve System Preferences:

```
System.Remote.Control = 1
```

Data Types

The following data types are used in this protocol:

- **float (f):** A 4-byte IEEE 754 single precision float
- **int (i):** A 4-bytes signed int
- **unsigned char (uc):** A 1-byte unsigned char (0–255)
- **string (s):** A UTF-8 encoded string. No terminator is specified. The string is a composite type, transmitted as a single int (i) specifying the number of characters in the string (N), followed by N unsigned chars (uc) containing the letters of the string.

**NOTE:** The bytes of the float and int types are transmitted in little endian order.

Command Format

Commands are transmitted as a single string (using characters a–z (0x61 – 0x7A) only), followed by any additional payload required by the command in the definition.

Response Format

The response to any command is composed of a status byte (unsigned char), followed by any additional payload required by the response.

Communication Delays

Once the first byte of the command string is sent, the rest of the command string and the payload data must follow without delay. At the end of COMMAND, the server must respond immediately. If there is a delay of more than 5 seconds during this process, the party waiting for data may drop the connection assuming that the peer has become unresponsive.

There is currently no limit on the delay between two consecutive commands.
Note: Alternatively, a maximum allowable delay may be defined, in which case, the client may issue periodic ‘connect’ commands to keep the connection alive.

Status Response Values

The meaning of the status values are as follows:

- **0x00**: Command was executed successfully. Any additional payload is sent as expected.
- **0xFF**: Command could not be executed successfully. No additional payload will follow.

TCP Protocol Stream

The following commands can be sent over the protocol stream.

**connect**

The client initiates the stream by sending a connect command string. There is no payload. The server responds with a status value of 0x00.

**goto**

The client sends a goto command string followed by four unsigned chars representing the hour, minute, second, and frame of the timecode.

The server responds with an appropriate status byte based on the execution of the command.

**play**

The client sends a play command string followed by a floating point value. Play in real-time is 1.0, stop is 0.0, reverse is -1.0, 2x is 2.0, etc.

The server responds with an appropriate status byte based on the execution of the command.

**gettc**

The client sends a gettc command string.

The server responds with an appropriate status byte (status byte may be 0xFF if no timeline exists, for instance). If the status byte is 0x00, it is followed by four unsigned chars representing the hour, minute, second, and frame of the timecode.

**getframerate**

The client sends a getframerate command string.

The server responds with an appropriate status byte. If the status byte is 0x00, it is followed by a floating point value for the frame rate.
Project Libraries, Collaborative, and Remote Workflows

Managing Project Libraries and Project Servers

This chapter describes how to set up and use project libraries in greater detail, giving you more control over how projects are saved and organized.

The chapter details how to set up local, network, and cloud project libraries you can use to administer DaVinci Resolve projects that are available to multiple DaVinci Resolve workstations.

What is a Project Library?

A Project Library (formerly project database), is a database file storing one or more DaVinci Resolve projects. When you create or load a project from the Project Manager, or save a current project, you read from or write to a project library. A project library contains multiple projects, and each project contains all the timelines, grades, clip metadata, visual effects, audio mixing, etc. for your film. A project library does not store the original media itself, only the instructions on how to use that media to create a finished film. DaVinci Resolve can access multiple project libraries, but can only connect to one project library at a time.
Using Project Libraries

Setting up a structure for storing projects and project libraries is an important part of creating streamlined and efficient workflows. For example, creating a separate project library for each TV series, commercial, or film a post house is working on helps compartmentalize your clients, and improves performance by only loading up what you need for a specific project.

There are three ways DaVinci Resolve uses to access project libraries, and the choice of which to use is largely determined by the amount of people working on the same project, and where they are in the world. Each option is described in detail below.

— **Local Project Libraries**: (the default option) Best used for productions using a single workstation to complete the entire film. Multiple people may work on the same project, but they work one at a time on the same machine. Your project libraries are stored locally on the computer where DaVinci Resolve is installed, and all media drives in the project are connected locally.

— **Network Project Libraries**: Best used for post houses or productions that have multiple DaVinci Resolve workstations in the same building, and want to be able to work on the same project from each room, or collaboratively at the same time. Your project libraries are stored on a separate computer, running the DaVinci Resolve Project Server application. All workstations must be connected to this computer on the same local area network (LAN), and either connected to the same media drives via a NAS or MAM system, or each having a locally connected copy (or proxies) of the media available.

— **Cloud Project Libraries**: Best used for post houses, companies or productions that have multiple DaVinci Resolve workstations in different places around the world, and want to be able to work on the same project from each location individually, or collaboratively at the same time. Your project libraries are stored in the Blackmagic cloud service. All workstations must be connected to the internet, and each system must have a locally connected copy (or proxies) of the media available.

Navigating the and using the Project Libraries sidebar is common to all the above types of project libraries.

— **Project Library**: Each accessible project library is listed by name, and clicking on it will connect that library and its contained projects to DaVinci Resolve. You can choose from many libraries, but only one library can be active at a time.

— **Sort Libraries**: Selects the sort order of how the project libraries appear, options are Name, Schema (date), Status, and Location. They can be sorted in both Ascending and Descending order.

— **Restore**: Allows you to load a project library that you previously backed up.

— **Search**: Allows you to search for a specific project library by text, and you can limit the search by Name, Schema, Status, and Location.
Local Project Libraries

Local project libraries are the simplest and most common type of project library and require no additional set up or configuration by the user, other than installing DaVinci Resolve. These libraries are saved locally to your workstation; by default they are placed in a folder called Resolve Disk Database, though they can be placed manually anywhere on your file system.

Creating a New Local Project Library

Creating a new local library is a simple and straightforward process.

To Create a New Local Project Library:

1. Click on the Show/Hide Project Libraries icon in the upper left of the Project Manager to expose the sidebar.
2. Select the Local icon from the Project Library options.
3. Click on the “Add Project Library” button at the bottom of the sidebar.
4. Select the Create option to make a new project library.
5. Enter a new name for your project library.
6. Press the Browse button next to Location, to select where on your local computer to save the project library.
7. Press the Create button.

You can now create or import new projects directly into your new local project library.
Connecting to an Existing Local Project Library

You can reconnect to an already existing project library using the following steps.

To connect to an existing project library:
1. Click on the Show/Hide Project Libraries icon in the upper left of the Project Manager, to expose the sidebar.
2. Select the Local icon from the Project Library options.
3. Click on the “Add Project Library” button at the bottom of the sidebar.
4. Select the Connect option to access the existing project library.
5. Enter a new name for your project library.
6. Press the Browse button next to Location, to select where on your local computer the folder containing the existing project library is. It is commonly named “Resolve Disk Project library.”
7. Press the Connect button.

You can now view and use all the existing projects directly from the existing local project library.

![Add Project Library dialog](image)

Disconnecting from a Local Project Library

You can disconnect and remove an already existing project library from the Project Libraries list using the following steps.

To disconnect from a project library:
1. Click on the Show/Hide Project Libraries icon in the upper left of the Project Manager to expose the sidebar.
2. Select the Local icon from the Project Library options.
3. Right-click on the project library that you want to disconnect from, and select disconnect from the context menu.
4. Press the disconnect button in the confirmation dialog.

Disconnecting a project library simply removes it from the available options in the Project Libraries sidebar. It does not delete the project library. You can either manually delete it in the OS filesystem, or reconnect to it using the steps described in Connecting to an Existing Local Project Library.
Backing up a Local Project Library

You can also back up project libraries by exporting them, and then reimport them later.

**To backup/export a project library:**

1. Select the project library you want to back up.
2. Click the Display Project Library Details icon (the circled letter “i” to the right of the project library).
3. Select the Back Up button.
4. Choose a location to which to save the backup in the Backup Project Library dialog, and click Save.

Restoring a Local Project Library

You can import existing project libraries to pass multiple projects between systems.

**To restore/import a project library:**

1. Click the Restore button at the top of the Project Libraries sidebar.
2. Find the project library you need to import using the file import dialog, and click Open.
3. In the Add Project Library dialog, do the following:
   a. Type a name for the new project library into the Name field. This will rename the imported project library but will not alter its contents. You can also name it the same as the original project library.
   b. Click within the Location field and use the Filesystem navigation dialog to choose the directory that contains the existing DaVinci Resolve project libraries.
4. Click Create, and the imported local project library will appear in the Local section of the Project Libraries sidebar.

Upgrading a Local Project Library

Selected libraries display an upgrade warning in the Project Manager only when you’ve installed a new version of DaVinci Resolve and you have project libraries that were created in older versions of DaVinci Resolve that need upgrading.
The upgrade warning in the Project Manager indicates that project library needs to be upgraded.

It's generally a good idea to back up a project library prior to upgrading it, in case something goes wrong. In general, upgrading from a whole version release to the next whole version release of DaVinci Resolve usually requires an upgrade, while upgrading to a dot release of the same version may or may not. If the currently used project library requires an update, you'll be told on application startup.

**To upgrade a project library from an old version of DaVinci Resolve:**

Click on a project library that needs updating, and select the Upgrade Project Library button. A dialog appears to confirm if you really want to upgrade that project library. Click Upgrade to proceed.

**Network Project Libraries**

Multiple DaVinci Resolve workstations can access the same project when you set up a Project Server that shares one or more network project libraries over a local network. Once you've set this up, there are two ways of using a shared project library.

**Multiple Users Sharing Projects**

The simplest case is for users to simply open up a project on the Project Server and work on it. Working this way, if you ever have to change rooms, or switch workstations, you can easily open that same project from any machine that's connected to the server on the same network without needing to export and import it first. For example, an assistant could be working with a colorist to prepare files for the next reel by conforming shots, managing VFX replacements, doing dust busting repairs, and so on in an unsupervised editing suite anywhere in the building, before saving their work and closing the project so the colorist can immediately open that same project in the grading theater across the hall.

Another way of taking advantage of shared Project Servers is to split large projects into sections, so multiple artists can work in parallel on different pieces of the whole in different suites, handing them off when necessary. For example, a feature film may be split into reels, or a film can be separated from the trailer and electronic press kit projects that it shares media with. In this case, each project can be edited, mixed, and graded by different people accessing the Project Server.

When a shared project is opened by someone else after it's already been opened, a dialog informs you that it's being opened in Read-only mode to prevent multiple users from accessing the project at the same time. If you load a Read-only project and decide you want to make changes anyway, you'll need to use the Save As command to create a duplicate project file using a new name in order to preserve your work.
Using Collaborative Workflow for Network Project Libraries

Alternately, you can use the Collaborative Workflow features in DaVinci Resolve to enable multiple collaborators on multiple workstations in multiple rooms to open and work on the very same project at the same time. For example, an editor can be editing a project’s main timeline in one room, while an assistant organizes media and adds metadata within the same project in another room, and a colorist grades dailies in that same project in yet another room, all accessing the same Project Server which allows them to work together in parallel. For more information, see Chapter 194, “Collaborative Workflow.”

All participants in a Collaborative Workflow must be using a network project library on a Project Server that’s properly set up.

Connecting to a Network Project Library on a DaVinci Resolve Project Server

The main difference between a local project library, and a network project library is that the network project library resides on another computer connected on the same network running the DaVinci Resolve Project Server. Setting up the Project Server itself is covered later in this chapter, but as a network project user in DaVinci Resolve you will need to understand how your local workstation connects to the Project Server.

Once the hardware and software install is done (essentially all computers connected on the same network, all running DaVinci Resolve, and one computer running the Project Server), you will need to authorize your computer to access the network project libraries on the Project Server and this is handled by "keys".

If you want to have access to a network project library you must be provided a key to it that is generated by the Project Server. The key is simply an .xml file with the extension "resolvedbkey".

To use an access key to enable easy connection to a Project Server:

1. Open DaVinci Resolve, and when the Project Manager appears, open the Project Libraries sidebar.
2. Drag the .resolvedbkey file and drop it anywhere within the Project Manager.
3. The shared project library should now appear in the Project Libraries sidebar, and if you select it, you’ll see all of the projects that are located in that project library on the Project Server.

You also may have been set up as a Member of the Project Server, and provided your own username and password. If that is the case, see the section “Connecting to an Existing Network Project Library” below.

Once you are connected to a network project library, you can manage them just as if you were connected locally.

Creating a New Network Project Library

Creating a new network project library is a simple and straightforward process.

To create a new network project library:

1. Click on the Show/Hide Project Libraries icon in the upper left of the Project Manager to expose the sidebar.
2. Select the Network icon from the Project Library options.
3 Click on the “Add Project Library” button at the bottom of the sidebar.
4 Select the Create option to make a new project library.
5 Enter a new name for your project library.
6 Enter the IP address of the DaVinci Resolve Project Server you’re accessing.
7 If you are a Member of the Project Server, enter your Username and Password. Otherwise, use the default user: postgres and password: DaVinci.
8 Click on the Create button.

You can now create or import new projects directly into your new network project library.

Creating a network project library

Connecting to an Existing Network Project Library

You can connect to an already existing project library on a Project Server by using the following steps.

