Objects on the focal plane (Z = 0.0) will be actual-sized. Objects farther along Z will become smaller. Objects closer along Z will get larger.

A value of 2.0 will exaggerate the effect dramatically, whereas a value of 0.0 will cancel the effects of perspective entirely.

**Size Over Life**
This spline control determines the size of a particle throughout its lifespan. The vertical scale represents a percentage of the value defined by the Size control, from 0 to 200%. The horizontal scale represents a percentage of the particle’s lifespan (0 to 100%).

This graph supports all the features available to a standard spline editor. These features can be accessed by right-clicking on the graph. It is also possible to view and edit the graph spline in the larger Spline Editor.

**Fade Controls**
This simple range slider provides a mechanism for fading a particle at the start and end of its lifetime. Increasing the Fade In value will cause the particle to fade in at the start of its life. Decreasing the Fade Out value will cause the particle to fade out at the end of its life.

This control’s values represent a percentage of the particle’s overall life, therefore, setting the Fade In to 0.1 would cause the particle to fade in over the first 10% of its total lifespan. For example, a particle with a life of 100 frames would fade in from frame 0…10.

**Merge Controls**
This set of particle controls affects the way individual particles are merged together. The Subtractive/Additive slider works as documented in the standard Merge node. The Burn-In control will cause the particles to overexpose, or “blow out,” when they are combined.

None of the Merge controls will have any effect on a 3D particle system.

**Blur Controls**
This set of particle controls can be used to apply a Blur to the individual particles. Blurring can be applied globally, by age, or by Z depth position.

None of the Blur controls will have any effect on a 3D particle system.
Blur (2D) and Blur Variance (2D)
These controls apply blur to each particle. Unlike the Blur in the pRender node, this is applied to each particle independently before the particles are merged together. The Blur Variance slider modifies the amount of blur applied to each particle.

Blur Over Life
This spline graph controls the amount of blur that is applied to the particle over its life. The vertical scale represents a percentage of the value defined by the Blur control. The horizontal scale represents a percentage of the particle's lifespan.

This graph supports all of the features available to a standard Spline Editor. These features can be accessed by right-clicking on the graph. It is also possible to view and edit the spline in the larger Spline editor.

Z Blur (DoF) (2D) and DoF Focus
This slider control applies blur to each particle based on its position along the Z axis.

The DoF Focus range control is used to determine what area of the image remains in focus. Lower values along Z are closer to the camera. Higher values are farther away. Particles within the range will remain in focus. Particles outside that range will have the blur defined by the Z Blur control applied to them.

Conditions

Conditions Tab
The Conditions tab limits the particles that are affected by the node's behavior. You can limit the particle using probability or more specifically using sets.
**Probability**
The Probability slider determines the percentage of chance that the node affects any given particle.

The default value of 1.0 affects all particles. A setting of 0.6 would mean that each particle has a 60 percent chance of being affected by the control.

Probability is calculated for each particle on each frame. For example, a particle that is not affected by a force on one frame has the same chance of being affected on the next frame.

**Start/End Age**
This range control can be used to restrict the effect of the node to a specified percentage of the particle lifespan.

For example, to restrict the effect of a node to the last 20 percent of a particle’s life, set the Start value to 0.8, and the End value remains at 1.0. The node on frames 80 through 100 only affects a particle with a lifespan of 100 frames.

**Set Mode Menu**
The Set Mode menu drives how the particle node influences the active particle sets. There are three options from this menu:

- **Ignore Sets**: The particle node disregards the state of the Set checkboxes and applies to all nodes.
- **Affect Specified Sets**: The particle node applies its behavior to the active Set checkboxes only.
- **Ignore Specified Sets**: The particle node applies its behavior to the inactive Set checkboxes only.

**Set #**
The state of a Set # checkbox determines if the Particle node’s effect will be applied to the particles in the set. It allows you to limit the effects of some nodes to a subset of particles.

Sets are assigned by the nodes that create particles. These include the pEmitter, pImage Emitter, pChangeStyle, and the pSpawn nodes.

**Region Tab**
The Region tab is used to restrict the node's effect to a geometric region or plane, and to determine the area where particles are created if it’s a pEmitter node or where the behavior of a node has influence.
The Region tab is common to almost all particle nodes. In the pEmitter node, Emitter Regions are used to determine the area where particles are created. In most other tools, it is used to restrict the tool's effect to a geometric region or plane. There are seven types of regions, each with its own controls. Only one emitter region can be set for a single pEmitter node. If the pRender is set to 2D, then the emitter region will produce particles along a flat plane in Z space. 3D emitter regions possess depth and can produce particles inside a user-defined, three-dimensional region.

**Region Mode Menu**
The Region Mode menu includes seven types of regions to define the area, each with its controls.

- **All:** In 2D, the particles will be created anywhere within the boundaries of the image. In 3D, this region describes a cube 1.0 x 1.0 x 1.0 units in size.
- **Bézier:** Bézier mode uses a user-created polyline to determine the region where particles are created. The Bézier mode works in both 2D and 3D modes; however, the Bézier polyline region can only be created in 2D.
  To animate the shape of the polyline over time or to connect it to another polyline, right-click the Shape animation label at the bottom of the inspector and select the appropriate option from the pop up menu.
- **Bitmap:** A Bitmap source from one of the other nodes in the composition will be used as the region where particles are born.
- **Cube:** A full 3D Cube is used to determine the region within which particles are created. The height, width, depth, and XYZ positions can all be determined by the user and be animated over time.
- **Line:** A simple line control determines where particles are created. The line is composed of two end-points, which can be connected to Paths or Trackers, as necessary. This type of emitter region includes X, Y, and Z position controls for the start and end of the line.
- **Mesh:** Any 3D Mesh can be used as a region. In Mesh mode, the region can also be restricted by the Object ID using the ObjectID slider. See below for a more in-depth explanation of how mesh regions work.
- **Rectangle:** The Rectangle region type is like the Cube type, except that this region has no depth in Z space. Unlike other 2D emitter regions, this region can be positioned and rotated in Z space.
- **Sphere:** This is a spherical 3D emitter region with Size and Center Z controls. Sphere (3D) is the default region type for a new pEmitter node.

**Mesh Regions**

**Region Type**
The Region Type drop-down menu allows you to choose whether the region will include the inner volume or just the surface. For example, with a pEmitter mesh region, this determines if the particles emit from the surface or the full volume.

**Winding Rule and Winding Ray Direction**
The Winding Rule and Winding Ray Direction parameters determine how the mesh region handles particle creation with meshes that are not closed, as is common in many meshes imported from external applications. This scenario is common with imported mesh geometry, and even geometry that appears closed will frequently appear to “leak” thanks to improperly welded vertices.
To determine if a particle is in the interior of an object, a ray is cast from infinity through that particle and then out to -infinity. The Winding Ray Direction determines which direction this ray is cast in. Each time a surface is pierced by the ray, it is recorded and added onto a total to generate a winding number. Going against a surfaces normal counts as +1, and going with the normal counts as -1.

The Winding Rule is then used to determine what is inside/outside. For example, setting the Winding Rule to Odd means that only particles with odd values for the winding number are kept when creating the particles. The exact same approach is used to ensure that polylines that intersect themselves are closed properly.

For example, the following node tree and image show two image planes being used as a mesh region for particle creation.

By setting the region’s Winding Ray Direction to the Z (blue) axis, this mesh can then be treated as a closed volume for purposes of particle creation, as pictured below.

Limit By ObjectID
Selecting this checkbox allows the Object ID slider to select the ObjectID used as part of the region.
Style Tab

The Style tab exists in the pEmitter, pSpawn, pChangeEvent, and pImage Emitter. It controls the appearance of the particles, allowing the look of the particles to be designed and animated over time.

Style

The Style menu provides access to the various types of particles supported by the Particle Suite. Each style has its specific controls, as well as controls it will share with other styles.

- **Point Style:** This option produces particles precisely one pixel in size. Controls that are specific to Point style are Apply Mode and Sub Pixel Rendered.

- **Bitmap Style and Brush Style:** Both the Bitmap and Brush styles produce particles based on an image file. The Bitmap style relies on the image from another node in the node tree, and the Brush style uses image files in the Brushes directory. They both have numerous controls for affecting their appearance and animation, described below.

- **Blob Style:** This option produces large, soft spherical particles, with controls for Color, Size, Fade timing, Merge method, and Noise.

- **Line Style:** This style produces straight line-type particles with optional “falloff.” The Size to Velocity control described below (under Size Controls) is often useful with this Line type. The Fade control adjusts the amount of falloff over the length of the line.

- **Point Cluster Style:** This style produces small clusters of single-pixel particles. Point Clusters are similar to the Point style; however, they are more efficient when a large quantity of particles is required. This style shares parameters with the Point style. Additional controls specific to Point Cluster style are Number of Points and Number Variance.

Style Options

The following options appear only on some of the styles, as indicated below.

Apply Mode (Point and Point Cluster)

This control applies only to 2D particles; 3D particle systems are not affected.

- **Add:** Overlapping particles are combined by adding together the color values of each particle.

- **Merge:** Overlapping particles are merged.

Sub Pixel Rendered (Point and Point Cluster)

This checkbox determines whether the point particles are rendered with Sub Pixel precision, which provides smoother-looking motion but blurrier particles that take slightly longer to render.

Number of Points and Variance (Point Cluster)

The value of this control determines how many points are in each Point Cluster.

Animate (Bitmap Style)

If the Bitmap source is a movie file or image sequence, this menu determines which frame is grabbed from the source and applied to newly-created particles.

- **Over Time:** All particles use the image produced by the Style Bitmap node at the current time, and change to each successive image together in step, as time increases. A particle created at frame 1 will contain the image at frame 1 of the Style Bitmap. At frame 2, the original particle will use the image from frame 2, and so will any new particles. All created particles will share the same bitmap image from their source at all times.
- **Particle Age**: Each particle animates through the sequence of images provided by the Style Bitmap node, independently of other particles. In other words, an individual particle’s appearance is taken from the Style Bitmap node at successive times, indexed by its age.

- **Particle Birth Time**: New particles take the image from the Style Bitmap node at the current time and keep it unchanged until the end of the particle’s lifespan. Thus, particles generated on a given frame will all have the same appearance and will stay that way.

**Time Offset (Bitmap Style)**
This control allows the Bitmap source frame to be offset in time from the current frame.

**Time Scale (Bitmap Style)**
This control scales the time range of the source bitmap images by a specified amount. For example, a scale of 2 will cause the particle created at frame 1 to be read from the bitmap source at frame 2.

**Gain (Bitmap and Brush Style)**
This control applies a gain correction to the image used as the bitmap. Higher values produce a brighter image, whereas lower values reduce both the brightness and the transparency of the image.

**Style Bitmap (Bitmap Style)**
This control appears when the Bitmap style is selected, along with an orange Style Bitmap input on the node’s icon in the Node view. Connect a 2D node to this input to provide images to be used for the particles. You can do this on the Node view, or you may drag and drop the image source node onto the Style Bitmap control from the Node Editor or Timeline, or right-click on the control and select the desired source from the Connect To menu.

**Brush (Brush Style)**
This menu shows the names of any image files stored in the Brushes directory. The location of the Brushes directory is defined in the Preferences dialog, under Path Maps. The default is the Brushes subdirectory within Fusion’s install folder. If no images are in this directory, the only option in the menu will be None, and no particles will be rendered.

**Noise (Blob Style)**
Increasing this control’s value will introduce grain-type noise to the blobby particle.

**Fade (Line Style)**
The Fade control adjusts the falloff over the line particle’s length.
The default value of 1.0 causes the line to fade out completely by the end of the length.
Color Controls
The Color Controls select the color and Alpha values of the particles generated by the emitter.

Color Variance
These range controls provide a means of expanding the colors produced by the pEmitter. Setting the Red variance range at -0.2 to +0.2 will produce colors that vary 20% on either side of the red channel, for a total variance of 40%. If the pEmitter is set to produce R0.5, G0.5, B0.5 (pure gray), the variance shown above will produce points with a color range between R0.3, G0.5, B0.5, and R0.7, G0.5, B0.5.

To visualize color space as values between 0-256 or as 0-65535, change the values used by Fusion using the Show Color As option provided in the General tab within the Preferences dialog.

Lock Color Variance
This checkbox locks the color variance of the particles. Unlocking this allows the color variance to be applied differently to each color channel, giving rise to a broader range of colors.

Particles Color Over Life controls

Color Over Life
This standard gradient control allows for the selection of a range of color values to which the particle will adhere over its lifetime.

The left point of the gradient represents the particle color at birth. The right point shows the color of the particle at the end of its lifespan.

Additional points can be added to the gradient control to cause the particle color to shift throughout its life.

This type of control can be useful for fire-type effects (for example, the flame may start blue, turn orange and end a darker red). The gradient itself can be animated over time by right-clicking on the control and selecting Animate from the contextual menu. All points on the gradient will be controlled by a single Color Over Life spline, which controls the speed at which the gradient itself changes. You may also use the From Image modifier, which produces a gradient from the range of colors in an image along a line between two points.
Chapter 104

Position Nodes

This chapter details the Position nodes available in Fusion.

The abbreviations next to each node name can be used in the Select Tool dialog when searching for tools and in scripting references.

For purposes of this document, node trees showing MediaIn nodes in DaVinci Resolve are interchangeable with Loader nodes in Fusion Studio, unless otherwise noted.
Volume Fog [VLF]

Volume Fog Node Introduction
The Volume Fog node is used to create sophisticated volumetric fog on images containing XYZ Position channels.

As opposed to 3D-rendered volumetric fog, it works on 2D images and delivers much faster results and interactive feedback when setting up the fog. See the “WPP Concept” section at the end of this chapter for further explanation of how this technology works and to learn about the required imagery.

Basic Node Setup
The Volume Fog node takes an image input; in the example below, it is a Renderer 3D with World Position enabled in the output channels. Another input is the 3D scene, which contains the camera. A Fast Noise node generates the fog texture.

Inputs
The following inputs appear on the Volume Fog node in the Node Editor.

- **Image**: The orange input accepts the primary image where the fog will be applied. This image contains a World Position Pass in the XYZ Position channels.

- **Fog Image**: The green Fog image input is for creating volumetric fog with varying depth and extent; a 2D image can be connected here. A good starting point is to use a Fast Noise at a small resolution of 256 x 256 pixels.

- **Effect Mask**: The blue input is for a mask shape created by polylines, basic primitive shapes, paint strokes, or bitmaps from other tools. Connecting a mask to this input limits the fog to certain areas.

- **Scene Input**: The magenta scene input accepts a 3D scene containing a 3D Camera.
Shape Tab
The Shape tab defines the size and location of the fog volume. You can either use the Pick buttons to select the location and orientation in the viewer or use the Translation, Rotation, and Scale controls.

Shape
This menu switches between a basic spherical or rectangular volume to be placed in your image. These volumes can then be further refined using the Fog image and effect mask.

Pick
Drag the Pick button into the viewer to select the XYZ coordinates from any 3D scene or 2D image containing XYZ values, such as a rendered World Pass, to position the center of the Volume object. When picking from a 2D image, make sure it’s rendered in 32-bit float to get full precision.

X, Y, Z Offset
These controls can be used to position the center of the fog volume manually or can be animated or connected to other controls in Fusion.

Rotation Pick
Drag the Pick button into the viewer to select the rotational values from any 3D Scene or 2D image containing those values, like an XYZ-Normal-Pass, to reorient the fog volume.

When picking from a 2D image, like an XYZ Normal pass, make sure it’s rendered in 32-bit float to get full precision and accurate rotational values.

X, Y, Z Rotation
Use these controls to rotate the fog volume around its center.
**X, Y, Z Scale**
Scale the fog volume in any direction from its center to refine further the overall Size value specified below.

**Size**
The overall size of the fog volume created.

**Soft Edge**
Controls how much the fog volume is faded toward the center from its perimeter to achieve a softer look.

![Color Tab](image)

**Color Tab**
The Color tab controls the detail and color of the fog.

**Adaptive Samples**
Volumes images consist of multiple layers, so there may be 64 layers in a volume. This checkbox adjusts the rendering algorithm for how to best blend those layers.

**Dither**
Applies a form of noise to improve the blending and hide visible layer differences.

**Samples**
Determines how many times a “ray” shot into the volume will be evaluated before the final image is created. Not unlike raytracing, higher values lead to more detail inside the volume but also increase render times.
**Z Slices**
The higher the Z Slices value, the more images from the connected Fog image sequence will be used to form the depth of the volume.

You can, for example, use a Fast Noise with a high Seethe Rate to create such a sequence of images. Be careful with the resolution of the images. Higher resolutions can require a large amount of memory. As a rule of thumb, a resolution of 256 x 256 pixels with 256 Z Slices (i.e., forming a 256 x 256 x 256 cubic volume, which will use up to 256 MB for full color 32-bit float data) should give you a good starting point.

**First Slice Time**
Determines which frame of the Global Range is used to deliver the first slice from the connected fog image sequence.

Make sure that both Global In and Global Out, as well as the valid range of your source node, fall within the range of First Slice Time + Z Slices.

**Color**
Allows you to modify the color of the fog generated. This will multiply over any color provided by the connected Fog image.

**Gain**
Increases or decreases the intensity of the fog. More Gain will lead to a stronger glow and less transparency in the fog. Lower values let the fog appear less dense.

**Subtractive/Additive Slider**
Similar to the Merge node, this value controls whether the fog is composed onto the image in Additive or Subtractive mode, leading to a brighter or dimmer appearance of the fog.

**Fog Only**
This option outputs the generated fog on a black background, which then can be composited manually or used as a mask on a Color Corrector for further refinement.

**Noise Tab**
The Noise tab controls the shape and pattern of the noise added to the fog.

**Detail**
Increase the value of this slider to produce a greater level of detail in the noise result. Larger values add more layers of increasingly detailed noise without affecting the overall pattern. High values take longer to render but can produce a more natural result.
**Gain**
This control increases or decreases the brightest parts of the noise map.

**Brightness**
This control adjusts the overall brightness of the noise map, before any gradient color mapping is applied. In Gradient mode, this produces a similar effect to the Offset control.

**Translation**
Use the Translation coordinate control to pan and move the noise pattern.

**Noise Rotation**
Use the Rotation controls to orient the noise pattern in 3D.

**Seethe**
Adjust this thumbwheel control to interpolate the noise map against a different noise map. This will cause a crawling shift in the noise, like it was drifting or flowing. This control must be animated to affect the noise over time.

**Discontinuous**
Normally, the Noise function interpolates between values to create a smooth, continuous gradient of results. Enable this checkbox to create hard discontinuity lines along some of the noise contours. The result will be a dramatically different effect.

**Inverted**
Select this checkbox to invert the noise, creating a negative image of the original pattern. This is most effective when Discontinuous is also enabled.

---

**Camera Tab**
For a perfect evaluation of a fog volume, a camera or 3D scene can be connected to the Scene input of the node.

**Camera**
If multiple cameras are available in the connected Scene input, this menu allows the selection of the correct camera needed to evaluate the fog volume. Instead of connecting a camera, position values can be provided manually or by connecting the XYZ values to other controls.

**Translation Pick**
Drag the Pick button into the viewer to select XYZ coordinates from any 3D scene or 2D image containing XYZ values, like a rendered World Pass, to define the center of the camera. When picking from a 2D image, make sure it’s rendered in 32-bit float to get full precision.
**X, Y, Z Offset**
These controls can be used to define the center of the camera manually or can be animated or connected to other controls in Fusion.

---

**Light Tab**
To utilize the controls in the Light tab, you must have actual lights in your 3D scene. Connect that scene, including Camera and Lights, to the 3D input of the node.

**Do Lighting**
Enables or disables lighting calculations. Keep in mind that when not using OpenCL (i.e., rendering on the CPU), these calculations may become a bit slow.

**Do In-Scattering**
Enables or disables light-scattering calculations. The volume will still be lit according to the state of the Do Lighting checkbox, but scattering will not be performed.

**Light Samples**
Determines how accurate the lighting is calculated. Higher values mean more accurate calculation at the expense of longer render times.
Density
This is similar to scattering in that it makes the fog appear thicker. With a high amount of scattering, though, the light will be scattered out of the volume before it has had much chance to travel through the fog, meaning it won’t pick up a lot of the transmission color. With a high density instead, the fog still appears thicker, but the light gets a chance to be transmitted, thus picking up the transmission color before it gets scattered out. Scattering is affected by the light direction when Asymmetry is not 0.0. Density is not affected by light direction at all.

Scattering
Determines how much of the light bouncing around in the volume ends up scattering the light out of the fog. If the light scatters more, or more accurately, then there’s a higher probability of the light being scattered out of the volume, hence less light is left to continue through the fog. This option can make the fog seem denser.

Asymmetry
Determines in what direction the light is scattered. A value of 0 produces uniform, or isotropic, scattering, meaning all directions have equal probability. A value greater than 0 causes “forward scattering,” meaning the light is scattered more into the direction of the light rays. This is similar to what happens with water droplets in clouds. A value smaller than 0 produces “back scattering,” where the light is more scattered back toward the original light source.

Transmission
Defines the color that is transmitted through the fog. The light that doesn’t get scattered out will tend toward this color. It is a multiplier, though, so if you have a red light, but blue transmission, you won’t see any blue.

Reflection
Changes the intensity of the light that is scattered out. Reflection can be used to modify the overall color before Emission is added. This will be combined with the color channels of the volume texture and then used to scale the values. The color options and the color channels of the volume texture are multiplied together, so if the volume texture were red, setting the Reflection color options to blue would not make the result blue. In such a case, they will multiply together to produce black.

Emission
This adds a bit of “glowing” to the fog, adding energy/light back into the calculation. If there are no lights in the scene, and the fog emission is set to be 1.0, the results are similar to no lighting, like turning off the Do Lighting option. Glowing can also be done while producing a different kind of look, by having a Transmission greater than 1. This, however, would never happen in the real world.

Common Controls

Settings Tab
The Settings tab in the Inspector is also duplicated in other Position nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.
Examples
In these examples, we are looking at a volume from the outside. On the left, you see how the Volume Fog looks with straight accumulation. That means the Do Lighting option is turned off.

On the right, you see the same volume with lighting/scattering turned on, and a single point light.

On the left with straight accumulation; in the middle with lighting, scattering, and a single point light; and on the right, the light in the scene has been moved, which also influences the look of the volume.

Volume Mask [VLM]

Volume Mask Node Introduction
The Volume Mask node is used to create volumetric masks from images containing XYZ Position channels.

This can, for example, be used to isolate objects for color correction without the need to track or rotoscope the scene. See the "WPP Concept" section later in this chapter for further explanation on how this technology works and to learn about the required imagery.
**Inputs**

The following three inputs appear on the Volume Mask node in the Node Editor:

- **Image:** The orange image input accepts a 2D image containing a World Position Pass in the XYZ Position channels.
- **Mask Image:** An image can be connected to the green mask image input for refining the mask.
- **Effect Mask:** The blue input is for a mask shape created by polylines, basic primitive shapes, paint strokes, or bitmaps from other tools. Connecting a mask to this input limits the volume mask to certain areas.

**Basic Node Setup**

Below, a MediaIn labeled RGBA contains the main rendered image from a 3D scene. A World Position Pass from a 3D-rendered scene is labeled WPP_PASS. The Channel Booleans node is used to map the X position pass to the red channel, Y to the green channel, and Z to the blue channel. The Volume Mask tool extracts the 3D position information from the World Position Pass to place a mask in 3D space. The mask is then used as an effect mask on a color corrector to selectively color correct objects in a 3D scene.

A Volume Mask tool takes advantage of World Position Pass for color correction in a 3D scene.

**Inspector**

![Volume Mask Node Inspector](image-url)
Shape Tab
The Shape tab defines the size and location of the Volume Mask. You can either use the Pick buttons to select the location and orientation in the viewer or use the Translation, Rotation, and Scale controls.

Shape
This menu switches between a spherical or rectangular mask to be placed in your image. The mask can be further refined using the mask image input.

Translation Pick
Drag the Pick button into the viewer to select XYZ coordinates from any 3D scene or 2D image containing XYZ values, like a rendered World Pass, to position the center of the Volume Mask. When picking from a 2D image, make sure it’s rendered in 32-bit float to get full precision.

X, Y, Z Offset
These controls can be used to position the center of the mask manually or can be animated or connected to other controls in Fusion.

Rotation Pick
Drag the Pick button into the viewer to select rotational values from any 3D scene or 2D image containing those values, like an XYZ Normal pass, to reorient the mask.

When picking from a 2D image, like an XYZ Normal pass, make sure it’s rendered in 32-bit float, and use World Space coordinates to get full precision and the correct rotational values.

X, Y, Z Rotation
Use these controls to rotate the mask around its center.

X, Y, Z Scale
Scale the mask in any direction from its center to further refine the overall Size value specified below.

Size
The overall size, in X, Y, and Z, of the mask created.

Soft Edge
Controls how much the Volume is faded toward the center from its perimeter to achieve a softer look.
Color Tab
The Color tab controls the color and blending of the mask image.

Color
Allows you to modify the color of the generated Volume Mask. This will add to any color provided by the connected mask image.

Subtractive/Additive Slider
Similar to the Merge node, this value controls whether the mask is composed onto the image in Additive or Subtractive mode, leading to a brighter or dimmer appearance of the mask.

Mask Only
Outputs the generated mask on a black background, which then can be used as a mask on a Color Corrector for further refinement.

Camera Tab
For a perfect evaluation of a Volume, a camera or 3D scene can be connected to the Scene input of the node.
Camera
If multiple cameras are available in the connected Scene input, this drop-down menu allows you to choose the correct camera needed to evaluate the Volume.
Instead of connecting a camera, position values can also be provided manually or by connecting the XYZ values to other controls.

Translation Pick
Drag the Pick button into the viewer to select XYZ coordinates from any 3D scene or 2D image containing XYZ values, like a rendered World Pass, to define the center of the camera.
When picking from a 2D image, make sure it’s rendered in 32-bit float to get full precision.

X, Y, Z Offset
These controls can be used to define the center of the camera manually or can be animated or connected to other controls in Fusion.

Common Controls
Settings Tab
The Settings tab in the Inspector is also duplicated in other Position nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.

Z to World Pos [Z2W]

Z to World Pos Node Introduction
The Z to World Pos node is used to either generate a World Position Pass from a Z channel and a 3D Camera or a Z channel from a World Position Pass and a 3D Camera.
Creating a World Position Pass from Z-depth can be useful when your 3D application is not capable of creating a WPP.
It can also be used when a 3D-tracking software outputs a per-pixel Z-depth together with the 3D Camera. Thus, the Volume Mask and Volume Fog could be applied to real-world scenes.
The quality of the resulting WPP depends mainly on the quality of the incoming Z channel.
See the “WPP Concept” section for further explanation on how this technology works and to learn about the required imagery.
**Inputs**

The following inputs appear on the node tile in the Node Editor:

- **Image**: The orange image input accepts an image containing a World Position Pass or a Z-depth pass, depending on the desired operation.

- **Effect Mask**: The blue input is for a mask shape created by polylines, basic primitive shapes, paint strokes, or bitmaps from other tools. Connecting a mask to this input limits the World Position Pass to certain areas.

- **Scene Input**: The magenta scene input accepts a 3D scene input containing a 3D Camera.

**Basic Node Setup**

Below, a MediaIn labeled RGBA contains the main rendered image from a 3D scene. A Z-depth pass from a 3D-rendered scene is labeled Z_PASS. The Channel Booleans node is used to map the Aux Z channel into either the red, green, or blue channel. The Z to World Position node is placed after the Channel Booleans node, and an imported 3D camera that matches the RGBA image is connected to the 3D camera input on the Z to World Position node. A Channel Booleans node is placed after the Z to World Position node, which can remap the X, Y, and Z positions for use in other nodes.

![A Z to World Position node creates a World Position Pass from a Z-depth pass](image)

**Inspector**

**Controls Tab**

The Controls tab determines whether you are creating a World Position Pass or a Z channel. If there is more than one camera in the connected scene, this tab also selects the camera to use for the calculation.

**Mode**

This menu switches between creating a Z channel from a World Position Pass or vice versa.
**Camera**
If multiple cameras are available in the connected Scene input, this drop-down menu allows you to choose the correct camera needed to evaluate the image.

**Common Controls**

**Settings Tab**
The Settings tab in the Inspector is also duplicated in other Position nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.

**WPP Concept**
The Position nodes in Fusion offer an entirely new way of working with masks and Volumetrics for footage containing XYZ Position channels. Z to World offers the option to create those channels out of a Z channel and 3D Camera information. For this overview, we refer to the World Position Pass as WPP.

**What Is a WPP?**
The WPP interprets each pixel’s XYZ position in 3D space as an RGB color value. For instance, if a pixel sits at 0/0/0, the resulting pixel has an RGB value of 0/0/0 and thus will be black. If the pixel sits at 1/0/0 in the 3D scene, the resulting pixel is entirely red. Of course, if the coordinates of the pixel are something like -60/75/123, WPP interprets those values as RGB color values as well.

Due to the potentially enormous size of a 3D scene, the WPP channel should always be rendered in 32-bit floating point to provide the accuracy needed. The image below shows a 3D rendering of a scene with its center sitting at 0/0/0 in 3D Space and the related WPP. For better visibility, the WPP is normalized in this example.

**Different Coordinate Spaces**
Rendering WPPs can occur in different Coordinate Spaces. These include World Space, Eye Space, and Object Space. The image below depicts how those different spaces look, although the nodes in Fusion require the WPP rendering to occur in World Space.
The Scene Input

The nodes offer a Scene input, which can either be a 3D camera or a 3D scene containing a camera. While the camera is vital for the Z to World node, Volume Mask and Volume Fog can generate their output without any camera attached or with the camera position set to 0/0/0.

However, connecting a camera that lines up with the original camera the WPP has been rendered from, or setting the camera's position manually, dramatically improves the accuracy and look of the resulting Fog or mask.

The “Invisible Sphere”

The example scene shown so far has an empty background, meaning there is nothing in the scene apart from the ground plane and the cubes.

If applying fog to a scene like that, which is larger than the ground plane, the result will look similar to the “w/o Sphere” example shown below because, with no WPP information outside the ground plane, the resulting value is 0/0/0, and the fog fills that area as well.

To get around that, you can add an invisible bounding sphere to your scene to create "dummy" WPP values to help the Fog node to create the correct volume as shown in the “with Sphere” example below.
The Common Controls

Nodes that handle Position operations share several identical controls in the Inspector. This section describes controls that are common among Position nodes.

Inspector

Settings Tab

The Settings tab in the Inspector can be found on every tool in the Position category. The controls are consistent and work the same way for each tool.

Blend

The Blend control is used to blend between the tool’s original image input and the tool’s final modified output image. When the blend value is 0.0, the outgoing image is identical to the incoming image. Normally, this will cause the tool to skip processing entirely, copying the input straight to the output.

Process When Blend is 0.0

The tool is processed even when the input value is zero. This can be useful if the node is scripted to trigger a task, but the node’s value is set to 0.0.
**Red/Green/Blue/Alpha Channel Selector**
These four buttons are used to limit the effect of the tool to specified color channels. This filter is often applied after the tool has been processed.

For example, if the Red button on a Blur tool is deselected, the blur will first be applied to the image, and then the red channel from the original input will be copied back over the red channel of the result.

There are some exceptions, such as tools for which deselecting these channels causes the tool to skip processing that channel entirely. Tools that do this will generally possess a set of identical RGBA buttons on the Controls tab in the tool. In this case, the buttons in the Settings and the Controls tabs are identical.

**Apply Mask Inverted**
Enabling the Apply Mask Inverted option inverts the complete mask channel for the tool. The mask channel is the combined result of all masks connected to or generated in a node.

**Multiply by Mask**
Selecting this option will cause the RGB values of the masked image to be multiplied by the mask channel's values. This will cause all pixels of the image not included in the mask (i.e., set to 0) to become black/transparent.

**Use Object/Use Material (Checkboxes)**
Some 3D software can render to file formats that support additional channels. Notably, the EXR file format supports Object and Material ID channels, which can be used as a mask for the effect. These checkboxes determine whether the channels will be used if present. The specific Material ID or Object ID affected is chosen using the next set of controls.

**Correct Edges**
This checkbox appears only when the Use Object or Use Material checkboxes are selected. It toggles the method used to deal with overlapping edges of objects in a multi-object image. When enabled, the Coverage and Background Color channels are used to separate and improve the effect around the edge of the object. If this option is disabled (or no Coverage or Background Color channels are available), aliasing may occur on the edge of the mask.