To connect to an existing project library on a Project Server:
1 Click on the Show/Hide Project Libraries icon in the upper left of the Project Manager to expose the sidebar.
2 Select the Network icon from the Project Library options.
3 Click on the “Add Project Library” button at the bottom of the sidebar.
4 Select the Connect option to access the existing project library.
5 Enter the name of the project library on the Project Server.
6 Enter the IP address of the DaVinci Resolve Project Server you’re accessing.
7 If you are a Member of the Project Server, enter your Username and Password. Otherwise, use the default user: postgres and password: DaVinci.
8 Press the Connect button.

You can now view and use all the existing projects directly from the existing network project library.
Disconnecting from a Network Project Library

You can disconnect and remove an already existing project library from the Project Libraries list using the following steps.

To disconnect from a network project library:

1. Click on the Show/Hide Project Libraries icon in the upper left of the Project Manager to expose the sidebar.
2. Select the Network icon from the Project Library options.
3. Select the project library you want to disconnect.
4. Click the Display Project Library Details icon (the circled letter “i” to the right of the project library).
5. Select the Remove button.
6. Press the disconnect button in the confirmation dialog.

Disconnecting a project library simply removes it from the available options in the Project Libraries sidebar. It does not delete the project library. You can either manually delete it in the OS filesystem, or reconnect to it using the steps described in Connecting to an Existing Local Project Library.

Backing up a Network Project Library

You can also back up project libraries by exporting them, and then reimport them later.

To backup/export a network project library:

1. Select the project library you want to back up.
2. Click the Display Project Library Details icon (the circled letter “i” to the right of the project library).
3. Select the Back Up button.
4. Choose a location to which to save the backup in the Backup Project library dialog, and click Save.

**Restoring a Network Project Library**

You can import existing project libraries to pass multiple projects between systems.

**To restore/import a network project library:**

1. Click on the Show/Hide Project Libraries icon in the upper left of the Project Manager to expose the sidebar.
2. Select the Network icon from the Project Library options.
3. Click the Restore button at the top of the Project Libraries sidebar.
4. Find the project library you need to import using the file import dialog, and click Open.
5. In the Add Project Library dialog, do the following:
   a. Enter a new name for your project library.
   b. Enter the IP address of the DaVinci Resolve Project Server you’re accessing.
   c. If you are a Member of the Project Server, enter your Username and Password. Otherwise, use the default user: postgres and password: DaVinci.
   d. Click on the Create button and the imported local project library will appear in the Network section of the Project Libraries sidebar.

**Duplicating a Network Project Library**

You can also duplicate a network project library as an additional backup, or save point in a large project.

**To duplicate a network project library:**

1. Select the project library you want to duplicate.
2. Click the Display Project Library Details icon (the circled letter “i” to the right of the project library).
3 Select the Duplicate button.
4 Choose a new unique name for the duplicated library and click OK.

Optimizing a Project Library

Sometimes, project libraries in DaVinci Resolve can become so large that their size affects performance. In these cases you may need to optimize them to improve access speed by “vacuuming” the project library of unnecessary spaces and reindexing it. Using the Optimize command can also be a valuable troubleshooting step in certain cases where you’re having problems opening, importing, or otherwise using projects saved within network project libraries.

To optimize a project library:
1 Select the project library you want to optimize.
2 Click the Display Project Library Details icon (the circled letter “i” to the right of the project library).
3 Click the Optimize button.
4 A warning dialog will appear. Click Optimize to proceed, otherwise click cancel to leave the project library in its current state.

Sharing a Key to a Network Project Library

If you wish, you can share your access key to a network project library with another user on the same local network.

To export a key to a network project library:
1 Click on the Show/Hide Project Libraries icon in the upper left of the Project Manager to expose the sidebar.
2 Select the Network icon from the Project Library options.
3 Select the project library you want to share the key to.
4 Click the Display Project Library Details icon (the circled letter “i” to the right of the project library).
5 Click the Share Key button.
6 Select the directory in your file system where you want to save the key to and click save.
7 Send the resulting .resolvedbkey file to the other user.

Using the DaVinci Resolve Project Server Application

DaVinci Resolve Project Server is a stand-alone application that lets you create, manage, backup, restore, and most importantly share project libraries on any workstation. Using this application, it’s not necessary to launch DaVinci Resolve just to manage your project libraries, and it’s no longer necessary to use Terminal to set up project library sharing as before (although you still can if you want to).

The DaVinci Resolve Project Server Interface

The DaVinci Resolve Project Server interface greatly resembles the DaVinci Resolve Project Manager with the Project Libraries sidebar open. However, it exposes all of the project library management tools that are available for creating and managing project libraries, including controls for sharing project libraries and creating access keys that are essential for quickly and easily creating and connecting to Project Servers.

The DaVinci Resolve Project Server window
This window has three main UI areas:

- **Project libraries list:** The Project libraries list in the Project Server application shows every single DaVinci Resolve network project library on your machine; even ones that have been disconnected. This makes it easy to find project libraries that you want to reconnect.

- **Projects browser:** Shows all projects and folders within the currently selected project library as icons or as a hierarchical list.

- **Toolbar:** A toolbar at the top of the window shows you functions that are available for managing DaVinci Resolve project libraries on your workstation.

The three controls at the top of the Project Libraries toolbar have the following functions:

- **Sort Order drop-down menu:** This menu lets you choose how to sort the various local and network project libraries displayed in the sidebar. You can sort by Database Name, Schema (by date), Status, or Location in Ascending or Descending order.

- **Restore:** Imports .resolve.backup files to restore a backed up project library.

- **Show Search Field:** Displays a search field and search criteria drop-down that lets you search for project libraries in the sidebar by Name, Schema, Status, or Location.

Clicking on the Display Project Library Details icon (the circled letter “i” to the right of the project library), shows additional information underneath each database in the sidebar, and exposes the Backup and Optimize buttons.

The controls exposed in the Project Library details have the following functions:

- **Project Library Settings:** Clicking on this gear icon allows to choose to Rename, Delete, or Export an Access Key for the library.

- **Project Library Enabled:** This toggle enables or disables the project library sharing.

- **Project Library Information:** Displays metadata about the library, such as Location (IP address of the Project Server), Status (compatible or upgrade required), and the created and modified dates.

- **Backup:** Selecting this button lets you export the project library to a backup file.

- **Optimize:** Selecting this button lets you optimize the project library for better performance.

- **Members:** This area shows you which members have access to the project, and the Manage Members button lets you add or remove their access.
Using the Project Server Application to Manage Network Project Libraries

The DaVinci Resolve Project Server utility is useful for accomplishing all kinds of administrative tasks.

Creating New Network Project Libraries

If necessary, you can create new network project libraries right within this utility.

To create a new network project library:

1. Click the Add Project Library button at the bottom of the Project Libraries list.
2. When the Create Project Library window appears, type a name for the new project library into the Name field. Because all projects in a network project library are saved internally within the network project library, no other changes are necessary.
3. Click Create, and the new network project library will appear in the Project Libraries list.

Backing Up and Restoring Project Libraries

You can also back up and restore project libraries without needing to open DaVinci Resolve. Furthermore, you can back up project libraries from older versions of DaVinci Resolve, making it easy to back up project libraries for safety before you upgrade them.

To backup/export a project library:

1. Select the project library you want to back up.
2. Click the Display Project Library Details icon (the circled letter “i” to the right of the project library).
3 Click the Back Up button.
4 Choose a location to which to save the backup in the Backup Project library dialog, and click Save.

To restore/import a project library:
1 Click the Restore button at the top of the Project Libraries sidebar.

2 Find the project library you need to import using the file import dialog, and click Open.
3 In the Add Project Library dialog, type a name for the new project library into the Name field. This will rename the imported project library but will not alter its contents. You can also name it the same as the original project library.
4 Click Create, and the imported local project library will appear in the Project Libraries sidebar.

Upgrading Project Libraries

From time to time, new versions of DaVinci Resolve require changes to the way projects are created, which requires project libraries created with older versions of DaVinci Resolve to be upgraded before you can access the projects within. Fortunately, this is a simple process.

It’s generally a good idea to back up a project library prior to upgrading it, in case something goes wrong. In general, upgrading from a whole version release to the next whole version release of DaVinci Resolve usually requires an upgrade, while upgrading to a dot release of the same version may or may not. If the currently used project library requires an update, you’ll be told on application startup.

To upgrade a project library from an old version of DaVinci Resolve:
Click on a project library that needs updating, and select the Upgrade Project Library button. A dialog appears to confirm if you really want to upgrade that project library. Click Upgrade to proceed.

Viewing Project Library Contents

If you’re using multiple project libraries to organize your projects, you can browse the contents of each project library to search for what you’re looking for. Simply click to select a project library in the sidebar, an orange highlight will appear, and all projects corresponding to that project library appear in the Project Manager window.
Optimizing Project Libraries

Sometimes, project libraries in DaVinci Resolve can become so large that their size affects performance. In these cases you may need to optimize them to improve access speed by “vacuuming” the project library of unnecessary spaces and reindexing it. Using the Optimize command can also be a valuable troubleshooting step in certain cases where you’re having problems opening, importing, or otherwise using projects saved within network project libraries.

To optimize a project library:

1. Select the project library you want to optimize.
2. Click the Display Project Library Details icon (the circled letter “i” to the right of the project library).
3. Click the Optimize button.
4. A warning dialog will appear. Click Optimize to proceed, otherwise click cancel to leave the project library in its current state.

Member Management in the DaVinci Resolve Project Server

It is possible to assign specific users to specific project libraries and adjust their roles. This gives extra granularity for security for complex projects with many users. Every network project library starts with the default user: postgres and password: DaVinci. This was until recently the only way to sign into the DaVinci Resolve Project Server remotely, but now you can add custom users and passwords as well. Members will be able to use their individual credentials to sign into network projects in the Project Manager.
To add a new member to the DaVinci Resolve Project Server:

1. Click the Members button on the top right of the DaVinci Resolve Project Server.
2. Click the Create New Member button at the bottom of the Members window.
3. Select a username and password for the member, you can optionally add a thumbnail photo as well.

4. Repeat as for as many new users as you want to add.
5. Click the Save button to store the new users, or click Cancel to discard your changes.

To delete an existing member from the DaVinci Resolve Project Server:

1. Click the Members button on the top right of the DaVinci Resolve Project Server.
2. Find the user you want to delete and press the trash can icon in that user’s row. There is no warning dialog for the deletion, and it is not undoable, so make sure you double check that you have selected the correct user.

To modify an existing member’s permissions in the DaVinci Resolve Project Server:

1. Click the Members button on the top right of the DaVinci Resolve Project Server.
2. To change the user’s role between Administrator and Collaborator use the selection menu.
3. To edit a user’s name and password details select the Pencil icon.

Assigning Members to Specific Project Libraries

Once you have created some members, you can add them to specific project libraries. This lets you have multiple teams of people, working on multiple projects off the same Project Server, without the off chance that they accidentally delete another teams projects, or have access to sensitive material.

To add or remove a member from a specific project library:

1. Open a project library’s details settings by clicking on the “i” icon to the right of its name.
2. Click on the Manage Members button at the bottom of the project library.
3. To add a member, check the box next to their name in the All Members field.
4. To remove a member, click on the “x” next to their name in the Added Members field.
Members added to a project library in this way will be able to log-in using their credentials in the Network Libraries section of the Project Manager in DaVinci Resolve.

### Sharing Network Project Libraries via the Project Server

You can also use the DaVinci Resolve Project Server to easily set up a shared Project Server on your local network. However, for this to work, you need to adhere to the following requirements:

- All workstations need to be connected to the Project Server on a local network.
- All network connections should be reasonably fast (preferably Gigabit Ethernet or faster).
- The computer functioning as the Project Server should be reasonably fast, but it doesn’t need fast GPU processing.

The following procedures describe how to set up a shared Project Server, and how to export an access key with which to easily set up other workstations to connect to it.

**To configure the DaVinci Resolve Project Server:**

1. Open the DaVinci Resolve Project Server application.
2. In the File > Network Interface menu choose the IP address you wish to use to connect to the client workstations.

The Network Interface menu
IMPORTANT

You must select the appropriate Network Interface IP address that matches the network the client computers are on before you create and share a project library or create an access key, otherwise a connection error will occur.

To share a project library using the DaVinci Resolve Project Server:

1. Select or create a DaVinci Resolve project library you want to share, and click the Project Library Enabled slider on. It’s at the top of the project library’s details section.
2. When a dialog appears asking if you want to authorize the configuration of your Project Server, click Authorize. That project library can now be shared among other DaVinci Resolve workstations on the same network.

Once you’ve set up a Project Server, it’s easy to connect other machines to that server using access keys that you can create using the DaVinci Resolve Project Server application.

To create an access key to enable easy connection to a Project Server:

1. Select a project library that you’ve set up to share, enter the library’s details section, and choose the Export Access Key option from the settings icon in the upper right.
2. Choose a location via the Create Access Key dialog, and click Save. An access key file is saved to the location you chose with the file extension .resolvedbkey.
3. Copy the .resolvedbkey file to the workstation you want to connect to the shared project library.
4. Open DaVinci Resolve, and when the Project Manager appears, open the Project libraries sidebar, and then drag the .resolvedbkey file and drop it anywhere within the Project Manager. The shared project library should now appear in the Project libraries sidebar, and if you select it, you’ll see all of the projects that are located in that project library on the Project Server.

If necessary, you can also disable sharing for any project library, preventing remote access to it from other workstations on the network.

To disable sharing:

1. With the DaVinci Resolve Project Server application open, select a project library you enabled sharing for, and click the Project Library Enabled slider off. It’s at the top of the project library’s details section.
2. When a dialog appears asking if you want to authorize the configuration of your PostgreSQL server, click Authorize. That project library will no longer be shared.

IMPORTANT

If you enable sharing on a computer that is later moved to another network (for example, if you set up Project Server sharing on a laptop), you’ll need to disable sharing and then re-enable it before you create access key files that will successfully connect to the new network location.
Cloud Project Libraries

Cloud project libraries, are hosted on Blackmagic’s Project Library servers on the internet allowing DaVinci Resolve users to connect and collaborate on the same projects from any location in the world.

Connecting to a Blackmagic Cloud Project Library

Blackmagic houses project library cloud servers in various locations around the world that users can access for a nominal monthly fee. While Blackmagic does host the project files, no actual media is stored on the Blackmagic servers making it still a very secure method of working remotely.

To sign into the Blackmagic cloud:

1. Sign up for a Blackmagic ID using your email address and credit card at http://blackmagicdesign.com
2. In the Project Manager Window select Cloud from the Project Library icons in the upper left.
3. Chose the Blackmagic Cloud option from the Sign-In dialog, and input your Blackmagic ID and Password.

To sign out of the Blackmagic cloud:

1. In the Project Manager Window, select Cloud from the Project Library icons in the upper left.
2. Click on the Sign Out icon (The small cloud with an “x” under it) in the upper right of the Blackmagic Cloud panel.

Accessing the Cloud Project Library in DaVinci Resolve

Once connected, cloud project libraries are accessed by clicking on the Show/Hide Project Libraries icon in the upper left of the Project Manager. A sidebar then opens up showing all your connected project libraries. Click on the Cloud icon to open up the cloud project library. It is split into two sections: “My Cloud,” which manages all the project libraries that you create, and “Shared with me,” which shows project libraries that other users have created, but given you shared access to.
The Blackmagic cloud library

**Optimization and Performance of a Cloud Project Library**

Before learning about how to create and manage cloud project libraries, it's worthwhile addressing server lag and optimizations. The project library is a database of all the edits, clip metadata, visual effects, color corrections, and audio engineering applied to your timeline. This project library is queried and updated constantly as you use DaVinci Resolve. When the project library is local to, or on the same network as your workstation, these updates happen more or less instantaneously. However, when the project server is half-way around the world on the internet, the speed of light and internet routing start to insert perceptible lag time.

Luckily the majority of the changes required to mitigate this have been done by the DaVinci Resolve team. They have re-written the underlying project library code over a period of several months to optimize it for internet performance, and in most cases the responsiveness will be indistinguishable from using a local project library. However, these types of processes involve intensive and persistent project library operations, and some lag will become apparent when:

- Changing cloud project libraries
- Loading a project from the cloud project library
- Backing up and restoring cloud project libraries

It's important to keep in mind, that once loaded, actually working in DaVinci Resolve will still be as fluid and responsive as you are used to.
Creating a New Cloud Project Library

Creating a new cloud library is a simple and straightforward process.

To create a new cloud project library:

1. Click on the Cloud icon to Sign into the Blackmagic cloud server in the Project Manager.
2. Click on the Show/Hide Project Libraries icon in the upper left of the Project Manager to expose the sidebar.
3. Select the Cloud icon from the Project Library options.
4. Click on the “Add Project Library” button at the bottom of the sidebar.
5. Enter a new name for your cloud project library, and then select the region in the world in which you want to host the server. It is best to select a server closest to the project’s editor.
6. Press the Create button.

You can now create or import new projects directly into your new cloud project library.

Deleting or Renaming a Cloud Project Library

If you are finished with a particular cloud project library and want to delete it or wish to change its name you can do so through the Project Libraries interface.

To delete a cloud project library:

1. Sign into the Blackmagic cloud server in the Project Manager.
2. Click on the Show/Hide Project Libraries icon in the upper left of the Project Manager to expose the sidebar.
3. Select the Cloud icon from the Project Library options.
Right-click on the library you want to delete in the Project Libraries sidebar, and select Delete from the drop-down menu.

Click the Delete button on the confirmation dialog box that opens.

Deleting a cloud project library is a permanent and not undoable action. Make sure you have everything you need from this library before you click delete. Once it’s gone, it’s gone.

To rename a cloud project library:
1. Sign into the Blackmagic cloud server in the Project Manager.
2. Click on the Show/Hide Project Libraries icon in the upper left of the Project Manager to expose the sidebar.
3. Select the Cloud icon from the Project Library options.
4. Right-click on the library you want to rename in the Project Libraries sidebar, and enter the new name in the dialog box.
5. Click the OK button.

**TIP:** You can not delete or change the name of the currently connected project library (indicated by an orange highlight around it). In order to do so, you must select and connect to another project library first, and then apply the steps above.

**Upgrading a Cloud Project Library**

From time to time, new versions of DaVinci Resolve require changes to the way projects are created, which requires project libraries created with older versions of DaVinci Resolve to be upgraded before you can access the projects within. Fortunately, this is a simple process.

To upgrade a cloud project library:
1. Sign into the Blackmagic cloud server in the Project Manager.
2. Click on the Show/Hide Project Libraries icon in the upper left of the Project Manager to expose the sidebar.
3. Select the Cloud icon from the Project Library options.
4. Right-click on the library you want to upgrade in the Project Libraries sidebar, and select Upgrade from the drop-down menu.
5. Click the upgrade button on the confirmation dialog box that opens.

**Sharing a Cloud Project Library**

You can share a cloud project library with other users around the world with a Blackmagic ID.

To share a Cloud project library:
1. Sign into the Blackmagic cloud server in the Project Manager.
2. Click on the Show/Hide Project Libraries icon in the upper left of the Project Manager to expose the sidebar.
3. Select the Cloud icon from the Project Library options.
4 Click on the Details icon (the circled letter “i”) on the cloud project library you wish to share to open the details settings.

5 A members list will appear, and your user name and email will be first on the list with a little crown icon, showing that you are the owner of this project library.

6 Click the Share button at the bottom of the sidebar.

7 Enter the Blackmagic ID (email address) of the person you want to share this project library with.

8 Press the Share button.

The user will instantly have access to this shared library, and an email will inform them as well. If the user was already logged in with their Blackmagic ID, they will have to log out and re-login again for the shared project library to show up in their cloud library.

**IMPORTANT**

The users you share your project library with have access to modifying and deleting any projects within that shared library, so be judicious about who you give access to.
Removing a User from a Shared Cloud Project Library

If you are the owner of a shared cloud project library, you can remove another shared user’s access to it.

**Removing a shared user from a cloud project library:**

1. Sign into the Blackmagic cloud server in the Project Manager.
2. Click on the Show/Hide Project Libraries icon in the upper left of the Project Manager to expose the sidebar.
3. Select the Cloud icon from the Project Library options.
4. Click on the Details icon (the circled letter “i”) on the cloud project library you wish to share to open the details settings.
5. A members list will appear, showing all users that have access to this project library.
6. Right-click on the user you wish to remove and select Remove Member from the drop-down list.

Backing up and Restoring a Cloud Project Library

You can back up and restore a cloud project library in the Blackmagic cloud itself.

**To back up a cloud project library:**

1. Sign into the Blackmagic cloud server in the Project Manager.
2. Click on the Show/Hide Project Libraries icon in the upper left of the Project Manager to expose the sidebar.
3. Select the Cloud icon from the Project Library options.
4. Click on the Details icon (the circled letter “i”) on the cloud project library you wish to back up to open the details settings.
5. Click the Back Up button.
6. After some time, a dialog box will appear confirming the backup has been made to the cloud.

**To restore an older version of a cloud project library:**

1. Sign into the Blackmagic cloud server in the Project Manager.
2. Click on the Show/Hide Project Libraries icon in the upper left of the Project Manager to expose the sidebar.
3. Select the Cloud icon from the Project Library options.
4. Click on the Details icon (the circled letter “i”) on the cloud project library you wish to restore to an earlier version to open the details settings.
5. Click the Restore button.
6. Navigate to the version that you want to restore in the Backups list.
7. Assign a new name to the restored library.
8. Click the Restore button.
Setting up a Cloud-Based Collaboration Workflow

As internet bandwidth has increased over the years, it has recently become possible to collaborate on a project completely online. While once you needed to be in the same building connected to a fast LAN, and Network Attached Storage (NAS), it is now possible to collaborate in real time from all around the world using the internet and cloud storage instead. Below are instructions for setting up a completely cloud-based workflow using the tools and settings in DaVinci Resolve 18 or higher.

This sample workflow consists of Editor A, Colorist B, and Audio Engineer C, all in different parts of the world, and wanting to collaborate on the same project at the same time. The ideal is to minimize the amount of media management involved and to not have to send individual project files back and forth.

Set up the Blackmagic Cloud and a Cloud Library

— Users A, B, and C sign up for the Blackmagic cloud service.
— Users A, B, and C log into the cloud in the Project Manager in their own copies of DaVinci Resolve.
— User A creates a new cloud library, and invites Users B and C to share it. Since User A is the editor, they will locate the cloud library’s server nearest themselves.

Set up the Cloud Storage

— Users A, B, and C sign up for a cloud storage provider (Dropbox, iCloud, OneDrive, Google Drive, etc.)
— Users A, B, and C configure their cloud storage so they all can share access to the same cloud-based folder. This folder should be at the top level of the cloud storage. They decide to name the folder Episode 12.
— Users A, B, and C create a file hierarchy system in their shared Episode 12 folder, such as new subfolders for Audio, Proxies, and Graphics.
— Users A, B, and C mount their shared storage folder on their own computers. Editor A adds some logos and still photos to the Graphics folder. Audio Engineer C adds some music and sound effects to the Audio folder. This takes a while to upload and distribute from the cloud, but eventually all users have the same media locally on their computers.

Create the Proxy Media

— Colorist B has the RAW camera masters on a hard drive connected to their system. Since only they need access to the RAW camera files for color grading, they will make low bandwidth proxies for the Editor and Audio Engineer to work with. These files are small enough to upload and store in their cloud storage folder.
— Colorist B creates proxy files of the RAW media in the Blackmagic Proxy Generator application (for more information on using the Blackmagic Proxy Generator, see Chapter 8 “Improving Performance, Proxies, and the Render Cache”).
— Colorist B uploads the proxy files to the Proxies folder in their cloud storage.

Setup the DaVinci Resolve Project and Settings

— Colorist B creates the new project in the cloud library, and sets up its resolution and frame rate, etc.
— Colorist B turns on the File > Multiple User Collaboration setting.
— Users A, B, and C open the project and set their individual file paths to their cloud storage folder “Episode 12” in the Path Mapping section of the Project Settings. For more information on Path Mapping, see Chapter 6 “Project Settings.”

— Colorist B imports the RAW media from their local hard drive into their Media Pool, and links them to the proxies he uploaded to the Episode12/Proxies folder. At this point, Editor A, and Audio Engineer C now have access to the proxy media, while Colorist B can switch back and forth between RAW media and Proxies as needed. If necessary, Colorist B can also decide to upload the RAW media to the shared folder if space and time allow. While the other users are waiting for this media to upload, if they have the “Prefer Camera Originals” setting checked in Playback > Proxy Handling menu, they can continue to edit using the proxies, and as the RAW media files upload, they will automatically replace the proxy files as they come in.

— Editor A imports their still photos to the Media Pool from the Episode 12/Graphics folder. They immediately become available to Users B and C without relinking.

— Audio Engineer C imports their music tracks to the Media Pool from the Episode 12/Audio folder. They immediately become available to Users A and B without relinking.

— As the users continue to add more media into the shared folder and bring it into the Media Pool, there may be a lag as the media is uploaded to the cloud storage, and then downloaded to the other users. During this time the clip will appear as media offline but will relink automatically once the file finishes its download to the local computer.

**Continue working in DaVinci Resolve’s Collaborative Workflow**

From here, the editor edits, the colorist colors, and the audio engineer handles the sound design all using DaVinci Resolve’s existing collaborative workflow tools. For more information on using these tools, see Chapter 194, ”Collaborative Workflow.”
Multi-user collaborative workflow uses “bin locking” to manage who has access to what when multiple collaborators open the same project.

However, collaborative workflow also allows multiple artists to do simultaneous editing, compositing, grading, and metadata entry to clips on the same timeline within a single project for which Collaboration has been enabled. Multiple users can simultaneously access the same timeline within the same project to edit, composite, and grade at the same time, while other editors and assistants can open different bins containing different timelines within the same project to do editorial and media management. This chapter describes how to set up multiple DaVinci Resolve workstations to collaborate, and how to use bin locking to work together.