For more information on the Coverage and Background Color channels, see Chapter 4, “Understanding Image Channels and Node Processing” in the Fusion Studio Reference Manual or Chapter 56 in the DaVinci Resolve Reference Manual.

**Object ID/Material ID (Sliders)**
Use these sliders to select which ID will be used to create a mask from the object or material channels of an image. Use the Sample button in the same way as the Color Picker: to grab IDs from the image displayed in the viewer. The image or sequence must have been rendered from a 3D software package with those channels included.
Motion Blur

- **Motion Blur**: This toggles the rendering of Motion Blur on the tool. When this control is toggled on, the tool’s predicted motion is used to produce the motion blur caused by the virtual camera’s shutter. When the control is toggled off, no motion blur is created.

- **Quality**: Quality determines the number of samples used to create the blur. A quality setting of 2 will cause Fusion to create two samples to either side of an object’s actual motion. Larger values produce smoother results but increase the render time.

- **Shutter Angle**: Shutter Angle controls the angle of the virtual shutter used to produce the motion blur effect. Larger angles create more blur but increase the render times. A value of 360 is the equivalent of having the shutter open for one full frame exposure. Higher values are possible and can be used to create interesting effects.

- **Center Bias**: Center Bias modifies the position of the center of the motion blur. This allows for the creation of motion trail effects.

- **Sample Spread**: Adjusting this control modifies the weighting given to each sample. This affects the brightness of the samples.

Use GPU

The Use GPU menu has three settings. Setting the menu to Disable turns off GPU hardware-accelerated rendering. Enabled uses the GPU hardware for rendering the node. Auto uses a capable GPU if one is available and falls back to software rendering when a capable GPU is not available.

Hide Incoming Connections

Enabling this checkbox can hide connection lines from incoming nodes, making a node tree appear cleaner and easier to read. When enabled, empty fields for each input on a node will be displayed in the Inspector. Dragging a connected node from the node tree into the field will hide that incoming connection line as long as the node is not selected in the node tree. When the node is selected in the node tree, the line will reappear.

Comments

The Comments field is used to add notes to a tool. Click in the empty field and type the text. When a note is added to a tool, a small red square appears in the lower-left corner of the node when the full tile is displayed, or a small text bubble icon appears on the right when nodes are collapsed. To see the note in the Node Editor, hold the mouse pointer over the node to display the tooltip.

Scripts

Three Scripting fields are available on every tool in Fusion from the Settings tab. They each contain edit boxes used to add scripts that process when the tool is rendering. For more details on scripting nodes, please consult the Fusion scripting documentation.
This chapter details the single node found in the Resolve Connect category, available only in standalone Fusion Studio.

The abbreviations next to each node name can be used in the Select Tool dialog when searching for tools and in scripting references.

For purposes of this document, node trees showing MediaIn nodes in DaVinci Resolve are interchangeable with Loader nodes in Fusion Studio, unless otherwise noted.
Contents

External Matte Saver [EMS] 2349
External Matte Saver [EMS]

The External Matte Saver node

NOTE: The Resolve Connect category and External Matte Saver node are available only in Fusion Studio.

External Matte Saver Node Introduction

The External Matte Saver node renders multiple mattes into multiple channels of an EXR file. This file is intended to import into DaVinci Resolve’s Color page as an efficient way to deliver multiple mattes for color grading. To perform the same operation with a traditional Saver node, a Channel Boolean is needed to place each matte into a channel, and then name that channel in the Saver. It requires a bit more of a set up. This node streamlines the process by providing multiple inputs and naming the channel based on the node.

Inputs

By default, the node provides a single input for a 2D image you want to save as a matte.

- Input: Although initially there is only a single orange input for a matte to connect, the Inspector provides an Add button for adding additional inputs. Each input uses a new color, but all accept 2D RGBA images.

Basic Node Setup

The External Matte Saver node can be placed at the end of any node tree branch for saving mattes. Below, it is connected to the Delta Keyer as well as three other mattes. Each matte beyond the initial one is connected by clicking the Add button in the Inspector first, and then a new input is provided on the node.
An External Matte Saver node added as a separate branch in a node tree to render the mattes

**Inspector**

**Controls Tab**

The Controls tab is used to name the saved file and determine where on your hard drive the file is stored.

**Filename**

Enter the name you want to use for the EXR file in the Filename field. At the end of the name, append the .exr extension to ensure that the file is saved as an EXR file.

**Browse**

Clicking the Browse button opens a standard file browser window where you can select the location to save the file.

**Mattes Tab**

The Mattes tab is where you set up the number of mattes saved in the file, the name for each channel, and the RGBA channels saved from each input.
Channels menu
The Channels menu allows you to select which channels are saved in the matte. You can choose the Alpha channel, the RGB channels, or the RGBA channels.

Channels Name
The Channels Name field allows you to customize the name of the matte channel you are saving. This name is displayed in DaVinci Resolve’s Color page.

Node Name
The Node Name field displays the source of the matte. This is automatically populated when you connect a node to the input.

Add
Clicking the Add button adds an input on the node and another set of fields for you to configure and name the new matte channel.

Settings Tab
The Settings Tab in the Inspector is similar to settings found in the Saver tool. The controls are consistent and work the same way as the Settings in other tools.

Blend
The Blend control is used to blend between the tool’s original image input and the tool’s final modified output image. When the blend value is 0.0, the outgoing image is identical to the incoming image. Normally, this causes the tool to skip processing entirely, copying the input straight to the output.
**Process When Blend Is 0.0**
The tool is processed even when the input value is zero. This can be useful if processing of this node is scripted to trigger another task, but the value of the node is set to 0.0.

**Red/Green/Blue/Alpha Channel Selector**
These four buttons are used to limit the effect of the tool to specified color channels. This filter is often applied after the tool has been processed.

For example, if the Red button on a Blur tool is deselected, the blur is first applied to the image, and then the red channel from the original input is copied back over the red channel of the result.

There are some exceptions, such as tools for which deselecting these channels causes the tool to skip processing that channel entirely. Tools that do this generally possess a set of identical RGBA buttons on the Controls tab in the tool. In this case, the buttons in the Settings and the Controls tabs are identical.

**Apply Mask Inverted**
Enabling the Apply Mask Inverted option inverts the complete mask channel for the tool. The mask channel is the combined result of all masks connected to or generated in a node.

**Multiply by Mask**
Selecting this option causes the RGB values of the masked image to be multiplied by the mask channel's values. This causes all pixels of the image not included in the mask (i.e., set to 0) to become black/transparent.

**Use Object/Use Material (Checkboxes)**
Some 3D software can render to file formats that support additional channels. Notably, the EXR file format supports Object ID and Material ID channels, which can be used as a mask for the effect. These checkboxes determine whether the channels are used, if present. The specific Material ID or Object ID affected is chosen using the next set of controls.

**Correct Edges**
This checkbox appears only when the Use Object or Use Material checkboxes are selected. It toggles the method used to deal with overlapping edges of objects in a multi-object image. When enabled, the Coverage and Background Color channels are used to separate and improve the effect around the edge of the object. If this option is disabled (or no Coverage or Background Color channels are available), aliasing may occur on the edge of the mask.

For more information on the Coverage and Background Color channels, see Chapter 4, “Understanding Image Channels and Node Processing” in the Fusion Studio Reference Manual or Chapter 56 in the DaVinci Resolve Reference Manual.

**Object ID/Material ID (Sliders)**
Use these sliders to select which ID is used to create a mask from the object or material channels of an image. Use the Sample button in the same way as the Color Picker: to grab IDs from the image displayed in the viewer. The image or sequence must have been rendered from a 3D software package with those channels included.
### Motion Blur

- **Motion Blur**: This toggles the rendering of Motion Blur on the tool. When this control is toggled on, the tool’s predicted motion is used to produce the motion blur caused by the virtual camera’s shutter. When the control is toggled off, no motion blur is created.

- **Quality**: Quality determines the number of samples used to create the blur. A quality setting of 2 causes Fusion to create two samples to either side of an object’s actual motion. Larger values produce smoother results but increase the render time.

- **Shutter Angle**: Shutter Angle controls the angle of the virtual shutter used to produce the motion blur effect. Larger angles create more blur but increase the render times. A value of 360 is the equivalent of having the shutter open for one full frame exposure. Higher values are possible and can be used to create interesting effects.

- **Center Bias**: Center Bias modifies the position of the center of the motion blur. This allows for the creation of motion trail effects.

- **Sample Spread**: Adjusting this control modifies the weighting given to each sample. This affects the brightness of the samples.

### Hide Incoming Connections

Enabling this checkbox can hide connection lines from incoming nodes, making a node tree appear cleaner and easier to read. When enabled, empty fields for each input on a node will be displayed in the Inspector. Dragging a connected node from the node tree into the field will hide that incoming connection line as long as the node is not selected in the node tree. When the node is selected in the node tree, the line will reappear.

### Comments

The Comments field is used to add notes to a tool. Click in the empty field and type the text. When a note is added to a tool, a small red square appears in the lower-left corner of the node when the full tile is displayed, or a small text bubble icon appears on the right when nodes are collapsed. To see the note in the Node Editor, hold the mouse pointer over the node to display the tooltip.

### Scripts

Three Scripting fields are available on every tool in Fusion from the Settings tab. They each contain edit boxes used to add scripts that process when the tool is rendering. For more details on scripting nodes, please consult the Fusion scripting documentation.
This chapter details the Stereo nodes available in Fusion. Stereoscopic nodes are available only in Fusion Studio and DaVinci Resolve Studio.

The abbreviations next to each node name can be used in the Select Tool dialog when searching for tools and in scripting references.

For purposes of this document, node trees showing MediaIn nodes in DaVinci Resolve are interchangeable with Loader nodes in Fusion Studio, unless otherwise noted.

Anaglyph [ANA]

The Anaglyph node

NOTE: The Anaglyph node is available only in Fusion Studio and DaVinci Resolve Studio.

Anaglyph Node Introduction

The Anaglyph node is used to create stereoscopic images by combining separate left eye and right eye images. It is most commonly used at the end of a stereoscopic workflow to display or deliver the final result.

Inputs

The three inputs on the Anaglyph node are the left eye input, right eye input, and effect mask.

- Left Eye Input: The orange input is used to connect the 2D image representing the left eye in the stereo comp.
- Right Eye Input: The green input is used to connect the 2D image representing the right eye in the stereo comp.
- Effect Mask: The blue input is for a mask shape created by polylines, basic primitive shapes, paint strokes, or bitmaps from other tools. Connecting a mask to this input limits the stereoscopic creation to only those pixels within the mask.

Basic Node Setup

The Anaglyph node is usually placed at the end of a stereoscopic node tree to display the final result.

When using separate images for the left and right eye, the left eye image is connected to the orange input, and the right eye image is connected to the green input of the node. When using either horizontally or vertically stacked images containing both left eye and right eye information, these only connect to the orange input.

An Anaglyph node using separate left and right eye inputs
Inspector

Controls Tab
Using the parameters in the Controls tab, the separate images are combined to create a stereoscopic output.

Color Type Menu
The Color Type menu allows you to choose between different color encodings to fit your preferred display device. To match your stereo glasses, you can choose between Red/Cyan, Red/Green, Red/Blue, Amber/Blue, and Green/Magenta encoding; Red/Cyan is the most commonly used.

Method
In addition to the color used for encoding the image, you can also choose five different methods from the Method menu: Monochrome, Half-color, Color, Optimized, and Dubois. These methods are described below.
• **Monochrome:** Assuming you are using a Red/Cyan Color Type, the left eye contains the luminance of the left image and is placed in the output of the red channel. The right eye contains the luminance of the right image and is placed in the output green and blue channels.

• **Half-Color:** Assuming you are using a Red/Cyan Color Type, the left eye contains the luminance of the left image and is placed in the output of the red channel. The right eye contains the color channels from the right image that match the glasses’ color for that eye.

• **Color:** The left eye contains the color channels from the left image that match the glasses’ color for that eye. The right eye contains the color channels from the right image that match the glasses’ color for that eye.

• **Optimized:** Used with red/cyan glasses, for example, the resulting brightness of what shows through the left eye is substantially less than the brightness of the right eye. Using typical ITU-R 601 ratios for luminance as a guide, the red eye would give 0.299 brightness, while the cyan eye would give 0.587+0.114=0.701 brightness—over twice as bright. The difference in brightness between the eyes can produce what are referred to as retinal rivalry or binocular rivalry, which can destroy the stereo effect. The Optimized method generates the right eye in the same fashion as the Color method. The left eye also uses the green and blue channels but in combination with increased brightness that reduces retinal rivalry. Since it uses the same two channels from each of the source images, it doesn’t reproduce the remaining one. For example, 1.05x the green and 0.45x the blue channels of the left image is placed in the red output channel, and the green and blue channels of the right image are placed in the output green and blue channels. Red from both the left and right images is not used.
• **Dubois:** Images with fairly saturated colors can produce retinal rivalry with the Half-color, Color, and Optimized methods because the color is visible in only one eye. For example, with red/cyan glasses, a saturated green object looks black in the red eye, and green in the cyan eye. The Dubois method uses the spectral characteristics of (specifically) red/cyan glasses and CRT (Trinitron) phosphors to produce a better anaglyph and in the end, tends to reduce retinal rivalry caused by such color differences in each eye. It also tends to reduce ghosting produced when one eye ‘leaks’ into the other eye. The particular calculated matrix in Fusion is designed for red/cyan glasses and isn’t available for other glasses types. Since it is also derived from CRT color primaries, it may not give the best results with a common LCD (though it’ll still likely produce less retinal rivalry and ghosting than the other methods).

![Dubois Image](image)

**Swap Eyes**
Allows you to swap the left and right eye inputs easily.

**Horiz Stack**
Takes an image that contains both left and right eye information stacked horizontally. These images are often referred to as “crosseyed” or “straight stereo” images. You only need to connect that one image to the orange input of the node. It then creates an image half the width of the original input, using the left half of the original image for the left eye and the right half of the original image for the right eye. Color encoding takes place using the specified color type and method.

**Vert Stack**
Takes an image that contains both left and right eye information stacked vertically. You only need to connect that one image to the orange input of the node. It then creates an image half the height of the original input, using the bottom half of the original image for the left eye and the top half of the original image for the right eye. Color encoding takes place using the specified color type and method.

**Common Controls**

**Settings Tab**
The Settings tab in the Inspector is also duplicated in other Stereo nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.
Combiner [COM]

The Combiner node

**NOTE:** The Combiner node is available only in Fusion Studio and DaVinci Resolve Studio.

Combiner Node Introduction

The Combiner node takes two stereoscopic inputs and creates so-called "stacked images" with the left and right eye, either side by side or on top of each other. Stereoscopic nodes are available only in Fusion Studio and DaVinci Resolve Studio.

**Inputs**

The two inputs on the Combiner node are used to connect the two images that get combined in a stacked stereo image.

- **Image 1 Input:** The orange input is used to connect the 2D image representing the left eye in the stereo comp.
- **Image 2 Input:** The green input is used to connect the 2D image representing the right eye in the stereo comp.

**Basic Node Setup**

Below, a left eye image and right eye image are connected to the Combiner node to create a single stacked stereo image. It can be more efficient to render out the stacked stereo images as EXR files than to generate the disparity on-the-fly.

**Inspector**

Left and right eye images are connected into a Combiner node to generate a stacked stereo image.
Controls Tab
To stack the images, the left eye image is connected to the orange input, and the right eye image is connected to the green input of the node.

Combine
The Combine menu provides three options for how the two images are made into a stacked stereo image.

- **None**: No operation will take place. The output image is identical to the left eye input.
- **Horiz**: Both images will be stacked horizontally, or side-by-side, with the image connected to the left eye input on the left. This will result in an output image double the width of the input image.
- **Vert**: Both images will be stacked vertically, or on top of each other, with the image connected to the left eye input on the bottom. This will result in an output image double the height of the input image.

Swap Eyes
Allows you to easily swap the left and right eye input.

Add Metadata
Metadata is carried along with the images and can be added to the existing metadata using this checkbox. To view Metadata, use the viewer’s SubView menu set to Metadata.

Common Controls

Settings Tab
The Settings tab in the Inspector is also duplicated in other Stereo nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.

Disparity [DIS]

![Disparity node](image)

**NOTE:** The Disparity node is available only in Fusion Studio and DaVinci Resolve Studio.

Disparity Node Introduction
Disparity generates the left/right shift between the frames in a stereo pair. It also generates the vertical disparity between the left/right images, which is usually a lot smaller than the horizontal disparity and ideally should be 0 to minimize viewing discomfort. When viewing the output of the Disparity node in the views, the human eye can distinguish quality/detail in the Disparity map better by looking at either the grayscale X disparity or Y disparity rather than looking at the combined XY disparity as a Red/Green color image.
The generated disparity is stored in the output image’s Disparity aux channel, where the left image contains the left > right disparity, and the right image contains the right > left disparity. Because disparity works based on matching regions in the left eye to regions in the right eye by comparing colors and gradients of colors, colors in the two eyes must be as similar as possible. Thus, it is a good idea to color correct ahead of time. It is also a good idea to crop away any black borders around the frames, as this confuses the disparity tracking (and also causes problems if you are using the Color Corrector’s histogram match ability to do the color matching).

In Stack mode, left and right outputs deliver the same image. If the left and right images have a global vertical offset larger than a few pixels, it can help the disparity tracking algorithm if you vertically align features in the left/right eyes ahead of time using a Transform node. Small details tend to get lost in the tracking process when you have a large vertical offset between left/right eyes.

Consider using a SmoothMotion node to smooth your disparity channel. This can help reduce time-dependent flickering when warping an eye. Also, think about whether you want to remove lens distortion before computing disparity. If you do not, your Disparity map becomes a combined Disparity and Lens Distortion map. This can have advantages and disadvantages. One disadvantage is that if you then do a vertical alignment, you are also removing lens distortion effects. When trying to reduce the computation time, start first with adjusting the Proxy and Number of Iterations sliders.

The Disparity node does not support RoI or DoD.

**Inputs**

The two inputs on the Disparity node are used to connect the left and right images.
- **Left Input:** The orange input is used to connect either the left eye image or the stacked image.
- **Right Input:** The green input is used to connect the right eye image. This input is available only when the Stack Mode menu is set to Separate.

**Outputs**

Unlike most nodes in Fusion, Disparity has two outputs for the left and right eye.

Left Output: This holds the left eye image with a new disparity channel, or a Stacked Mode image with a new disparity channel.

Right Output: This holds the right eye image with a new disparity channel. This output is visible only if Stack Mode is set to Separate.

**Basic Node Setup**

Below, a left eye image and right eye image are connected to the Disparity node. The Disparity node then outputs each eye to Saver nodes. It can be more efficient to render out the stereo images as EXR files than to generate the disparity on-the-fly.

Left and right eye images are connected into a Disparity node to generate and render out a stereo image.
Inspector

Proxy (for Tracking)
The input images are resized down by the proxy scale, tracked to produce the disparity, and then the resulting disparities are scaled back up. This option is purely to speed up the calculation of the disparity, which can be slow. The computational time is roughly proportional to the number of pixels in the image. This means a proxy scale of 2 gives a 4x speedup, and a proxy scale of 3 gives a 9x speedup. In general, 1:1 proxy will give the most detailed flow, but keep in mind that this is highly dependent on the amount of noise and film grain. If noise is present in large quantities, it can completely obliterate any gains moving from 2:1 to 1:1 proxy. In some situations, it can even make things worse. You can think of the Proxy setting as acting as a simplistic low-pass filter for removing noise/grain.

Advanced
The Advanced settings section has parameter controls to tune the Disparity map calculations. The default settings have been chosen to be the best default values from experimentation with many different shots and should serve as a good standard. In most cases, tweaking of the Advanced settings is not needed.

Smoothness
This controls the smoothness of the disparity. Higher values help deal with noise, while lower values bring out more detail.

Edges
This slider is another control for smoothness but applies it based on the color channel. It tends to have the effect of determining how edges in the disparity follow edges in the color images. When it is set to a lower value, the disparity becomes smoother and tends to overshoot edges. When it is set to a higher value, edges in the disparity align more tightly with the edges in the color images, and details from the color channels start to slip into the disparity, which is not usually desirable.

As a rough guideline, if you are using the disparity to produce a Z channel for post effects like depth of field, experiment with higher values, but if you are using the disparity to do interpolation, you might want to keep the values lower.

In general, if the Edges slider is set too high, there can be problems with streaked out edges when the disparity is used for interpolation.
**Match Weight**
This controls how matching is done between neighboring pixels in the left image and neighboring pixels in the right image. When a lower value is used, large structural color features are matched. When higher values are used, small sharp variations in the color are matched. Typically, a good value for this slider is in the [0.7, 0.9] range. Setting this option higher tends to improve the matching results in the presence of differences due to smoothly varying shadows or local lighting variations between the left and right images. You should still color match the initial images so they are as similar as possible; this option tends to help with local variations (e.g., lighting differences due to light passing through a mirror rig).

**Mismatch Penalty**
This controls how the penalty for mismatched regions grows as they become more dissimilar. The slider provides a choice between a balance of Quadratic (lower values) and Linear (higher values) penalties. Lower value Quadratic settings strongly penalize large dissimilarities, while higher value Linear settings are more robust to dissimilar matches. Moving this slider toward lower tends to give a disparity with more small random variations in it, while higher values produce smoother, more visually pleasing results.

**Warp Count**
Turning down the Warp Count makes the disparity computations faster. In particular, the computational time depends linearly upon this option. To understand what this option does, you need to understand that the Disparity algorithm progressively warps the left image until it matches with the right image. After some point, convergence is reached, and additional warps are just a waste of computational time. The default value in Fusion is set high enough that convergence should always be reached. You can tweak this value to speed up the computations, but it is good to watch how the disparity is degrading in quality at the same time.

**Iteration Count**
Turning down the Iteration Count makes the disparity computations faster. In particular, the computational time depends linearly upon this option. Just like adjusting Warp Count, at some point adjusting this option higher will yield diminishing returns and will not produce significantly better results. By default, this value is set to something that should converge for all possible shots and can be tweaked lower fairly often without reducing the disparity’s quality.

**Filtering**
This menu determines the filtering operations used during flow generation. Catmull-Rom filtering will produce better results, but at the same time, it increases the computation time steeply.

**Stack Mode**
This menu determines how the input images are stacked.

When set to Separate, the Right Input and Output will appear, and separate left and right images must be connected.

**Swap Eyes**
Enabling this checkbox causes the left and right images to swap.

**Common Controls**

**Settings Tab**
The Settings tab in the Inspector is also duplicated in other Stereo nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.
Disparity To Z [D2Z]

The DisparityToZ node

**NOTE:** The Disparity to Z node is available only in Fusion Studio and DaVinci Resolve Studio.

Disparity to Z Node Introduction

Disparity To Z takes a 3D camera and an image containing a disparity channel as inputs, and outputs the same image but with a newly computed Z channel.

Optionally, this node can output Z into the RGB channels. Ideally, either a stereo Camera 3D or a tracked stereo camera is connected into Disparity To Z. However, if no camera is connected, the node provides artistic controls for determining a Z channel. The depth created by this node can be used for post effects like fogging or depth of field (DoF).

The Z values produced become more incorrect the larger (negative) they get. The reason is that disparity approaches a constant value as Z approaches -infinity. So $Z = -1000$ and $Z = -10000$ and $Z = -100000$ may map to $D = 142.4563$ and $D = 142.4712$ and $D = 142.4713$. As you can see, there is only 0.0001 in D to distinguish between 10,000 and 100,000 in Z. The maps produced by disparity are not accurate enough to make distinctions like this.

**Inputs**

The three inputs on the Disparity To Z node are used to connect the left and right images and a camera node.

- **Left Input:** The orange input is used to connect either the left eye image or the stack image.
- **Right Input:** The green input is used to connect the right eye image. This input is available only when the Stack Mode menu is set to Separate.
- **Stereo Camera:** The magenta input is used to connect a stereo camera node.

**Outputs**

Unlike most nodes in Fusion, Disparity To Z has two outputs for the left and right eye.

Left Output: This holds the left eye image with a new Z channel, or a Stacked Mode image with a new disparity channel.

Right Output: This holds the right eye image with a new Z channel. This output is visible only if Stack Mode is set to Separate.
Basic Node Setup

Disparity To Z takes a 3D camera and stereo images containing a disparity channel as inputs. The output is an image with a newly computed Z channel.

A Disparity to Z node creates an image with a Z channel

Inspector

Controls Tab

In addition to outputting Z values in the Z channel, this tab promotes the color channels to float32 and outputs the Z values into the color channels as \([z, z, z, 1]\). This option is useful to get a quick look at the Z channel.

NOTE: Z values are negative, becoming more negative the further you are from the camera. The viewers only show 0.0 to 1.0 color, so to visualize other data it has to be converted via a normalization method to fit in a display 0-1 range. To do this, right-click in the viewer and choose Options > Show Full Color Range.

Output Z to RGB

Rather than keeping the Z values within the associated aux channel only, they will be copied into the RGB channels for further modification with any of Fusion’s nodes.

Refine Z

The Enable checkbox refines the depth map based upon the RGB channels. The refinement causes edges in the flow to align more closely with edges in the color channels. The downside is that unwanted details in the color channels start to show up in the flow. You may want to experiment with using this option to soften out harsh edges for Z-channel post effects like depth of field or fogging.
**HiQ Only**
Activating this checkbox causes the Refine Z option to process only when rendering is set to High Quality. You can ensure High Quality is enabled by right-clicking to the left or right of the transport controls in the main toolbar.

**Strength**
Increasing this slider does two things. It smooths out the depth in constant color regions and moves edges in the Z channel to correlate with edges in the RGB channels.

Increasing the refinement has the undesirable effect of causing texture in the color channel to show up in the Z channel. You will want to find a balance between the two.

**Radius**
This is the radius of the smoothing algorithm.

**Stack Mode**
This menu determines how the input images are stacked.

When set to Separate, the Right Input and Output will appear, and separate left and right images must be connected.

**Swap Eyes**
Enabling this checkbox causes left and right images to be swapped.

---

**Camera Tab**
If you need correct real-world Z values because you are trying to match some effect to an existing scene, you should use the External Camera options to get precise Z values back. If any Z-buffer will suffice and you are not that particular about the exact details of how it is offset and scaled, or if there is no camera available, the Artistic option might be helpful.

- **External Mode**: An input is available on the node to connect an existing stereo Camera 3D. This can either be a single stereo Camera 3D (i.e., its eye separation is set to non-zero), or a pair of (tracked) Camera 3Ds connected via the Camera 3D > Stereo > Right Camera input.

- **Artistic Mode**: If you do not have a camera, you can adjust these controls to produce an “artistic” Z channel whose values will not be physically correct but will still be useful. To reconstruct the Disparity > Z Curve, pick (D, Z) values for a point in the foreground and a point in the background.

**TIP**: If artistic mode is a little too “artistic” for you and you want more physically-based parameters to adjust (e.g., convergence and eye separation), create a dummy Camera 3D, connect it into the Disparity To Z > Camera input, and then fiddle with the Camera 3D’s controls.
**Foreground Disparity (Pick from Left Eye)**
When the camera Mode is set to Artistic, a Foreground Disparity slider is available. This is the disparity for the closest foreground object. It will get mapped to the depth value specified by the Foreground Depth control. Any objects with disparity outside of the range [ForegroundDisparity, BackgroundDisparity] will have their disparity values clipped to this range leading to flat areas in the Z channel, so make sure that you pick values that enclose the actual disparity range.

**Background Disparity (Pick from Left Eye)**
When the camera Mode is set to Artistic, a Background Disparity is available. This is the disparity for the furthest background object. It will get mapped to the depth value specified by the Background Depth control. One way to think of this input is as the upper limit to disparity values for objects at -infinity. This value should be for the left eye. The corresponding value in the right eye will be the same in magnitude but negative.

**Foreground Depth**
This is the depth to which Foreground Disparity will be mapped. Think of this as the depth of the nearest object. Note that values here are positive depth.

**Background Depth**
This is the depth to which Background Disparity will be mapped. Think of this as the depth of the most distant object.

**Falloff**
Falloff controls the shape of the depth curve between the requested foreground and background depths. When set to Hyperbolic, the disparity-depth curve behaves roughly like depth = constant/disparity. When set to Linear, the curve behaves like depth = constant * disparity. Hyperbolic tends to emphasize Z features in the foreground, while linear gives foreground/background features in the Z channel equal weighting.

Unless there's a specific reason, choose Hyperbolic, as it is more physically accurate, while Linear does not correspond to nature and is purely for artistic effect.

**Common Controls**

**Settings Tab**
The Settings tab in the Inspector is also duplicated in other Stereo nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.
Global Align [GA]

The Global Align node is available only in Fusion Studio and DaVinci Resolve Studio.

Global Align Node Introduction

As opposed to Stereo Align, this node does not utilize optical flow at all. It’s meant as a fast and convenient way to do simple stereo alignment for both X and Y as well as rotation.

Global Align comes in handy at the beginning of the node chain to visually correct major differences between the left and right eye before calculating Disparity.

Manually correcting large discrepancies between left and right, as well as applying an initial color matching, helps Disparity generate more accurate results.

Inputs

The two inputs on the Global Align node are used to connect the left and right images.

- **Left Input:** The orange input is used to connect either the left eye image or the stack image.
- **Right Input:** The green input is used to connect the right eye image. This input is available only when the Stack Mode menu is set to Separate.

Outputs

Unlike most nodes in Fusion, Global Align has two outputs for the left and right eye.

- **Left Output:** This outputs the newly aligned left eye image.
- **Right Output:** This outputs the newly aligned right eye image.

Basic Node Setup

Global Align is typically placed at the beginning of the node tree. Below it is inserted between the left and right eye images and the Disparity node to visually correct major differences.
A Global Align node used to manually correct left and right eye discrepancies

**Inspector**

The Controls tab includes translation and rotation controls to align the stereo images manually.

**Translation X and Y**
- **Balance**: Determines how the global offset is applied to the stereo footage.
- **None**: No translation is applied.
- **Left Only**: The left eye is shifted, while the right eye remains unaltered.
- **Right Only**: The right eye is shifted, while the left eye remains unaltered.
- **Split Both**: Left and right eyes are shifted in opposite directions.

**Snap to Nearest Pixel**
While adjusting the X or Y shift dial, this option ensures that the image is shifted in full pixel amounts only to maintain optimum quality. This avoids sub-pixel rendering of the image, which could result in subtle blurring.

**Rotation**
- **Balance**: Determines how the global rotation is applied to the stereo footage.
- **None**: No rotation is applied.
- **Left Only**: The left eye is rotated, while the right eye remains unaltered.
- **Right Only**: The right eye is rotated, while the left eye remains unaltered.
- **Split Both**: Left and right eyes are rotated in opposite directions.

**Angle**
This dial adjusts the angle of the rotation. Keep in mind that the result depends on the Balance settings. If only rotating one eye by, for example, 10 degrees, a full 10-degree rotation will be applied to that eye.

When applying rotation in Split mode, one eye will receive a -5 degree and the other eye a +5 degree rotation.

**Translation Filter Method**
This menu chooses the filter method that delivers the best results depending on the content of your footage.

**Visualization**
This control allows for different color encodings of the left and right eye to conveniently examine the results of the above controls without needing to add an extra Anaglyph or Combiner node.

Set this to None for final output.

**Stack Mode**
Determines how the input images are stacked.

When set to Separate, the right input and output will appear, and separate left and right images must be connected.

**Swap Eyes**
With Stacked Mode, image stereo pairs’ left and right images can be swapped.

**Common Controls**

**Settings Tab**
The Settings tab in the Inspector is also duplicated in other Stereo nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.

### New Eye [NE]

![The NewEye node](image)

**NOTE**: The New Eye node is available only in Fusion Studio and DaVinci Resolve Studio.
New Eye Node Introduction

The New Eye node constructs a new image by interpolating between two existing stereo images using the embedded disparity channels. This node can also be used to replace one view with a warped version of the other. In Stack Mode, L and R outputs will output the same image.

You can map the left eye onto the right eye and replace it. This can be helpful when removing errors from certain areas of the frame.

New Eye does not interpolate the aux channels but instead destroys them. In particular, the disparity channels are consumed/destroyed. Add another Disparity node after the New Eye if you want to generate Disparity for the realigned footage.

Inputs

The two inputs on the New Eye node are used to connect the left and right images.