Introduction to Collaborative Workflow

Multi-user collaborative workflow allows simultaneous editing, compositing, grading, and Media Pool clip management by multiple people within a single project that has been enabled for collaboration. Collaboration takes three different forms:

— Using bin locking, multiple editors can simultaneously edit different timelines in different bins of the same project, while assistant editors can reorganize clips and edit the metadata in other bins within the same project. Bins are automatically locked when selected by a particular user and unlocked when deselected by that same user, or they can be manually set to be either locked or unlocked as circumstances require.

— Using clip locking, multiple colorists and compositing artists can work together in the same timeline, in either the Color page or Fusion page, without fear of overwriting one another’s work. A clip is locked automatically when a user selects that clip to work on, and is unlocked (with the work checked in) when that same user selects a different clip. Clip locking in the Fusion page is maintained separately from clip locking on the Color page, so a compositing artist and colorist can work together on the same shot.

— One editor, one compositing artist, and one colorist can work together on the same clip in the same Timeline of the same project without conflict.

Overall, working in DaVinci Resolve in Collaborative Workflow mode is identical to working in non-collaborative mode. However, there are a few collaborative capabilities that are worth knowing about.

Collaborative Render Cache Support

Each collaborator on a project can have individualized render cache settings on their machine, enabling everyone to cache to a format that their workstation can best handle and that meets their needs.

Collaborative Support for Individual Monitoring

If necessary, each collaborator on a project can override the output and monitoring settings of a project on their particular workstation. When a project is set to use Collaborative Workflow, a “Use Local Overrides” checkbox appears in the Video Monitoring group of the Project Settings that lets you choose how to monitor on your particular workstation.

Collaborative Marker, Flag, and Clip Color Support

Collaborative workflow supports the modification of markers, flags, clip metadata, and clip color from the Color page. Additionally, FrameIO comment markers are supported by collaborative workflow.

Read Only Mode

Users can load collaborative projects in Read Only Mode.

Collaborative Support for HDR

Starting with DaVinci Resolve 16, there is support for Dolby Vision and HDR10+ in collaborative workflows.
Requirements for Collaboration

In order to use collaborative workflow:

— All users must be working on a project that’s been saved on a properly configured remote project library server. This remote project library server can be on one of the actively used DaVinci Resolve workstations, or it can be another computer on your network that simply hosts shared projects, but it should be on a computer that is never shut down or put to sleep, to prevent projects suddenly becoming unavailable.

— All machines participating in a collaborative workflow must be networked. They can be on the same local area network (LAN), but you can also connect computers on different subnets.

— Shared projects should ideally use media on some type of fast storage area network (SAN), with each collaborator connected to that SAN so that every workstation that’s connected to the project being collaborated on has direct access to the same media. In a pinch, shared volumes over a network will work, but proper SANs will provide significant performance benefits. Facilities using multiple computer platforms (macOS, Windows, and Linux) together can use the Mapped Mount option of the Media Storage Locations list, found in the DaVinci Resolve System Preferences, to facilitate cross platform drive connection.

For more information on setting up a project library server, see Chapter 193, “Managing Project Libraries and Project Servers.”

Enabling Project Collaboration

Starting with DaVinci Resolve 14, the process of initiating a collaborative workflow has been vastly simplified over previous versions.

To open a project and initiate a collaborative workflow:
1. Open DaVinci Resolve on a computer that’s connected to a remote project library server.
2. Open any project on the remote project library DaVinci Resolve is connected to using the Project Manager.
3. When the project is open, choose File > Enable Collaboration.

Once collaboration is enabled, two additional buttons appear at the lower-right corner of the DaVinci Resolve interface, next to the Project Manager and Project Setting buttons. These are the Collaboration Chat and Collaboration buttons.

The Collaboration Chat button (far left) and the Collaboration button (second from left)
NOTE: When you enable collaboration, the “Auto conform missing clips as media is added to Media Pool" option in the General Options panel of the Project Settings is automatically disabled, as it interferes with collaborative workflow. Also, Live Save is automatically turned on in the Auto Save panel of the User Preferences, to ensure that all collaborators' work is saved regularly to avoid conflicts between collaborators.

Opening Projects to Collaborate

Projects that have Collaboration enabled appear with a badge below their thumbnail in the Project Manager to let you know that project is available for collaboration.

An icon indicates that a project in the Project Manager is available for collaboration.

At this point, anyone else who has access to this remote project library server can simply open this project up and work collaboratively with you. Whenever a collaborator opens the same project you’re working in, the Collaboration Chat button at the bottom of the DaVinci Resolve UI highlights to let you know you have a message.

Opening the Collaboration Chat window shows who’s collaborating with you.

A new message in the Collaboration Chat window lets you know who else has opened the project you’re working on.
Customizing Your Collaborator Identification

Once you’ve set up a project for collaboration, you want to make sure it’s easy to tell all your collaborators apart. Clicking the Collaboration button opens a list of all collaborators, or project members, working in that project.

Opening the Collaboration list shows all the current project members.

The top member is you, and you can change the name you use by editing the text field. Additionally, you can click the icon to the left and choose a new color for yourself from the icons in the pop-up menu below. All the badges that indicate who has a lock on which folders, timelines, and shots are color-coded, so it’s a good idea for everyone to choose their own custom color so you can tell who’s doing what.

How Collaboration Works

At its simplest, collaborative workflow uses a “first come, first served” model to manage who has can make changes to what. Essentially, the first collaborator to select a bin in the Media Pool, open a timeline, or select a clip in the Fusion page or Color page gets a “lock” on that item. Once an item is locked (indicated by a colored collaborator badge), other collaborators can look at it, but they cannot make changes. This prevents versioning conflicts from occurring.

Bin and clip locks are released when a collaborator selects a different bin or timeline in the Media or Edit pages, or a different clip in the Fusion page or Color page. At that point, the changes that have been made to the previously locked item are “checked in” and made available to all collaborators once they
refresh their project (by clicking a circular refresh icon that appears to the right of bins in the Media Pool or in the corner of the Edit page Viewer).

All changes that collaborators make are automatically saved to the project as they’re made, via Live Save (which is always on in Collaborative mode), so no work will ever be lost as you collaborate with your team. However, each collaborator gets to decide when they want to update the bin, timeline, or clip they’re currently working on to see the changes made by everyone else, in order to prevent a kaleidoscope of constant alterations to compositions and grades from being a distraction while you’re working.

The following sections describe Bin and Timeline locking and Clip locking in more detail.

**Automatic Bin and Timeline Locking**

Whenever a collaborator opens a particular bin, that bin and its contents are locked, preventing any other collaborators who open that project from making alterations to anything inside that same bin. This prevents versioning conflicts while work is in progress. When a bin is locked, you can still view its contents, if for instance you just need to figure out where a particular clip has been put, but you can’t make changes.

Furthermore, when a collaborator opens a timeline in either the Edit or Fairlight pages, whatever bin that timeline is in is locked as well, along with any other timelines or clips in that bin. Collaborators can open locked bins and see the contents for reference, but they cannot make any organizational or editorial changes. The only things that can be changed once a bin and its contents are locked are the creation or alterations of clip compositions in the Fusion page, and alterations to clip grades in the Color page.

You can always tell when a collaborator has a lock on a bin and its contents because a badge appears to the right of the bin in the Bin list, and in the corner of timeline thumbnails that are visible in the Media Pool browser area. Hovering the mouse over that badge in the Bin list reveals a tooltip with that collaborator’s name.

An icon indicates that another collaborator has a lock on the Reel 2 bin, the Pool Shark (Trimming) timeline, and the Alternate bin.

Once a collaborator (someone other than you) makes changes to a bin’s contents or to a timeline, you’ll see a circular “refresh” badge appear by each affected bin in the Bin List of the Media Pool. Click these badges whenever you want to update your version of the shared project with all organizational and editorial changes made by others in that bin.
An icon indicates that another collaborator has made changes, clicking it refreshes your project to show those changes.

To release a bin or timeline, simply select another bin or timeline. It’s that simple.

Managing Bin Locks Manually

You can also manually control the locked state of bins, during instances where you want to keep bins locked for future use or prevent them from becoming locked when you only want to browse the contents.

**Keeping Bins Locked**

If you want to lock one or more bins that you know you’re going to be switching among to either prevent other collaborators from making changes or so that nobody else inadvertently prevents you from having access, you can right-click one or more selected bins and choose Lock Bins to lock them. Bins locked in this way remain locked, even when you deselect them, until you right-click them again and choose Unlock Bins.

Manually locked bins stay locked even when they’re not selected.

**Keeping Bins Unlocked**

Additionally, you can choose to keep bins unlocked when selected. For example, you may just want to examine the contents of a bin without keeping someone else from editing its contents. In this case, simply Option-click any bin to open that bin in read-only mode, which is indicated by an eyeball badge to the left of that bin in the Bin list. In this mode, any other collaborator can still lock that bin while you’re examining its contents. Selecting any other bin will clear this read-only status.

Selecting a bin in read-only mode allows collaborators to lock that bin while you examine its contents.
**TIP:** While a bin is open but manually unlocked by you, you can still open clips into the Source Viewer and add markers to them, so long as another user doesn’t select that same bin and lock you out.

### Manually Unlocking Timelines

You can also manually manage the locking of timelines. Ordinarily, opening a timeline automatically locks other collaborators out of making changes to that timeline, and also locks the bin that timeline appears within. However, if you’ve finished making changes to a timeline and you want to release it to other collaborators for immediate work, you can unlock the currently open timeline.

To unlock a timeline to let other collaborators work on it:

1. Right-click that timeline in the Media Pool and choose Timelines > Unlock Timeline from the contextual menu.
2. Your collaborator will then need to right-click the Media Pool bin the timeline is in to be able to edit it.

### Automatic Clip Locking

Clip locking in the Fusion and Color pages works similarly. As multiple compositing artists work in the Fusion page, and multiple colorists work in the Color page, the first compositing artist or colorist to select any given clip has an automatic lock on that clip. Other compositing artists or colorists will see a badge on that clip in the Thumbnail timeline showing that it’s locked as well as letting them know who has the lock. In the following screenshot, a green badge at the corner of clip 12 in the Color page Thumbnail timeline indicates that clip is locked.

![Badges in the Thumbnail timeline indicate which clips are locked because a collaborator is grading them](image)

### Automatically Checking In Work When You Change Clips

When you’re finished with the clip you’re working on, you need only select another clip for the changes you made to the previously selected clip to be automatically saved and pushed to all other colorists who are working on that timeline in the Color page. No refresh is needed. This is the main difference between clip locking in the Color page and bin locking.
Compositing Artists and Colorists Can Work Together

The Fusion page and Color page each maintain separate clip locks. This means that for any given pool of compositing artists, only one will be able to work on a given clip at a time, while in the Color page only a single colorist will be able to work on a clip at a time.

However, because Fusion and Color page clip locking is maintained separately, that means that one compositing artist and one colorist can work on a single clip in the timeline simultaneously, even while an editor is working on that timeline.

Receiving Changes Made by Collaborators

As you work collaboratively, it will be common for groups of compositing artists to be executing multiple compositions at a time, while colorist and their assistants will be working on the grade, and an editor and their assistants will be refining the edit, all working together within the same project.

Receiving Changes On the Edit Page

While compositors are compositing and colorists are grading clips within the same timeline of the same project, each clip that’s adjusted in the Fusion or Color page triggers a Refresh badge to appear in three areas of the Edit page, so the collaborating editor(s) can decide when to update their timeline to see the changes that have been made.

— At the upper-right corner of the Timeline Viewer. Clicking this badge refreshes the composites and grades of all clips in the currently open Timeline.

![Refresh badge in the Timeline Viewer](image1)

A clickable “update” badge appears in the corner of the Timeline Viewer for timelines with edits, grades, and composites that have been updated

— At the right of the bin containing the modified timeline in the Media Pool’s bin list. Clicking this badge refreshes all clips in the Timeline within that bin.

![Update badge in the Media Pool bin](image2)

A clickable “update” badge appears over bins containing timelines in the Media Pool with edits, grades, and composites that have been updated

— At the upper-right corner of each modified clip in the Timeline.
A clickable “update” badge appears over clips in the Timeline with edits, grades, and composites that have been updated.

**Receiving Changes On the Fusion and Color Pages**

For collaborators working on the Fusion or Color pages, other badges indicate when editors have made changes to the Timeline, or when other compositing artists or colorists have made changes to other clips in that timeline.

— Timelines that you’re locked out of because another collaborator has a lock on them are indicated by a badge at the upper-right corner of the Viewer, while changes made to the Timeline by editors on the Edit page are indicated by a refresh badge in the same location. Clicking this badge refreshes all clips in the Timeline.

— If you open up the Media Pool, then a badge appears at the right of any bin in the Bin List that’s been reorganized or that contains a modified timeline. Clicking this badge refreshes all clips in the Timeline within that bin.

— A badge appears at the upper-right corner of each clip in the Thumbnail timeline that’s been modified by a fellow compositing artist or colorist. Clicking a single clip’s badge updates that clip alone.
A badge appears over clips in the Timeline with grades that have been updated. Clicking this badge refreshes just that clip.

Examples of Collaborators Working Together

The first collaborator that opens a timeline is the only person that can make editorial changes to that timeline in the Edit or Fairlight pages. Other collaborators who open that project are “locked out” of making changes to the Edit or Fairlight pages, but they can see the Timeline, and they can make grading changes in the Fusion or Color pages. This means in situations where you want multiple editors to be working on a project, it can be ideal to organize your program into separate “reels,” where each reel of a project is a separate timeline in a separate bin.

Multiple Editors Working Together

The first collaborator that opens a timeline is the only person that can make editorial changes to that timeline in the Edit or Fairlight pages. Other collaborators who open that project are “locked out” of making changes to the Edit or Fairlight pages, but they can see the Timeline, and they can make grading changes in the Fusion or Color pages. This means in situations where you want multiple editors to be working on a project, it can be ideal to organize your program into separate “reels,” where each reel of a project is a separate timeline in a separate bin.

On the other hand, if two or more editors must both work on the same timeline, this can be accomplished using duplicate timelines and then merging the changes back together later on. For example, collaborating editor Anne can do the following to make changes to a timeline that editor Erin is already working on:

— First, Anne can duplicate the locked timeline into a separate bin from the one Erin has a lock on. Alternately, Erin could be proactive and duplicate the timeline into a separate bin in advance.
— Second, Anne will re-edit the duplicate timeline to make whatever changes are necessary to a different scene than the one Erin is currently working on. Working on different scenes is the cleanest and easiest way of using this workflow.
— Third, Anne uses Collaborative Chat to notify Erin that the changes are finished.
— Fourth, Erin then refreshes the project to see Anne’s updated duplicate timeline in the Media Pool, right-clicks it, and chooses Compare With Current Timeline from the contextual menu to show the Timeline Comparison window that makes it possible to merge the changed section of the duplicate timeline with the original timeline that Erin already has open.
In the following screenshot, Erin’s highlighted changes (made while Anne was working) can be seen at the left, and Anne’s highlighted changes can be seen at the right. Right-clicking within the right highlighted area reveals an Accept Change command that lets that scene’s changes be merged from the duplicate timeline back to Erin’s original timeline.

Using the Compare With Current Timeline command lets you see the differences between two differently edited versions of the same timeline, and merge a scene’s worth of changes that a collaborator has made (at right) back to the original timeline.

For more information on comparing timelines, see Chapter 34, “Creating and Working with Timelines.”

Editors and Assistant Editors Working Together

Collaborators can edit metadata, create new bins, and reorganize clips within unlocked bins only. This means that your project should be organized so that an editor can lock the contents of the bins they need to work with at a given point in time, while the assistants can work on additional timelines and media within other bins in that project.

However, in addition to being able to copy timelines from a locked bin to a bin that you control, you can also copy clips from one timeline to another. In this way, if you absolutely need to make changes to source clips while the original source clips are locked, you can make your changes to copies of these clips.

Editors and Compositing Artists Working Together

Editors and compositing artists can work together closely, since compositing artists can create compositions for one or more clips in a timeline while it’s being edited, even though that timeline and the bin it’s in are locked to other editors.

Here’s an example of an editor working on a commercial spot with a lot of greenscreen material working together with one or more compositing artists.

— First, the editor cuts together each foreground clip with actors performing as a rough cut, and once that rough cut is assembled, they edit in the background clips that accompany each greenscreen clips to create a series of stack of clips.

— Second, the editor selects each stack of clips, one by one, and uses the New Fusion Clip command to create Fusion clips that the compositing artists can work on. By making each of these clips into Fusion clips, the editor is making it easy for the compositing artists to have access to all the clips necessary for each composition from within the Fusion page, collaboratively.
— At this point, the editor uses collaborative chat to notify the compositing artists that there are composites ready for them to work on, and the editor can then turn their attention back to refining the edit.

— Upon being notified that they can begin work, one or more compositing artists start working through the Fusion clip compositions while the editor is working, to create each multi-layered composite that’s necessary. As each compositing artist finishes a clip and moves to a new clip to begin work, the editor sees a notification badge at the upper-right corner of each clip in the Timeline that’s been composited, as well as notification badges in the Bin List of the Media Pool, and at the upper-right corner of the Timeline viewer. Clicking any of these badges will refresh one or more of these clips, so the editor can see the changes.

### Multiple Compositing Artists Working Together

To prevent versioning issues, only one compositing artist can work on a particular clip at a particular time in the Fusion page, and the first compositing artist to select a clip puts a lock on that clip. Other collaborators looking at the Thumbnail timeline in the Fusion page will see a small icon that shows it’s locked, letting them know they can’t make any changes to it until whoever is working on that composition moves to another clip.

A small icon indicates that you’re locked out because another compositing artist is working on that clip.

This means that multiple compositing artists can’t work on the same composition at the same time. However, an assisting compositing artist can do preparatory work on one composition, such as doing rotoscoping, paint, particle system design, or any other time-consuming task, while a lead compositing artist works on another shot in the meantime. Once the assisting compositor is done, they can select another clip to work on and use collaborative chat to let the other compositor know they’re done and that clip is ready for more work.

In order to prevent half-finished work from being disseminated to other collaborators, a clip that’s in the process of being worked on in the Fusion page isn’t updated for anyone else who’s working on that same timeline until the compositing artist who’s working on it selects another clip. Immediately upon being deselected, all changes are automatically checked in and made available to all other collaborators, who see notification badges in the Fusion page and the Edit page to alert them that changes are available and that they can refresh their timeline to see the updates.
Editors and Colorists Working Together

Colorists and editors can work together very closely in DaVinci Resolve, as colorists can grade the shots of a timeline that an editor is currently working on, even though that timeline and the bin it’s in are locked to other editors.

From the colorist’s point of view, whenever the editor makes an alteration to the Timeline, a badge appears at the upper-right corner of the Color page Viewer to indicate that a change has been made to the timeline being graded. Clicking this badge updates the timeline the Colorist is working on.

In order to prevent half-finished work from being disseminated to the editor (or worse, being seen by the client), clips that are in the process of being graded aren’t updated for other collaborators that are looking at that timeline until the colorist who’s working on it “checks in” their work by selecting another clip. So, from the editor’s point of view, whenever a colorist has finished grading a clip and has selected another clip to grade, a series of badges appear in the Edit page, one on the clip that’s been graded, one on the Timeline Viewer and one on the bin in the Bin List that contains the Timeline. Clicking any of these badges updates the Timeline with the latest grades.

Multiple Colorists Working Together

Only one colorist can work on a particular clip at a particular time, and the first colorist to select a clip puts a lock on that clip. Other collaborators looking at the Thumbnail timeline in the Color page will see a small icon that shows it’s locked, letting them know they can’t make any changes to it until whoever is grading that clip moves to another clip.

In order to prevent half-finished work from being disseminated to other colorists or editors, a clip that’s in the process of being graded isn’t updated for other collaborators that are looking at that timeline until the colorist who’s working on it selects another clip. These changes are then automatically made available to all other collaborators working in the Color page, who see badges appear in the Edit and Color pages to indicate which clips have updates available.

This makes it easy for multiple colorists to work together. For example, an assistant colorist can be notified via Collaborative Chat to draw a custom window that a senior colorist needs for a grade. The assistant opens that timeline in another suite, selects the appropriate clip, and draws the window. Once finished, the assistant simply selects a different clip, and the changes they’ve made are immediately available to the senior colorist, who sees a badge on that clip in the Thumbnail timeline and can click to update it.
Managing Notes Among Collaborators

If an editor wants to send a note to colorists or compositing artists, they can do one of the following:

— They can add a marker with note text to the Timeline ruler (the marker appears in the marker submenu in the Color page Viewer option menu)
— They can add a marker with note text to a clip (that marker appears in the mini-timeline of the Color page)
— They can color code clips in different ways to get the colorist’s attention (clip color coding appears as a dot in the Thumbnail timeline).
— Of course, the editor and colorist can always interact via the collaborative chat window, as well.

Collaboration Chat

To facilitate communication among collaborators, DaVinci Resolve has built-in text chat, called Collaboration Chat. Simply click the Collaboration Chat button to open the chat window, and chat away.

The Collaboration Chat window for communication among collaborators

The Collaboration Chat button at the bottom of the DaVinci Resolve interface highlights orange whenever someone texts while this window is closed, letting you know you have messages that are waiting.

The Collaboration Chat highlights to let you know you have a message
Chapter 195

Remote Grading and Remote Monitoring

This chapter describes how to set up Remote Grading using two separate DaVinci Resolve systems in different locations via the internet, to have one system remotely control the other for color grading.

Remote Monitoring allows you to stream a high quality video signal from one DaVinci Resolve system to another workstation over the internet or on the same network.

Introduction to Remote Grading

To enable colorists to work interactively with clients across the globe, DaVinci Resolve offers a remote grading option. It allows two matching DaVinci Resolve systems to be synchronized via an Internet connection such that changes made on the colorist’s workstation are immediately applied on the remote client’s workstation.

Cue commands are also synchronized to ensure that both systems are always on the same frame in the Timeline. Starting or stopping playback on the colorist’s DaVinci Resolve also starts and stops the remote client system. While a remote grading session is in progress, input from the user at the remote client’s DaVinci Resolve workstation is ignored.

Currently, the remote grading feature supports only color correction and does not allow editing or conforming during a session. The two colorist and remote DaVinci Resolve systems must have matching timelines and the number of clips, clip durations, and system resolutions must match. The requirements and limitations of a remote grading session are summarized below.

Requirements for Remote Grading

— The same version of DaVinci Resolve must be installed on both systems.
— The Timeline to be graded must be conformed on both machines prior to the start of the remote grading session.
— The number of clips on the Timeline and the duration of each clip must be identical.
— While grading, the active Timeline and versions on the remote client system are constantly updated. Creating, deleting, or switching the Timeline on the client’s DaVinci Resolve is not allowed. Doing so will terminate the remote grading session immediately.
— You cannot make any grading adjustments on the remote client’s DaVinci Resolve workstation until the remote grading session has ended.

**NOTE:** Remote grading does not require a shared project library.

Setting Up for Remote Grading

To start a remote grading session, the client’s DaVinci Resolve must be able to connect to the colorist’s system using TCP/IP.

1. Open DaVinci Resolve on the remote client’s workstation (the one that’s being remotely controlled), log in, and open the project that will be remotely graded.
2. Choose Workspace > Remote Grading (Ctrl-G) on the remote client’s workstation. A window is displayed with text fields to enter the IP address and port number of the colorist’s system.
3 Set the IP address field to the IP of the colorist’s DaVinci Resolve workstation. If the colorist’s system already has a public IP address, the port number can be left at its default value (15000). If the colorist’s system is on a private network, the colorist or their network administrator should set the port number to one on the public IP router that is internally routed to port 15000 of the colorist’s DaVinci Resolve.

4 Once the remote client clicks Connect, the client’s DaVinci Resolve system will attempt to establish a connection with the remote colorist's workstation.

5 Once the connection is established, a pop-up appears on the colorist’s screen asking for permission to accept a Remote Grading connection.

6 Click OK to accept, minimize the size of this dialog window, and continue grading normally.

The Remote Grading session will remain active until one of the users chooses to disconnect or an error occurs causing DaVinci Resolve to automatically terminate the session.

Remote Grading Restrictions

To allow operation over low bandwidth and a potentially long latency Internet connection there are some restrictions to remote operation.

— When playback is started, the playback speeds on the two DaVinci Resolve systems may differ. The frame positions are only guaranteed to be synchronized when playback is stopped.

— Input/output/display LUTs applied from the Config page on the colorist’s DaVinci Resolve will not have any effect on the client system. LUTs selected on the client’s DaVinci Resolve will be applied instead.

— Presets applied from the Config/Color pages on the colorist’s system will not have any effect on the client’s system. Presets selected on the client’s DaVinci Resolve will be applied instead.

Introduction to DaVinci Remote Monitoring (Studio Version Only)

DaVinci Remote Monitoring is an application that allows you to have access to a low latency, high quality video signal over a network for editing and color grading purposes. This allows editors and colorists the ability to work remotely using the Resolve Interface and a data stream from a central DaVinci Resolve workstation. This data stream is of high enough quality that you can run the signal through a Blackmagic DeckLink or UltraStudio device to a grading monitor and have the same confidence in the output as if it was connected locally.

The stream quality can be adjusted for your particular needs and available bandwidth. For example, an editor may only need an HD h.264 8-bit 4:2:0 codec for offline editing, while a colorist may need the full UHD h.265 12 bit 4:4:4 RGB codec for HDR grading.
For clarity in this section we will refer to the main DaVinci Resolve workstation in the post house or data center that is streaming the video as the “Resolve Server”, and the workstation that is receiving the stream as the “Resolve Client.” However in reality these are just two computers running the same version of the DaVinci Resolve Studio and the DaVinci Remote Monitoring apps, and have nothing to do with the DaVinci Resolve Project Server described in an earlier chapter.