- **Left Input:** The orange input is used to connect either the left eye image or the stack image.
- **Right Input:** The green input is used to connect the right eye image. This input is available only when the Stack Mode menu is set to Separate.

Outputs

Unlike most nodes in Fusion, New Eye has two outputs for the left and right eye.

- **Left Output:** This outputs the left eye image with a new disparity channel, or a Stacked Mode image with a new disparity channel.
- **Right Output:** This outputs the right eye image with a new disparity channel. This output is visible only if Stack Mode is set to Separate.

Basic Node Setup

The New Eye node in the example below constructs a new image by interpolating between the two stereo images using the embedded disparity channels.

![A New Eye node creates a new stereo image using embedded disparity](image-url)
Inspector

Controls Tab

The Controls tab is divided into identical parameters for the left eye and right eye. The parameters are used to select which eye to recreate and the methods used for the interpolation.

Enable

The Enable checkbox allows you to activate the left or right eye independently. The New Eye will replace enabled eye with an interpolated eye. For example, if the left eye is your “master” eye and you are recreating the right eye, you would disable the left eye and enable the right eye.

Lock XY

Locks the X and Y interpolation parameters. When they are unlocked, you can provide separate interpolation factors for using the X and Y disparity. For example, if you are working with the right eye and you have the X Interpolation slider set to 1.0 and the Y Interpolation slider set to -1.0, you will be effectively interpolating the left eye onto the right eye but vertically aligned to the left eye.

XY Interpolation Factor

Interpolation determines where the interpolated frame is positioned, relative to the two source frames. A slider position of -1.0 outputs the frame Left and a slider position of 1.0 outputs the frame Right. A slider position of 0.0 outputs a result that is halfway between Left and Right.
**Depth Ordering**
The Depth Ordering is used to determine which parts of the image should be rendered on top. When warping images, there is often overlap. When the image overlaps itself, there are two options for which values should be drawn on top.

- **Largest Disparity On Top**: The larger disparity values will be drawn on top in the overlapping image sections.
- **Smallest Disparity On Top**: The smaller disparity values will be drawn on top in the overlapping image sections.

**Clamp Edges**
Under certain circumstances, this option can remove the transparent gaps that may appear on the edges of interpolated frames. Clamp Edges will cause a stretching artifact near the edges of the frame that is especially visible with objects moving through it or when the camera is moving.

Because of these artifacts, it is a good idea to use Clamp Edges only to correct small gaps around the edges of an interpolated frame.

**Softness**
Helps to reduce the stretchy artifacts that might be introduced by Clamp Edges.

If you have more than one of the Source Frame and Warp Direction checkboxes turned on, this can lead to doubling up of the stretching effect near the edges. In this case, you'll want to keep the softness rather small at around 0.01. If you have only one checkbox enabled, you can use a larger softness at around 0.03.

**Source Frame and Warp Direction**
The output of this node is generated by combining up to four different warps. You can choose to use either the color values from the left or right frame in combination with the Forward (left > right) Disparity or the Backward (right > left) Disparity. Sometimes you will want to replace an existing eye. For example, if you want to regenerate the right eye, you would only use left eye warps.

It’s good to experiment with various options to see which gives the best effect. Using both the left and right eyes can help fill in gaps on the left/right side of images. Using both the Forward/Backward Disparity can give a doubling-up effect in places where the disparities disagree with each other.

- **Left Forward**: Takes the Left frame and uses the Forward Disparity to interpolate the new frame.
- **Right Forward**: Takes the Right frame and uses the Forward Disparity to interpolate the new frame.
- **Left Backward**: Takes the Left frame and uses the Back Disparity to interpolate the new frame.
- **Right Backward**: Takes the Right frame and uses the Back Disparity to interpolate the new frame.

**Common Controls**

**Settings Tab**
The Settings tab in the Inspector is also duplicated in other Stereo nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.
**Splitter [SPL]**

The Splitter node

**NOTE:** The Splitter node is available only in Fusion Studio and DaVinci Resolve Studio.

**Splitter Node Introduction**

The Splitter takes a stacked input image—for example, created with the Combiner—and provides two output images: a left eye and a right eye.

**Inputs**

The two inputs on the Splitter node are used to connect the left and right images.

- **Left Input:** The orange input is used to connect a stacked stereo image.

**Outputs**

Unlike most nodes in Fusion, the Splitter node has two outputs for the left and right eye.

- **Left Output:** This outputs the left eye image.
- **Right Output:** This outputs the right eye image.

**Basic Node Setup**

Below, a stacked stereo image is connected to the input on a Splitter where a left and right eye is output.

A Splitter node creates a left and right image from a stacked stereo image

**Inspector**
Controls Tab
The Controls tab is used to define the type of stacked image connected to the node’s input.

Split
The Split menu contains three options for determining the orientation of the stacked input image.

- **None**: No operation takes place. The output image on both outputs is identical to the input image.
- **Horiz**: The node expects a horizontally stacked image. This will result in two output images, each being half the width of the input image.
- **Vert**: The node expects a vertically stacked image. This will result in two output images, each being half the height of the input image.

Swap Eyes
Allows you to easily swap the left and right eye outputs.

Common Controls

Settings Tab
The Settings tab in the Inspector is also duplicated in other Stereo nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.

**Stereo Align [SA]**

The StereoAlign node

**NOTE:** The Stereo Align node is available only in Fusion Studio and DaVinci Resolve Studio.

**Stereo Align Node Introduction**
This extremely versatile node for fixing Stereo issues can be used for performing any of the following actions or combinations thereof:

- Vertical alignment of one eye to the other
- Changing the convergence
- Changing the eye separation

By combining these operations in one node, you can execute them using only a single image resampling. In essence, this node can be thought of as applying scales and translation to the disparities and then using the modified disparities to interpolate between the views.
NOTE: Changing the eye separation can cause holes to appear, and it may not be possible to fill them since the information needed may not be in either image. Even if the information is there, the disparity may have mismatched the holes. You may need to fill the holes manually. This node modifies only the RGBA channels.

TIP: Stereo Align does not interpolate the aux channels but instead destroys them. In particular, the disparity channels are consumed/destroyed. Add another Disparity node after the StereoAlign if you want to generate Disparity for the realigned footage.

Inputs
The two inputs on the Stereo Align node are used to connect the left and right images.
- **Left Input:** The orange input is used to connect either the left eye image or the stack image.
- **Right Input:** The green input is used to connect the right eye image. This input is available only when the Stack Mode menu is set to Separate.

Outputs
Unlike most nodes in Fusion, Stereo Align has two outputs for the left and right eye.
- **Left Output:** This outputs the left eye image with a new disparity channel, or a Stacked Mode image with a new disparity channel.
- **Right Output:** This outputs the right eye image with a new disparity channel. This output is visible only if Stack Mode is set to Separate.

Basic Node Setup
Below, the Stereo Align receives the left and right eye images with disparity. Once the adjustments are made, another Disparity node is added after it to generate disparity for the realigned footage.

A Stereo Align node destroys the disparity channel, so another Disparity node is placed after it.
Inspector

**Controls Tab**

**Vertical Alignment**

This option determines how the vertical alignment is split between two eyes. Usually, the left eye is declared inviolate, and the right eye is aligned to it to avoid resampling artifacts.

When doing per pixel vertical alignment, it may be helpful to roughly pre-align the images by a global Y-shift before disparity computation because the disparity generation algorithm can have problems resolving small objects that move large distances.

Also, be aware that you must be careful about lens distortion because even if two cameras are perfectly vertically aligned, they will still have vertical disparities due to lens distortion. As a best practice, remove the lens distortion before computing the disparity. When a vertical alignment of the right eye is done, you have essentially removed the Y-component of the lens distortion in the right eye, and it will look wrong later when you try to distort it again.

**Apply to**

- **Right**: Only the right eye is adjusted.
- **Left**: Only the left eye is adjusted.
- **Both**: The vertical alignment is split evenly between the left and right eyes.
**Mode**
- **Global**: The eyes are simply translated up or down by the Y-shift to match up.
- **Per Pixel**: The eyes are warped pixel-by-pixel using the disparity to vertically align.

Keep in mind that this can introduce sampling artifacts and edge artifacts.

**Y-shift**
Y-shift is available only when the Mode menu is set to Global. You can either adjust the Y-shift manually to get a match or drag the Sample button into the viewer, which picks from the disparity channel of the left eye. Also remember, if you use this node to modify disparity, you can’t use the Sample button while viewing the node’s output.

**Snap to Whole Pixels**
You can snap the global shift to whole pixels by enabling this option. When enabled, there is no resampling of the image, but rather a simple shift is done so there will be no softening or image degradation.

**Convergence Point**
The Convergence Point section is used as a global X-translation of L/R images.

**Apply to**
This menu determines which eyes are affected by convergence. You can choose to apply the convergence to the left eye, right eye, or split between the two. In most cases, this will be set to Split. If you set the eyes to Split, then the convergence will be shared 50-50 between both eyes. Sharing the convergence between both eyes means you get half the shift in each eye, which in turn means smaller holes and artifacts that need to be fixed later. The tradeoff is that you’ve resampled both eyes rather than keeping one eye as a pure reference master.

**X-shift**
You can either use the slider to adjust the X-shift manually to get a match or use the Sample button to pick from the disparity channels for easy point-to-feature alignment.

**Snap**
You can snap the global shift to whole pixels using this option. In this mode, there is no resampling of the image, but rather a simple shift is done so there will be no softening or image degradation.

**Eye Separation**
Eye Separation changes the distance between the left/right eyes, causing objects in the left/right eyes to converge/diverge further depending on their distance from the camera.

This has the same effect as the Eye Separation option in the Camera 3D node.

**Separation**
This is a scale factor for eye separation.
- When set to 0.0, this leaves the eyes unchanged.
- Setting it to 0.1 increases the shifts of all objects in the scene by a factor of 10% in each eye.
- Setting it to 0.1 will scale the shifts of all objects 10% smaller.
Unlike the Split option for vertical alignment, which splits the alignment effect 50-50 between both eyes, the Both option will apply 100-100 eye separation to both eyes. If you are changing eye separation, it can be a good idea to enable per-pixel vertical alignment, or the results of interpolating from both frames can double up.

**Left/Right Eye Options**
The left and right eye options contain depth ordering and warp direction controls independently for the left and right eye.

**Depth Ordering**
The Depth Ordering is used to determine which parts of the image should be rendered on top. When warping images, there is often overlap. When the image overlaps itself, there are two options for which values should be drawn on top.

- **Largest Disparity On Top:** The larger disparity values will be drawn on top in the overlapping image sections.
- **Smallest Disparity On Top:** The smaller disparity values will be drawn on top in the overlapping image sections.

**Clamp Edges**
Under certain circumstances, this option can remove the transparent gaps that may appear on the edges of interpolated frames. Clamp Edges will cause a stretching artifact near the edges of the frame that is especially visible with objects moving through it or when the camera is moving.

Because of these artifacts, it is a good idea to use Clamp Edges only to correct small gaps around the edges of an interpolated frame.

**Edge Softness**
Helps to reduce the stretchy artifacts that might be introduced by Clamp Edges.

If you have more than one of the Source Frame and Warp Direction checkboxes turned on, this can lead to doubling up of the stretching effect near the edges. In this case, you'll want to keep the softness rather small at around 0.01. If you have only one checkbox enabled, you can use a larger softness at around 0.03.

**Source Frame and Warp Direction**
The output of this node is generated by combining up to four different warps. You can choose to use either the color values from the left or right frame in combination with the Forward (left > right) Disparity or the Backward (right > left) Disparity. Sometimes you will want to replace an existing eye. For example, if you want to regenerate the right eye, you would use only left eye warps.

It’s good to experiment with various options to see which gives the best effect. Using both the left and right eyes can help fill in gaps on the left/right side of images. Using both the Forward/Backward Disparity can give a doubling-up effect in places where the disparities disagree with each other.

- **Left Forward:** Takes the Left frame and uses the Forward Disparity to interpolate the new frame.
- **Right Forward:** Takes the Right frame and uses the Forward Disparity to interpolate the new frame.
- **Left Backward:** Takes the Left frame and uses the Back Disparity to interpolate the new frame.
- **Right Backward:** Takes the Right frame and uses the Back Disparity to interpolate the new frame.
**Stack Mode**
In Stack Mode, L and R outputs will output the same image.

If High Quality is off, the interpolations are done using nearest-neighbor sampling, leading to a more “noisy” result. To ensure High Quality is enabled, right-click under the viewers, near the transport controls, and choose High Quality from the pop-up menu.

**Swap Eyes**
Allows you to easily swap the left and right eye outputs.

**Common Controls**

**Settings Tab**
The Settings tab in the Inspector is also duplicated in other Stereo nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.

---

**Example**

Different settings for Eye Separation...

...and example settings for Convergence
Z To Disparity [Z2D]

NOTE: The Z To Disparity node is available only in Fusion Studio and DaVinci Resolve Studio.

Z To Disparity Node Introduction

Z To Disparity takes a stereo camera and an image containing a Z channel and outputs the same image but with disparity channels in it. This is useful for constructing a Disparity map from CG renders, which will be more accurate than the Disparity map created from the Disparity node.

Inputs

The three inputs on the Z To Disparity node are used to connect the left and right images and a camera node.

- **Left Input**: The orange input is used to connect either the left eye image or the stack image.
- **Right Input**: The green input is used to connect the right eye image. This input is available only when the Stack Mode menu is set to Separate.
- **Stereo Camera**: The magenta input is used to connect a stereo perspective camera, which may be either a Camera 3D with eye separation, or a tracked L/R Camera 3D.

Outputs

Unlike most nodes in Fusion, Z To Disparity has two outputs for the left and right eye.

- **Left Output**: This outputs the left eye image containing a new disparity channel, or a Stacked Mode image with a new disparity channel.
- **Right Output**: This outputs the right eye image with a new disparity channel. This output is visible only if Stack Mode is set to Separate.

Basic Node Setup

Below, a stereo camera and an image containing a Z channel is connected to a Z To Disparity node. The same image is output with disparity channels.
A Z To Disparity node takes an image with a Z channel and creates a disparity channel.

Inspector

Controls Tab
The Controls tab includes settings that refine the conversion algorithm.

Output Disparity To RGB
In addition to outputting disparity values into the disparity channel, activating this checkbox causes Z To Disparity to also output the disparity values into the color channels as \( \{x, y, 0, 1\} \). When activated, this option will automatically promote the RGBA color channels to float32. This option is useful for a quick look to see what the disparity channel looks like.

Refine Disparity
This refines the Disparity map based on the RGB channels.

Strength
Increasing this slider does two things. It smooths out the depth in constant color regions and moves edges in the Z channel to correlate with edges in the RGB channels. Increasing the refinement has the undesirable effect of causing texture in the color channel to show up in the Z channel. You will want to find a balance between the two.

Radius
This is the pixel-radius of the smoothing algorithm.

Stack Mode
In Stack Mode, L and R outputs will output the same image. If HiQ is off, the interpolations are done using nearest-neighbor sampling, leading to a more “noisy” result.
Swap Eyes
This allows you to easily swap the left and right eye outputs.

Camera Tab
The Camera tab includes settings for selecting a camera and setting its conversion point if necessary.

Camera Mode
If you need correct real-world disparity values because you are trying to match some effect to an existing scene, you should use the External setting to get precise disparity values back. When External is selected, a magenta camera input is available on the node to connect an existing stereo Camera 3D node, and use the Camera settings to determine the Disparity settings.

If you just want any disparity and do not particularly care about the exact details of how it is offset and scaled, or if there is no camera available, then the Artistic setting might be helpful.

Camera
If you connect a Merge 3D node that contains multiple cameras to the camera input, the Camera menu allows you to select the camera to use.

Artistic Camera Mode

If you do not have a camera, you can adjust the artistic controls to produce a custom disparity channel whose values will not be physically correct but will be good enough for compositing hacks. There are two controls to adjust:

Convergence Point
This is the Z value of the convergence plane. This corresponds to the negative of the Convergence Distance control that appears in Camera 3D. At this distance, objects in the left and right eyes are at exactly the same position (i.e., have zero disparity).

Objects that are closer appear to pop out of the screen, and objects that are further appear behind the screen.
**Background Disparity (Sample from Left Eye)**
This is the disparity of objects in the distant background. You can think of this as the upper limit to disparity values for objects at infinity. This value should be for the left eye. The corresponding value in the right eye will be the same in magnitude but negative.

**Settings Tab**
The Settings tab in the Inspector is also duplicated in other Stereo nodes. These common controls are described in detail in the following "The Common Controls" section.

### The Common Controls
The Common Settings tab can be found on virtually every tool found in Fusion. The following controls are specific settings for Stereo nodes.

**Settings Tab**

![Settings Tab Image]

**Blend**
The Blend control is used to blend between the tool’s original image input and the tool’s final modified output image. When the blend value is 0.0, the outgoing image is identical to the incoming image. Normally, this will cause the tool to skip processing entirely, copying the input straight to the output.
Process When Blend Is 0.0
The tool is processed even when the input value is zero. This can be useful if the node is scripted to trigger a task, but the node's value is set to 0.0.

Red/Green/Blue/Alpha Channel Selector
These four buttons are used to limit the effect of the tool to specified color channels. This filter is often applied after the tool has been processed.

For example, if the Red button on a Blur tool is deselected, the blur will first be applied to the image, and then the red channel from the original input will be copied back over the red channel of the result.

There are some exceptions, such as tools for which deselecting these channels causes the tool to skip processing that channel entirely. Tools that do this will generally possess a set of identical RGBA buttons on the Controls tab in the tool. In this case, the buttons in the Settings and the Controls tabs are identical.

Apply Mask Inverted
Enabling the Apply Mask Inverted option inverts the complete mask channel for the tool. The mask channel is the combined result of all masks connected to or generated in a node.

Multiply by Mask
Selecting this option will cause the RGB values of the masked image to be multiplied by the mask channel's values. This will cause all pixels of the image not included in the mask (i.e., set to 0) to become black/transparent.

Use Object/Use Material (Checkboxes)
Some 3D software can render to file formats that support additional channels. Notably, the EXR file format supports Object ID and Material ID channels, which can be used as a mask for the effect. These checkboxes determine whether the channels will be used, if present. The specific Material ID or Object ID affected is chosen using the next set of controls.

Correct Edges
This checkbox appears only when the Use Object or Use Material checkboxes are selected. It toggles the method used to deal with overlapping edges of objects in a multi-object image. When enabled, the Coverage and Background Color channels are used to separate and improve the effect around the edge of the object. If this option is disabled (or no Coverage or Background Color channels are available), aliasing may occur on the edge of the mask.

For more information on the Coverage and Background Color channels, see Chapter 4, “Understanding Image Channels and Node Processing” in the Fusion Studio Reference Manual or Chapter 56 in the DaVinci Resolve Reference Manual.

Object ID/Material ID (Sliders)
Use these sliders to select which ID will be used to create a mask from the object or material channels of an image. Use the Sample button in the same way as the Color Picker: to grab IDs from the image displayed in the viewer. The image or sequence must have been rendered from a 3D software package with those channels included.

Hide Incoming Connections
Enabling this checkbox can hide connection lines from incoming nodes, making a node tree appear cleaner and easier to read. When enabled, empty fields for each input on a node will be displayed in the Inspector. Dragging a connected node from the node tree into the field will hide that incoming connection line as long as the node is not selected in the node tree. When the node is selected in the node tree, the line will reappear.
**Comments**
The Comments field is used to add notes to a tool. Click in the empty field and type the text. When a note is added to a tool, a small red square appears in the lower-left corner of the node when the full tile is displayed, or a small text bubble icon appears on the right when nodes are collapsed. To see the note in the Node Editor, hold the mouse pointer over the node to display the tooltip.

**Scripts**
Three Scripting fields are available on every tool in Fusion from the Settings tab. They each contain edit boxes used to add scripts that process when the tool is rendering. For more details on scripting nodes, please consult the Fusion scripting documentation.
Chapter 107

Tracker Nodes

This chapter details the Tracker nodes available in Fusion.

The abbreviations next to each node name can be used in the Select Tool dialog when searching for tools and in scripting references.

For purposes of this document, node trees showing MediaIn nodes in DaVinci Resolve are interchangeable with Loader nodes in Fusion Studio, unless otherwise noted.

Tracker [TRA]

The Tracker node

Tracker Node Introduction
The Tracker is used to detect and follow one or more pixel patterns across frames in moving video. The tracking data can then be used to control the position or values of other nodes in the composition (for example, the center of a Light Rays node). Additionally, trackers can be used to stabilize an image or to apply destabilization to one image based on the motion of another.

Inputs
The Tracker has three inputs:

- **Background:** The orange image input accepts the main 2D image to be tracked.
- **Foreground:** The optional green foreground accepts a 2D image to be merged on top of the background as a corner pin or match move.
- **Effect Mask:** The blue input is for a mask shape created by polylines, basic primitive shapes, paint strokes, or bitmaps from other tools. Connecting a mask to this input limits the tracking to certain areas.

Basic Node Setup
Tracker nodes can be applied inline with other nodes or as a branch from the clip you want to track. When used inline, an image can be stabilized by connecting it to the orange background input. After the image is tracked, setting the Tracker’s Operation menu to Match Move will apply a stabilization to the connected image.

A Tracker node connected inline to an image for stabilization

When used as an offshoot from the node tree, an image can be tracked and then that tracking data is published for use on another node somewhere else in the node tree. The output of the Tracker does not need to connect to another node. The tracking data is published and can be used via the Connect To contextual menu.
The Tracker can also work as a replacement for a Merge tool in match-moving setups. Below, the Tracker tracks the image connected to the orange background input and applies the tracking data to the image connected to the foreground input. The same foreground-over-background merge capabilities are available in the Tracker node.

**Tracker Onscreen Controls**

Each pattern in the Tracker has its own set of onscreen controls used to select the pixels in the image to be tracked. These controls are visible in the viewers whenever you select a tracker in the node tree.

**Pattern Rectangle**

In the viewer, the tracker displays a solid-line red rectangle called the pattern rectangle. Every pixel within the rectangle makes up the pattern used for tracking. You can resize the pattern if necessary by dragging on the rectangle's borders.
**Search Rectangle**

Whenever the mouse moves over the pattern rectangle, a second rectangle with a dashed outline appears. The dashed outline represents the search area, which determines how far away from the current pattern the Tracker looks in the next frame. The search area should always be larger than the pattern, and it should be large enough to encompass the largest frame-to-frame movement in the scene. Faster moving objects require larger search areas, and slower moving objects can get away with smaller search areas. The larger the search area, the longer it takes to track, so try not to make the search area larger than necessary. If the selected Tracker has a custom name, the name of that Tracker is displayed as a label at the bottom right of the search area rectangle.

The search rectangle is the area searched from frame to frame to locate the pattern.

**Repositioning the Tracker**

The pattern rectangle has a small handle in the upper-left corner. Dragging on the handle repositions the pattern. An enlarged view of the pattern is displayed under your mouse pointer to assist with the precise positioning of the pattern. This thumbnail disappears when the mouse button is released. You can adjust the magnification ratio in the Inspector’s Options tab.

Dragging the handle magnifies the pattern rectangle for precise placement.

**TIP:** There is no limit to the number of trackers that can be used in one composition, or the number of objects that use the tracking data. There is also no limit to the number of patterns that can be tracked by a single Tracker node. This chapter serves as a reference for the various controls in the Tracker, but we strongly suggest you read the more general information in Chapter 15, “Using the Tracking Node” in the Fusion Studio manual or Chapter 65 in the DaVinci Resolve manual.

The Tracker can be employed in two forms: as a node in the Node Editor or as a modifier attached to a parameter. When used as a node in the Node Editor, the image tracked comes from the input to the Tracker node. When used as a modifier, controls appear in the Modifiers tab for the node with the connected control. Tracker Modifiers can track only one pattern, but the image source can come from anywhere in the composition. Use this technique when tracking a quick position for an element.
Inspector

The Trackers tab contains controls for creating, positioning, and initiating tracking operations. After tracking, offset controls are used to improve the alignment of the image following the track.

Track Buttons
There are four buttons to initiate tracking, and one button in the middle used to stop a track in progress. These buttons can track the current pattern forward or backward in time. Holding the pointer over each button displays a tooltip with the name of each button.

The buttons operate as follows:

- **Track Reverse**: Clicking this button causes all active trackers to begin tracking, starting at the end of the render range and moving backward through time until the beginning of the render range.

- **Track Reverse From Current Time**: Clicking this button causes all active trackers to begin tracking, starting at the current frame and moving backward through time until the beginning of the render range.

- **Stop Tracking**: Clicking this button or pressing ESC stops the tracking process immediately. This button is active only when tracking is in process.
• **Track Forward From Current Time:** Clicking this button causes all active trackers to begin tracking, starting at the current frame and moving forward through time until the end of the render range.

• **Track Forward:** Clicking this button causes all active trackers to begin tracking, starting at the first frame in the render range and moving forward through time until the end of the render range.

**Tracking Behavior Controls**
The following controls all affect how trackers adapt to changing patterns, how the resulting track path is defined, and how many keyframes are generated.

**Frames Per Path Point**
This slider determines how often the Tracker sets a keyframe on the path. The default is 1, which sets a keyframe on the tracked path at every frame.

Increasing the value causes the tracked path to be less accurate. This may be desirable if the track is returning fluctuating results, but under normal circumstances, leave this control at its default value.

![Tip](image)

**Adaptive Mode**
Fusion is capable of reacquiring the tracked pattern, as needed, to help with complex tracks. This menu determines the Adaptive tracking method.

• **None:** When set to None, the tracker searches for the original pattern in each frame.

• **Every Frame:** When set to Every Frame, the tracker reacquires the pattern every frame. This helps the Tracker compensate for gradual changes in profile and lighting over time.

• **Best Match:** When set to Best Match, the tracker compares the original selected pattern to the pattern acquired at each frame. If the variation between the two patterns exceeds the threshold amount defined by the Match Tolerance control, the tracker does not reacquire the pattern on that frame. This helps to avoid Tracker drift caused by transient artifacts that cross the pattern’s path (such as a shadow).

**Path Center**
This menu determines how the Tracker behaves when repositioning a pattern. This menu is particularly useful when a pattern leaves the frame or changes so significantly that it can no longer be tracked.

• **Pattern Center:** When Pattern Center is selected in the menu, the tracked path continues from the center of the new path. This is appropriate when replacing an existing path entirely.

• **Track Center (append):** When Track Center (append) is selected in the menu, the path tracked by a new pattern will be appended to the existing path. The path created is automatically offset by the required amount. This setting is used to set a new tracking pattern when the original pattern moves out of the frame or gets obscured by other objects. This technique work bests if the new pattern is located close to the position of the original pattern to avoid any problems with parallax or lens distortion.
Tracker List
A Tracker node can track multiple patterns. Each tracker pattern created in the current Tracker node is managed in the Tracker List.

Tracker List
The Tracker List shows the names of all trackers created.

- Each tracker pattern appears in the list by name, next to a small checkbox. Clicking the name of the tracker pattern will select that tracker pattern.
- The controls below the list will change to affect that tracker pattern only. Click a selected tracker pattern once to rename the tracker pattern to something more descriptive.
- Clicking the checkbox changes the state of the tracker.

Tracker States

- **Enabled (black checkbox):** An enabled pattern will re-track each time the track is initiated. Its path data is available for use by other nodes, and the data is available for Stabilization and Corner Positioning.
- **Suspended (white circle):** A Suspended pattern does not re-track when the track is initiated. The data is locked to prevent additional changes. The data from the path is still available for other nodes, and the data is available for advanced Tracking modes like Stabilization and Corner Positioning.
- **Disabled (clear):** A Disabled pattern does not create a path when tracking is initialized, and its data is not available to other nodes or for advanced Tracking operations like Stabilization and Corner Positioning.

Add/Delete Tracker
Use these buttons to add or delete trackers from your Tracker List.

Show
This menu selects what controls are displayed in the Tracker node controls. They do not affect the operation of the tracker; they only affect the lower half of the Inspector interface.

- **Selected Tracker Details:** When Selected Tracker Details is chosen, the controls displayed pertain only to the currently selected tracker. You will have access to the Pattern window and the Offset sliders.
- **All Trackers:** When All Trackers is selected, the pattern window for each of the added tracking patterns is displayed simultaneously below the Tracker List.
Left Pattern Display

The pattern display has two side-by-side image windows and a series of status bars. The window on the left shows the pattern initially selected, while the one on the right shows a real-time display of the current pattern as tracking progresses.

As the onscreen controls move while tracking, the display in the leftmost window updates to show the pattern. As the pattern moves, the vertical bars immediately to the right of the image indicate the clarity and contrast of the image channels.

The best channel or channels get selected for tracking based on clarity. These channels have a gray background in the vertical bar representing that channel. You can use the automatic tracking or override the selection and choose the channel by selecting the button beneath the channel to track.

Under normal circumstances, the channel selected shows in the pattern display. If the selected channel is blue, then a grayscale representation of the blue channel for the pattern appears. The image is represented in color only when you activate the Full Color button. Override this behavior by selecting the Show Full Color button beneath the pattern display instead of the Show Selected Channel button.

TIP: Because Fusion looks for the channel with the highest contrast automatically, you might end up tracking a noisy but high-contrast channel. Before tracking, it’s always a good idea to zoom in to your footage and check the RGB channels individually.

Right Pattern Display

The pattern display on the right indicates the actual pattern acquired for tracking. This display is black until tracking the selected pattern for the first time. The pattern display becomes active during tracking, displaying the pattern that Fusion acquires from frame to frame.

As the tracking occurs, the pattern from each frame accumulates into a Flipbook, which can be played back in the pattern window after tracking by using the transport controls at the bottom of the window.

While the track is progressing, the vertical bar immediately to the right of the pattern shows how confident Fusion is that the current pattern matches the initially selected pattern. A green bar indicates a high degree of confidence that the current pattern matches the original, a yellow bar indicates less certainty, and a red bar indicates extreme uncertainty.

After tracking, the pattern display shows a small Flipbook of the track for that pattern to help identify problem frames for the track.
Tracker Sizes
In addition to onscreen controls, each tracker has a set of sizing parameters that let you adjust the pattern and search box.

- **Pattern Width and Height**: Use these controls to adjust the width and height of the selected tracker pattern manually. The size of the tracker pattern can also be adjusted in the viewer, which is the normal method, but small adjustments are often easier to accomplish with the precision of manual controls.

- **Search Width and Height**: The search area defines how far Fusion will look in the image from frame to frame to reacquire the pattern during tracking. As with the Pattern Width and Height, the search area can be adjusted in the viewer, but you may want to make small adjustments manually using these controls.

Tracked Center
This positional control indicates the position of the tracker’s center. To remove a previously tracked path from a tracker pattern, right-click this parameter and select Remove Path from the contextual menu.

X and Y Offset
The Offset controls help to create a track for objects that may not provide very well defined or reliable patterns. The Offset controls permit the tracking of something close to the intended object instead. Use these Offsets to adjust the desired position of the path, while the tracker pattern rectangle is positioned over the actual tracking location.

The Offset can also be adjusted directly in the viewer by activating the Offsets button in the viewer toolbar.

The tracker offset icon in the upper left of the viewer is used to offset the tracking pattern from the intended object.
Operation Tab
While the Trackers tab controls let you customize how the Tracker node analyzes motion to create motion paths, the Operation tab puts the analyzed motion data to use, performing image transforms of various kinds.

The Tracker node is capable of performing a wide variety of functions, from match moving an object into a moving scene, smoothing out a shaky camera movement, or replacing the content of a sign. Use the options and buttons in the Operation tab to select the function performed by the Tracker node.

Operation Menu
The Operation menu contains four functions performed by the Tracker. The remaining controls in this tab fine-tune the result of this selection.

- **None:** The Tracker performs no additional operation on the image beyond merely locating and tracking the chosen pattern. This is the default mode, used to create a path that will then drive another parameter on another node.
- **Match Move:** When only the orange background input is connected, this mode stabilizes the image. When a foreground image is connected to the green foreground input, the foreground image matches the position, rotation, and scaling based on the tracking patterns. Stabilizing and match move require a minimum of one tracking pattern to determine position, and two or more to determine scaling and rotation.
- **Corner Positioning:** The Corner Positioner mode tracks the four corners of a rectangular object and replaces the contents with a new image. This function requires a minimum of four tracking patterns. If there are not enough tracking patterns, new tracking patterns are added until the total equals four.
- **Perspective Positioning:** This mode is the inverse of the Corner Positioning mode. Rather than replacing the contents of the rectangle, the four trackers are mapped to the four corners of the image. This is generally used to remove perspective from an image. Like the Corner Positioning mode, this mode requires four tracking patterns, which automatically get added if there are fewer patterns.