Requirements for DaVinci Remote Monitoring

The Resolve Server must have the following hardware and software requirements for DaVinci Remote Monitoring to work:

— The Resolve Server needs an RTX series NVIDIA GPU and drivers installed. AMD GPUs are currently incompatible.
— The Resolve Server needs to have the Linux or Windows version of DaVinci Resolve Studio installed. macOS is currently incompatible for use as the Resolve Server.
— The Resolve Server must have the “Allow Remote Streaming Connections” box checked in the General section of the System Preferences.

The Resolve Client must have the following hardware and software requirements for DaVinci Remote Monitoring to work:

— The Resolve Client needs an RTX series NVIDIA GPU and drivers installed. AMD GPUs are currently incompatible.
— The Resolve Client must have the Linux or Windows version of DaVinci Resolve Studio installed.
— The Resolve Client can be a Mac with the DaVinci Resolve Studio macOS version installed, but will be limited to an 8-bit 4:2:0 stream only.
— The Resolve Client can use a Blackmagic DeckLink or UltraStudio for broadcast quality output of the data stream to a grading monitor.
— The Resolve Client can use an ethernet capable control surface like the DaVinci Resolve Advanced or Mini Panels, provided they are setup to connect over the network to the Resolve Server.

The network connecting the Server and Client must meet the following requirements for DaVinci Remote Monitoring to work:

— The same version of DaVinci Resolve Studio and the DaVinci Remote Monitoring app must be used on the client and server computers.
— Both Resolve Client and Server must be on the same network, either locally via LAN, or over the internet via VPN etc.
— TCP port 16410 must be open between the systems.
— You must know the IP address of the Resolve Server.
— The Resolve Client must have some application for remotely controlling the desktop of the Resolve Server installed and running, giving them keyboard and mouse input to the server.
Setting Up DaVinci Remote Monitoring

To start a DaVinci Remote Monitoring session, the Resolve Client must connect to the Resolve Server by opening the DaVinci Remote Monitoring application. A settings window will then allow you to determine the parameters of the remote session. The DaVinci Remote Monitoring application is installed automatically with DaVinci Resolve Studio, and is found in the DaVinci Resolve folder.

- **IP Address**: Input the IP address of the Resolve Server you want to connect to.
- **Port**: The Port used to connect is currently fixed at 16410.
- **Output Device**: Select a DeckLink or UltraStudio device connected to the Resolve Client for monitoring the data stream’s output.
- **Automatically detect output mode**: When checked, the output mode selected will automatically mirror the resolution and frame rate set in the Project Settings on the Resolve Server.
- **Output Mode**: Lets you locally override the output resolution and frame rate settings of the project from the Resolve Server, when you uncheck the “Automatically detect output mode” box above.
- **Video Codec**: Sets the codec and bit depth of the data stream from the Resolve Server.
- **Bit Rate**: Sets the bit rate of the data stream from the Resolve Server.

When the settings are correct, click the Connect button in the lower right to start the DaVinci Remote Monitoring session.

The DaVinci Resolve Remote Monitoring application interface

Once the connection has been initiated from the Resolve Client, the Resolve Server must approve the connection by clicking accept on the resulting Initiate Remote Streaming dialog box. You can do this either physically on the server with a connected mouse, or over the network by using any kind of remote desktop software.
Once the connected, the word “Streaming” is displayed in the lower left of the application along side the time connected. You will be able to control the remote Resolve Server GUI from your local client computer using your remote desktop software, and stream the broadcast quality video signal to your DeckLink or UltraStudio for monitoring.

To end a DaVinci Remote Monitoring Session, click the Disconnect button in the lower right hand corner of the application.

**DaVinci Remote Monitoring Restrictions**

There are currently some limitations to the DaVinci Remote Monitoring application to be aware of.

- When connecting over the internet, bandwidth restrictions can hamper performance. If the bandwidth drops too low, or cuts out completely the server will disconnect with an error message.
- The Resolve Server and Clients require the Windows or Linux versions of Resolve Studio and only support RTX series NVIDIA GPUs.
- MacOS clients are possible, but are currently limited to 8-bit 4:2:0 video codecs.
- Currently DaVinci Remote Monitoring only works with the Cut, Edit, Color and Deliver pages.
- Currently Audio is limited to only 2 channels.
- Currently on the Color page, GUI viewer overlays (for power windows, reference wipes, Open FX controls, etc.) are not working.

**Import Project** – Page 67
Imports a DaVinci Resolve Project file (.drp).

**Import Metadata To** – Page 382
Imports Metadata from a .csv file into DaVinci Resolve.

**Export**
Tools for the exportation of files and media from DaVinci Resolve.

- **Bin** – Page 353
- **Timeline** – Page 353
- **Subtitles** – Page 976
- **Fusion Composition** – Page 1146

**Export Project** – Page 66
Exports a DaVinci Resolve Project File (.drp).

**Export Metadata From** – Page 382
Exports Metadata from DaVinci Resolve to a .csv file.

**Quick Export** – Page 551
Opens the Quick Export Window.

**Project Manager** – Page 66
Opens the Project Manager Window.

**Project Settings** – Page 122
Opens the Project Settings Window.

**Project Notes** – Page 81
Opens the Project Notes editor.

**Single User Project** – Page 3942
Disables the Project Collaboration features.

**Multiple User Collaboration** – Page 3942
Enables Project Collaboration with other DaVinci Resolve workstations.

**Media Management** – Page 838
Opens the Media Management Window.

**Reconform from Bins** – Page 1030
Reconforms a timeline using media in a selected bin.

**Reconform from Media Storage** – Page 1034
Reconforms a timeline using media in a specific file system folder.

**easyDCP** – Page 3877
Exposes the easyDCP toolset.

**Enable Collaboration** – Page 3942
Enables Project Collaboration with other DaVinci Resolve workstations.

**Dolby Vision®** – Page 233
Loads the license and configuration files to enable Dolby Vision advanced trim controls.
Edit

**Undo** – Page 62
Undos the previous change.

**Redo** – Page 62
Redo the previous change.

**History** – Page 62
Opens the Undo History submenu.

**Cut** – Page 685
Performs a cut operation on the current selection.

**Ripple Cut** – Page 685
Performs a ripple cut operation on the current selection.

**Cut Head** – Page 3533
Cuts the clip from the playhead backwards in the Fairlight page.

**Cut Tail** – Page 3533
Cuts the clip from the playhead forwards in the Fairlight page.

**Copy** – Page 685
Performs a copy operation on the current selection.

**Copy Head** – Page 3533
Copies the clip from the playhead backwards in the Fairlight page.

**Copy Tail** – Page 3533
Copies the clip from the playhead forwards in the Fairlight page.

**Paste** – Page 685
Pastes the previously copied/cut selection.

**Paste Insert** – Page 685
Pastes a clip as an insert edit.

**Paste Attributes** – Page 857
Pastes video and audio attributes.

**Paste Value** – Page 3008
Pastes the value of a specific parameter between Color nodes.

**Remove Attributes** – Page 858
Removes audio and video attributes.

**Dolby Vision®** – Page 233
Copy and Paste Trim metadata for Dolby Vision.

**Duplicate Clip or Current Timeline** – Page 360
Makes a copy of the current clip or timeline.

**Duplicate Selection** – Page 3528
Duplicates one or more selected clips in Fairlight.

**Delete Selected**
Performs a delete function on all selected items.

**Ripple Delete** – Page 650
Performs a ripple delete on the selected clip.

**Delete Gaps** – Page 652
Deletes gaps in the active timeline.

**Select All**
Performs a Select All function on the active panel.

**Deselect All**
Clears any selections in the active panel.

**Select** – Page 630
Opens up a submenu for selecting adjacent clips in a timeline.

**Insert** – Page 709
Performs an Insert Edit using the selected clip.

**Overwrite** – Page 708
Performs an Overwrite Edit using the selected clip.

**Replace** – Page 710
Performs a Replace Edit using the selected clip.

**Place on Top** – Page 498
Performs a Place on Top Edit using the selected clip.

**Ripple Overwrite** – Page 497
Performs a Ripple Overwrite Edit using the selected clip.

**Fit to Fill** – Page 694
Performs a Fit to Fill Edit using the selected clip.

**Append to End of Timeline** – Page 719
Adds the selected clip to the end of the timeline.

**Multicam** – Page 750
Exposes the Multicam editing controls.

**Swap Clips Towards Left** – Page 680
Swaps the selected clips with the clip to the left of the selection.

**Swap Clips Towards Right** – Page 680
Swaps the selected clips with the clip to the right of the selection.

**Switch to Timeline After Edit**
Automatically switches focus to the timeline after an edit, rather than the Source Viewer.

**Decompose Compound Clips on Edit** – Page 767
Automatically decomposes nested clips on timelines for easier editing.
Trim

**Normal Edit Mode** – Page 675
Puts the timeline in Selection Mode.

**Trim Mode** – Page 772
Puts the timeline in Trim Mode.

**Range Selection Mode** – Page 3516
Selects Range Selection Mode in Fairlight.

**Dynamic Trim mode** – Page 801
Puts the timeline in Dynamic Trim Mode.

**Toggle Slip/Slide Mode** – Page 771
Toggles between slip and slide trim modes.

**Blade Edit Mode** – Page 683
Switches the timeline to blade mode.

**Select Nearest Edit Point**
Selects the nearest edit point to the playhead.

**Select Nearest Video Edit Point**
Selects the nearest edit point to the playhead on the video tracks only.

**Select Nearest Audio Edit Point**
Selects the nearest edit point to the playhead on the audio tracks only.

**Select Nearest Clip/Gap**
Selects the nearest clip or gap to the playhead.

**Edit Point Type**
Toggles the currently selected edit point among the outgoing, centered, or incoming part of the edit.

**Toggle V+A/V/A**
Toggles the Edit Point type above between video, audio, or video and audio combined selections.

**Select Nearest Edit To** – Page 782
Selects the nearest edit point to a variety of clip parameters.

**Select Nearest Clip To** – Page 771
Selects the nearest clip to a variety of clip parameters.

**Nudge**
Opens a menu to move the selected clips one frame, or multiple frames left or right.

**Trim Start** – Page 799
Cuts all clips intersecting the playhead from that point backwards.

**Trim End** – Page 799
Cuts all clips intersecting the playhead from that point forwards.

**Trim to Selection** – Page 3527
Trims the heads and tails of the clips to the selected range in the Fairlight page.

**Extend Edit** – Page 771
Resizes one or more selected edit points or clips.

**Extend Edit Selection To** – Page 801
Opens a menu to select previous and next tracks and edits for the Extend Edit function.

**Move Edit Selection To** – Page 801
Opens a menu to move to previous and next tracks and edits for the Extend Edit function.

**Resize** – Page 772
Changes the clip in/out points based on the playhead position.

**Ripple** – Page 772
Changes the clip in/out points based on the playhead position, using a Ripple operation.

**Roll** – Page 772
Changes the clip in/out points based on the playhead position, using a Roll operation.

**Slip Playhead To** – Page 801
Slips the clip from the current position of the playhead to the in or out point of the clip.

**Fade In to Playhead** – Page 940
Creates a fade in from the beginning of the clip to the playhead position.

**Fade Out to Playhead** – Page 940
Creates a fade out from the playhead position to the end of the clip.

**Crossfade Selection**
Creates a crossfade for the selected range in the Fairlight page.

**Slip Audio** – Page 658
Opens a menu to slip audio forwards and backwards at a frame or subframe level.

**Slip Eye** – Page 303
Slips the opposite eye left or right one frame in the Color Page’s Stereo 3D palette.
Timeline

**Add Transition** – Page 862
Adds the default transition to the selected edit point.

**Add Video Only Transition** – Page 862
Adds the default transition to the selected Video edit point only.

**Add Audio Only Transition** – Page 862
Adds the default transition to the selected Audio edit point only.

**Bounce Selected Tracks to New Layer** – Page 3587
Bounces the selected tracks to a new layer in the Fairlight page.

**Bounce Mix to Track** – Page 3587
Bounces the selected mix to a new track in the Fairlight page.

**Select Clips Backward** – Page 641
Selects all clips backward from the playhead on either a single track, or all tracks.