Additional Layering Controls
When you choose any operation other than None, a series of additional controls appear.

**Merge**
The Merge control determines what is done (if anything) with the image provided to the green Foreground input of the Tracker. This menu appears when the operation is set to anything other than None.

- **BG Only:** The foreground input is ignored; only the background is affected. This is used primarily when stabilizing the background image.
- **FG Only:** The foreground input is transformed to match the movement in the background, and this transformed image is passed through the Tracker’s output. This Merge technique is used when match moving one layer’s motion to another layer’s motion.
- **FG Over BG:** The foreground image is merged over the background image, using the Merge method described by the Apply Mode control that appears.
- **BG Over FG:** The background is merged over the foreground. This technique is often used when tracking a layer with an Alpha channel so that a more static background can be applied behind it.
Apply Mode and Operator Menus

This menu provides a variety of options that determine how the two layers should be combined. The options in this menu are identical to those found in the Merge node.

- **Apply Modes**: The Apply Mode setting determines the math used when blending or combining the foreground and background pixels.
  - **Normal**: The Default merge mode uses the foreground's Alpha channel as a mask to determine which pixels are transparent and which are not. When this is active, another menu shows possible operations, including Over, In, Held Out, Atop, and XOr.
  - **Screen**: Screen merges the images based on a multiplication of their color values. The Alpha channel is ignored, and layer order becomes irrelevant. The resulting color is always lighter. Screening with black leaves the color unchanged, whereas screening with white will always produce white. This effect creates a similar look to projecting several film frames onto the same surface. When this is active, another menu shows possible operations, including Over, In, Held Out, Atop, and XOr.
  - **Dissolve**: Dissolve mixes two image sequences together. It uses a calculated average of the two images to perform the mixture.
  - **Multiply**: Multiplies the values of a color channel. This will give the appearance of darkening the image as the values are scaled from 0 to 1. White has a value of 1, so the result would be the same. Gray has a value of 0.5, so the result would be a darker image or, in other words, an image half as bright.
  - **Overlay**: Overlay multiplies or screens the color values of the foreground image, depending on the color values of the background image. Patterns or colors overlay the existing pixels while preserving the highlights and shadows of the color values of the background image. The background image is not replaced but is mixed with the foreground image to reflect the original lightness or darkness of the background image.
  - **Soft Light**: Soft Light darkens or lightens the foreground image, depending on the color values of the background image. The effect is similar to shining a diffused spotlight on the image.
  - **Hard Light**: Hard Light multiplies or screens the color values of the foreground image, depending on the color values of the background image. The effect is similar to shining a harsh spotlight on the image.
  - **Color Dodge**: Color Dodge uses the foreground's color values to brighten the background image. This is similar to the photographic practice of dodging by reducing the exposure of an area of a print.
  - **Color Burn**: Color Burn uses the foreground's color values to darken the background image. This is similar to the photographic practice of burning by increasing the exposure of an area of a print.
  - **Darken**: Darken looks at the color information in each channel and selects the background or foreground image’s color value, whichever is darker, as the result color. Pixels lighter than the merged colors are replaced, and pixels darker than the merged color do not change.
  - **Lighten**: Lighten looks at the color information in each channel and selects the background or foreground image’s color values, whichever is lighter, as the result color value. Pixels darker than the merged color are replaced, and pixels lighter than the merged color do not change.
- **Difference**: Difference looks at the color information in each channel and subtracts the foreground color values from the background color values or the background from the foreground, depending on which has the greater brightness value. Merging with white inverts the color. Merging with black produces no change.

- **Exclusion**: Exclusion creates an effect similar to but lower in contrast than the Difference mode. Merging with white inverts the base color values. Merging with black produces no change.

- **Hue**: Hue creates a result color with the luminance and saturation of the background color values and the hue of the foreground color values.

- **Saturation**: Saturation creates a result color with the luminance and hue of the base color and the saturation of the blend color.

- **Color**: Color creates a result color with the luminance of the background color value and the hue and saturation of the foreground. This preserves the gray levels in the image and is useful for coloring monochrome images.

- **Luminosity**: Luminosity creates a color with the hue and saturation of the background color and the luminance of the foreground color. This mode creates an inverse effect from that of the Color mode.

- **Operator Modes**: This menu is used to select the Operation Mode of the merge. It determines how the foreground and background are combined to produce a result. This drop-down menu is visible only when the Merge node’s Apply Mode is set to either Normal or Screen.

**NOTE**: For an excellent description of the math underlying the Operation modes, read “Compositing Digital Images,” Porter, T., and T. Duff, SIGGRAPH 84 proceedings, pages 253-259. Essentially, the math is as described below.

**TIP**: Some modes not listed in the Operator drop-down menu (Under, In, Held In, Below) are easily obtained by swapping the foreground and background inputs and choosing a corresponding mode.

The formula used to combine pixels in the merge is always \( fg * x + bg * y \). The different operations determine exactly what \( x \) and \( y \) are, as shown in the description for each mode.

The Operator modes are as follows:

- **Over**: The Over mode adds the foreground layer to the background layer by replacing the pixels in the background with the pixels from the Z wherever the foreground’s Alpha channel is greater than 1.
  \[ x = 1, \ y = 1 - \text{foreground Alpha} \]

- **In**: The In mode multiplies the Alpha channel of the background input against the pixels in the foreground. The color channels of the foreground input are ignored. Only pixels from the foreground are seen in the final output. This essentially clips the foreground using the mask from the background.
  \[ x = \text{background Alpha}, \ y = 0 \]
- **Held Out**: Held Out is essentially the opposite of the In operation. The pixels in the foreground image are multiplied against the inverted Alpha channel of the background image. You can accomplish exactly the same result using the In operation and a Matte Control node to invert the matte channel of the background image.

\[ x = 1 - \text{[background Alpha]}, \ y = 0 \]

- **ATop**: ATop places the foreground over the background only where the background has a matte.

\[ x = \text{[background Alpha]}, \ y = 1 - \text{[foreground Alpha]} \]

- **XOr**: XOr combines the foreground with the background wherever either the foreground or the background have a matte, but never where both have a matte.

\[ x = 1 - \text{[background Alpha]}, \ y = 1 - \text{[foreground Alpha]} \]

- **Subtractive/Additive**: This slider controls whether Fusion performs an Additive merge, a Subtractive merge, or a blend of both. This slider defaults to Additive merging for most operations, assuming the input images are premultiplied (which is usually the case). If you don’t understand the difference between Additive and Subtractive merging, here’s a quick explanation:

  - An Additive merge is necessary when the foreground image is premultiplied, meaning that the pixels in the color channels have been multiplied by the pixels in the Alpha channel. The result is that transparent pixels are always black since any number multiplied by 0 always equals 0. This obscures the background (by multiplying with the inverse of the foreground Alpha), and then simply adds the pixels from the foreground.

  - A Subtractive merge is necessary if the foreground image is not premultiplied. The compositing method is similar to an Additive merge, but the foreground image is first multiplied by its Alpha to eliminate any background pixels outside the Alpha area.

In most software applications, you will find the Additive/Subtractive option displayed as a simple checkbox. Fusion lets you blend between the Additive and Subtractive versions of the merge operation, which is occasionally useful for dealing with problem composites with edges that are calling attention to themselves as too bright or too dark.

For example, using a Subtractive setting on a premultiplied image may result in darker edges. Using an Additive setting with a non-premultiplied image may result in lightening the edges. By blending between Additive and Subtractive, you can tweak the edge brightness to be just right for your situation.

**Filter Method (Match Move)**

Determines which filter to use to handle image transforms made using the Tracker node. This menu appears only when the Operation Mode is set to Match Move.

- **Box**: This is a simple interpolation resize of the image.

- **Linear**: This uses a simplistic filter, which produces relatively clean and fast results.

- **Quadratic**: This filter produces a nominal result. It offers a good compromise between speed and quality.

- **Cubic**: This produces better results with continuous-tone images but is slower than Bi-Cubic. If the images have fine detail in them, the results may be blurrier than desired.

- **Catmull-Rom**: This produces good results with continuous-tone images that are resized down. It produces sharp results with finely detailed images.
• **Gaussian**: This is very similar in speed and quality to Bi-Cubic.

• **Mitchell**: This is similar to Catmull-Rom but produces better results with finely detailed images. It is slower than Catmull-Rom.

• **Lanczos**: This is very similar to Mitchell and Catmull-Rom but is a little cleaner and also slower.

• **Sinc**: This is an advanced filter that produces very sharp, detailed results; however, it may produce visible “ringing” in some situations.

• **Bessel**: This is similar to the Sinc filter but may be slightly faster.

**Edges**
This menu selects how the revealed edges are handled when the image is moved to match position and scaling.

• **Black Edges**: Out-of-frame edges revealed by Stabilization are left black.

• **Wrap**: Portions of the image moved off frame to one side are used to fill edges that are revealed on the opposite side.

• **Duplicate**: The last valid pixel on an edge is repeated to the edge of the frame.

• **Mirror**: Image pixels are mirrored to fill to the edge of the frame.

**Position, Rotation, and Scaling Checkboxes (Match Move)**
The Position, Rotation, and Scaling checkboxes appear only when the mode is set to Match Move. They determine what components of motion that Stabilization will attempt to correct in the image. For example, if only the Position checkbox is selected, no attempt will be made to correct for Rotation and Scaling in the image.

**Flatten Transformation (Match Move)**
This checkbox appears only when the mode is set to Match Move. Like most transformations in Fusion, Stabilization is concatenated with other sequential transformations by default. Selecting this checkbox will flatten the transform, breaking any concatenation taking place and applying the transform immediately.

**Mapping Type**
The Mapping Type control appears only in the Corner Positioning mode. There are two options in the menu:

• **Bi_Linear**: The first method is Bi-Linear, where the foreground image is mapped into the background without any attempt to correct for perspective distortion. This is identical to how previous versions of Fusion operated.

• **Perspective**: The foreground image is mapped into the background taking perspective distortion into account. This is the preferred setting since it maps better to the real world than the older Bi-Linear setting.

**Corner Selector (Corner or Perspective Positioning)**
When the operation of the Tracker is set to either Corner or Perspective Positioning modes, four drop-down menus appear. These options choose which trackers map to each of the four corners of the rectangle. This is useful when a Tracker has more than four patterns selected, and you must choose which patterns the positioners use.
Rotate Clockwise and Counter-Clockwise Buttons (Corner or Perspective Positioning)
These controls appear only when the operation of the Tracker is set to either Corner or Perspective Positioning modes. They are used to rotate the foreground image by 90 degrees before it is applied to the background.

Stabilize Settings
The Tracker node automatically outputs several steady and unsteady position outputs to which other controls in the Node Editor can be connected. The Stable Position output provides X and Y coordinates to match or reverse motion in a sequence. These controls are available even when the operation is not set to Match Move, since the Stable Position output is always available for connection to other nodes.

Match Move Settings
These settings determine how tracking data is correlated with the reference pattern for making transforms.

Pivot Type
The Pivot type menu determines how the anchor point for rotation is selected.

- Tracker Average: Averages the location based on the tracking points.
- Selected Tracker: Provides a menu where one of the current trackers can be selected as the pivot point.
- Manual: Displays X and Y position number fields where you can manually position the pivot points.

Reference
The Reference mode determines the “snapshot frame” based on the frame where the pattern is first selected. All Stabilization is intended to return the image back to that reference.

- Select Time: Lets you select the current frame.
- Start: The Snapshot Frame is determined to be the first frame in the tracked path. All Stabilization is intended to return the image back to that reference.
- Start and End: The Start and End Reference mode is somewhat different from all other Reference modes. Where the others are intended to take a snapshot frame to which all stabilization returns, immobilizing the image, the Start and End mode is intended to smooth existing motion, without removing it. This mode averages the motion between the Start and End of the path, drawing a straight line between those points. When this mode is active, it reveals the Reference Intermediate Points control. Increasing the value of this control increases the number of points in the path used by the Reference, smoothing the motion from a straight line between Start and End without making it wholly linear.
- End: The Snapshot Frame is determined to be the last frame in the tracked path. All Stabilization is intended to return the image back to that reference.

TIP: By default, the Tracker displays a single displacement path of the tracked data in the Spline Editor. To view X and Y paths of the tracked points in the Spline Editor, go to Preferences > Globals > Splines.
Display Options Tab
The Display Options tab lets you customize the look of onscreen controls in the viewer.

![Display Options Tab](image)

Show Pattern Names
This option defines whether the Tracker’s pattern names will be displayed in the viewer. Switch it off to see the pattern rectangle instead.

Enlarged Pattern on Dragging
This option defines whether there is a magnified thumbnail view when positioning the pattern rectangle.

Enlargement Scale
The zoom factor that is used when positioning the pattern rectangle when the above option is activated.

**TIP:** The outputs of a tracker (seen in the Connect to... menu) can also be used by scripts. They are:
- **SteadyPosition**: Steady Position
- **UnsteadyPosition**: Unsteady Position
- **SteadyAxis**: Steady Axis
- **SteadySize**: Steady Size
- **UnsteadySize**: Unsteady Size
- **SteadyAngle**: Steady Angle
- **UnsteadyAngle**: Unsteady Angle
- **Position1**: Tracker 1 Offset position
- **PerspectivePosition1**: Tracker 1 Perspective Offset position
- **PositionX1**: Tracker 1 Offset X position (3D Space)
- **PositionY1**: Tracker 1 Offset Y position (3D Space)
- **PerspectivePositionX1**: Tracker 1 Perspective Offset X position (3D Space)
- **PerspectivePositionY1**: Tracker 1 Perspective Offset Y position (3D Space)
- **SteadyPosition1**: Tracker 1 Steady Position
- **UnsteadyPosition1**: Tracker 1 Unsteady Position (likewise for the 2nd, 3rd, and so on)

Common Controls

Settings Tab
The Settings tab in the Inspector is also duplicated in other Tracking nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.
Planar Tracker Node [PTRA]

Planar Tracker Node Introduction

The Planar Tracker node is designed to solve a match-moving problem that commonly comes up during post-production. As an example, live-action footage can often contain a planar surface such as a license plate or a road sign that needs new numbers in the license plate or a new city’s name on the road sign. Often, the problem is that the camera is moving in the shot, so the license plate or road sign is continuously changing perspective. You cannot just merge a new license plate over the existing one without accounting for the perspective distortions. A time-intensive way to solve this problem would be to use a Corner Pin node and manually keyframe the four corners. The Planar Tracker automates this keyframing process and tracks the perspective distortions of a planar surface over time. That tracking data is then applied with those same perspective distortions to a different foreground.

For more information on using the Planar Tracker, see Chapter 16, “Planar Tracking” in the Fusion Studio Reference Manual or Chapter 66 in the DaVinci Resolve Reference Manual.

TIP: Part of using a Planar Tracker is also knowing when to give up and fall back to using Fusion’s Tracker node or to manual keyframing. Some shots are simply not trackable, or the resulting track suffers from too much jitter or drift. The Planar Tracker is a useful time-saving node in the artist’s toolbox, but while it may track most shots, it is not a 100% solution.

What the Planar Tracker Saves

While the Planar Tracker does save the resulting final track in the composition on disk, it does not save temporary tracking information such as the individual point trackers (compared with the Camera Tracker, which does save the individual point trackers). Some consequences of this include:

- The point trackers no longer appear in the viewer when a comp containing a Planar Tracker node is saved and reloaded.
- Tracking may not be resumed after a comp containing a Planar Tracker node has been saved and reloaded. In particular, this also applies to auto saves. For this reason, it is good to complete all planar tracking within one session.
- The size of composition files is kept reasonable (in some situations, a Planar Tracker can produce hundreds of megabytes of temporary tracking data).
- Saving and loading of compositions is faster and more interactive.
Inputs
The Planar Tracker has four inputs:

- **Background**: The orange background image input accepts a 2D image with the planar surface to be tracked.
- **Corner Pin 1**: The green corner pin 1 input accepts a 2D image to be pinned on top of the background. There may be multiple corner pin inputs, named Corner Pin 1, Corner Pin 2,...etc.
- **Occlusion Mask**: The white occlusion mask input is used to mask out regions that do not need to be tracked. Regions where this mask is white will not be tracked. For example, a person moving in front of and occluding bits of the pattern may be confusing the tracker, and a quickly-created rough rotomask around the person can be used to tell the tracker to ignore the masked-out bits.
- **Effect Mask**: The blue input is for a mask shape created by polylines, basic primitive shapes, paint strokes, or bitmaps from other tools. Connecting a mask to this input limits the output of the Planar Tracker to certain areas.

Basic Node Setup
A basic Planar Tracker setup consists of just two nodes: a MediaIn connects to the background input and the Planar Tracker can be used as a separate branch from the rest of the node tree. Once the tracking is completed, a Planar Transform node should be generated to use the planar tracking data.

A Planar Tracker can be isolated on its own branch of a node tree

A Typical Planar Tracker Workflow
The following steps outline the workflow with the Planar Tracker:

1. **Remove lens distortion**: The more lens distortion in the footage, the more the resulting track will slide and wobble.

2. **Connect footage**: Connect a Loader or MediaIn node that contains a planar surface to the orange background input and view the Planar Tracker node in a viewer.

3. **Select a reference frame**: Move to a frame where the planar surface to be tracked is not occluded and click the Set button to set this as a reference frame.

4. **Choose the pattern**: In the viewer, make sure the onscreen controls are visible, and draw a polygon around the planar surface you want to track. This is called the “pattern.” In most cases, this will probably be a rectangle, but an arbitrary closed polygon can be used. The pixels enclosed by this region will serve as the pattern that will be searched for on other frames. Note that it is important that the pattern is drawn on the reference frame. Do not confuse the pattern with the region to corner pin (which always has four corners and is separately specified in Corner Pin mode).
5 Adjust render range: In the Keyframes Editor, adjust the render range to match the range of frames where the planar surface is visible.

6 Adjust track options: Frequently changed options include Tracker, Motion Type, and Track Channel.

7 Mask out occluders: If moving objects partially cover up the planar surface, you may wish to connect an occlusion mask to the Planar Tracker. When using the Hybrid tracker, providing a mask to deal with occluding objects is strongly recommended, while with the Point tracker it is recommended to try tracking without a mask.

8 Track: Click the Go button to return to the reference frame. Press the Track To End button and wait for the track to complete. Click the Go button to return to the reference frame again. Press the Track To Start button and wait for the track to complete. Note that the tracks in the viewer are not selectable or deletable as they are in a Camera Tracker.

9 Check track quality: Visually inspect the track to see how accurate it is. Does it stick to the surface? Switching to Steady mode can help here.

10 Use the track: At this point, in most cases you will create a Planar Transform node from the Inspector and use it to apply the tracked perspective distortion onto masked images. If the image you are applying the tracking data to is full frame unmasked clip, you can use the Steady, Corner Pin, and Stabilize operation modes in the Planar Tracker.

Inspector

Controls Tab
The Controls tab contains controls for determining how the Planar Tracker will be used, setting the reference frame and initiating the track.

Operation Mode
The Operation Mode menu selects the purpose of the Planar Tracker node. The Planar Tracker has four modes of operation:

- **Track**: Used to isolate a planar surface and track its movement over time. Then, you can create a Planar Transform node that uses this data to match move another clip in various ways.
• **Steady:** After analyzing a planar surface, this mode removes all motion and distortions from the planar surface, usually in preparation for some kind of paint or roto task, prior to “unsteadying” the clip to restore the motion.

• **Corner Pin:** After analyzing a planar surface, this mode computes and applies a matching perspective distortion to a foreground image you connect to the foreground input of the Planar Tracker node, and merges it on top of the tracked footage.

• **Stabilize:** After analyzing a planar surface, this mode allows smoothing of a clip’s translation, rotation, and scale over time. This is good for getting unwanted vibrations out of a clip while retaining the overall camera motion that was intended.

The last three modes (Steady, Corner Pin, and Stabilize) use the tracking data produced in Track mode.

**NOTE:** None of the operations can be combined together. For example, both Corner Pin and Stabilize cannot be done at the same time, nor can a track be done while in corner pinning mode.

**Reference Time**
The Reference Time determines the frame where the pattern is outlined. It is also the time from which tracking begins. The reference frame cannot be changed once it has been set without destroying all pre-existing tracking information, so scrub through the footage to be tracked and choose carefully. The reference frame must be chosen carefully to give the best possible quality track.

You choose a reference frame by moving the playhead to an appropriate frame and then clicking the Set button to choose that frame.

**Pattern Polygon**
You specify which region of the image you want to track by drawing a polygon on the reference frame. Typically, when you first add a Planar Tracker node, you are immediately ready to start drawing a polygon in the viewer, so it’s best to do this right away. When choosing where to draw a polygon, make sure the region selected belongs to a physically planar surface in the shot. In a pinch, a region that is only approximately planar can be used, but the less planar the surface, the poorer the quality of the resulting track.

As a rule of thumb, the more pixels in the pattern, the better the quality of the track. In particular, this means the reference frame pattern should be:

- As large as possible.
- As much in frame as possible.
- As unoccluded as possible by any moving foreground objects.
- At its maximal size (e.g., when tracking an approaching road sign, it is good to pick a later frame where it is 400 x 200 pixels big rather than 80 x 40 pixels).
- Relatively undistorted (e.g., when the camera orbits around a flat stop sign, it is better to pick a frame where the sign is face-on parallel to the camera rather than a frame where it is at a highly oblique angle).

If the pattern contains too few pixels or not enough trackable features, this can cause problems with the resulting track, such as jitter, wobble, and slippage. Sometimes dropping down to a simpler motion type can help in this situation.
After you've drawn a pattern, a set of Pattern parameters lets you transform and invert the resulting polygon, if necessary.

**Track Mode**

Track mode is unlike the other three options in the Operation menu in that is the only option that initiates the planar tracking. The other modes use the tracking data generated by the Track mode.

**Tracker**

There are two available trackers to pick from:

- **Point:** Tracks points from frame to frame. Internally, this tracker does not actually track points-per-se but rather small patterns like Fusion’s Tracker node. The point tracker possesses the ability to automatically create its internal occlusion mask to detect and reject outlier tracks that do not belong to the dominant motion. Tracks are colored green or red in the viewer, depending on whether the point tracker thinks they belong to the dominant motion or they have been rejected. The user can optionally supply an external occlusion mask to further guide the Point tracker.

- **Hybrid Point/Area:** Uses an Area tracker to track all the pixels in the pattern. Unlike the Point tracker, the Area tracker does not possess the ability to automatically reject parts of the pattern that do not belong to the dominant motion, so you must manually provide it with an occlusion mask. Note that for performance reasons, the Hybrid tracker internally first runs the Point tracker, which is why the point tracks can still be seen in the viewer.

There is no best tracker. They each have their advantages and disadvantages:

- **Artist Effort (occlusion masks):** The Point tracker will automatically create its internal occlusion mask. However, with the Hybrid tracker, you need to spend more time manually creating occlusion masks.

- **Accuracy:** The Hybrid tracker is more accurate and less prone to wobble, jitter, and drift since it tracks all the pixels in the pattern rather than a few salient feature points.

- **Speed:** The Hybrid tracker is slower than the Point tracker.

In general, it is recommended to first quickly track the shot with the Point tracker and examine the results. If the results are not good enough, then try the Hybrid tracker.

**Motion Type**

Determines how the Planar Tracker internally models the distortion of the planar surface being tracked. The five distortion models are:

- Translation.
- Translation, Rotation (rigid motions).
- Translation, Rotation, Scale (takes squares to squares, scale is uniform in x and y).
- Affine includes translation, rotation, scale, skew (maps squares to parallelograms).
- Perspective (maps squares to generic quadrilaterals).

Each successive model is more general and includes all previous models as a special case.

When in doubt, choose Perspective for the initial track attempt. If the footage being tracked has perspective distortions in it, and the Planar Tracker is forced to work with a simpler motion type, this can end up causing the track to slide and wobble.
Sometimes with troublesome shots, it can help to drop down to a simpler motion model—for example, when many track points are clustered on one side of the tracked region or when tracking a small region where there are not many trackable pixels.

**Output**
Controls what is output from the Planar Tracker node while in the Track operation mode.

- **Background**: Outputs the input image unchanged.
- **Background - Preprocessed**: The Planar Tracker does various types of preprocessing on the input image (e.g., converting it to luma) before tracking. It can be useful to see this when deciding which track channel to choose.
- **Mask**: Outputs the pattern as a black and white mask.
- **Mask Over Background**: Outputs the pattern mask merged over the background.

**Track Channel**
Determines which image channel in the background image is tracked. It is good to pick a channel with high contrast, lots of trackable features, and low noise. Allowed values are red, green, blue, and luminance.

**Tracking Controls**
These controls are used to control the Tracker. Note that while tracking, only track to a new frame if the current frame is already tracked or it is the reference frame.

- **Track to start**: Tracks from the current frame backward in time to the start (as determined by the current render range).
- **Step tracker to previous frame**: Tracks from the current frame to the previous frame.
- **Stop tracking**: Stops any ongoing tracking operations.
- **Step tracker to next frame**: Tracks from the current frame to the next frame.
- **Track to end**: Tracks from the current frame forward in time to the end (as determined by the current render range).
- **Trim to start**: Removes all tracking data before the current frame.
- **Delete**: Deletes all tracking data at all times. Use this to destroy all current results and start tracking from scratch.
- **Trim to end**: Removes all tracking data after the current frame. This can be useful, for example, to trim the end of a track that has become inaccurate when the pattern starts to move off frame.

**Show Splines**
This button to the right of the “Trim to end” button opens the Spline Editor and shows the splines associated with the Planar Tracker node. This can be useful for manually deleting points from the Track and Stable Track splines.

**Right-Click Here for Track Spline**
While tracking, a spline containing 4 x 4 matrices at each keypoint is created. This is known as the “Track spline” or just “Track” for short. These matrices completely describe the distortions of the tracked pattern.
Create Planar Transform
After tracking footage, this button can be pressed to create a Planar Transform node on the Node Editor. The current tracking data is embedded in the Planar Transform node so that it can replicate the planar distortions tracked by the Planar Tracker node. Unless you are compositing a full frame foreground that matches the same dimensions as the raster, it is best to create a Planar Transform and use it to apply motion to the foreground.

Steady Mode
In Steady mode, the Planar Tracker transforms the background plate to keep the pattern as motionless as possible. Any leftover motion is because the Planar Tracker failed to follow the pattern accurately or because the pattern did not belong to a physically planar surface.

Steady mode is not very useful for actual stabilization, but is useful for checking the quality of a track. If the track is good, during playback the pattern should not move at all while the rest of the background plate distorts around it. It can be helpful to zoom in on parts of the pattern and place the mouse cursor over a feature and see how far that feature drifts away from the mouse cursor over time.

Steady Time
This is the time where the pattern’s position is snapshotted and frozen in place. It is most common to set this to the reference frame.

Invert Steady Transform
This causes the Planar Tracker node to reverse the effects of the steady transform. This means two Planar Tracker nodes connected back to back with the second set to invert should give back the original image. If you place an effects node in between the two, then the effect will be locked in place. This should only be used to accomplish effects that cannot be done through corner pinning, since it involves two resamplings, causing softening of the background image.

Clipping Mode
Determines what happens to the parts of the background image that get moved off frame by the steady transform:

- **Domain**: The off frame parts are kept.
- **Frame**: The off frames parts are thrown away.

Domain mode is useful when Steady mode is being used to “lock” an effect to the pattern. As an example, consider painting on the license plate of a moving car. One way to do this is to use a Planar Tracker node to steady the license plate, then a Paint node to paint on the license plate, and then a second Planar Tracker to undo the steady transform. If the Clipping mode is set to Domain, the off frame parts generated by the first Planar Tracker are preserved so that the second Planar Tracker can, in turn, map them back into the frame.

Corner Pin Mode
In Corner Pin mode, one or more textures can be attached to a previously tracked planar surface and undergo the same perspective distortions as the surface.

The corner pin workflow with Planar Tracker is:

1. **Track**: select a planar surface in the shot that you wish to attach a texture to or replace the texture on. Track the shot (see the tracking workflow in the Track section).

2. **Switch the Operation Mode to Corner Pin**: When Corner Pin mode is entered from Track mode, the pattern polygon is hidden and a corner pin control is shown in the viewer.
3 **Connect in the texture:** In the Node Editor, connect the output of the MediaIn node containing the texture to the Corner Pin 1 input on the Planar Tracker node.

4 **Adjust corner pin:** Drag the corners of the corner pin in the viewer until the texture is positioned correctly. Sometimes the Show Grid option is useful when positioning the texture. Additionally, if it helps to position it more accurately, scrub to other times and make adjustments to the corner pin.

5 **Review:** Play back the footage and make sure the texture “sticks” to the planar surface.

**Merge Mode**

Controls how the foreground (the corner pinned texture) is merged over the background (the tracked footage). If there are multiple corner pins, this option is shared by all of them. There are four options to pick from:

- BG only
- FG only
- FG over BG
- BG over FG

**Number of Corner Pins**

Use the + and - buttons to increase or decrease the number of corner pins. Each time an additional corner pin is created, a corresponding input appears on the node in the Node Editor.

**Corner Pin 1 Input Group**

Each corner pin has a group of related inputs:

- **Enable:** Controls the visibility of the corner pin in the viewer.
- **Show Grid:** Shows a grid over the corner pin. This can be useful when positioning the corners.
- **Merge Options:** Controls merging of corner pin texture over the background. (See the documentation for the Merge node.)
- **Reference Time Positions:** The positions of the four corners at the reference time. If the track was not perfect, these positions can be animated to make adjustments on top of the track.

**Stabilize Mode**

Stabilize mode is used to smooth out shakiness in the camera by applying a transform that partially counteracts the camera shake. This stabilizing transform (contained in the Stable Track spline) is computed by comparing neighboring frames.

**NOTE:** Stabilize mode only smooths out motions, while Steady mode tries to completely “lock off” all motion.

Be aware that the Planar Tracker stabilizes based on the motion of the pattern, so it is essential to choose the pattern carefully. If the motion of the pattern does not represent the motion of the camera, then there may be unexpected results. For example, if tracking the side of a moving truck and the camera is moving alongside it, the Planar Tracker smooths the combined motion of both the truck and the mounted camera. In some cases, this is not the desired effect. It may be better to choose the pattern to be on some fixed object like the road or the side of a building, which would result in smoothing only the motion of the camera.
One unavoidable side effect of the stabilization process is that transparent edges appear along the edges of the image. These edges appear because the stabilizer does not have any information about what lies off frame, so it cannot fill in the missing bits. The Planar Tracker node offers the option to either crop or zoom away these edges. When filming, if the need for post-production stabilization is anticipated, it can sometimes be useful to film at a higher resolution (or lower zoom).

The Planar Tracker Stabilization Workflow

1. **Track**: Select a roughly planar region that represents the motion that you want to stabilize. Track the shot (see the tracking workflow in the Track section).

2. **Switch the Operation Mode to Stabilize**: Until a stabilization is computed, the Planar Tracker will just output the input footage.

3. **Adjust stabilization options**: Frequently changed options are Parameters to Smooth and Smoothing Radius.

4. **Compute stabilization**: Press the Compute Stabilization button and wait for the stabilization computations to finish. Play back the output of the Planar Tracker node to see the effects of the stabilization. Notice that transparent edges have been introduced around the edges of the image by the stabilization transform.

5. **Refine**: Adjust the stabilization options and recompute the stabilization as many times as desired.

6. **Handle transparent edges (optional)**: Set the Frame Mode to either Zoom or Crop as desired and then click the Auto Zoom or Auto Crop button. Play back the footage to observe the effects. If there is too much zoom or the image has been cropped too small, try reducing the amount of smoothing.

**Parameters to Smooth**

Specify which of the following parameters to smooth:

- X Translation
- Y Translation
- Rotation
- Scale

**Smoothing Window**

When stabilizing a particular frame, this determines how the contributions of neighboring frames are weighted. Available choices are Box and Gaussian.

**Smoothing Radius (Frames)**

Determines the number of frames whose transforms are averaged together to compute the stabilization. A larger Smoothing Radius results in more smoothing but introduces more transparent edges.

**Compute Stabilization**

Clicking this button runs the stabilizer, overwriting the results of any previous stabilization. As soon as the stabilization is finished, the output of the Planar Tracker node will be immediately updated with the stabilization applied.
NOTE: The stabilizer uses the Track spline (created by the tracker) to produce the Stable Track spline. Both of these splines’ keyframes contain 4 x 4 matrices, and the keyframes are editable in the Spline Editor.

Clipping Mode
Determines what happens to the parts of the background image that get moved off frame by the stabilization:

- **Domain**: The off frame parts are kept.
- **Frame**: The off frames parts are thrown away.

Frame Mode
This controls how transparent edges are handled. The available options include:

- **Full**: Do nothing. Leaves the transparent edges as is.
- **Crop**: Crops away the transparent edges. When this option is selected, the size of Planar Tracker’s output image is smaller than the input image. No image resamplings occur. In Crop mode, use the Auto Crop button or manually adjust the crop window by changing the X Offset, Y Offset, and Scale sliders.
  - **Auto Crop Button**: When this button is clicked, the Planar Tracker will examine all the frames and pick the largest possible crop window that removes all the transparent edges. The computed crop window will always be centered in frame and pixel aligned. When clicked, Auto Crop updates the X/Y Offset and Scale sliders.

- **Zoom**: Scales the image bigger until the transparent edges are off frame. Choosing this option causes an image resampling to occur. The downside of this approach is that it reduces the quality (slightly softens) of the output image. In Zoom mode, use the Auto Zoom button or manually adjust the zoom window by changing the X Offset, Y Offset, and Scale sliders.
  - **Auto Zoom**: When this button is clicked, the Planar Tracker will examine all the frames and pick the smallest possible zoom factor that removes all the transparent edges. The computed zoom window will always be centered in frame. When clicked, Auto Zoom updates the X/Y Offset and Scale sliders.

Right-Click Here for Stable Track Spline
Right-clicking over this label provides access to a spline whose keyframes contain 4 x 4 matrices which in turn represent the stabilization transforms. This is mostly here for completeness and for advanced users.
Options Tab
These controls affect the look of onscreen controls in the viewer.

![PlanarTracker](image)

**Darken Image**
Darkens the image while in Track mode in order to better see the controls and tracks in the viewer. The Shift+D keyboard shortcut toggles this.

**Show Track Markers**
Toggles the display of the dots marking the location of trackers at the current time.

**Show Trails**
Toggles the display of the trails following the location of trackers.

**Trail Length**
Allows changing the length of tracker trails. If the pattern is moving very slowly, increasing the length can sometimes make the trails easier to follow in the viewer. If the pattern is moving very fast, the tracks can look like spaghetti in the viewer. Decreasing the length can help.

**Inlier/Outlier Colors**
When tracking, the tracker analyzes the frame and detects which of the multitudinous tracks belong to the dominant motion and which ones represent anomalous, unexplainable motion. By default, tracks belonging to the dominant motion are colored green (and are called inliers) and those that do not belong are colored red (and are called outliers). Only the inlier tracks are used when computing the final resulting track.

Common Controls

**Settings Tab**
The Settings tab in the Inspector is also duplicated in other Tracking nodes. These common controls are described in detail at the end of this chapter in "The Common Controls" section.
Planar Transform Node [Pxf]

The Planar Transform node applies perspective distortions generated by a Planar Tracker node onto any input mask or masked image. The Planar Transform node can be used to reduce the amount of time spent on rotoscoping objects. The workflow here centers around the notion that the Planar Tracker node can be used to track objects that are only roughly planar. After an object is tracked, a Planar Transform node can then be used to warp a rotospline, making it approximately follow the object over time. Fine-level cleanup work on the rotospline then must be done.

Depending on how well the Planar Tracker followed the object, this can result in substantial time savings in the amount of tedious rotoscoping. The key to using this technique is recognizing situations where the Planar Tracker performs well on an object that needs to be rotoscoped.

A rough outline of the workflow involved is:

1. **Track**: Using a Planar Tracker node, select a pattern that represents the object to be rotoscoped. Track the shot (see the tracking workflow in the Track section for the Planar Tracker node).
2. **Create a Planar Transform node**: Press the Create Planar Transform button on the Planar Tracker node to do this. The newly created Planar Transform node can be freely cut and pasted into another composition as desired.
3. **Rotoscope the object**: Move to any frame that was tracked by the Planar Tracker. When unsure if a frame was tracked, look in the Spline Editor for a tracking keyframe on the Planar Transform node. Connect a Polygon node into the Planar Transform node. While viewing the Planar Transform node, rotoscope the object.
4. **Refine**: Scrub the timeline to see how well the polygon follows the object. Adjust the polyline on frames where it is off. It is possible to add new points to further refine the polygon.

**Inputs**

The Planar Transform has only two inputs:

- **Image Input**: The orange image input accepts a 2D image on which the transform will be applied.
- **Effect Mask**: The blue input is for a mask shape created by polylines, basic primitive shapes, paint strokes, or bitmaps from other tools. Connecting a mask to this input limits the output of the Planar Transform to certain areas.
**Basic Node Setup**

The example below uses a Planar Transform node between a masked MediaIn2 node and the foreground input to a Merge node. The background MediaIn1 node connects to the Planar Tracker, which was used to generate the Planar Transform. Once the Planar Transform is created, the Planar Tracker is no longer needed in the node tree.

![A Planar Transform creating a match move](image)

**Inspector**

The Planar Transform node has very few controls, and they are all located in the Controls tab. It's designed to apply the analyzed Planar Tracking data as a match move.

**Controls Tab**

The Planar Transform node has very few controls, and they are all located in the Controls tab. It's designed to apply the analyzed Planar Tracking data as a match move.

**Reference Time**

This is the reference time that the pattern was taken from in the Planar Tracker node used to produce the Planar Transform.

**Right-Click Here for Track Spline**

The Track spline contains information about the perspective distortions stored in 4 x 4 matrices. When a Planar Transform node is exported from a Planar Tracker node, the Track spline produced by the Planar Tracker is shared by connecting it with the Planar Transform node. A consequence of this sharing of the Track spline is that if the track is changed in the Planar Tracker node, the Planar Transform will be automatically updated. Note that this spline can be examined in the Spline Editor, which is useful for seeing the extent of tracked frames.

**Common Controls**

**Settings Tab**

The Settings tab in the Inspector is also duplicated in other Tracking nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.
Camera Tracker [CTra]

Camera Tracker Introduction

Camera tracking is match moving, and a vital link between 2D and 3D, allowing compositors to integrate 3D renders into live-action scenes. The Camera Tracker node is used to calculate the path of a live-action camera and generate a virtual camera in 3D space. This virtual camera’s motion is intended to be identical to the motion of the actual camera that shot the scene. Using the calculated position and movement of the virtual camera provides the flexibility to add 3D elements to a live-action scene. Also, the Camera Tracker creates a point cloud in 3D space that can be used to align objects and other 3D models to the live-action scene.

For more information about how to use the Camera Tracker, see Chapter 24, “3D Camera Tracking” in the Fusion Studio Reference Manual or Chapter 69, in the DaVinci Resolve Reference Manual.
**Inputs**

The Camera Tracker has two inputs:

- **Background:** The orange image input accepts a 2D image you want tracked.
- **Occlusion Mask:** The white occlusion mask input is used to mask out regions that do not need to be tracked. Regions where this mask is white will not be tracked. For example, a person moving in front of and occluding bits of the scene may be confusing to the tracker, and a quickly-created rough mask around the person can be used to tell the tracker to ignore the masked-out bits.

**Basic Node Setup**

The Camera Tracker background input is used to connect the image you want tracked. Polygon masks can be connected into the occlusion mask input to identify areas the tracker should ignore.

**Inspector**

**Track Tab**

The Track tab contains the controls you need to set up an initial analysis of the scene.

**Auto Track**

Automatically detects trackable features and tracks them through the source footage. Tracks will be automatically terminated when the track error becomes too high, and new tracks are created as needed. The values of the Detection Threshold and Minimum Feature Separation sliders can be used to control the number and distribution of auto tracks.
**Reset**
Deletes all the data internal to the Camera Tracker node, including the tracking data and the solve data (camera motion path and point cloud). To delete only the solve data, use the Delete button on the Solve tab.

**Preview AutoTrack Locations**
Turning this checkbox on will show where the auto tracks will be distributed within the shot. This is helpful for determining if the Detection Threshold and Minimum Feature Separation need to be adjusted to get an even spread of trackers.

**Detection Threshold**
Determines the sensitivity to detect features. Automatically generated tracks will be assigned to the shot and the Detection Threshold will force them to be either in locations of high contrast or low contrast.

**Minimum Feature Separation**
Determines the spacing between the automatically generated tracking points. Decreasing this slider causes more auto tracks to be generated. Keep in mind that a large number of tracking points will also result in a lengthier solve.

**Track Channel**
Used to nominate a color channel to track: red, green, blue, or luminance. When nominating a channel, choose one that has a high level of contrast and detail.

**Track Range**
Used to determine which frames are tracked:
- **Global**: The global range, which is the full duration of the Timeline.
- **Render**: The render duration set on the Timeline.
- **Valid**: The valid range is the duration of the source media.
- **Custom**: A user determined range. When this is selected, a separate range slider appears to set the start and end of the track range.

**Bidirectional Tracking**
Enabling this will force the tracker to track backward after the initial forward tracking. When tracking backward, new tracks are not started but rather existing tracks are extended backward in time. It is recommended to leave this option on, as long tracks help give better solved cameras and point clouds.

**Gutter Size**
Trackers can become unstable when they get close to the edge of the image and either drift or jitter or completely lose their pattern. The Camera Tracker will automatically terminate any tracks that enter the gutter region. Gutter size is given as a percentage of pattern size. By default, it’s 100% of pattern size, so a 0.04 pattern means a 0.04 gutter.
New Track Defaults

There are three methods in which the Camera Tracker node can analyze the scene, and each has its own strengths when dealing with certain types of camera movement.

- **Tracker:** Internally, all the Trackers use the Optical Flow Tracker to follow features over time and then further refine the tracks with the trusted Fusion Tracker or Planar Tracker. The Planar Tracker method allows the pattern to warp over time by various types of transforms to find the best fit. These transforms are:
  - Translation
  - Translation and Rotation
  - Translation, Rotation, and Scale
  - Affine
  - Perspective

It is recommended to use the default TRS setting when using the Planar Tracker. The Affine and Perspective settings need large patterns in order to track accurately.

- **Close Tracks When Track Error Exceeds:** Tracks will be automatically terminated when the tracking error gets too high. When tracking a feature, a snapshot of the pixels around a feature are taken at the reference time of the track. This is called a pattern, and that same pattern of pixels is searched for at future times. The difference between the current time pattern and the reference time pattern is called the track error. Setting this option higher produces longer but increasingly less accurate tracks.

- **Solve Weight:** By default, each track is weighted evenly in the solve process. Increasing a track’s weight means it has a stronger effect on the solved camera path. This is an advanced option that should be rarely changed.

Auto Track Defaults

Set a custom prefix name and/or color for the automatically generated tracks. This custom color will be visible when Track Colors in the Options tab is set to User Assigned.

Camera Tab

The controls of the Camera tab let you specify the physical aspects of the live-action camera, which will be used as a starting point when searching for solve parameters that match the real-world camera. The more accurate the information provided in this section, the more accurate the camera solve.

The Camera tab includes controls relating to the lens and gate aspects of the camera being solved for.
**Focal Length**
Specify the known constant focal length used to shoot the scene or provide a guess if the Refine Focal Length option is activated in the Solve tab.

**Film Gate**
Choose a film gate preset from the drop-down menu or manually enter the film back size in the Aperture Width and Aperture Height inputs. Note that these values are in inches.

**Aperture Width**
In the event that the camera used to shoot the scene is not in the preset drop-down menu, manually enter the aperture width (inches).

**Aperture Height**
In the event that the camera used to shoot the scene is not in the preset drop-down menu, manually enter the aperture height (inches).

**Resolution Gate Fit**
This defines how the image fits the sensor size. Often, film sensors are sized to cover a number of formats, and only a portion of the sensor area is recorded into an image.

For example, a 16:9 image is saved out of a full aperture-sized sensor.

Typically, fit to Width or Height is the best setting. The other fit modes are Inside, Outside, or Stretched.

**Center Point**
This is where the camera lens is aligned to the camera. The default is (0.5, 0.5), which is the middle of the sensor.

**Use Source Pixel Aspect**
This will use the squeeze aspect of the pixels that is loaded in the image. HD is square pixels, but NTSC has a pixel aspect ratio of 0.9:1, and Anamorphic CinemaScope is 2:1 aspect.

Disabling this option exposes Pixel X and Y number fields where you can customize the source pixel aspect.

**Auto Camera Planes**
When enabled, the camera’s image plane and far plane are automatically moved to enclose the point cloud whenever a solve completes. Sometimes, though, the solver can atypically fling points off really deep into the scene, consequently pushing the image plane very far out. This makes the resulting scene unwieldy to work with in the 3D views. In these cases, disable this option to override this default behavior (or delete the offending tracks).
Solve Tab

The Solve tab is where the tracking data is used to reconstruct the camera’s motion path along with the point cloud. It is also where cleanup of bad or false tracks is done, and other operations on the tracks can be performed, such as defining which marks are exported in the Point Cloud 3D. The markers can also have their weight set to affect the solve calculations.

For example, a good camera solve may have already been generated, but there are not enough locators in the point cloud in an area where an object needs to be placed, so adding more tracks and setting their Solve Weight to zero will not affect the solved camera but will give more points in the point cloud.

Solve

Pressing Solve will launch the solver, which uses the tracking information and the camera specifications to generate a virtual camera path and point cloud, approximating the motion of the physical camera in the live-action footage. The console will automatically open, displaying the progress of the solver.

Delete

Delete will remove any solved information, such as the camera and the point cloud, but will keep all the tracking data.

Average Solve Error

Once the camera has been solved, a summary of the solve calculation is displayed at the top of the Inspector. Chief among those details is the Average Solve Error. This number is a good indicator of whether the camera solve was successful. It can be thought of as the difference
(measured in pixels) between tracks in the 2D image and the reconstructed 3D locators reprojected back onto the image through the reconstructed camera. Ultimately, in trying to achieve a low solve error, any value less than 1.0 pixels will generally result in a good track. A value between 0.6 and 0.8 pixels is considered excellent.

**Clean Tracks by Filter**
Clicking this button selects tracks based on the Track Filtering options. If the Auto Delete Tracks By Filter checkbox is activated, the selected tracks will be deleted as well.

**Clean Foreground Tracks**
Clicking this button makes a selection of the tracks on fast-moving objects that would otherwise cause a high solve error. The selection is determined by the Foreground Threshold slider.

**Foreground Threshold**
This slider sets the detection threshold for finding the tracks on fast-moving objects. The higher the value, the more forgiving.

**Auto Delete Tracks by Filter**
With this checkbox enabled, tracks that are selected by the Clean Tracks By Filter button will be deleted. Enable the checkbox, and then press Clean Tracks By Filter. Any track that meets the filtering options is then selected and deleted.

**Auto Delete Foreground Tracks**
With this checkbox enabled, tracks that are selected by the Clean Foreground Tracks button will be deleted. Enable the checkbox, and then press Clean Foreground Tracks. Any track that meets the foreground threshold criteria is deleted.

**Accept Solve Error**
This slider sets an acceptable maximum threshold level for the solve error. If the solve error is greater than this value, the Camera Tracker will sweep the focal length setting in an attempt to bring the solve error under the Accept Solve Error value. If the solver cannot find a solution, the Camera Tracker will display a message in the console that the solver failed. If a solution cannot be found, ideally you should try to input the correct focal length or alternatively manually clean some noisy tracks then re-solve.

**Auto Select Seed Frames**
With this enabled, the Camera Tracker nominates two frames that will be used as a reference for initiating the solve. These two frames are initially solved for and a camera is reconstructed, and then gradually more frames are added in, and the solution is “grown” outward from the seed frames. The choice of seed frames strongly affects the entire solve and can easily cause the solve to fail. Seed frames can be found automatically or defined manually.

Disabling this will allow the user to select their own two frames. Manual choice of seed frames is an option for advanced users. When choosing seed frames, it is important to satisfy two conflicting desires: the seed frames should have lots of tracks in common yet be far apart in perspective (i.e., the baseline distance between the two associated cameras is long).

**Refine Focal Length**
Enabling this will allow the solver to adjust the focal length of the lens to match the tracking points. You can prevent the focal length being adjusted by setting the Focal Length parameter in the Camera Tab.
Enable Lens Parameter
When enabled, lens distortion parameters are exposed to help in correcting lens distortion when solving.

- **Refine Center Point**: Normally disabled, camera lenses are normally centered in the middle of the film gate but this may differ on some cameras. For example, a cine camera may be set up for Academy 1.85, which has a sound stripe on the left, and shooting super35, the lens is offset to the right.

- **Refine Lens Parameters**: This will refine the lens distortion or curvature of the lens. There tends to be larger distortion on wide angle cameras.

**NOTE:** When solving for the camera’s motion path, a simulated lens is internally created to model lens distortion in the source footage. This simulated lens model is much simpler than real-world lenses but captures the lens distortion characteristics important for getting an accurate camera solve. Two types of distortion are modeled by Camera Tracker:

1 **Radial Distortion**: The strength of this type of distortion varies depending on the distance from the center of the lens. Examples of this include pincushion, barrel, and mustache distortion. Larger values correspond to larger lens curvatures. Modeling radial distortion is especially important for wide angle lenses and fisheye lenses (which will have a lot of distortion because they capture 180 degrees of an environment and then optically squeeze it onto a flat rectangular sensor).

2 **Tangential Distortion**: This kind of distortion is produced when the camera’s imaging sensor and physical lens are not parallel to each other. It tends to produce skew distortions in the footage similar to distortions that can be produced by dragging the corners of a corner pin within Fusion. This kind of distortion occurs in very cheap consumer cameras and is practically non-existent in film cameras, DSLRs, and pretty much any kind of camera used in film or broadcast. It is recommended that it be left disabled.

Enable Lens Parameters
When disabled, the Camera Tracker does not do any lens curvature simulations. This is the default setting and should remain disabled if there is a very low distortion lens or the lens distortion has already been removed from the source clip. Activating the Enable Lens Parameters checkbox determines which lens parameters will be modeled and solved for. Parameters that are not enabled will be left at their default values. The following options are available:

- **Radial Quadratic**: Model only Quadratic radial lens curvature, which is either barrel or pincushion distortion. This is the most common type of distortion. Selecting this option causes the low and high order distortion values to be solved for.

- **Radial Quartic**: Model only Quartic radial lens curvature, which combines barrel and pincushion distortion. This causes the low and high order distortion values to be solved for.

- **Radial & Tangential**: Model and solve for both radial and tangential distortion. Tangential relates to misaligned elements in a lens.

- **Division Quadratic**: Provides a more accurate simulation of Quadratic radial lens curvature. This causes the low and high order distortion values to be solved for.
- **Division Quartic**: Provides a more accurate simulation of Quartic radial lens curvature. This causes the low and high order distortion values to be solved for.
  - **Lower Order Radial Distortion**: This slider is available for all simulations. It determines the quadratic lens curvature.
  - **Higher Order Radial Distortion**: This slider is available only for Quartic simulations. Determines the quartic lens curvature.
  - **Tangential Distortion X/Y**: These sliders are available only for Tangential simulations. Determines skew distortion.

**Track Filtering**
The Camera Tracker can produce a large number of automatically generated tracks. Rather than spending a lot of time individually examining the quality of each track, it is useful to have some less time-intensive ways to filter out large swaths of potentially bad tracks. The following input sliders are useful for selecting large amounts of tracks based on certain quality metrics, and then a number of different possible operations can be made on them. For example, weaker tracks can selected and deleted, yielding a stronger set of tracks to solve from. Each filter can be individually enabled or disabled.

**Minimum Track Length (Number of Markers)**
Selects tracks that have a duration shorter than the slider’s value. Short tracks usually don’t get a chance to move very far and thus provide less perspective information to the solver than a longer track, yet both short and long tracks are weighted evenly in the solve process, making long tracks more valuable to the solver. Locators corresponding to shorter tracks are also less accurately positioned in 3D space than those corresponding to longer tracks. If the shot has a lot of long tracks, it can be helpful to delete the short tracks. For typical shots, using a value in the range of 5 to 10 is suggested. If there are not a lot of long tracks (e.g., the camera is quickly rotating, causing tracks to start and move off frame quickly), using a value closer to 3 is recommended.

**Maximum Track Error**
Selects tracks that have an average track error greater than the slider’s value. When tracking, tracks are automatically terminated when their track error exceeds some threshold. This auto termination controls the maximum track error, while this slider controls the average track error. For example, tracks following the foliage in a tree tend to be inaccurate and sometimes may be detected by their high average error.

**Maximum Solve Error**
Selects tracks that have a solve error greater than the slider’s value. One of the easiest ways to increase the accuracy of a camera solve is to select the 20% of the tracks with the highest solve error and simply delete them (although this can sometimes make things worse).

**Select Tracks Satisfying Filters**
Selects the tracks within the scene that meet the above Track Filtering values. Note that when this button is pressed, the tracks that satisfy the filter values are displayed in the Selected Tracks area of the Solve tab and are colored in the viewer. This button is useful when Auto Select Tracks While Dragging Sliders is turned off or if the selection, for example, was accidentally lost by mis-clicking in the viewer.

**Auto Select Tracks While Dragging Sliders**
When this is ticked on, dragging the above sliders (Minimum Track Length, Maximum Track Error, Maximum Solve Error) will cause the corresponding tracks to be interactively selected in the viewer.
Operations on Selected Tracks

Tracks selected directly in the viewer with the mouse or selected via track filtering can have the following operations applied:

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete</td>
<td>Will remove the tracks from the set. When there are bad tracks, the simplest and easiest option is to simply delete them.</td>
</tr>
<tr>
<td>Trim Previous</td>
<td>Will cut the tracked frames from the current frame to the start of the track. Sometimes it can be more useful to trim a track than deleting it. For example, high quality long tracks that become inaccurate when the feature they are tracking starts to become occluded or when the tracked feature moves too close to the edge of the image.</td>
</tr>
<tr>
<td>Trim Next</td>
<td>Will cut the tracked frames from the current frame to the end of the track.</td>
</tr>
<tr>
<td>Rename</td>
<td>Will replace the current auto generated name with a new name.</td>
</tr>
<tr>
<td>Set Color</td>
<td>Will allow for user assigned color of the tracking points.</td>
</tr>
<tr>
<td>Export Flag</td>
<td>This controls whether the locators corresponding to the selected tracks will be exported in the point cloud. Default all locators flagged as exportable.</td>
</tr>
<tr>
<td>Solve Weight</td>
<td>By default, all the tracks are used and equally weighted when solving for the camera’s motion path. The most common use of this option is to set a track’s weight to zero so it does not influence the camera’s motion path but is still has a reconstructed 3D locator. Setting a track’s weight to values other than 1.0 or 0.0 should only be done by advanced users. Onscreen display of track names and values are controlled by these functions.</td>
</tr>
<tr>
<td>None</td>
<td>Will clear/hide the selected tracks.</td>
</tr>
<tr>
<td>Toggle</td>
<td>Will swap the selected tracks and unselect sets.</td>
</tr>
<tr>
<td>All</td>
<td>Will select all tracks.</td>
</tr>
<tr>
<td>Show Names</td>
<td>Will display the track name, by default these are a number.</td>
</tr>
<tr>
<td>Show Frame Range</td>
<td>Will display the start and end frame of a track.</td>
</tr>
<tr>
<td>Show Solve Error</td>
<td>Will display the amount of solve error each selected track has.</td>
</tr>
</tbody>
</table>

Selected Tracks

This area displays the properties of a track point or group of points. It has options to:

- **Clear**: Deselects all tracks and clears this area.
- **Invert**: Deselects the current selected tracks and selects the other tracks.
- **Visible**: Selects all the trackers at the current frame.
- **All**: Selects all trackers on all frames.
- **Search**: Selects tracks whose names contain a substring.

**TIP:** Also select tracks directly in the 2D viewer using the mouse or in the 3D viewer by selecting their corresponding locators in the point cloud.
Export

The Export tab lets you turn the tracked and solved data this node has generated into a form that can be used for compositing.

The Export button will create a basic setup that can be used for 3D match moving:

- A Camera 3D with animated translation and rotation that matches the motion of the live-action camera and an attached image plane.
- A Point Cloud 3D containing the reconstructed 3D positions of the tracks.
- A Shape 3D set to generate a ground plane.
- A Merge 3D merging together the camera, point cloud, and ground plane. When the Merge 3D is viewed through the camera in a 3D viewer, the 3D locators should follow the tracked footage.
- A Renderer 3D set to match the input footage.
The export of individual nodes can be enabled/disabled in the Export Options tab.

**Update Previous Export**
When this button is clicked, the previously exported nodes are updated with any new data generated. These previously exported nodes are remembered in the Previous Export section at the bottom of this section. Here’s an example of how this is handy:

1. Solve the camera and export.
2. Construct a complex Node Editor based around the exported nodes for use in set extension.
3. The camera is not as accurate as preferred or perhaps the solver is rerun to add additional tracks to generate a denser point cloud. Rather than re-exporting the Camera 3D and Point Cloud 3D nodes and connecting them back in, just press the Update Previous Export button to “overwrite” the existing nodes in place.

**Automatically Update Previous Export After Solves**
This will cause the already exported nodes (Camera 3D, Point Cloud 3D, Lens Distort, Renderer 3D, and the ground plane) to auto update on each solve.

**3D Scene Transform**
Although the camera is solved, it has no idea where the ground plane or center of the scene is located. By default, the solver will always place the camera in Fusion’s 3D virtual environment so that on the first frame it is located at the origin (0, 0, 0) and is looking down the -Z axis. You have the choice to export this raw scene without giving the Camera Tracker any more information, or you can set the ground plane and origin to simplify your job when you begin working in the 3D scene. The 3D Scene Transform controls provide a mechanism to correctly orient the physical ground plane in the footage with the virtual ground plane in the 3D viewer. Adjusting the 3D Scene Transform does not modify the camera solve but simply repositions the 3D scene to best represent the position of the live-action camera.

**NOTE:** If you export the scene and then make changes in the 3D Scene Transform, it is important to manually click Update Previous Export to see the results in the exported nodes.

**Aligned/Unaligned**
The Aligned/Unaligned menu locks or unlocks the origin and ground plane settings. When set to Unaligned, you can select the ground plane and origin either manually or by selecting locators in the viewer. When in unaligned mode, a 3D Transform control in the 3D viewer can be manually manipulated to adjust the origin.

Once alignment of the ground plane and origin has been completed, the section is locked by switching the menu to Aligned.

**Set from Selection**
When set to unaligned, buttons labeled Set from Selection are displayed under the Origin, Orientation, and Scale sections. Clicking these buttons takes the selecting locators in the viewer and aligns the ground plane or origin based on the selection.
For instance, to set the ground plane, do the following:

1. After solving, set the 3D Scene Transform menu to Unaligned.
2. Find a frame where the ground plane is at its largest and clearest point.
3. In the viewer, drag a selection rectangle around all the ground plane locators.
4. Hold Shift and drag again to add to the selection.
5. In the Orientation section, make sure the Selection Is menu correctly matches the orientation of the selected locators.
6. Click the Set from Selection button located under the Orientation parameters.
7. Set the 3D Scene Transform menu back to Aligned.

To get the best result when setting the ground plane, try to select as many points as possible belonging to the ground and having a wide separation.

**TIP:** When selecting points for the ground plane, it is helpful to have the Camera Tracker node viewed in side-by-side 2D and 3D views. It may be easier to select tracks belonging to the ground by selecting tracks from multiple frames in the 2D viewer rather than trying to box select locators in the 3D viewer.

Setting the origin can help you place 3D objects in the scene with more precision. To set the origin, you can follow similar steps, but only one locator is required for the origin to be set. When selecting a locator for the origin, select one that has a very low solve error.

**Ground Plane Options**
These controls let you adjust the ground plane for the scene, which is a crucial step in making sure the composite looks correct.

<table>
<thead>
<tr>
<th>Color</th>
<th>Will set the color of the ground plane.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Size</td>
<td>Controls how big the ground plane can be set.</td>
</tr>
<tr>
<td>Subdivision Level</td>
<td>Shows how many polygons are in the ground plane.</td>
</tr>
<tr>
<td>Wireframe</td>
<td>Sets whether the ground plane is set as wireframe or solid surface when displayed in 3D.</td>
</tr>
<tr>
<td>Line Thickness</td>
<td>Adjusts how wide the lines will draw in the view.</td>
</tr>
<tr>
<td>Offset</td>
<td>By default, the center of the ground plane is placed at the origin (0, 0, 0). This can be used to shift the ground plane up and down along the y-axis.</td>
</tr>
</tbody>
</table>

**Export Options**
Provides a checkbox list of what will be exported as nodes when the Export button is pressed. These options are Camera, Point Cloud, Ground Plane, Renderer, Lens Distortion, and Enable Image Plane in the camera.

The Animation menu allows you to choose between animating the camera and animating the point cloud. Animating the camera leaves the point cloud in a locked position while the camera is keyframed to match the live-action shot. Animating the point cloud does the opposite. The camera is locked in position while the entire point cloud is keyframed to match the live-action shot.
**Previous Export**
When the Update Previous Export button is clicked, the previously exported nodes listed here are updated with any new data generated (this includes the camera path and attributes, the point cloud, and the renderer).

**Options**
The Options tab lets you customize the Camera Tracker's onscreen controls so you can work most effectively with the scene material you have.

![Options Tab]

**Trail Length**
Displays trail lines of the tracks overlaid on the viewer. The amount of frames forward and back from the current frame is set by length.

**Location Size**
In the 3D viewer, the point cloud locators can be sized by this control.

Track Colors, Locator Colors, and Export Colors each have options for setting their color to one of the following: User Assigned, Solve Error, Take From Image, and White.

<table>
<thead>
<tr>
<th>Track Colors</th>
<th>Onscreen tracks in the 2D view.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Locator Colors</td>
<td>Point Cloud locators in the 3D view.</td>
</tr>
<tr>
<td>Export Colors</td>
<td>Colors of the locators that get exported within the Point Cloud node.</td>
</tr>
</tbody>
</table>

**Darken Image**
Dims the brightness of the image in viewers to better see the overlaid tracks. This affects both the 2D and 3D viewers.
Visibility
Toggles which overlays will be displayed in the 2D and 3D viewers. The options are Tracker Markers, Trails, Tooltips in the 2D Viewer, Tooltips in the 3D viewer, Reprojected Locators, and Tracker Patterns.

Colors
Sets the color of the overlays.

- **Selection Color**: Controls the color of selected tracks/locators.
- **Preview New Tracks Color**: Controls the color of the points displayed in the viewer when the Preview AutoTrack Locations option is enabled.
- **Solve Error Gradient**: By default, tracks and locators are colored by a green-yellow-red gradient to indicate their solve error. This gradient is completely user adjustable.

Reporting
Outputs various parameters and information to the Console.

Understanding Camera Tracking
On large productions, camera tracking or 3D match moving is often handed over to experts who have experience with the process of tracking and solving difficult shots. There is rarely a shot where you can press a couple of buttons and have it work perfectly. It does take an understanding of the whole process and what is essential to get a good solved track.

The Camera Tracker must solve for hundreds of thousands of unknown variables, which is a complex task. For the process to work, it is essential to get good tracking data that exists in the shot for a long time. False or bad tracks will skew the result. This section explains how to clean up false tracks and other techniques to get a good solve.

Workflow
Getting a good solve is a repeated process.

Track > Solve > Refine Filters > Solve > Cleanup tracks > Solve > Cleanup from point cloud > Solve > Repeat.

Initially, there are numerous tracks, and not all are good, so a process of filtering and cleaning up unwanted tracks to get to the best set is required. At the end of each cleanup stage, pressing Solve ideally gives you a progressively lower solve error. This needs to be below 1.0 for it to be good for use with full HD content, and even lower for higher resolutions. Refining the tracks often but not always results in a better solve.

False Tracks
False tracks are caused by a number of conditions, such as moving objects in a shot, or reflections and highlights from a car. There are other types of false tracks like parallax errors where two objects are at different depths, and the intersection gets tracked. These moiré effects can cause the track to creep. Recognizing these False tracks and eliminating them is the most important step in the solve process.

Track Lengths
Getting a good set of long tracks is essential; the longer the tracks are, the better the solve. The Bi-Directional tracking option in the Tracker tab is used to extend the beginning of tracks in time. The longer in time a track exists and the more tracks that overlap in time of a shot, the more consistent and accurate the solve.
**Seed Frames**

Two seed frames are used in the solve process. The algorithm chooses two frames that are as far apart in time yet share the same tracks. That is why longer tracks make a more significant difference in the selection of seed frames.

The two Seed frames are used as the reference frames, which should be from different angles of the same scene. The solve process will use these as a master starting point to fit the rest of the tracks in the sequence.

There is an option in the Solve tab to Auto Detect Seed Frames, which is the default setting and most often a good idea. However, auto detecting seed frames can make for a longer solve. When refining the Trackers and re-solving, disable the checkbox and use the Seed 1 and Seed 2 sliders to enter the previous solve’s seed frames. These seed frames can be found in the Solve Summary at the top of the Inspector after the initial solve.

**Refine Filters**

After the first solve, all the Trackers will have extra data generated. These are solve errors and tracking errors.

Use the refine filters to reduce unwanted tracks, like setting minimum tracker length to eight frames. As the value for each filter is adjusted, the Solve dialog will indicate how many tracks are affected by the filter. Then Solve again.

**Onscreen Culling**

Under the Options tab, set the track to 20. This will display each track on footage with ±20 frame trail. When scrubbing/playing through the footage, false tracks can be seen and selected onscreen, and deleted by pressing the Delete key. This process takes an experienced eye to spot tracks that go bad. Then Solve again.

You can view the exported scene in a 3D perspective viewer. The point cloud will be visible. Move and pan around the point cloud, select and delete points that seem to have no inline with the image and the scene space. Then Solve again.

Repeat the process until the solve error is below 1.0 before exporting.

**Common Controls**

**Settings Tab**

The Settings tab in the Inspector is also duplicated in other Tracking nodes. These common controls are described in detail in the following "The Common Controls" section.
The Common Controls

Nodes that handle tracking operations share several identical controls in the Inspector. This section describes controls that are common among Tracking nodes.

Inspector

Settings Tab
The Settings tab in the Inspector can be found on every tool in the Tracking category. The controls are consistent and work the same way for each tool.

Blend
The Blend control is used to blend between the tool’s original image input and the tool’s final modified output image. When the blend value is 0.0, the outgoing image is identical to the incoming image. Normally, this will cause the tool to skip processing entirely, copying the input straight to the output.

Process When Blend Is 0.0
The tool is processed even when the input value is zero. This can be useful if the node is scripted to trigger a task, but the node’s value is set to 0.0.
Red/Green/Blue/Alpha Channel Selector
These four buttons are used to limit the effect of the tool to specified color channels. This filter is often applied after the tool has been processed.

For example, if the Red button on a Blur tool is deselected, the blur will first be applied to the image, and then the red channel from the original input will be copied back over the red channel of the result.

There are some exceptions, such as tools for which deselecting these channels causes the tool to skip processing that channel entirely. Tools that do this will generally possess a set of identical RGBA buttons on the Controls tab in the tool. In this case, the buttons in the Settings and the Controls tabs are identical.

Apply Mask Inverted
Enabling the Apply Mask Inverted option inverts the complete mask channel for the tool. The mask channel is the combined result of all masks connected to or generated in a node.

Multiply by Mask
Selecting this option will cause the RGB values of the masked image to be multiplied by the mask channel's values. This will cause all pixels of the image not included in the mask (i.e., set to 0) to become black/transparent.

Use Object/Use Material (Checkboxes)
Some 3D software can render to file formats that support additional channels. Notably, the EXR file format supports Object ID and Material ID channels, which can be used as a mask for the effect. These checkboxes determine whether the channels will be used, if present. The specific Material ID or Object ID affected is chosen using the next set of controls.

Correct Edges
This checkbox appears only when the Use Object or Use Material checkboxes are selected. It toggles the method used to deal with overlapping edges of objects in a multi-object image. When enabled, the Coverage and Background Color channels are used to separate and improve the effect around the edge of the object. If this option is disabled (or no Coverage or Background Color channels are available), aliasing may occur on the edge of the mask.

For more information on the Coverage and Background Color channels, see Chapter 4, “Understanding Image Channels and Node Processing” in the Fusion Studio Reference Manual or Chapter 56 in the DaVinci Resolve Reference Manual.

Object ID/Material ID (Sliders)
Use these sliders to select which ID will be used to create a mask from the object or material channels of an image. Use the Sample button in the same way as the Color Picker: to grab IDs from the image displayed in the viewer. The image or sequence must have been rendered from a 3D software package with those channels included.
Motion Blur

- **Motion Blur**: This toggles the rendering of Motion Blur on the tool. When this control is toggled on, the tool’s predicted motion is used to produce the motion blur caused by the virtual camera’s shutter. When the control is toggled off, no motion blur is created.

- **Quality**: Quality determines the number of samples used to create the blur. A quality setting of 2 will cause Fusion to create two samples to either side of an object’s actual motion. Larger values produce smoother results but increase the render time.

- **Shutter Angle**: Shutter Angle controls the angle of the virtual shutter used to produce the motion blur effect. Larger angles create more blur but increase the render times. A value of 360 is the equivalent of having the shutter open for one full frame exposure. Higher values are possible and can be used to create interesting effects.

- **Center Bias**: Center Bias modifies the position of the center of the motion blur. This allows for the creation of motion trail effects.

- **Sample Spread**: Adjusting this control modifies the weighting given to each sample. This affects the brightness of the samples.

Use GPU

The Use GPU menu has three settings. Setting the menu to Disable turns off GPU hardware-accelerated rendering. Enabled uses the GPU hardware for rendering the node. Auto uses a capable GPU if one is available and falls back to software rendering when a capable GPU is not available.

Hide Incoming Connections

Enabling this checkbox can hide connection lines from incoming nodes, making a node tree appear cleaner and easier to read. When enabled, empty fields for each input on a node will be displayed in the Inspector. Dragging a connected node from the node tree into the field will hide that incoming connection line as long as the node is not selected in the node tree. When the node is selected in the node tree, the line will reappear.

Comments

The Comments field is used to add notes to a tool. Click in the empty field and type the text. When a note is added to a tool, a small red square appears in the lower-left corner of the node when the full tile is displayed, or a small text bubble icon appears on the right when nodes are collapsed. To see the note in the Node Editor, hold the mouse pointer over the node to display the tooltip.

Scripts

Three Scripting fields are available on every tool in Fusion from the Settings tab. They each contain edit boxes used to add scripts that process when the tool is rendering. For more details on scripting nodes, please consult the Fusion scripting documentation.
Chapter 108

Transform Nodes

This chapter details the Transform nodes available in Fusion.

The abbreviations next to each node name can be used in the Select Tool dialog when searching for tools and in scripting references.

For purposes of this document, node trees showing MediaIn nodes in DaVinci Resolve are interchangeable with Loader nodes in Fusion Studio, unless otherwise noted.
Camera Shake [CSH]

Camera Shake Node Introduction

This node can simulate a variety of camera shake-style motions from organic to mechanical. It is not the same as the Shake Modifier, which generates random number values for parameters.

For more information on the Shake modifier, see Chapter 60, "Modifiers" in the Fusion Studio Reference Manual or Chapter 111 in the DaVinci Resolve Reference Manual.

The Camera Shake node concatenates its result with adjacent transformation nodes for higher-quality processing.

Inputs

The two inputs on the Camera Shake node are used to connect a 2D image and an effect mask, which can be used to limit the camera shake area.

- **Input**: The orange input is used for the primary 2D image that shakes.
- **Effect Mask**: The blue input is for a mask shape created by polylines, basic primitive shapes, paint strokes, or bitmaps from other tools. Connecting a mask to this input limits the camera shake area to only those pixels within the mask. An effects mask is applied to the tool after the tool is processed.

Basic Node Setup

The Camera Shake background input is used to connect the image you want to transform. Polygon masks can be connected into the occlusion mask input to identify areas the camera shake should ignore.

The Camera Shake node can be connected directly after a MediaIn node or any node providing a 2D output.
Inspector

Controls Tab
The Controls tab includes parameters for adjusting the offsets, strength, speed, and frequency of the simulated camera shake movement.

**Deviation X and Y**
These controls determine the amount of shake applied to the image along the horizontal (X) and vertical (Y) axes. Values between 0.0 and 1.0 are permitted. A value of 1.0 generates shake positions anywhere within the boundaries of the image.

**Rotation Deviation**
This determines the amount of shake that is applied to the rotational axis. Values between 0.0 and 1.0 are permitted.

**Randomness**
Higher values in this control cause the movement of the shake to be more irregular or random. Smaller values cause the movement to be more predictable.

**Overall Strength**
This adjusts the general amplitude of all the parameters and blends that affect in and out. A value of 1.0 applies the effect as described by the remainder of the controls.

**Speed**
Speed controls the frequency, or rate, of the shake.

**Frequency Method**
This selects the overall shape of the shake. Available frequencies are Sine, Rectified Sine, and Square Wave. A Square Wave generates a much more mechanical-looking motion than a Sine.
Filter Method
When rescaling a pixel, surrounding pixels are often used to give a more realistic result. There are various algorithms for combining these pixels, called filters. More complex filters can give better results but are usually slower to calculate. The best filter for the job often depends on the amount of scaling and on the contents of the image itself.

- **Box**: This is a simple interpolation resize of the image.
- **Linear**: This uses a simplistic filter, which produces relatively clean and fast results.
- **Quadratic**: This filter produces a nominal result. It offers a good compromise between speed and quality.
- **Cubic**: This produces better results with continuous-tone images. If the images have fine detail in them, the results may be blurrier than desired.
- **Catmull-Rom**: This produces good results with continuous-tone images that are resized down. This produces sharp results with finely detailed images.
- **Gaussian**: This is very similar in speed and quality to Bi-Cubic.
- **Mitchell**: This is similar to Catmull-Rom but produces better results with finely detailed images. It is slower than Catmull-Rom.
- **Lanczos**: This is very similar to Mitchell and Catmull-Rom but is a little cleaner and also slower.
- **Sinc**: This is an advanced filter that produces very sharp, detailed results; however, it may produce visible “ringing” in some situations.
- **Bessel**: This is similar to the Sinc filter but may be slightly faster.

Window Method (Sinc and Bessel Only)
Some filters, such as Sinc and Bessel, require an infinite number of pixels to calculate exactly. To speed up this operation, a windowing function is used to approximate the filter and limit the number of pixels required. This control appears when a filter that requires windowing is selected.

- **Hanning**: This is a simple tapered window.
- **Hamming**: Hamming is a slightly tweaked version of Hanning that does not taper all the way down to zero.
- **Blackman**: A window with a more sharply tapered falloff.
- **Kaiser**: A more complex window with results between Hamming and Blackman.

Most of these filters are useful only when making an image larger. When shrinking images, it is common to use the Bi-Linear filter, however, the Catmull-Rom filter will apply some sharpening to the results and may be useful for preserving detail when scaling down an image.

Example
Resize filters. From left to right: Nearest Neighbor, Box, Linear, Quadratic, Cubic, Catmull-Rom, Gaussian, Mitchell, Lanczos, Sinc, and Bessel.
Edges
This menu determines how the Edges of the image are treated.

- **Canvas:** This causes the edges that are revealed by the shake to be the canvas color—usually transparent or black.
- **Wrap:** This causes the edges to wrap around (the top is wrapped to the bottom, the left is wrapped to the right, and so on).
- **Duplicate:** This causes the Edges to be duplicated, causing a slight smearing effect at the edges.
- **Mirror:** Image pixels are mirrored to fill to the edge of the frame.

Invert Transform
Select this control to Invert any position, rotation, or scaling transformation. This option might be useful for exactly removing the motion produced in an upstream Camera Shake.

Flatten Transform
The Flatten Transform option prevents this node from concatenating its transformation with adjacent nodes. The node may still concatenate transforms from its input, but it will not concatenate its transformation with the node at its output.

Common Controls

Settings Tab
The Settings tab in the Inspector is also duplicated in other Transform nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.

Crop [CRP]

The Crop node

Crop Node Introduction
The Crop node can be used to cut out a portion of an image or to offset the image into a larger image area. However, unlike using a mask, this node actually changes the resolution of the image.

**TIP:** You can crop an image in the viewer by activating the Allow Box Selection in the upper-left corner of the viewer while the Crop node is selected and viewed. Then, drag a crop rectangle around the area of interest to perform the operation.

**NOTE:** Because this node changes the physical resolution of the image, animating the parameters is not advised.
**Inputs**

The single input on the Crop node is used to connect a 2D image for cropping.

- **Input:** The orange input is used for the primary 2D image you want to crop.

**Basic Node Setup**

Below, the Crop node is inserted between the MediaIn1 node and the background input of the Merge. Unlike using a mask tool, cropping the MediaIn1 changes the resolution of the clip. The cropped MediaIn1 node connected to the orange background input also sets the resolution of the Merge output.

![Crop node setup diagram](image)

The Crop node can be used to cut out a portion of an image

**Inspector**

![Crop node inspector](image)

**Controls Tab**

The Controls tab provides XY Offset and XY Size methods for cropping the image.

**Offset X and Y**

These controls position the image off the screen by pushing it left/right or up/down. The cropped image disappears off the edges of the output image. The values of these controls are measured in pixels.

**Size X and Y**

Use these controls to set the vertical and horizontal resolution of the image output by the Crop node. The values of these controls are measured in pixels.
**Keep Aspect**
When toggled on, the Crop node maintains the aspect of the input image.

**Keep Centered**
When toggled on, the Crop node automatically adjusts the X and Y Offset controls to keep the image centered. The XY Offset sliders are automatically adjusted, and control over the cropping is done with the Size sliders or the Allow Box Selection button in the viewer.

**Reset Size**
This resets the image dimensions to the size of the input image.

**Reset Offset**
This resets the X and Y Offsets to their defaults.

**Change Pixel Aspect**
Enable this checkbox to reveal a Pixel Aspect control that can be used to change the image’s pixel aspect.

**Clipping Mode**
This option sets the mode used to handle the edges of the image when performing domain of definition (DoD) rendering. This is profoundly important for nodes like Blur, which may require samples from portions of the image outside the current domain.

- **Frame**: The default option is Frame, which automatically sets the node’s domain of definition to use the full frame of the image, effectively ignoring the current domain of definition. If the upstream DoD is smaller than the frame, the remaining area in the frame will be treated as black/transparent.
- **Domain**: Setting this option to Domain will respect the upstream DoD when applying the node’s effect. This can have adverse clipping effects in situations where the node employs a large filter.
- **None**: Setting this option to None does not perform any source image clipping at all. This means that any data required to process the node’s effect that would normally be outside the upstream DoD is treated as black/transparent.

**Auto Crop Tab**
Auto Crop tab analyzes the selected channel and crops the image based on that channel’s boundaries. The adjustments from auto crop are seen in the Crop tab parameters.

**RGBA Color Channels**
Select which channels are examined for an Auto Crop. This is useful for auto cropping images with non-solid backgrounds in a specific color channel, like a blue color gradient. Toggling the channel off causes Auto Crop to ignore it when evaluating the image.

**Auto Crop**
This evaluates the image and attempts to determine the background color. It then crops each side of the image to the first pixel that is not that color.
Common Controls

Settings Tab
The Settings tab in the Inspector is also duplicated in other Transform nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.

DVE [DVE]

DVE Node Introduction
The DVE (Digital Video Effects) node is a 3D-image transformation similar to nodes found in old, tape-based online editing suites. The node encompasses image rotations, perspective changes, and Z moves. The axis can be defined for all transformations.

Inputs
The three inputs on the DVE node are used to connect a 2D image, DVE mask, and an effect mask, which can be used to limit the DVE area.

- Input: The orange input is used for the primary 2D image that is transformed by the DVE.
- DVE Mask: The white DVE mask input is used to mask the image prior to the DVE transform being applied. This has the effect of modifying both the image and the mask.
- Effect Mask: The blue input is for a mask shape created by polylines, basic primitive shapes, paint strokes, or bitmaps from other tools. Connecting a mask to this input causes the DVE to modify only the image within the mask. An effects mask is applied to the tool after the tool is processed.

Basic Node Setup
In the example below, the DVE node is inserted between the MediaIn2 node and the foreground input of the Merge. The MediaIn1 node is manipulated in the DVE node and composited over the top of the MediaIn1 node.

The DVE node modifying the foreground input of a Merge node
Inspector

Controls Tab
The Controls tab includes all the transform parameters for the DVE.

Pivot X, Y, and Z
Positions the axis of rotation and scaling. The default is 0.5, 0.5 for X and Y, which is in the center of the image, and 0 for Z, which is at the center of Z space.

Rotation Order
Use these buttons to determine in what order rotations are applied to the image.

XYZ Rotation
These controls are used to rotate the image around the pivot along the X-, Y- and Z-axis.

Center X and Y
This positions the center of the DVE image onscreen. The default is 0.5, 0.5, which positions the DVE in the center of the image.

Z Move
This zooms the image in and out along the Z-axis. Visually, when this control is animated, the effect is similar to watching an object approach from a distance.

Perspective
This adds additional perspective to an image rotated along the X- or Y-axis, similar to changing the Field of View and zoom of a camera.

Masking Tab
The DVE node allows pre-masking of its input image. This offers the ability to create transformations from the masked area of the image while leaving the remainder of the image unaffected.

Unlike regular effect masks, the masking process occurs before the transformation. All the usual mask types can be applied to the DVE mask.
Black Background
Toggle this on to erase the area outside the mask from the transformed image.

Fill Black
Toggle this on to erase the area within the mask (before transformation) from the DVE’s input, effectively cutting the masked area out of the image. Enabling both Black Background and Fill Black will show only the masked, transformed area.

Alpha Mode
This determines how the DVE will handle the Alpha channel of the image when merging the transformed image areas over the untransformed image.

- **Ignore Alpha**: This causes the input image’s Alpha channel to be ignored, so all masked areas will be opaque.
- **Subtractive/Additive**: These cause the internal merge of the pre-masked DVE image over the input image to be either Subtractive or Additive.

An Additive setting is necessary when the foreground DVE image is premultiplied, meaning that the pixels in the color channels have been multiplied by the pixels in the Alpha channel. The result is that transparent pixels are always black, since any number multiplied by 0 always equals 0. This obscures the background (by multiplying with the inverse of the foreground Alpha), and then simply adds the pixels from the foreground.

A Subtractive setting is necessary if the foreground DVE image is not premultiplied. The compositing method is similar to an Additive merge, but the foreground DVE image is first multiplied by its own Alpha, to eliminate any background pixels outside the Alpha area.

Common Controls

**Settings Tab**
The Settings tab in the Inspector is also duplicated in other Transform nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.
Letterbox [LBX]

The Letterbox node

Letterbox Node Introduction

Use the Letterbox node to adapt existing images to the frame size and aspect ratios of any other format. The most common use of this node is to convert film resolution images to HD-sized frames for viewing on an external television monitor. Horizontal or vertical black edges are automatically added where necessary to compensate for aspect ratio differences. This node actually changes the resolution of the image.

NOTE: Because this node changes the physical resolution of the image, animating the controls is not recommended.

Inputs

The single input on the Letterbox node is used to connect a 2D image for letterbox/cropping.

– Input: The orange input is used for the primary 2D image you want to letterbox/crop.

Basic Node Setup

The Letterbox node is used in the example below to change the resolution of the Merge node’s output. Depending on how the resolution is modified, side pillars, or a horizontal letterbox mask, is applied to “fill in” the frame area, which the Merge node output does not cover.

The Letterbox node converting the Merge output resolution and adding letterbox masking where needed
Inspector

Controls Tab
The Controls tab includes parameters for adjusting the resolution and pixel aspect of the image. It also has the option of letterboxing or pan-and-scan formatting.

Width and Height
The values of these controls determine the size of the output image as measured in pixels.

**TIP:** You can use the formatting contextual menu to quickly select a resolution from a list. Place the pointer over the Width or Height controls, and then right-click to display the contextual menu. The bottom of the menu displays a Select Frame Format submenu with available frame formats. Select any one of the choices from the menu to set the Height, Width, and Aspect controls automatically.

Auto Resolution
Activating this checkbox automatically sets the Width and Height sliders to the Frame Format settings found in the Preferences window for Fusion Studio or to the resolution of the DaVinci Resolve Timeline.

Pixel Aspect X and Y
These controls determine the pixel aspect ratio of the output image.

Center X and Y
This Center control repositions the image window when used in conjunction with Pan-and-Scan mode. It has no effect on the image when the node is set to Letterbox mode.

Mode
This control is used to determine the Letterbox node’s mode of operation.

- **Letterbox/Envelope:** This corrects the aspect of the input image and resizes it to match the specified width.
- **Pan-and-Scan:** This corrects the aspect of the input image and resizes it to match the specified height. If the resized input image is wider than the specified width, the Center control can be used to animate the visible portion of the resized input.
Filter Method

When rescaling a pixel, surrounding pixels are often used to give a more realistic result. There are various algorithms for combining these pixels, called filters. More complex filters can give better results but are usually slower to calculate. The best filter for the job often depends on the amount of scaling and on the contents of the image itself.

- **Box:** This is a simple interpolation resize of the image.
- **Linear:** This uses a simplistic filter, which produces relatively clean and fast results.
- **Quadratic:** This filter produces a nominal result. It offers a good compromise between speed and quality.
- **Cubic:** This produces better results with continuous-tone images. If the images have fine detail in them, the results may be blurrier than desired.
- **Catmull-Rom:** This produces good results with continuous-tone images that are resized down. This produces sharp results with finely detailed images.
- **Gaussian:** This is very similar in speed and quality to Bi-Cubic.
- **Mitchell:** This is similar to Catmull-Rom but produces better results with finely detailed images. It is slower than Catmull-Rom.
- **Lanczos:** This is very similar to Mitchell and Catmull-Rom but is a little cleaner and also slower.
- **Sinc:** This is an advanced filter that produces very sharp, detailed results; however, it may produce visible “ringing” in some situations.
- **Bessel:** This is similar to the Sinc filter but may be slightly faster.

Window Method (Sinc and Bessel Only)

Some filters, such as Sinc and Bessel, require an infinite number of pixels to calculate exactly. To speed up this operation, a windowing function is used to approximate the filter and limit the number of pixels required. This control appears when a filter that requires windowing is selected.

- **Hanning:** This is a simple tapered window.
- **Hamming:** Hamming is a slightly tweaked version of Hanning that does not taper all the way down to zero.
- **Blackman:** A window with a more sharply tapered falloff.
- **Kaiser:** A more complex window with results between Hamming and Blackman.

Most of these filters are useful only when making an image larger. When shrinking images, it is common to use the Bi-Linear filter; however, the Catmull-Rom filter will apply some sharpening to the results and may be useful for preserving detail when scaling down an image.

Example

Different resize filters. From left to right: Nearest Neighbor, Box, Linear, Quadratic, Cubic, Catmull-Rom, Gaussian, Mitchell, Lanczos, Sinc, and Bessel.
Common Controls

Settings Tab
The Settings tab in the Inspector is also duplicated in other Transform nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.

Resize [RSZ]

The Resize node

Resize Node Introduction
Use the Resize node to increase or decrease the resolution of an input image. This is useful for converting images from one format to another (for example, from film to video resolution). This node actually changes the resolution of the image.

NOTE: Because this node changes the physical resolution of the image, animating the controls is not advised.

Inputs
The single input on the Resize node is used to connect a 2D image for resizing.

- **Input**: The orange input is used for the primary 2D image you want to resize.

Basic Node Setup
Below, the Resize node is inserted between the MediaIn1 node and the background input of the Merge. Unlike using a Transform tool, resizing the MediaIn1 changes the resolution of the clip. The resized MediaIn1 node connected to the orange background input also sets the resolution of the Merge output.

The Resize node can be used to scale an image and change its resolution.
Inspector

Controls Tab
The Controls tab includes parameters for changing the resolution of the image. It uses pixel values in the Width and Height controls.

**Width**
This controls the new resolution for the image along the X-axis.

**Height**
This controls the new resolution for the image along the Y-axis.

**TIP:** You can use the formatting contextual menu to quickly select a resolution from a list. Place the mouse pointer over the Width or Height controls, and then right-click to display the contextual menu. The bottom of the menu displays a Select Frame Format submenu with available frame formats. Select any one of the choices from the menu to set the Height and Width controls automatically.

**Auto Resolution**
Activating this checkbox automatically sets the Width and Height sliders to the Frame Format settings found in the Preferences window for Fusion Studio or the resolution in the DaVinci Resolve Timeline.

**Reset Size**
Resets the image dimensions to the original size of the image.

**Keep Frame Aspect**
When toggled on, the Resize node maintains the aspect of the original image, preserving the original ratio between width and height.

**Only Use Filter in HiQ**
The Resize node will normally use the fast Nearest Neighbor filter for any non-HiQ renders, where speed is more important than full accuracy. Disable this checkbox to force Resize to always use the selected filter for all renders.

**Change Pixel Aspect**
Enable this checkbox to reveal a Pixel Aspect control that can be used to change the image’s pixel aspect.
Filter Method
When rescaling a pixel, surrounding pixels are often used to give a more realistic result. There are various algorithms for combining these pixels, called filters. More complex filters can give better results but are usually slower to calculate. The best filter for the job often depends on the amount of scaling and on the contents of the image itself.

- **Box**: This is a simple interpolation resize of the image.
- **Linear**: This uses a simplistic filter, which produces relatively clean and fast results.
- **Quadratic**: This filter produces a nominal result. It offers a good compromise between speed and quality.
- **Cubic**: This produces better results with continuous-tone images. If the images have fine detail in them, the results may be blurrier than desired.
- **Catmull-Rom**: This produces good results with continuous-tone images that are resized down. This produces sharp results with finely detailed images.
- **Gaussian**: This is very similar in speed and quality to Bi-Cubic.
- **Mitchell**: This is similar to Catmull-Rom but produces better results with finely detailed images. It is slower than Catmull-Rom.
- **Lanczos**: This is very similar to Mitchell and Catmull-Rom but is a little cleaner and also slower.
- **Sinc**: This is an advanced filter that produces very sharp, detailed results; however, it may produce visible “ringing” in some situations.
- **Bessel**: This is similar to the Sinc filter but may be slightly faster.

Window Method (Sinc and Bessel Only)
Some filters, such as Sinc and Bessel, require an infinite number of pixels to calculate exactly. To speed up this operation, a windowing function is used to approximate the filter and limit the number of pixels required. This control appears when a filter that requires windowing is selected.

- **Hanning**: This is a simple tapered window.
- **Hamming**: Hamming is a slightly tweaked version of Hanning that does not taper all the way down to zero.
- **Blackman**: A window with a more sharply tapered falloff.
- **Kaiser**: A more complex window with results between Hamming and Blackman.

Most of these filters are useful only when making an image larger. When shrinking images, it is common to use the Bi-Linear filter; however, the Catmull-Rom filter will apply some sharpening to the results and may be useful for preserving detail when scaling down an image.

Example

Different resize filters. From left to right: Nearest Neighbor, Box, Linear, Quadratic, Cubic, Catmull-Rom, Gaussian, Mitchell, Lanczos, Sinc, and Bessel.
Common Controls

Settings Tab
The Settings tab in the Inspector is also duplicated in other Transform nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.

Scale [SCL]

The Scale node

Scale Node Introduction
The Scale node is almost identical to the Resize node, except that Resize uses exact dimensions, whereas the Scale node uses relative dimensions to describe the change to the source image’s resolution. This node actually changes the resolution of the image.

NOTE: Because this node changes the physical resolution of the image, animating the controls is not advised.

Inputs
The single input on the Scale node is used to connect a 2D image for scaling.

- Input: The orange input is used for the primary 2D image you want to scale.

Basic Node Setup
Below, the Scale node is inserted between the MediaIn1 node and the background input of the Merge. Unlike using a Transform tool, scaling the MediaIn1 changes the resolution of the clip. The resized MediaIn1 node connected to the orange background input also sets the resolution of the Merge output.

The Scale node can be used to scale an image and change its resolution
Inspector

Controls Tab
The Controls tab includes parameters for changing the resolution of the image. It uses a multiplier of size to set the new resolution. An Edges menu allows you to determine how the edges of the frame are handled if the scaling decreases.

Lock X/Y
When selected, only a Size control is shown, and changes to the image’s scale are applied to both axes equally. If the checkbox is cleared, individual Size controls appear for both X and Y Size.

Size
The Size control is used to set the scale used to adjust the resolution of the source image. A value of 1.0 would have no affect on the image, while 2.0 would scale the image to twice its current resolution. A value of 0.5 would halve the image’s resolution.

Only Use Filter in HiQ
The Scale node will normally use the fast Nearest Neighbor filter for any non-HiQ renders, where speed is more important than full accuracy. Disable this checkbox to force Scale to always use the selected filter for all renders.

Change Pixel Aspect
Enable this checkbox to reveal a Pixel Aspect control that can be used to change the image’s pixel aspect.

Filter Method
When rescaling a pixel, surrounding pixels are often used to give a more realistic result. There are various algorithms for combining these pixels, called filters. More complex filters can give better results but are usually slower to calculate. The best filter for the job often depends on the amount of scaling and on the contents of the image itself.

- **Box**: This is a simple interpolation resize of the image.
- **Linear**: This uses a simplistic filter, which produces relatively clean and fast results.
- **Quadratic**: This filter produces a nominal result. It offers a good compromise between speed and quality.
- **Cubic**: This produces better results with continuous-tone images. If the images have fine detail in them, the results may be blurrier than desired.
- **Catmull-Rom**: This produces good results with continuous-tone images that are resized down. This produces sharp results with finely detailed images.
- **Gaussian**: This is very similar in speed and quality to Bi-Cubic.
- **Mitchell**: This is similar to Catmull-Rom but produces better results with finely detailed images. It is slower than Catmull-Rom.
- **Lanczos**: This is very similar to Mitchell and Catmull-Rom but is a little cleaner and also slower.
- **Sinc**: This is an advanced filter that produces very sharp, detailed results; however, it may produce visible "ringing" in some situations.
- **Bessel**: This is similar to the Sinc filter but may be slightly faster.

### Window Method (Sinc and Bessel Only)

Some filters, such as Sinc and Bessel, require an infinite number of pixels to calculate exactly. To speed up this operation, a windowing function is used to approximate the filter and limit the number of pixels required. This control appears when a filter that requires windowing is selected.

- **Hanning**: This is a simple tapered window.
- **Hamming**: Hamming is a slightly tweaked version of Hanning that does not taper all the way down to zero.
- **Blackman**: A window with a more sharply tapered falloff.
- **Kaiser**: A more complex window with results between Hamming and Blackman.

Most of these filters are useful only when making an image larger. When shrinking images, it is common to use the Bi-Linear filter; however, the Catmull-Rom filter will apply some sharpening to the results and may be useful for preserving detail when scaling down an image.

**NOTE**: Because this node changes the physical resolution of the image, animating the controls is not advised.

### Example

Different resize filters. From left to right: Nearest Neighbor, Box, Linear, Quadratic, Cubic, Catmull-Rom, Gaussian, Mitchell, Lanczos, Sinc, and Bessel.
Transform [XF]

The Transform node can be used for simple 2D transformations of the image, such as moving, rotating, and scaling. The image's aspect can also be modified using the Transform node.

The Transform node concatenates its result with adjacent Transformation nodes. The Transform node does not change the image's resolution.

Inputs

The two inputs on the Transform node are used to connect a 2D image and an effect mask, which can be used to limit the transformed area.

- Input: The orange input is used for the primary 2D image that gets transformed.
- Effect Mask: The blue input is for a mask shape created by polylines, basic primitive shapes, paint strokes, or bitmaps from other tools. Connecting a mask to this input limits the transform area to only those pixels within the mask. An effects mask is applied to the tool after the tool is processed.

Basic Node Setup

The Transform node in the example below is inserted between the MediaIn2 node and the foreground input of the Merge. Unlike using a Scale or Resize tool, transforming the MediaIn2 does not change the resolution of the clip. For that reason, it is the tool most often used to scale, move, and rotate a clip.

The Transform node can be used to scale an image without changing its resolution.
Inspector

Controls Tab
The Controls tab presents multiple ways to transform, flip (vertical), flop (horizontal), scale, and rotate an image. It also includes reference size controls that can reinterpret the coordinates used for width and height from relative values of 0-1 into pixel values based on the image’s resolution.

Center X and Y
This sets the position of the image on the screen. The default is 0.5, 0.5, which places the image in the center of the screen. The value shown is always the actual position multiplied by the reference size. See below for a description of the reference size.

Pivot X and Y
This positions the axis of rotation and scaling. The default is 0.5, 0.5, which is the center of the image.