**Select Clips Forward** – Page 641
Selects all clips forward from the playhead on either a single track, or all tracks.

**Select Clips With Flag Color** – Page 642
Selects all clips previously flagged with a specific color.

**Select Clips With Marker Color** – Page 642
Selects all clips having markers with a specific color.

**Select Clips With Clip Color** – Page 642
Selects all clips with a specific color.

**Razor** – Page 682
Activates the Razor (Blade) tool.

**Split Clip** – Page 674
Splits a clip at the playhead position.

**Join Clip** – Page 674
Joins two clips that are separated by a through edit.

**Detect Scene Cuts** – Page 416
Activates Scene Cut Detection on the current selection.

**Mute Tracks** – Page 3586
Mutes the selected audio track in the Fairlight Page.

**Solo Tracks** – Page 3586
Solos the selected audio track in the Fairlight Page.

**Clear Solo** – Page 3586
Un-solos all tracks in the Fairlight Page.

**Clean Up Video Tracks** – Page 691
Opens a toolset to improve the organization of a timeline’s video tracks.

**Flatten Audio Track Layers** – Page 3421
Flattens out Track Layers in the Fairlight Page.

**Trim Audio Edits to Frame Boundaries** – Page 820
Eliminates any sub-frame audio adjustments.

**Switch to Camera Originals** – Page 471
Toggles between Camera Masters and ISO’s in ATEM projects.

**Match Frame** – Page 745
Performs a Match Frame operation on the clip.

**Swap Timeline and Source Viewer** – Page 767
Opens a timeline loaded in the source viewer in a timeline instead.

**Snapping**
Turns playhead snapping on and off.

**Linked Selection** – Page 654
Toggles linked selection of clips.

**Linked Move Across Tracks** – Page 655
Toggles linked clips moving tracks together.

**Selection Follows Playhead** – Page 582
Toggles the automatic selection of the clip under the playhead.

**Layered Audio Editing** – Page 3535
Turns on Audio Layering in the Fairlight Page.

**Audio Scrubbing** – Page 583
Toggles audio scrubbing on or off.

**Loop Jog** – Page 3479
Toggles Loop Jog in the Fairlight Page.

**Ripple Timeline Markers** – Page 730
Timeline markers will reflow with ripple operations.

**Playback Post-Roll** – Page 583
The playhead will continue playing past the last clip in the timeline.

**Track Destination Selection** – Page 695
Chooses specific tracks for editing operations.

**Lock Tracks**
Prevents further changes to the selected track.

**Auto Track Selector** – Page 630
Automatically select tracks for editing operations.

**Enable/Disable Video Tracks** – Page 581
Shows or hides specific video tracks.

**Output Blanking** – Page 266
Sets letterboxing options.

**Find Current Timelines in Media Pool** – Page 369
Opens the bin in the media pool with the selected timeline, and highlights it.
Clip

**New Compound Clip** – Page 762
Makes a compound clip out of the selected clips.

**New Fusion Clip** – Page 1134
Makes a Fusion composition out of the selected clips.

**New VFX Connect Clip** – Page 992
Links the current selection to the stand alone version of Fusion.

**Open in Timeline** – Page 767
Opens a nested timeline temporarily into its component pieces for editing.

**Decomposing in Place** – Page 768
Breaks a nested timeline into its original component pieces.

**Conform Lock Enabled** – Page 1028
Locks clip references to a specific media file, preventing accidental changes.

**Conform Lock with Media Pool Clip** – Page 1028
Forces a clip to reference a specific media file selected in the Media Pool.

**Enable Clip** – Page 650
Toggles a clip’s visibility on or off.

**Link Clips** – Page 657
Toggles Link or Unlink for the selected clips.

**Show Keyframe Editor** – Page 979
Opens a clip’s keyframe editor for animating parameters.

**Show Curve Editor** – Page 980
Opens the clip’s curve editor for advanced keyframing.

**Change Clip Duration** – Page 492
Opens the Change Clip Duration tools.

**Change Clip Speed** – Page 951
Opens the simple speed retiming controls.

**Freeze Frame** – Page 951
Creates a still frame for the duration of the selected clip using the frame under the playhead.

**Retime Controls** – Page 953
Opens the Retime Controls on the selected clip.

**Reset Retime** – Page 955
Resets the Retime Controls on a clip back to their original state.

**Auto Align Clips** – Page 685
Aligns clips on a timeline based on timecode or audio waveform.

**Audio** – Page 822
Opens a menu to change the audio volume of a clip.

**Take Selector** – Page 761
Creates a Take Selector from the selected clips.

**Finalize Take** – Page 762
Removes a Take Selector and uses the starred take.

**Multicam Cut** – Page 757
Cuts to another angle in a Multicam Clip.

**Multicam Switch** – Page 757
Changes to another angle in a Multicam Clip without cutting.

**Render Cache Fusion Output** – Page 186
Toggles the options for caching Fusion compositions in a timeline.

**Render Cache Color Output** – Page 186
Toggles the Render Cache on or off for Color operations in the timeline.

**Find Clip in Media Pool** – Page 747
Locates the selected clip in the Media Pool.

**Match Frame to Source Clip** – Page 745
Performs a Match Frame operation on the selected clip in the timeline.
Mark

Mark In – Page 623
Sets the In Point on a clip or timeline.

Mark Out – Page 623
Sets the Out Point on a clip or timeline.

Mark Video In – Page 624
Creates an in point for the video track of a split edit.

Mark Video Out – Page 624
Creates an out point for the video track of a split edit.

Mark Audio In – Page 624
Creates an in point for the audio tracks of a split edit.

Mark Audio Out – Page 624
Creates an out point for the audio tracks of a split edit.

Convert In and Out to Duration Marker – Page 626
Turns the in and out points into a duration marker.

Set In and Out from Duration Marker – Page 626
Turns a duration marker into In and Out Points.

Clean In – Page 616
Removes the In Point on a clip or timeline.

Clean Out – Page 625
Removes the Out Point on a clip or timeline.

Clear In and Out – Page 625
Removes both the In and Out Points on a clip or timeline.

Clear Video In and Out – Page 625
Clears the In and Out Points on the Video track for a split edit.

Clear Audio In and Out – Page 625
Clears the In and Out Points on the Audio tracks for a split edit.

Mark Clip – Page 698
Automatically sets In and Out Points based on a clip duration.

Mark Selection – Page 698
Automatically sets In and Out Points based on total duration of multiple clips.

Create SubClip – Page 412
Creates a subclip based on the In and Out points of a clip.

Keyframe Timeline Mode – Page 3009
Choose which keyframe types to copy between Color grades.

Add Keyframe – Page 3107
Adds a Dynamic Keyframe at the playhead position.

Add Static Keyframe – Page 3107
Adds a Static Keyframe at the playhead position.

Delete Keyframe
Removes a keyframe at the playhead position.

Delete All Keyframes
Removes all keyframes from a selected parameter.

Move Selected Keyframes Left
Moves all selected keyframes left by 1 frame.

Move Selected Keyframes Right
Moves all selected keyframes right by 1 frame.

Move Selected Keyframes Up
Moves all selected keyframes up by 1 unit.

Move Selected Keyframes Down
Moves all selected keyframes down by 1 unit.

Add Marker – Page 724
Adds a marker to a clip or timeline by color.

Add and Modify Marker – Page 724
Adds a marker to a clip or timeline, and opens the Marker properties dialog.

Modify Marker – Page 728
Opens the Marker properties dialog for the selected marker.

Delete Marker – Page 730
Deletes the selected Marker

Delete All Markers – Page 730
Deletes all markers on a clip or timeline, or by specific marker color.

Add Flag – Page 724
Adds a flag to a clip by color.

Clear Flags – Page 724
Removes all flags from a selected clip.

Delete All Flags – Page 724
Removes all flags from all clips by color.

Set Clip Color – Page 740
Changes a clip’s color in the timeline.
**View**

**Stills**
Opens a menu for manipulating stills in the Gallery

- **Grab Stil** – Page 2979
- **Play Still** – Page 2982
- **Previous Still** – Page 2982
- **Next Still** – Page 2982

**Show RGB Picker Values In** – Page 2856
Toggles Picker view between 8 and 10 bit RGB color ranges.

**Highlight** – Page 2903
Sets the highlight type for the Color viewer.

**Viewer Channels** – Page 2733
Allows you to view an isolated channel in the Viewer.

**Bypass Color and Fusion** – Page 570
Turns on or off Color and/or Fusion operations in a timeline.

**Show Reference Wipe** – Page 2744
Toggles the Reference Wipe on and off.

**Reference Wipe Mode** – Page 2747
Select the Reference Wipe Mode.

**Wipe Style** – Page 2746
Sets the Reference Wipe style.

**Invert Wipe** – Page 2746
Reverses each half of the wipe.

**Reference Reposition** – Page 3234
Opens the Reference Sizing options in the Color page.

**Step Timeline Wipe One Frame Reverse** – Page 2983
Moves the selected wipe timeline clip back one frame.

**Step Timeline Wipe One Frame Forward** – Page 2983
Moves the selected wipe timeline clip forward one frame.

**Display Broadcast Safe Exceptions** – Page 2744
Turns on the Broadcast Safe overlay.

**Window Outline** – Page 2924
Chooses the Window Outline viewing options.

**Timeline Thumbnail Mode** – Page 2773
Toggles clip order between A or C mode in the Color page.

**Timeline Thumbnail Info** – Page 2770
Choose what clip info is shown on the thumbnail in the Color page.

**Timeline Thumbnail Size** – Page 2768
Chooses the size of the thumbnails in the Color page.

**Show Current Clip With Handles** – Page 2770
Shows the handles of a clip in the Color page.

**Source/Timeline Viewer** – Page 569
Toggles between making the Source or Timeline viewer active in the Edit page.

**Source Clip/Source Tape** – Page 484
Toggles between Source Clip and Source Tape in the Cut page viewer.

**Primaries/Log Color Wheels** – Page 2805
Toggles between Wheels and Log mode in the Primaries palette in the Color page.

**Viewer Actual Size**
Sets the viewer zoom to 100%

**Zoom Viewer to Fit**
Sets the viewer zoom to fit into the current viewer window size.

**Zoom**
Zoom options for the viewer.

**Zoom Around Mouse Pointer** – Page 602
Centers the timeline zoom on the pointer rather than the playhead in the Edit page.

**Track Waveform Zoom** – Page 3421
Sets waveform zooming parameters in the Fairlight page.

**Switch Eye To** – Page 303
Chooses the current eye for Stereoscopic workflows.

**Split Screen** – Page 2748
Set the Split Screen mode in the Color page.

**Safe Area** – Page 882
Toggles the safe area overlays for the Edit and Color pages.

**Select Aspect Ratio** – Page 882
Selects the Aspect Ratio for the Safe Area overlay.

**Enable 2D Timeline Scroll** – Page 603
Toggles the scroll wheel behavior in the Edit page, between scrolling vertically through the tracks (enabled), and scrolling horizontally through the timeline (disabled).
View continues

**Show Gray Backgrounds in Viewer** – Page 2742
Sets the background in the viewer to gray instead of black.

**Viewer Overlay** – Page 947
Sets the Viewer On Screen controls in the Edit Page.

**Show Duplicate Frames** – Page 606
Duplicate clips are marked in the Edit page timeline.

**Show File Names** – Page 384
Toggles between displaying Clip names or File names in the Edit page.

**Change Clip Duration** – Page 492
Shows the names of the original audio files in the Edit page.

**Timeline Scrolling** – Page 3424
Sets the timeline scrolling method in the Fairlight page.

**Show Playhead Shadow** – Page 582
Displays the Playhead Shadow in the Edit page.

**Show Preview Marks** – Page 700
Toggles Preview Marks on or off in the Edit page.

**Show Smart Bins** – Page 357
Turns the Smart Bins on or off in the Edit page.

**Show Power Bins** – Page 354
Turns the Power Bins on or off in the Edit page.

**Show Audio Track Layers** – Page 3536
Reveals track layers in the Fairlight page.

**Show Subtitle Regions** – Page 964
Shows or Hides regions in the subtitle tracks.

**Show Markers** – Page 738
Shows or Hides markers based on color.

**Show Flags** – Page 724
Shows or Hides flags based on color.

**Enable Preview During Editing** – Page 777
Enables or disables the multi-frame displays in the Edit page.
**Playback**

**Use Optimized Media if Available** – Page 173
Toggles the use of Optimized Media or original media.

**Proxy Handling** – Page 190
Exposes a submenu to control how proxy media playback is handled.

**Timeline Proxy Resolution** – Page 175
Options for Timeline Proxy Mode playback.

**Render Cache** – Page 181
Options for using the Render Cache.

**Delete Render Cache** – Page 175
Options for Deleting the Render Cache.

**Fusion Memory Cache** – Page 186
Options for using the Fusion Cache.

**Play Reverse** – Page 616
Plays 100% backward.

**Stop** – Page 616
Stops playback.

**Play Forward** – Page 616
Plays 100% forward.

**Pause/Start Playback** – Page 616
 Stops and Starts playback.

**Play Again** – Page 616
Restarts playback from the original position.

**Stop and Go to Last Position** – Page 619
Playhead returns to original position on stop.

**Record** – Page 3478
Initiates recording in the Fairlight Page.

**Fast Reverse** – Page 610
Plays in Fast Reverse.

**Fast Forward** – Page 616
Plays in Fast Forward.

**Play Slow** – Page 617
Plays forward in Slow Motion.

**Fast Review** – Page 576
Initiates the Fast Review function.

**Loop/Unloop** – Page 618
Toggles Looping playback on or off.

**Play Around/To** – Page 618
Options for choosing the Play Around/To mode.

**Timecode** – Page 619
Options to increment or decrement timecode.

**Go To** – Page 625
Options to move the playhead directly to a certain location.

**Step One** – Page 616
Move forward or backward one frame or one second.

**Previous**
Moves playhead to the previous Clip, Keyframe, Marker or Gap.

**Next**
Moves playhead to the next Clip, Keyframe, Marker or Gap.

**Jump Left** – Page 3481
Moves clip selection left in the Fairlight page.

**Jump Right** – Page 3481
Moves clip selection right in the Fairlight page.

**Cintel Scanner** – Page 433
Transport controls for the Cintel Scanner.
Fusion

Show Toolbar – Page 1104
Toggles the Fusion toolbar on or off.