Use Size and Aspect
This checkbox determines whether the Transform node provides independent Size controls for the X and Y scale or if Size and Aspect controls are used instead.

Size
This modifies the scale of the image. Values range from 0 to 5, but any value greater than zero can be entered into the edit box. If the Use Size and Aspect checkbox is selected, this control will scale the image equally along both axes. If the Use Size and Aspect option is off, independent control is provided for X and Y.

Aspect
This control changes the aspect ratio of an image. Setting the value above 1.0 stretches the image along the X-axis. Values between 0.0 and 1.0 stretch the image along the Y-axis. This control is available only when the Use Size and Aspect checkbox is enabled.
**Angle**
This control rotates the image around the axis. Increasing the Angle rotates the image in a counterclockwise direction. Decreasing the Angle rotates the image in a clockwise direction.

**Flip Horizontally and Vertically**
Toggle this control on to flip the image along the X- or Y-axis.

**Edges**
This menu determines how the edges of the image are treated when the edge of the raster is exposed.

- **Canvas:** This causes the edges of the image that are revealed to show the current Canvas Color. This defaults to black with no Alpha and can be set using the Set Canvas Color node.
- **Wrap:** This wraps the edges of the image around the borders of the image. This is useful for seamless images to be panned, creating an endless moving background image.
- **Duplicate:** This causes the edges of the image to be duplicated as best as possible, continuing the image beyond its original size.
- **Mirror:** Image pixels are mirrored to fill to the edge of the frame.

**Filter Method**
When rescaling a pixel, surrounding pixels are often used to give a more realistic result. There are various algorithms for combining these pixels, called filters. More complex filters can give better results but are usually slower to calculate. The best filter for the job often depends on the amount of scaling and on the contents of the image itself.

- **Box:** This is a simple interpolation resize of the image.
- **Linear:** This uses a simplistic filter, which produces relatively clean and fast results.
- **Quadratic:** This filter produces a nominal result. It offers a good compromise between speed and quality.
- **Cubic:** This produces better results with continuous-tone images. If the images have fine detail in them, the results may be blurrier than desired.
- **Catmull-Rom:** This produces good results with continuous-tone images that are resized down. This produces sharp results with finely detailed images.
- **Gaussian:** This is very similar in speed and quality to Bi-Cubic.
- **Mitchell:** This is similar to Catmull-Rom but produces better results with finely detailed images. It is slower than Catmull-Rom.
- **Lanczos:** This is very similar to Mitchell and Catmull-Rom but is a little cleaner and also slower.
- **Sinc:** This is an advanced filter that produces very sharp, detailed results; however, it may produce visible “ringing” in some situations.
- **Bessel:** This is similar to the Sinc filter but may be slightly faster.
Window Method (Sinc and Bessel Only)
Some filters, such as Sinc and Bessel, require an infinite number of pixels to calculate exactly. To speed up this operation, a windowing function is used to approximate the filter and limit the number of pixels required. This control appears when a filter that requires windowing is selected.

- **Hanning:** This is a simple tapered window.
- **Hamming:** Hamming is a slightly tweaked version of Hanning that does not taper all the way down to zero.
- **Blackman:** A window with a more sharply tapered falloff.
- **Kaiser:** A more complex window with results between Hamming and Blackman.

Most of these filters are useful only when making an image larger. When shrinking images, it is common to use the Bi-Linear filter; however, the Catmull-Rom filter will apply some sharpening to the results and may be useful for preserving detail when scaling down an image.

Example

Different resize filters. From left to right: Nearest Neighbor, Box, Linear, Quadratic, Cubic, Catmull-Rom, Gaussian, Mitchell, Lanczos, Sinc, and Bessel.

Invert Transform
Select this control to invert any position, rotation, or scaling transformation. This option is useful when connecting the Transform to the position of a tracker for the purpose of reintroducing motion back into a stabilized image.

Flatten Transform
The Flatten Transform option prevents this node from concatenating its transformation with adjacent nodes. The node may still concatenate transforms from its input, but it will not concatenate its transformation with the node at its output.

Reference Size
The controls under the Reference Size menu do not directly affect the image. Instead they allow you to control how Fusion represents the position of the Transform node’s center.

Normally, coordinates are represented as values between 0 and 1, where 1 is a distance equal to the full width or height of the image. This allows for resolution independence, because you can change the size of the image without having to change the value of the center.

One disadvantage to this approach is that it complicates making pixel-accurate adjustments to an image. To demonstrate, imagine an image that is 100 x 100 pixels in size. To move the center of the image to the right by 5 pixels, we would change the X value of the transform center from 0.5, 0.5 to 0.55, 0.5. We know the change must be 0.05 because 5/100 = 0.05.

The Reference Size controls allow you to specify the dimensions of the image. This changes the way the control values are displayed, so that the Center shows the actual pixel positions in the X and Y number fields of the Center control. Extending our example, if you set the Width and Height to 100 each, the Center would now be shown as 50, 50, and we would move it 5 pixels toward the right by entering 55, 50.
Internally, the Transform node still stores this value as a number between 0 to 1, and if you were to query the Center controls value via scripting, or publish the Center control for use by other nodes, then you would retrieve the original normalized value. The change is visible only in the value shown for Transform Center in the node control.

**Reference Width and Height Sliders**
Set these to the width and height of the image to change the way that Fusion displays the values of the Transform node’s Center control.

**Auto Resolution**
Enable this checkbox to use the current frame format settings in Fusion Studio or the timeline resolution in DaVinci Resolve to set the Reference Width and Reference Height values.

**The Common Controls**

Nodes that handle Transform operations share several identical controls in the Inspector. This section describes controls that are common among Transform nodes.

**Inspector**

![Inspector settings](image_url)
Settings Tab
The Settings tab in the Inspector can be found on every tool in the Transform category. The Settings controls are even found on third-party Transform-type plug-in tools. The controls are consistent and work the same way for each tool.

Blend
The Blend control is used to blend between the tool’s original image input and the tool’s final modified output image. When the blend value is 0.0, the outgoing image is identical to the incoming image. Normally, this will cause the tool to skip processing entirely, copying the input straight to the output.

Process When Blend Is 0.0
The tool is processed even when the input value is zero. This can be useful if the node is scripted to trigger a task, but the node’s value is set to 0.0.

Red/Green/Blue/Alpha Channel Selector
These four buttons are used to limit the effect of the tool to specified color channels. This filter is often applied after the tool has been processed.

For example, if the Red button on a Blur tool is deselected, the blur will first be applied to the image, and then the red channel from the original input will be copied back over the red channel of the result.

There are some exceptions, such as tools for which deselecting these channels causes the tool to skip processing that channel entirely. Tools that do this will generally possess a set of identical RGBA buttons on the Controls tab in the tool. In this case, the buttons in the Settings and the Controls tabs are identical.

Apply Mask Inverted
Enabling the Apply Mask Inverted option inverts the complete mask channel for the tool. The mask channel is the combined result of all masks connected to or generated in a node.

Multiply by Mask
Selecting this option will cause the RGB values of the masked image to be multiplied by the mask channel’s values. This will cause all pixels of the image not included in the mask (i.e., set to 0) to become black/transparent.

Use Object/Use Material (Checkboxes)
Some 3D software can render to file formats that support additional channels. Notably, the EXR file format supports Object ID and Material ID channels, which can be used as a mask for the effect. These checkboxes determine whether the channels will be used, if present. The specific Material ID or Object ID affected is chosen using the next set of controls.

Correct Edges
This checkbox appears only when the Use Object or Use Material checkboxes are selected. It toggles the method used to deal with overlapping edges of objects in a multi-object image. When enabled, the Coverage and Background Color channels are used to separate and improve the effect around the edge of the object. If this option is disabled (or no Coverage or Background Color channels are available), aliasing may occur on the edge of the mask.

For more information on the Coverage and Background Color channels, see Chapter 18, “Understanding Image Channels” in the Fusion Studio Reference Manual or Chapter 69 in the DaVinci Resolve Reference Manual.
Object ID/Material ID (Sliders)
Use these sliders to select which ID will be used to create a mask from the object or material channels of an image. Use the Sample button in the same way as the Color Picker: to grab IDs from the image displayed in the viewer. The image or sequence must have been rendered from a 3D software package with those channels included.

Motion Blur
- **Motion Blur**: This toggles the rendering of Motion Blur on the tool. When this control is toggled on, the tool’s predicted motion is used to produce the motion blur caused by the virtual camera’s shutter. When the control is toggled off, no motion blur is created.
- **Quality**: Quality determines the number of samples used to create the blur. A quality setting of 2 will cause Fusion to create two samples to either side of an object’s actual motion. Larger values produce smoother results but increase the render time.
- **Shutter Angle**: Shutter Angle controls the angle of the virtual shutter used to produce the motion blur effect. Larger angles create more blur but increase the render times. A value of 360 is the equivalent of having the shutter open for one full frame exposure. Higher values are possible and can be used to create interesting effects.
- **Center Bias**: Center Bias modifies the position of the center of the motion blur. This allows for the creation of motion trail effects.
- **Sample Spread**: Adjusting this control modifies the weighting given to each sample. This affects the brightness of the samples.

Use GPU
The Use GPU menu has three settings. Setting the menu to Disable turns off GPU hardware-accelerated rendering. Enabled uses the GPU hardware for rendering the node. Auto uses a capable GPU if one is available and falls back to software rendering when a capable GPU is not available.

Hide Incoming Connections
Enabling this checkbox can hide connection lines from incoming nodes, making a node tree appear cleaner and easier to read. When enabled, empty fields for each input on a node will be displayed in the Inspector. Dragging a connected node from the node tree into the field will hide that incoming connection line as long as the node is not selected in the node tree. When the node is selected in the node tree, the line will reappear.

Comments
The Comments field is used to add notes to a tool. Click in the empty field and type the text. When a note is added to a tool, a small red square appears in the lower-left corner of the node when the full tile is displayed, or a small text bubble icon appears on the right when nodes are collapsed. To see the note in the Node Editor, hold the mouse pointer over the node to display the tooltip.

Scripts
Three Scripting fields are available on every tool in Fusion from the Settings tab. They each contain edit boxes used to add scripts that process when the tool is rendering. For more details on scripting nodes, please consult the Fusion scripting documentation.
Chapter 109

VR Nodes

This chapter details the Virtual Reality (VR) nodes available in Fusion.

The abbreviations next to each node name can be used in the Select Tool dialog when searching for tools and in scripting references.

For purposes of this document, node trees showing MediaIn nodes in DaVinci Resolve are interchangeable with Loader nodes in Fusion Studio, unless otherwise noted.

**VR Nodes**

You can create and fix spherical (360°) video, often described as Virtual Reality, or VR, using Fusion’s set of VR nodes. Dome productions, planetariums, and other special-venue theaters have utilized the flexibility of Fusion and its 3D system to produce and deliver special content for years.

The equirectangular (lat-long) format often used for 360° video is similar to how a globe is represented by a flat world map, with the poles at the top and bottom edges of the image and the forward viewpoint at the center.

**TIP:** You can create stereo VR using two stacked Lat Long images, one for each eye.

A VR Sphere displayed in the Node Editor and Fusion’s 3D viewer
Fusion supports several common spherical image formats and can easily convert between them.

- **VCross and HCross**: VCross and HCross are the six square faces of a cube laid out in a cross, vertically or horizontally, with the forward view in the center of the cross in a 3:4 or 4:3 image.
- **VStrip and HStrip**: VStrip and HStrip are the six square faces of a cube laid vertically or horizontally in a line, ordered as Left, Right, Up, Down, Back, Front (+X, -X, +Y, -Y, +Z, -Z) in a 1:6 or 6:1 image.
- **LatLong**: LatLong is a single 2:1 image in an equirectangular mapping.

You can display both spherical video and live 3D scenes from the comp directly to headsets, including those from Oculus Rift and HTC Vive.

Fusion’s “Fix it in post” tools for VR make it easy to perform several important tasks that are common in these types of productions.

### Lat Long Patcher [LLP]

The Lat Long Patcher node

**NOTE**: The VR category and Lat Long node are available only in Fusion Studio and DaVinci Resolve Studio.

#### Lat Long Patcher Node Introduction

Equirectangular stitched images often need patches, paintwork, or other VFX applied. The Lat Long Patcher extracts and de-warps a section of a lat-long (equirectangular) image to be treated, and can warp and merge fixes back over the original. You can quickly pick a section of the spherical image to patch or paint, and then apply it back to the original image. Note that matching rotations are used in both Extract and Apply modes, allowing a node’s operation to be easily reversed by a copy or instance with the same rotation settings.

#### Input

The Lat Long Patcher node includes two inputs. The orange input accepts a 2D image in an equirectangular format, where the X-axis represents 0–360 degrees longitude, and the Y-axis represents –90 to +90 degrees latitude. The effect mask input is provided, although rarely used on VR nodes.

- **Image Input**: The orange image input accepts a equirectangular (lat-long) 2D RGBA image.
- **Effect Mask**: The effect mask input is provided, although rarely used on VR nodes.
**Basic Node Setup**

The Loader node connects to the input on a Lat Long Patcher node. The output of a Lat Long Patcher node is set to Extract. It is then connected to whatever image-processing operation is required. A second Lat Long Patcher node set to Apply takes an input from the processed extraction and merges it over the top of the original source.

![Diagram of node setup](image)

Two Lat Long Patchers used to repair a section

**Inspector**

**Controls Tab**

The Controls tab is used to extract and later reapply a section from an equirectangular image. Rotation controls allow you to select the exact portion you need to repair.

**Mode**

- **Extract**: Pulls a de-warped 90-degree square image from the equirectangular image.
- **Apply**: Warps and merges a 90-degree square image over the equirectangular image. Because the square image’s Alpha is used, this allows, for example, paint strokes or text drawn over a transparent black background to be applied to the original equirectangular image, avoiding any double-filtering from de-warping and re-warping the original.

**Rotation Order**

These buttons choose the ordering of the rotations around each axis. For example, XYZ rotates first around the X axis (pitch/tilt), then around the Y axis (pan/yaw), and then around the Z axis (roll). Any of the six possible orderings can be chosen.

**Rotation**

These dials rotate the spherical image around each of the X, Y, and Z axes, offering independent control over pitch/tilt, pan/yaw, and roll, respectively.
Common Controls

Settings Tab
The Settings tab in the Inspector is duplicated in other VR nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.

Pano Map [PaM]

The Pano Map node

NOTE: The VR category and Pano Map node are available only in Fusion Studio and DaVinci Resolve Studio.

Pano Map Node Introduction
The Pano Map node converts images from one spherical layout to another, such as from a cube map to an equirectangular format. The node can also perform rotations of the spherical images when converting.

Input
The Pano Map node includes two inputs. The orange input accepts a 2D image in an equirectangular, cube map or other spherical formats. The effect mask input is provided, although rarely used on VR nodes.

- **Image Input:** The orange Image input accepts a spherical formatted 2D RGBA image that gets converted to another spherical format.
- **Effect Mask:** The effect mask input is provided, although rarely used on VR nodes.

Basic Node Setup
In the example below, a Loader node containing a Lat Long image connects to the input on a Pano Map node. The Pano Map node is used to convert the image to an H-Cross format. It is then connected to whatever image-processing operation is required.

A Pano Map used to convert from one VR format to another
Inspector

Controls Tab
The Controls tab is used to determine the format of the input image and the desired output format.

From/To
- **Auto**: Auto detects the incoming image layout from the metadata and image frame aspect.
- **VCross and HCross**: VCross and HCross are the six square faces of a cube laid out in a cross, vertically or horizontally, with the forward view in the center of the cross in a 3:4 or 4:3 image.
- **VStrip and HStrip**: VStrip and HStrip are the six square faces of a cube laid vertically or horizontally in a line, ordered as Left, Right, Up, Down, Back, Front (+X, -X, +Y, -Y, +Z, -Z) in a 1:6 or 6:1 image.
- **LatLong**: LatLong is a single 2:1 image in equirectangular mapping.

Rotation Order
These buttons choose the ordering of the rotations around each axis. For example, XYZ rotates first around the X axis (pitch/tilt), then around the Y axis (pan/yaw), and then around the Z axis (roll). Any of the six possible orderings can be chosen.

Rotation
These dials rotate the spherical image around each of the X, Y, and Z axes, offering independent control over pitch/tilt, pan/yaw, and roll, respectively.

Common Controls

Settings Tab
The Settings tab in the Inspector is duplicated in other VR nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.
Spherical Camera [3SC]

The Spherical Camera node

Spherical Camera Node Introduction

The Spherical Camera is not located in the VR category of the Effects Library but in the 3D category. However, it is commonly used in creating and fixing VR content, so it is referenced here. The Spherical Camera allows the 3D Renderer node to output an image covering all viewing angles, laid out in several different formats. This image may be used, for example, as a skybox texture or reflection map or viewed in a VR headset. The Image Width setting in the 3D Renderer sets the size of each square cube face so that the resulting image may be a multiple of this size horizontally and vertically.

For more detail on the Spherical Camera node, refer to Chapter 29, “3D Nodes” in the Fusion Studio manual or Chapter 80 in the DaVinci Resolve manual.

Spherical Stabilizer

The Spherical Stabilizer node

NOTE: The VR category and Spherical Stabilizer node are available only in Fusion Studio and DaVinci Resolve Studio.

Spherical Stabilizer Node Introduction

VR live action often uses handheld cameras, causing shaky footage to be a common problem. The Spherical Stabilizer node automatically identifies and tracks visible features in the footage, and then analyzes their movement to identify pan, tilt, and roll rotations. After tracking, it is then possible to smooth out or stabilize the rotation of the footage.

Inputs

The Spherical Stabilizer node has a single orange input.

- Image: This orange image input node requires an image in a spherical layout, which can be any of Lat Long (2:1 equirectangular), Horizontal/Vertical Cross, or Horizontal/Vertical Strip.
Basic Node Setup

In the example below, a 2:1 Lat Long image is connected to the input of the Spherical Stabilizer node. Once the image is stabilized, the output of the Spherical Stabilizer node is a steadied clip.

Inspector

Controls Tab

The Controls tab contains parameters to initiate the tracking and modify the results for stabilization or smoothing.

Reject Dominant Motion Outliers While Tracking

With this control activated (the default setting), features that move contrary to the majority of other features are ignored. This helps ignore the movement of subjects in the shot, preferring stable and consistent markers from the surrounding environment.

Track Controls

These buttons initiate tracking and analysis of the shot. Be aware that the reference frame used for stabilization is set to the first frame tracked.

- Track Backward from End Frame starts tracking backward from the end of the current render range.
- Track Backward from Current Time starts tracking backward from the current frame.
- Stop ceases tracking, preserving all results so far.
- Track Forward from Current Time starts tracking forward from the start of the current render range.
- Track Forward from Start Frame starts tracking forward from the current time.

Append to Track

- Replace causes the Track Controls to discard any previous tracking results and replace them with the newly-created track.
- Append adds the new tracking results to any earlier tracks.
**Stabilization Strength**
This control varies the amount of smoothing or stabilization applied, from 0.0 (no change) to 1.0 (maximum).

**Smoothing**
The Spherical Stabilizer node can eliminate all rotation from a shot, fixing the forward viewpoint (Still mode, 0.0) or gently smooth out any panning, rolling, or tilting to increase viewer comfort (Smooth mode, 1.0). This slider allows either option or anything in between.

**Offset Rotation**
Often a shot is not entirely level and needs the horizon to be realigned, or perhaps a desired pan should be reintroduced after fully stabilizing the shot. The Offset Rotation controls allow additional manual control of the Spherical Stabilizer’s rotation of the footage, for pitch/tilt (X), pan/yaw (Y), and roll (Z), respectively. Rotation is always performed in the order X, Y, Z.

**Common Controls**

**Settings Tab**
The Settings tab in the Inspector is duplicated in other VR nodes. These common controls are described in detail in the following “The Common Controls” section.

---

**The Common Controls**

Nodes that handle VR operations share a number of identical controls in the Inspector. This section describes controls that are common among VR nodes.

**Inspector**

![Inspector panel](image)
Settings Tab
The Settings tab in the Inspector can be found on every tool in the VR category. The controls are consistent and work the same way for each tool.

Apply Mask Inverted
Enabling the Apply Mask Inverted option inverts the complete mask channel for the tool. The mask channel is the combined result of all masks connected to or generated in a node.

Use GPU
The Use GPU menu has three settings. Setting the menu to Disable turns off hardware-accelerated rendering using the graphics card in your computer. Auto uses a capable GPU if one is available and falls back to software rendering when a capable GPU is not available.

Hide Incoming Connections
Enabling this checkbox can hide connection lines from incoming nodes, making a node tree appear cleaner and easier to read. When enabled, empty fields for each input on a node are displayed in the Inspector. Dragging a connected node from the node tree into the empty field hides that incoming connection line as long as the node is not selected in the node tree. When the node is selected in the node tree, the line reappears.

Comments
The Comments field is used to add notes to a tool. Click in the empty field and type the text. When a note is added to a tool, a small red square appears in the lower-left corner of the node when the full tile is displayed, or a small text bubble icon appears on the right when nodes are collapsed. To see the note in the Node Editor, hold the mouse pointer over the node to display the tooltip.

Scripts
Three Scripting fields are available on every tool in Fusion from the Settings tab. They each contain edit boxes used to add scripts that process when the tool is rendering. For more details on scripting nodes, please consult the Fusion scripting documentation.
Chapter 110

Warp Nodes

This chapter details the Warp nodes available in Fusion.

The abbreviations next to each node name can be used in the Select Tool dialog when searching for tools and in scripting references.

For purposes of this document, node trees showing MediaIn nodes in DaVinci Resolve are interchangeable with Loader nodes in Fusion Studio, unless otherwise noted.

Coordinate Space [CDS]

Coordinate Space Node Introduction
The Coordinate Space node changes the coordinate space of the image from rectangular to polar or from polar to rectangular.

Inputs
The two inputs on the Coordinate Space node are used to connect a 2D image and an effect mask, which can be used to limit the distorted area.

- **Input**: The orange input is used for the primary 2D image that is distorted.
- **Effect Mask**: The blue input is for a mask shape created by polylines, basic primitive shapes, paint strokes, or bitmaps from other tools. Connecting a mask to this input limits the distortion to only those pixels within the mask. An effects mask is applied to the tool after the tool is processed.

Basic Node Setup
The Coordinate Space node is used below to make a circular pattern based on a Fast Noise, Mosaic Blur (DaVinci Resolve Resolve FX only), and a Transform node. The Crop node at the end is used to set the desired resolution.

The Coordinate Space node can help create motion graphics backgrounds.
Example
To demonstrate a basic tunnel effect that can be achieved with this node:
1. Add a Text+ node with some text, and then animate it to move along a path from the top of the frame to the bottom.
2. Connect the output of the Text+ node to a Coordinate Space node.
3. Select Polar to Rectangular from the Shape menu.

As the text moves from top to bottom along the original path, it appears to move from an infinite distance in the Coordinate Space node. It may be necessary to flip the text using a Transform node to make it appear the correct way in the Coordinate Space node. Another common use for the Coordinate Space node is to use it in pairs: two of them set to different Shape settings with a Drip or Transform node in between. When used in this way, the effect gets modified while the image remains the same.

Inspector

Controls Tab
The Controls tab Shape menu switches between Rectangular to Polar and Polar to Rectangular. Consider the following example to demonstrate the two coordinate spaces.

Common Controls

Settings Tab
The Settings tab in the Inspector is also duplicated in other Warp nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.
Corner Positioner [CPN]

The Corner Positioner can be used to position the four corners of an image interactively. This would typically be used to replace a sign or other rectangular portion of a scene. Connect all corners to Paths or Trackers for animation purposes.

Inputs

The two inputs on the Corner Positioner node are used to connect a 2D image and an effect mask, which can be used to limit the warped area.

- **Input:** The orange input is used for the primary 2D image that is warped.
- **Effect Mask:** The blue input is for a mask shape created by polylines, basic primitive shapes, paint strokes, or bitmaps from other tools. Connecting a mask to this input limits the Corner Positioner to only those pixels within the mask. An effects mask is applied to the tool after the tool is processed.

Basic Node Setup

Below, the Corner Positioner is used to position the rectangular corners of the MediaIn2 to fit within a specific area of the MediaIn1 node. A Planar Tracker tracks the background, and then a Planar Transform is used to keep the Corner Positioner in place as the background clip moves. Once the planar tracking is completed, and the Planar Transform is created, the Planar Tracker node is no longer needed, and you can delete it.

The Corner Positioner corner pins a clip in place and uses a Planar Transform to match move it to the background.
Inspector

Controls Tab
The Controls tab includes transform and offset adjustments for the four corners of the image.

Mapping Type
This determines the method used to project the image caused by the Corner Positioner. In Bi-Linear mode, a straight 2D warping takes place. In Perspective mode, the image is calculated with the offsets in 2D space and then mapped into a 3D perspective.

Corners X and Y
There are four points in the Corner Positioner. Drag these around to position each corner of the image interactively. Attach these control points to any of the usual modifiers.

The image input is deformed and perspective corrected to match the position of the four corners.

Offset X and Y
These controls can be used to offset the position of the corners slightly. This is useful when the corners are attached to Trackers with patterns that may not be positioned exactly where they are needed.

Common Controls

Settings Tab
The Settings tab in the Inspector is also duplicated in other Warp nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.
Dent [DNT]

The Dent node

Dent Node Introduction
The Dent node creates a circular deformation of an image similar to a Fish Eye Lens effect, with the choice of six different Dent filters.

Inputs
The two inputs on the Dent node are used to connect a 2D image and an effect mask, which can be used to limit the warped area.

- **Input:** The orange input is used for the primary 2D image that is warped.
- **Effect Mask:** The blue input is for a mask shape created by polylines, basic primitive shapes, paint strokes, or bitmaps from other tools. Connecting a mask to this input limits the Dent to only those pixels within the mask. An effects mask is applied to the tool after the tool is processed.

Basic Node Setup
The Dent node is used below to make a circular pattern based on a Fast Noise and a Mosaic Blur (DaVinci Resolve Resolve FX only). The Crop node at the end is used to set the desired resolution.

The Dent node can help create lens distortion effects or a motion graphics background

Inspector
Controls Tab
The adjustments in the Controls tab are used to change the Dent style, position, size, and strength.

Type
Select the type of Dent filter to use from this menu. All parameters for the Dent can be keyframed.

Dent 1
This creates a bulge dent.

Kaleidoscope
This creates a dent, mirrors it, and inverts it.

Dent 2
This creates a displacement dent.

Dent 3
This creates a deform dent.

Cosine Dent
This creates a fracture to a center point.

Sine Dent
This creates a smooth rounded dent.

Center X and Y
This positions the Center of the Dent effect on the image. The default values are 0.5, 0.5, which center the effect in the image.

Size
This changes the size of the area affected by the dent. Animate this slider to make the dent grow.

Strength
This changes the overall strength of the dent.

Common Controls

Settings Tab
The Settings tab in the Inspector is also duplicated in other Warp nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.
Displace [DSP]

Displace Node Introduction

The Displace node uses a map image to displace or refract another image. This is useful for creating a vast range of effects from bevels and heat distortion to glass and water effects.

Inputs

There are three inputs on the Displace node: The primary image, the displacement map foreground image, and an effect mask.

- **Input**: The orange image input is a required connection for the primary image you wish to displace.
- **Foreground Image**: The green input is also required as the image used to displace the background. Once connected, you can choose red, green, blue, Alpha, or luminance channel to create the displacement.
- **Effect Mask**: The optional blue effect mask input expects a mask shape created by polylines, basic primitive shapes, paint strokes, or bitmaps from other tools. Connecting a mask to this input limits the displacement to only those pixels within the mask. An effects mask is applied to the tool after it is processed.

Basic Node Setup

Below, the Displace node uses a Fast Noise to generate the Displace map. Increasing the see the rate can produce heat distortion or flag waving effects.

![The Displace node using a Fast Noise node for the Displace map](image-url)
Inspector

Controls Tab
The Controls tab is used to change the style, position, size, strength, and lighting (embossing) of the displacement.

Type
The Type menu is used to choose in what mode the Displace node operates. The Radial mode uses the map image that refracts each pixel out from the center, while X/Y mode provides control over the amount of displacement along each axis individually.

**NOTE:** There is one set of Refraction controls while in Radial mode, and two sets in XY mode—one for each of the X and Y channels.

Center (Radial Only)
The Center control defines the point from which pixels are displaced toward or away.

Refraction Channel
This drop-down menu controls which channel from the foreground image is used to displace the image. Select from Red, Green, Blue, Alpha, or Luminance channels. In XY mode, this control appears twice, once for the X displacement and once for the Y displacement.

Refraction Strength (Radial)
Controls the strength of the refraction. Higher values cause stronger or more pronounced refraction.

X and Y Refraction (X/Y)
Two separate sliders appear to control the Refraction strength along the X- and Y-axis separately. Otherwise, this is exactly like Refraction Strength.

Light Power
This controls the intensity, or strength, of the simulated light, causing bright and dim areas to form according to the contour of the refraction image. Higher values cause the bright and dim areas to be more pronounced.
**Light Angle**  
This sets the angle of the simulated light source.

**Spread**  
This widens the Displacement effect and takes the edge off the Refraction map. Higher values cause the ridges or edges to spread out.

**Light Channel**  
Select the channel from the refraction image to use as the simulated light source. Select from Color, Red, Green, Blue, Alpha, or Luminance channels.

**NOTE:** The Radial mode pushes pixels inward or outward from a center point, based on pixel values from the Displacement map. The XY mode uses two different channels from the map to displace pixels horizontally and vertically, allowing more precise results. Using the XY mode, the Displace node can even accomplish simple morphing effects. The Light controls allow directional highlighting of refracted pixels for simulating a beveled look.

**Common Controls**

**Settings Tab**  
The Settings tab in the Inspector is also duplicated in other Warp nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.

---

**Drip [DRP]**

**Drip Node Introduction**  
The Drip node creates a ripple effect over the entire image, which has the potential to animate outward from a central source. There are a variety of different Drip effects from which to choose.

**Inputs**  
The two inputs on the Drip node are used to connect a 2D image and an effect mask, which can be used to limit the warped area.

- **Input:** The orange input is used for the primary 2D image that is warped.
- **Effect Mask:** The blue input is for a mask shape created by polylines, basic primitive shapes, paint strokes, or bitmaps from other tools. Connecting a mask to this input limits the warping to only those pixels within the mask. An effects mask is applied to the tool after the tool is processed.
Basic Node Setup

Below, the Drip node is used to make rippling water-style effects using a MediaIn node.

The Drip node can be connected directly after a MediaIn node or any node providing a 2D output.

Inspector

The Controls tab is used to change the style, position, size, strength, and phase for animating the "ripples" of the Drip.

Shape

Use this control to select the shape of the Drip.

Circular

This creates circular ripples. This is the default Drip mode.

Square

This creates even-sided quadrilateral drips.

Random

This creates a randomly dispersed noise that distorts your image and is similar to a particle effect.

Horizontal

This creates horizontal waves that move in one direction.

Vertical

This creates vertical waves that move in one direction.

Exponential

This creates a Drip effect that looks like a diamond shape with inverted, curved sides (an exponential curve flipped and mirrored).
Star
This creates an eight-way symmetrical star-shaped ripple that acts as a kaleidoscope when the phase is animated.

Radial
This creates a star-shaped ripple that emits from a fixed pattern.

Center X and Y
Use this control to position the center of the Drip effect in the image. The default is 0.5, 0.5, which centers the effect in the image.

Aspect
Control the aspect ratio of the various Drip shapes. A value of 1.0 causes the shapes to be symmetrical. Smaller values cause the shape to be taller and narrower, while larger values cause shorter and wider shapes.

Amplitude
The Amplitude of the Drip effect refers to the peak height of each ripple. Use the slider to change the amount of distortion the Drip applies to the image. A value of 0.0 gives all ripples no height and therefore makes the effect transparent. A maximum Amplitude of 10 makes each ripple extremely visible and completely distorts the image. Higher numbers can be entered via the text entry boxes.

Dampening
Controls the Dampening, or falloff, of the amplitude as it moves away from the center of the effect. It can be used to limit the size or area affected by the Drip.

Frequency
This changes the number of ripples emanating from the center of the Drip effect. A value of 0.0 indicates no ripples. Move the slider up to a value of 100 to correspond with the density of desired ripples.

Phase
This controls the offset of the frequencies from the center. Animate the Phase value to make the ripple emanate from the center of the effect.

Common Controls

Settings Tab
The Settings Tab in the Inspector is also duplicated in other Warp nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.
Grid Warp [GRD]

The Grid Warp node is a 2D deformation grid with flexible vertices. The image is deformed so that the source grid matches the destination grid.

Inputs

The two inputs on the Grid Warp node are used to connect a 2D image and an effect mask, which can be used to limit the warped area.

- **Input:** The orange input is used for the primary 2D image that is warped.
- **Effect Mask:** The blue input is for a mask shape created by polylines, basic primitive shapes, paint strokes, or bitmaps from other tools. Connecting a mask to this input limits the warping to only those pixels within the mask. An effects mask is applied to the tool after the tool is processed.

Basic Node Setup

Below, two Grid Warp nodes are used to warp different areas of a frame. This can be useful for chaining the framing in a shot or adding slight movement to a still. Using the Copy Src to Dest button, only the area modified by Grid Warp 2 is pasted as the foreground in the Merge.

The Grid Warp can be used to shift areas within a shot for reframing or adding animation to a still.
Inspector

Controls Tab
The Controls tab contains parameters that configure the onscreen grid as well the type of distortion applied when a control point on the grid is moved.

Source and Destination
The Source and Destination buttons determine whether the source grid or destination grid is currently active. Only one grid can be displayed or manipulated at a time. The selected button is highlighted to indicate that it is the currently active grid.

All other controls in this tab affect the grid selected by this control.

Selection Type
These three buttons determine the selection types used for manipulating the points. There are three options available.

Selected
When in Selected mode, adjustments to the grid are applied only to the currently selected points. This mode is identical to normal polyline operation.

Region
In Region mode, all points within the area around the mouse pointer move when the mouse button is clicked. New points that enter the region during the move are ignored. Choosing this option exposes Magnet Distance and Magnet Strength controls to determine the size and falloff of the area.

Magnetic
In Magnetic mode, all points within the area around the mouse pointer move when the mouse button is clicked. New points that enter the region during the move are affected as well. Choosing this option exposes Magnet Distance and Magnet Strength controls to determine the size and fall off of the area.
**Magnet Distance**  
The default node for selecting and manipulating the grid is a Magnet node. The magnet is represented in the viewer by a circle around the mouse pointer. The Magnet Distance slider controls how large the region of effect for the magnet is, as in the size of the circle. Drag on the grid and any vertex within the range of the slider moves.

To increase the size of the magnet, increase the value of this slider. Alternately, adjust the size of the magnet by holding down the D key while dragging the mouse.

**Magnet Strength**  
The Magnet Strength slider increases or decreases the falloff of the magnet cursor’s effect. At a setting of 0.0, the magnetic cursor has no effect, and vertices do not move at all. As the values increase, the magnet causes a greater range of motion in the selected vertices. Use smaller values for a more sensitive adjustment and larger values for broad-sweeping changes to the grid.

**X and Y Grid Size**  
The X and Y Grid Size sliders control the number of divisions in the grid. Where the X and Y divisions intersect, a control vertex is created.

Be aware that changing either of these controls after applying changes in the grid resets the entire grid. Set the X and Y grid sizes to the appropriate resolution before making detailed adjustments to the grid.

**Subdivision Level**  
The Subdivision Level determines how many subdivisions there are between each set of divisions. Subdivisions do not generate vertices at intersections. The more subdivisions, the smoother the deformation is likely to be, but the slower it is to render.

**Center**  
The Center coordinates determine the exact center of the grid. The onscreen Center control is invisible while editing the grid. Select the Edit Rect mode, and the grid center becomes visible and available for editing.

Use the Center control to move the grid through a scene without affecting the animation applied to the individual vertices. For example, while deforming lips, track the motion of the face with a Tracker, and connect the grid center to the Tracker. This matches the grid with slight movements of the head while focusing on the deformation of the lips.

**Angle**  
This Angle control rotates the entire grid.

**Size**  
The Size control increases or decreases the scale of the grid.

**Edit Buttons**  
There are four edit modes available, each of which can be selected by clicking on the appropriate button.

**Edit None**  
Set the grid to Edit None mode to disable the display of all onscreen controls.

**Edit Grid**  
The Edit Grid mode is the default mode. While this mode is enabled, the grid is drawn in the viewer, and the control vertices of the grid can be manipulated directly.
Edit Rectangle
When the grid is in Edit Rectangle mode, the onscreen controls display a rectangle that determines the dimensions of the grid. The sides of the rectangle can be adjusted to increase or decrease the grid’s dimension. This mode also reveals the onscreen Center control for the grid.

Edit Line
The Edit Line mode is beneficial for creating grids around organic shapes. When this mode is enabled, all onscreen controls disappear, and a spline can be drawn around the shape or object to be deformed. While drawing the spline, a grid is automatically created that best represents that object. Additional controls for Tolerance, Over Size, and Snap Distance appear when this mode is enabled. These controls are documented below.

Set Mesh to Entire Image
The Set Mesh to Entire Image button automatically resets the size of the grid to the exact dimensions of the image. Any adjustments to vertices within the grid are reset.

Copy Buttons
These two buttons provide a technique for copying the exact shape and dimensions of the source grid to the destination, or the destination grid to the source. This is particularly useful after setting the source grid to ensure that the destination grid’s initial state matches the source grid before beginning a deformation.

Point Tolerance
This control is visible only when the Edit Line mode is enabled. The Point Tolerance slider determines how much tessellation the grid applies to match the density of points in the spline closely. The lower this value, the fewer vertices there are in the resulting grid, and the more uniform the grid appears. Higher values start applying denser grids with variations to account for regions in the spline that require more detail.

Oversize Amount
This control is visible only when the Edit Line mode is enabled. The Oversize Amount slider is used to set how large an area around the spline should be included in the grid. Higher values create a larger border, which can be useful when blending a deformation back into the source image.

Snap Distance
This control is visible only when the Edit Line mode is enabled. The Snap Distance slider dictates how strongly the drawn spline attracts surrounding vertices. If a vertex is close enough to a spline’s edge, the vertex moves to line up with the spline. The higher the value, the farther the reach of the spline.

Right-Click Here for Mesh Animation
The grids are static by default. Right-clicking on the Right-Click Here for Mesh Animation label provides a contextual menu with options for animating the grid or connecting it to another grid in the composition.

The grid uses a Polychange spline. Any adjustment to the control points adds or modifies the keyframe for all points on that spline.

Right-Click Here for Shape Animation
This label appears only in the Edit Line mode. Right-clicking on the Right-Click Here for Shape Animation label reveals a pop-up menu used to animate the shaping polyline or to connect it to other polylines.
Render Tab
The Render tab controls the final rendered quality and appearance of the warping.

Render Method
The Render Method drop-down menu is used to select the rendering technique and quality applied to the mesh. The three settings are arranged in order of quality, with the first, Wireframe, as the fastest and lowest of quality. The default mode is Render, which produces final resolution, full-quality results.

Anti-Aliasing
The Anti-Aliasing control appears only as a checkbox when in Wireframe Render mode. In other modes, it is a drop-down menu with three levels of quality. Higher degrees of anti-aliasing improve image quality dramatically but vastly increase render times. The Low setting may be an appropriate option while setting up a large dense grid or previewing a node tree, but rarely for a final render.

Filter Type
When the Render Method is set to something other than Wireframe mode, the Filter Type menu is visible and set to Area Sample. This setting prevents the grid from calculating area samples for each vertex in the grid, providing good render quality. Super Sample can provide even better results but requires much greater render times.

Wireframe Width
This slider appears only when the Render Method is set to Wireframe. It determines the width of the lines that make up the wireframe.

Anti-Aliased
This checkbox appears only when the Render Method is set to Wireframe. Use this checkbox to enable/disable anti-aliasing for the lines that make up the wireframe.

Black Background
The Black Background checkbox determines whether pixels outside of the grid in the source image are set to black or if they are preserved.

Object ID and Material ID
Enable the Object ID or Material ID checkboxes to have the grid output the proper ID channel in the final render.
Set Image Coordinates at Subdivision Level
This checkbox defaults to enabled and sets the image coordinates at the subdivision level.

Force Destination Render
This checkbox defaults to enabled and forces a destination render.

Contextual Menu Options
The Grid Warp node places a submenu for both source and destination grids in the viewer’s contextual menu. Both menus have the exact same name, where only the menu for the active grid is populated with options. The other menu is empty. The contextual menu options are also available from the toolbar that appears in the viewer.

Modify Only/Done
These two options set the mesh to Modify Only and Done modes, respectively. Select Modify Only to edit the mesh or Modify Done to prevent any further changes to a mesh.

Smooth/Linear
Use Smooth and Linear options to apply or remove smoothing from selected vertices.

Auto Smooth Points
When Auto Smooth Points is enabled, the vertices in the grid are automatically smoothed whenever they are moved. This is generally enabled by default.

Z Under/Z Same/Z Over
When two vertices in a grid overlap, one ends up getting clipped by the other. Z Under, Z Same, and Z Over are used to select which vertices are rendered on top and which are rendered behind.

Select All
This option selects all points in the mesh.
Show Key Points, Handles, Grid, and Subdivisions
Use these four options to enable or disable the display of the grid, key points (vertices), Bézier handles, and subdivisions in the viewers.

Reset Selected Points
This resets Selected Points (vertices) to their default positions.

Reset All Points
This resets all points (vertices) in the mesh to their default positions.

Stop Rendering
This option stops rendering, which disables all rendering of the Grid Warp node until the mode is turned off. This is frequently useful when making a series of fine adjustments to a complex grid.

Grid Warp Toolbar
Whenever the Grid Warp node is selected and is in Edit Grid mode, the Grid Warp toolbar is displayed in the views. This toolbar provides a variety of options for manipulating and adjusting the grid. The toolbar buttons in this toolbar are described in the preceding “Contextual Menu Options” section.

The Grid Warp viewer toolbar

Common Controls

Settings Tab
The Settings tab in the Inspector is also duplicated in other Warp nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.

Lens Distort [LENS]

The Lens Distort node

Lens Distort Node Introduction
This node can be used to remove or add lens distortion in an image. The lens distortion in an image depends on the lens, quality, number of elements, and many other factors.

One reason to remove lens distortion is to composite with an undistorted layer. For example, compositing a 3D element over a distorted live-action layer will cause unwanted effects like straight lines not matching up on the foreground and background. The resulting composite will not look believable.
**Inputs**

The two inputs on the Lens Distort node are used to connect a 2D image and an effect mask, which can be used to limit the distorted area.

- **Input:** The orange input is used for the primary 2D image that is distorted.
- **Effect Mask:** The blue input is for a mask shape created by polylines, basic primitive shapes, paint strokes, or bitmaps from other tools. Connecting a mask to this input limits the distortion to only those pixels within the mask. An effects mask is applied to the tool after the tool is processed.

**Basic Node Setup**

A simplified example below applies the Lens Distort in Undistort mode to the MediaIn1 live-action layer, composites the 3D elements, and finally applies the Lens Distort at the end with the same settings, but this time in Distort mode to get the original look and distortion back into the image.

![Node Tree Diagram](image)

Lens Distort applied on the live-action media at the beginning of the node tree, and once again at the end.

**Inspector**

![Inspector Panel](image)
Controls Tab

The Controls tab presents various ways to customize or build the lens distortion model you want. Camera Settings allow you to specify the camera used to capture the content.

Mode

Undistort removes the lens distortion to create a flattened image. Distort brings the original lens distortion back into the image.

Edges

Determines how samples that fall outside the frame are treated.

- **Canvas**: Pixels outside the frame are set to the default canvas color. In most cases, this is black with no Alpha.
- **Duplicate**: Pixels outside the frame are duplicated. This results in “smeared” edges but is useful when, for example, applying a blur because in that case black pixels would result in the unwanted blurring between the actual image and the black canvas.

Clipping Mode

- **Domain**: Retains all pixels that might be moved out of the frame for later re-distorting.
- **Frame**: Pixels moved outside the frame are discarded.

Output Distortion Map

Outputs the location of pixels as a warped screen-coordinate map.

Camera Settings

The options known from the Camera 3D are duplicated here. They can either be set manually or connected to an already existing Camera 3D.

Lens Distortion Model

Select the appropriate 3D Equalizer Lens Distortion model here: 3DE Classic Model, 3DE4 Anamorphic, 3DE4 Radial Fisheye, or 3DE4 Radial. Please consult the 3D Equalizer manual for further explanation. The sliders in the 3DE Classic LD Model are most likely best suited for manually applying (un)distortion, without having imported lens data.

Supersampling [HiQ]

Sets the number of samples used to determine each destination pixel. As always, higher supersampling leads to higher render times. 1×1 bilinear is usually of sufficient quality, but with high lens distortion near the edges of the lens, there are noticeable differences to higher settings.

Supersampling Mode [HiQ]

The type of sample done for each supersample. Nearest leads to a crisper but more aliased image. Bi-Linear gives a blurrier result.

Load Distortion Data

Allows the user to load a Lens Distortion profile created, for example, by the 3D Equalizer.
How to Manually Determine Lens Distortion

In an ideal world, one would have exact lens parameters from each lens that was used during the shoot, and one could use those values to undistort the image. However, in the real world, those parameters have not been taken on set or don’t match. Another approach is to use software like 3D Equalizer, which analyzes the footage and delivers a dataset that can be imported into the Lens Distort node right away.

And finally, one could try to manually eyeball the amount of lens distortion using the control sliders. To do that, one could either look for horizontal or vertical lines in the footage that are supposed to be straight and straighten them out using the controls, or shoot a full-frame checkerboard pattern on set as a reference.

Common Controls

Settings Tab

The Settings tab in the Inspector is also duplicated in other Warp nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.

Perspective Positioner [PPN]

Perspective Positioner Node Introduction

The Perspective Positioner is the complementary node to the Corner Positioner node. It "unpins" an image by positioning corner points on a perspective distorted area, thereby removing the perspective from the image. This function can also be used to wobble and warp the image by animating the points over time.

Inputs

The two inputs on the Perspective Positioner node are used to connect a 2D image and an effect mask, which can be used to limit the transformed area.

- **Input**: The orange input is used for the primary 2D image that is transformed.
- **Effect Mask**: The blue input is for a mask shape created by polylines, basic primitive shapes, paint strokes, or bitmaps from other tools. Connecting a mask to this input limits the transform to only those pixels within the mask. An effects mask is applied to the tool after the tool is processed.

Basic Node Setup

In the example below, the Perspective Positioner is used to unpin a perspective distorted area of the MedianIn2 in order to paint on the flat texture. The MedianIn2 is then corner pinned back into place. The Perspective Positioner and Corner Positioner do not concatenate, so some softness is introduced with these nodes.
The Perspective Positioner unpins an image to paint on a texture map

Inspector

Controls Tab
The Controls tab contains parameters for selecting vector channels and controlling how much distortion they apply to an image.

Mapping Type
The Mapping Type menu is used to select the type of transform used to distort the image. Bi-Linear is available for support of older projects. Leaving this on Perspective is strongly suggested since the Perspective setting maps the real world more accurately.

Corners X and Y
There are the four control points of the Perspective Positioner. Interactively drag these in the viewers to position each corner of the image. You can refine their position using the Top, Bottom, Left, and Right controls in the Inspector.

Common Controls

Settings Tab
The Settings tab in the Inspector is also duplicated in other Warp nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.
Vector Distortion [DST]

The Vector Distortion node

Vector Distortion Node Introduction

The Vector Distortion node distorts the main source image along the X- and Y-axis separately, based on the vector channel data in the source image or vector channels from a second reference image.

Inputs

There are three inputs on the Vector Distort node for the primary 2D image, the distort image with vector channels and an effect mask.

- **Input**: The orange image input is a required connection for the primary image you wish to distort. If this image has vector channels, they are used in the distortion.
- **Distort**: The green input is an optional distort image input used to distort the background image based on vector channels. Once connected, it overrides vector channels in the input image.
- **Effect Mask**: The optional blue effect mask input expects a mask shape created by polylines, basic primitive shapes, paint strokes, or bitmaps from other tools. Connecting a mask to this input limits the displacement to only those pixels within the mask. An effects mask is applied to the tool after it is processed.

Basic Node Setup

In the example below, the MediaIn1 node uses an Optical Flow node to generate the vector channels, which are then passed on to the Vector Distort node. MediaIn2 is distorted and composited over the background.

The Vector Distort node relies on the image having vector channels or an Optical Flow node to generate them.
Inspector

The Controls tab contains parameters for selecting vector channels and controlling how much distortion they apply to an image.

X Channel and Y Channel
These two menus are used to select which channel of the (green) distort image input is used to distort the X and Y channels. If no distort reference image is connected, then channels from the main orange input are used instead.

Flip Channel X and Flip Channel Y
Use these checkboxes to flip the direction of the distortion along the specified axis.

Lock Scale X/Y
Select this checkbox to separate the Scale slider into separate Scale X and Scale Y sliders.

Scale
Use the Scale slider to apply a multiplier to the values of the distortion reference image.

Lock Bias X/Y
Select this checkbox to separate the Bias slider into separate Bias X and Bias Y sliders.

Center Bias
Use the Center Bias slider to shift or nudge the distortion along a given axis.

Edges
This menu determines how the edges of the image are treated.

- Canvas: This causes the edges that are revealed by the shake to be the canvas color—usually transparent or black.
- Duplicate: This causes the edges to be duplicated, causing a slight smearing effect at the edges.

Glow
Use this slider to add a glow to the result of the vector distortion.
Common Controls

Settings Tab
The Settings tab in the Inspector is also duplicated in other Warp nodes. These common controls are described in detail at the end of this chapter in “The Common Controls” section.

Vortex [VTX]

The Vortex node

Vortex Node Introduction
The Vortex effect appears as a swirling whirlpool in specified regions of the image. The Vortex can be made to move and grow by animating the various controls.

Inputs
There are two inputs on the Vortex node for the primary 2D image and the effect mask.
- **Input**: The orange image input is a required connection for the primary image you wish to swirl.
- **Effect Mask**: The optional blue effect mask input expects a mask shape created by polylines, basic primitive shapes, paint strokes, or bitmaps from other tools. Connecting a mask to this input limits the swirling vortex to only those pixels within the mask. An effects mask is applied to the tool after it is processed.

Basic Node Setup
Below, the Vortex is applied to text for creating motion graphics. Since the Vortex will cause the text to swirl outside the text boundary, a Set Domain node is used to expand the text boundary, ensuring that the text is not cropped when the Vortex is applied.

The Vortex is used to create swirling whirlpool effects
Inspector

Controls Tab
The Controls tab contains parameters for adjusting the position, size, and strength of the Vortex effect.

**Center X and Y**
This control is used to position the center of the Vortex effect on the image. The default is 0.5, 0.5, which positions the effect in the center of the image.

**Size**
Size changes the area affected by the Vortex. You can drag the circumference of the effect in the viewer or use the Size slider.

**Angle**
Drag the rotation handle in the viewer or use the thumbwheel control to change the amount of rotation in the Vortex. The higher the angle value, the greater the swirling effect.

**Power**
Increasing the Power slider makes the Vortex smaller but tighter. It effectively concentrates it inside the given image area.

Common Controls

**Settings Tab**
The Settings tab in the Inspector is also duplicated in other Warp nodes. These common controls are described in detail in the following "The Common Controls" section.
The Common Controls

Nodes that handle Warp operations share a number of identical controls in the Inspector. This section describes controls that are common among Warp nodes.

Inspector

Settings Tab

The Settings tab in the Inspector can be found on every tool in the Warp category. The Settings controls are even found on third-party Warp-type plug-in tools. The controls are consistent and work the same way for each tool.

Blend

The Blend control is used to blend between the tool’s original image input and the tool’s final modified output image. When the blend value is 0.0, the outgoing image is identical to the incoming image. Normally, this will cause the tool to skip processing entirely, copying the input straight to the output.
**Process When Blend Is 0.0**
The tool is processed even when the input value is zero. This can be useful if the node is scripted to trigger a task, but the node’s value is set to 0.0.

**Red/Green/Blue/Alpha Channel Selector**
These four buttons are used to limit the effect of the tool to specified color channels. This filter is often applied after the tool has been processed.

For example, if the Red button on a Blur tool is deselected, the blur will first be applied to the image, and then the red channel from the original input will be copied back over the red channel of the result.

There are some exceptions, such as tools for which deselecting these channels causes the tool to skip processing that channel entirely. Tools that do this will generally possess a set of identical RGBA buttons on the Controls tab in the tool. In this case, the buttons in the Settings and the Controls tabs are identical.

**Apply Mask Inverted**
Enabling the Apply Mask Inverted option inverts the complete mask channel for the tool. The mask channel is the combined result of all masks connected to or generated in a node.

**Multiply by Mask**
Selecting this option will cause the RGB values of the masked image to be multiplied by the mask channel's values. This will cause all pixels of the image not included in the mask (i.e., set to 0) to become black/transparent.

**Use Object/Use Material (Checkboxes)**
Some 3D software can render to file formats that support additional channels. Notably, the EXR file format supports Object ID and Material ID channels, which can be used as a mask for the effect. These checkboxes determine whether the channels will be used, if present. The specific Material ID or Object ID affected is chosen using the Object and Material ID sliders explained below.

**Correct Edges**
This checkbox appears only when the Use Object or Use Material checkboxes are selected. It toggles the method used to deal with overlapping edges of objects in a multi-object image. When enabled, the Coverage and Background Color channels are used to separate and improve the effect around the edge of the object. If this option is disabled (or no Coverage or Background Color channels are available), aliasing may occur on the edge of the mask.

For more information on the Coverage and Background Color channels, see Chapter 4, “Understanding Image Channels and Node Processing” in the Fusion Studio Reference Manual or Chapter 56 in the DaVinci Resolve Reference Manual.

**Object ID/Material ID (Sliders)**
Use these sliders to select which ID will be used to create a mask from the object or material channels of an image. Use the Sample button in the same way as the Color Picker: to grab IDs from the image displayed in the viewer. The image or sequence must have been rendered from a 3D software package with those channels included.
Motion Blur

- **Motion Blur:** This toggles the rendering of Motion Blur on the tool. When this control is toggled on, the tool’s predicted motion is used to produce the motion blur caused by the virtual camera’s shutter. When the control is toggled off, no motion blur is created.

- **Quality:** Quality determines the number of samples used to create the blur. A quality setting of 2 will cause Fusion to create two samples to either side of an object’s actual motion. Larger values produce smoother results but increase the render time.

- **Shutter Angle:** Shutter Angle controls the angle of the virtual shutter used to produce the motion blur effect. Larger angles create more blur but increase the render times. A value of 360 is the equivalent of having the shutter open for one full frame exposure. Higher values are possible and can be used to create interesting effects.

- **Center Bias:** Center Bias modifies the position of the center of the motion blur. This allows for the creation of motion trail effects.

- **Sample Spread:** Adjusting this control modifies the weighting given to each sample. This affects the brightness of the samples.

Use GPU

The Use GPU menu has three settings. Setting the menu to Disable turns off GPU hardware-accelerated rendering. Enabled uses the GPU hardware for rendering the node. Auto uses a capable GPU if one is available and falls back to software rendering when a capable GPU is not available.

Hide Incoming Connections

Enabling this checkbox can hide connection lines from incoming nodes, making a node tree appear cleaner and easier to read. When enabled, empty fields for each input on a node will be displayed in the Inspector. Dragging a connected node from the node tree into the field will hide that incoming connection line as long as the node is not selected in the node tree. When the node is selected in the node tree, the line will reappear.

Comments

The Comments field is used to add notes to a tool. Click in the empty field and type the text. When a note is added to a tool, a small red square appears in the lower-left corner of the node when the full tile is displayed, or a small text bubble icon appears on the right when nodes are collapsed. To see the note in the Node Editor, hold the mouse pointer over the node to display the tooltip.

Scripts

Three Scripting fields are available on every tool in Fusion from the Settings tab. They each contain edit boxes used to add scripts that process when the tool is rendering. For more details on scripting nodes, please consult the Fusion scripting documentation.
Chapter 111

Modifiers

This chapter details the modifiers available in Fusion.

Modifiers

Modifiers are extensions to a node’s standard set of parameters found in the Inspector; in fact, modifiers are designed to control other parameters. They can be as simple as a motion path or linking two parameters. However, they can also be elaborate expressions, procedural functions, external data, third-party plug-ins, or scripted Fuses. You can add modifiers by right-clicking over a parameter in the Inspector and choosing a modifier from the menu. Alternatively, you can right-click a control in the viewer. Not all modifiers are displayed in the right-click menu for all parameters. Some modifiers work only on specific parameter types.

**NOTE:** Text3D and Text+ have additional text-specific modifiers, which are covered in their nodes’ sections.

---

**Bézier Spline**

The Bézier Spline is one of the animation modifiers in Fusion and is typically applied to numerical values rather than point values. It is automatically applied when you keyframe a parameter or each time you right-click a number field and select Animate.
Usage

You can add the Bézier Spline to the Spline Editor by right-clicking a number field and selecting BezierSpline. Since this is the most common choice for animation splines, it is separated from the Modify With menu for quicker access. Selecting BezierSpline from the menu adds a keyframe at the current location and displays a Bézier spline in the Spline Editor.

Unlike most modifiers, this modifier has no actual Controls tab in the Inspector. However, the Spline Editor displays the Bézier spline, and it can be controlled there. The Bézier Spline offers individual control over each control point’s smoothness using Bézier handles. The smoothness is applied in multiple ways:

- To make the control points smooth, select them, and press Shift-S. The handles can be used to modify the smoothness further.
- To make the control points linear, select them, and press Shift-L. These operations can also be performed using the contextual menu.
- Select the control point(s), right-click, and select Smooth or Linear. The menu also allows the user to smooth a spline using a convolution analysis called a Savitzky-Golay filter. Select the control point(s), right-click, and select Smooth Points -Y Dialog.

Ease In/Out

Traditional Ease In/Out can also be modified by using the number field virtual sliders in the Spline Editor. Select the control points you want to modify, right-click, and select Ease In/Out... from the contextual menu. Then use the number field virtual sliders to control the Ease In/Out numerically.
B-Spline

An alternative to the Bézier Spline, B-spline is another animation modifier in Fusion and is typically applied to numerical values rather than point values. It is applied by right-clicking a parameter and selecting Modify With > B-Spline.

Usage

- This animation spline modifier has no actual Controls tab. However, the Spline Editor displays the B-spline, and it can be controlled there. Notice that, though the actual value of the second keyframe is 0, the value of the resulting spline is 0.33 due to the unique smoothing and weighing algorithms of a B-spline.
- The weight can be modified by clicking the control point to select it, holding the W key, and moving the mouse left and right to lower or increase the tension. This is also done with multiple selected control points simultaneously.

Calculation

Calculations are used to create indirect connections between parameters. A Calculation can perform a mathematical expression based on two operands, where each operand can be connected to another parameter or set manually.

Additionally, using Time offsets and Scale controls in the Time tab, the Calculation control can access values of a parameter at times other than the current time.

The Calculation’s most common use is for connecting two parameters when one value range or scope is inappropriate for the other parameter.

NOTE: The Expression modifier is essentially a more flexible version of the Calculation modifier, with a single exception. It is far easier to manipulate the timing of the operands provided in the Calculation modifier than it is to do so with an Expression.
Inspector

Calc Tab
The Calc tab includes two dials used for the connected parameter and value that gets mathematically combined. The Operator menu selects how the Second Operand value combines with the parameter’s value.

First and Second Operand
These sliders are connected to published or animated parameters or manually set to the desired values for the calculation.

Operator
Select from the mathematical operations listed in this menu to determine how the two operands are combined. Clicking the drop-down arrow opens the menu with the following options:

- Add
- Subtract (First - Second)
- Multiply
- Divide (First / Second)
- Divide (Second / First)
- Subtract (Second - First)
- Minimum
- Maximum
- Average
- First only
Time Tab
The Time tab is used to modify the time of the Calculation modifier. The controls here retime the speed of the effect or offset it in time.

First and Second Operand Time Scale
These sliders multiply the frame number and return the value of the operands at the multiplied frame number. A value of 1 returns the value of the operand at frame x when the composition is on frame x. For example, if the first operand is animated with a value of 1 to 50 from frame 0 to 10, then a scale of 0.5 would cause the calculation to return a value of 25 at frame 10 (effectively slowing the animation by half for the purposes of the calculation).

First Operand and Second Operand Time Offset
These sliders return the value of the operand at the Time Offset specified. A value of 10 would return the value of the operand 10 frames forward in time, and -10 would return the value of the operand 10 frames back in time. See the example below for a practical example.

Example
The following example uses a calculation to apply blur to a Text node in inverse proportion to the size of the text.

1. Open a new composition that starts on frame 0 and ends on frame 100.
2. At frame 0, add a Text+ node to the composition.
3. Enter a small amount of text and set the size to 0.05
4. Click the Keyframe button to the right of the Size slider to add a keyframe.
5. Move to frame 100 and set the Size value to 0.50.
6. Connect a Blur node after the Text+ node.
7. View the Blur node in one of the viewers.
   To have the blur decrease in strength as the text gets bigger, a simple “pick whip”-style parameter linking does not work. The controls cannot be directly connected together because the values of the Text Size control are getting bigger instead of smaller.
8. Right-click the Blur Size and select Modify With > Calculation from the contextual menu.
   This adds a Calculation modifier to the Blur node. At the top of the Inspector, a new set of controls appears in the Modifiers tab while the Blur node is selected.
9. At the top of the Inspector, select the Modifiers tab (F11).
10. Right-click the First Operand slider and select Connect To > Text 1 > Size from the contextual menu.
    Although the Blur Size is now connected to the Text Size parameter, this connection isn’t very useful. The maximum value of the Blur Size control is 0.5, which is hardly noticeable as a blur.
11. Set the Operator drop-down menu to Multiply.
12. Set the Second Operand slider to 100.
   Now the first operand is multiplied by 100, and adjusting the dial gives you a much blurrier blur.
Switch to the Time tab of the modifier and set the First Operand Time Scale to -1.0. Normally, the first operand gets the value of the control it is connected to from the same frame as the current time. So at frame 10, the first operand is set to the same value as the Text size at frame 10. By setting this value to -1, the value is read from one frame back in time whenever the current time of the composition advances by 1 frame.

However, this means that the Calculation would be reading the value of the Text size at frame -10 when we are at frame 10 in the composition.

To correct for this, set the First Operand Time Offset slider to 100.

Return to the Tools tab at the top of the Inspector and press Play (Spacebar) to watch how the value of the Blur Size relates to the value of the Text Size.

CoordTransform Position

Because of the hierarchical nature of 3D in Fusion, the original position of an object in a 3D scene often fails to indicate the current position of the object. For example, an image plane might initially have a position at 1, 2, 1, but then be scaled, offset, and rotated by other tools further downstream in the node tree, ending up with an absolute location of 10, 20, 5. This can complicate connecting an object further downstream in the composition directly to the position of an upstream object. The Coordinate Transform modifier can be added to any set of the XYZ coordinate controls to calculate the current position of a given object at any point in the scene hierarchy. To add a Coordinate Transform modifier, right-click the numeric input on any node, and select Modify With > CoordTransform Position from the contextual menu.

Inspector

Controls Tab

The Controls tab has two fields for the target and scene input. The target is for the node continuing the original coordinates, while the scene input is used for the scene with the new coordinates.

Target Object

This control is connected to the 3D tool that produces the original coordinates to be transformed. To connect a tool, drag the node from the Node Editor into the text edit control, or right-click the control and select the tool from the contextual menu. It is also possible to type the tool’s name directly into the control.

SubID

The SubID slider can be used to target an individual sub-element of certain types of geometry, such as an individual character produced by a Text 3D tool or a specific copy created by a Duplicate 3D tool.

Scene Input

This control should be connected to the 3D tool, which outputs the scene containing the object at the new location. To connect a tool, drag and drop a tool tile from the Node Editor into the text edit control, or right-click the control and select an object from the Connect To pop-up menu.
Cubic Spline

The Cubic Spline is another animation modifier in Fusion that is normally applied to numerical values rather than point values. It can be applied by right-clicking a numerical control and selecting Modify With > Natural Cubic Spline.

Usage

Being an animation spline, this modifier has no actual Controls tab. However, its effect can be seen and influenced in the Spline Editor.

Expression

An expression is a variable or a mathematical calculation added to a parameter, rather than a straight numeric value. You can add an expression to any parameter in Fusion, or you can add the Expression modifier, which adds several tabs to the modifier Inspector. Adding this modifier to a parameter adds the ability to manipulate that parameter based on any number of controls, either positional or value-based. This modifier offers exceptional flexibility compared to the more limited