Fusion Settings – Page 1128
Opens the Fusion Settings window.

Reset Composition
Resets a Fusion composition to its initial state.

Macro Editor – Page 1230
Opens the Macro Editor.

Import
Specific file format import for Fusion.
  > Alembic Scene – Page 1754
  > FBX Scene – Page 1698
  > PSD – Page 1153
  > Shapes – Page 1148
  > SVG – Page 1148
  > Tracks – Page 1148

Render All Savers – Page 1159
Renders OpenEXR files.
**Color**

**Nodes** – Page 3041
Opens a menu for various node operations.

**Reset** – Page 3040
Options for resetting a Node.

**Grade Version** – Page 2996
Opens a menu for clip Version operations.

**Preview Memory** – Page 3041
Preview a saved grade on the current clip.

**Original Memory** – Page 3041
Reverts to a grade’s original state.

**Apply Grade From One Clip Prior** – Page 3011
Copies a grade from one clip back.

**Apply Grade From Two Clips Prior** – Page 3011
Copies a grade from two clips back.

**Apply Grade** – Page 3010
Applies a grade to the selected clips.

**Append Node Graph** – Page 3012
Appends a node graph to the end of the current node tree.

**Ripple Node Changes to Selected Clips** – Page 3019
Copies changes made in a node to a selected clips.

**Ripple Node Changes to Current Group** – Page 3020
Copies changes made in a node to a group.

**Append Node to Selected Clips** – Page 3020
Appends the selected node to multiple clips.

**Active Playhead** – Page 2770
Chooses the Active Playhead.

**Auto Color** – Page 2791
Performs an Auto Color operation.

**Memories** – Page 2993
Load and Save Memories.

**Presets** – Page 2903
Accesses HSL Qualifier color presets.

**Tracker** – Page 2954
Basic Tracker controls.

**Resolve Live** – Page 285
Opens the Resolve Live interface.

**Printer Light Hotkeys** – Page 2821
Activates Printer Light controls on the numerical keypad.

**Full Printer Light** – Page 2820
Adjust printer lights in Full increments.

**Half Printer Light** – Page 2822
Adjust printer lights in Half increments.

**Quarter Printer Light** – Page 2822
Adjust printer lights in Quarter increments.

**Dolby Vision** – Page 233
Performs an automatic Dolby Vision trim analysis.

**HDR10+** – Page 250
Performs an automatic HDR10+ trim analysis.

**HDR Vivid**
Performs an automatic HDR Vivid trim analysis.
**Fairlight**

**Bus Format** – Page 3468  
Opens the Bus Format window where you can create mono to multi-channel Atmos buses.

**Bus Assign** – Page 3470  
Opens the Bus Assign window where you can patch buses to tracks, tracks to buses and buses to buses.

**Presets Library** – Page 596  
Opens the Presets Library allowing you to choose saved Preset Configurations for EQ, Dynamics, Plugins, Global Track, Global Bus and Fairlight Configurations.

**Link Group** – Page 3465  
Opens the Link Group window allowing you to link groups of tracks.

**VCA Assign** – Page 3584  
Opens the VCA Assign window allowing you to assign VCA groups to specific tracks.

**Patch Input/Output** – Page 3472  
Opens the Patch Input/Output window allowing you to patch Source to Destination routings.

**Test Tone Settings** – Page 3453  
Opens the Test Tone Settings window with the Oscillator for creating various signal tones.

**Remote Control Settings**  
Opens the SMPTE timecode settings in the Fairlight page.

**Input Monitor Style** – Page 3489  
Allows you to choose how to monitor an input.

**Mute** – Page 3420  
Global monitoring Mute.

**Dim** – Page 3418  
Global monitoring Dim.

**Immersive Audio**  
Exposes the following immersive audio tools.
- **B-Chain Control** – Page 3669
- **Space View Scope** – Page 3671
- **Import Master - import ADM files** – Page 3659
- **Export Master - export ADM files** – Page 3659
- **Renderer Settings** – Page 3659

**Automation** – Page 3591  
Lists the Fairlight automation options.

**Batch Fade Settings** – Page 3539  
Opens the Batch Fade Settings window to set fade types and durations.

**Apply Batch Fades** – Page 3540  
Applies the fades set in the Batch Fade Settings window.

**Show Clip Gain Line** – Page 3555  
Shows or hides the Clip Gain Line in clips on the timeline.
Workspace

**Switch to Page** – Page 13
Switches to the selected page.

**Show Page** – Page 13
Shows or hides specific pages.

**Show Page Navigation** – Page 14
Disables page navigation icons in the GUI.

**Show Panel in Workspace** – Page 50
Shows or hides specific panels.

**Active Panel Selection** – Page 48
Switches to the selected panel.

**Media Pool Windows** – Page 361
Presents a list of open Bin windows.

**Dual Screen** – Page 51
Puts the DaVinci Resolve interface in Dual Screen Layout.

**Viewer Mode** – Page 2739
Chooses the Viewer Mode.

**Fairlight Viewer** – Page 3653
Chooses the Fairlight Viewer mode.

**Single Viewer Mode** – Page 570
Toggles Single Viewer mode in the Edit Page.

**Layout Presets** – Page 54
Saves and Loads custom screen layouts.

**Reset UI Layout** – Page 54
Resets the UI Layout to the default settings.

Deactivates the DaVinci Resolve Studio license on this computer.
Regulatory Notices

Disposal of Waste of Electrical and Electronic Equipment Within the European Union.

The symbol on the product indicates that this equipment must not be disposed of with other waste materials. In order to dispose of your waste equipment, it must be handed over to a designated collection point for recycling. The separate collection and recycling of your waste equipment at the time of disposal will help conserve natural resources and ensure that it is recycled in a manner that protects human health and the environment. For more information about where you can drop off your waste equipment for recycling, please contact your local city recycling office or the dealer from whom you purchased the product.

FCC

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. Operation of this product in a residential area is likely to cause harmful interference, in which case the user will be required to correct the interference at personal expense.

Operation is subject to the following two conditions:

1. This device may not cause harmful interference.
2. This device must accept any interference received, including interference that may cause undesired operation.

ISED Canada Statement
This device complies with Canadian standards for Class A digital apparatus. Any modifications or use of this product outside its intended use could void compliance to these standards. Connection to HDMI interfaces must be made with high quality shielded HDMI cables. This equipment has been tested for compliance with the intended use in a commercial environment. If the equipment is used in a domestic environment, it may cause radio interference.

Bluetooth®
The DaVinci Resolve Speed Editor is a Bluetooth wireless technology enabled product. Contains transmitter module FCC ID: QOQBGM113
This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. Contains transmitter module IC: 5123A-BGM113
This device complies with Industry Canada's license-exempt RSS standards and exception from routine SAR evaluation limits given in RSS-102 Issue 5. Certified for Japan, certificate number: 209-J00204. This equipment contains specified radio equipment that has been certified to the technical regulation conformity certification under the radio law. This module has certification in South Korea, KC certification number: MSIP-CRM-BGT-BGM113

Technical Specification for Low Power Radio Frequency Equipment 3.8.2 Warnings
Without permission granted by the NCC, any company, enterprise, or user is not allowed to change frequency, enhance transmitting power or alter original characteristic as well as performance to a approved low power radio-frequency devices. The low power radio-frequency devices shall not influence aircraft security and interfere legal communications; If found, the user shall cease operating immediately until no interference is achieved. The said legal communications means radio communications is operated in compliance with the Telecommunications Management Act. The low power radio-frequency devices must be susceptible with the interference from legal communications or ISM radio wave radiated devices. Davinci Resolve Speed Editort is class A digital device. Operation of this product in a residential area, it may cause radio frequency disturbance, in this case the user will be required to take appropriate measures. NCC ID number: CCAO21LP1880T3

Pending Certification for South Africa by ICASA, approval number TA-2021/1350

Certified for Mexico (NOM), for Bluetooth module manufactured by Silicon Labs, model number BGM113A Includes transmitter module certified in Mexico IFT: RCBSIBG20-2560

Hereby, Blackmagic Design declares that the product (DaVinci Resolve Speed Editor) is using wideband transmission systems in 2.4 GHz ISM band is in compliance with directive 2014/53/EU. The full text of the EU declaration of conformity is available from compliance@blackmagicdesign.com
**Safety Information**

**Weight Warning**

The Fairlight Console has considerable weight even when empty. For example, a 3 Bay console weighs up to 110 kg empty, and 157 kg fully assembled. You should always move a Fairlight console with at least 4 people using safe lifting procedures, such as keeping the back straight, bending the knees and lifting with careful, controlled movements.

**Electrical Warning Notice and Disclaimer**

For installations involving the fitting of more than five Fairlight modules, additional earthing requirements must be fitted before connecting the supply. This requirement does not apply if each group of five Fairlight modules can be connected to separate wall or floor socket outlets.

Earth posts are welded internally at both ends of the console frame for connecting earth wires from the console frame to the building earth point. Either of these posts can be used and they are marked with the following label.

Blackmagic Design recommends appointing a qualified and licenced electrician to install, test and commission this wiring system.

Blackmagic Design does not accept responsibility for the safety, reliability, damage or personal injury caused to, or by, any third-party equipment fitted into the console.

For protection against electric shock, the equipment must be connected to a mains socket outlet with a protective earth connection. In case of doubt contact a qualified electrician.

To reduce the risk of electric shock, do not expose this equipment to dripping or splashing.

Product is suitable for use in tropical locations with an ambient temperature of up to 40°C.

Ensure that adequate ventilation is provided around the product and that it is not restricted.

When rack mounting, ensure that the ventilation is not restricted by adjacent equipment.

No operator serviceable parts inside product. Refer servicing to your local Blackmagic Design service center.

The DaVinci Resolve Speed Editor contains a single cell Lithium battery. Keep lithium batteries away from all sources of heat, do not use the product in temperatures greater than 40°C.

Use only at altitudes not more than 2000m above sea level.

**State of California statement**

This product can expose you to chemicals such as trace amounts of polybrominated biphenyls within plastic parts, which is known to the state of California to cause cancer and birth defects or other reproductive harm.

For more information go to [www.P65Warnings.ca.gov](http://www.P65Warnings.ca.gov).
Warranty

12 Months Limited Warranty

Blackmagic Design warrants that DaVinci Resolve color grading control panels, editing keyboards and audio consoles will be free from defects in materials and workmanship for a period of 12 months from the date of purchase. If a product proves to be defective during this warranty period, Blackmagic Design, at its option, either will repair the defective product without charge for parts and labor, or will provide a replacement in exchange for the defective product. Periodical updates to the operational software are not included under this warranty.

In order to obtain service under this warranty, you the Customer, must notify Blackmagic Design of the defect before the expiration of the warranty period and make suitable arrangements for the performance of service. The Customer shall be responsible for packaging and shipping the defective product to a designated service center nominated by Blackmagic Design, with shipping charges pre paid. Customer shall be responsible for paying all shipping changes, insurance, duties, taxes, and any other charges for products returned to us for any reason.

This warranty shall not apply to any defect, failure or damage caused by improper use or improper or inadequate maintenance and care. Blackmagic Design shall not be obligated to furnish service under this warranty: a) to repair damage resulting from attempts by personnel other than Blackmagic Design representatives to install, repair or service the product, b) to repair damage resulting from improper use or connection to incompatible equipment, c) to repair any damage or malfunction caused by the use of non Blackmagic Design parts or supplies, or d) to service a product that has been modified or integrated with other products when the effect of such a modification or integration increases the time or difficulty of servicing the product.

THIS WARRANTY IS GIVEN BY BLACKMAGIC DESIGN IN LIEU OF ANY OTHER WARRANTIES, EXPRESS OR IMPLIED. BLACKMAGIC DESIGN AND ITS VENDORS DISCLAIM ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. BLACKMAGIC DESIGN’S RESPONSIBILITY TO REPAIR OR REPLACE DEFECTIVE PRODUCTS IS THE WHOLE AND EXCLUSIVE REMEDY PROVIDED TO THE CUSTOMER FOR ANY INDIRECT, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES IRRESPECTIVE OF WHETHER BLACKMAGIC DESIGN OR THE VENDOR HAS ADVANCE NOTICE OF THE POSSIBILITY OF SUCH DAMAGES. BLACKMAGIC DESIGN IS NOT LIABLE FOR ANY ILLEGAL USE OF EQUIPMENT BY CUSTOMER. BLACKMAGIC IS NOT LIABLE FOR ANY DAMAGES RESULTING FROM USE OF THIS PRODUCT. USER OPERATES THIS PRODUCT AT OWN RISK.
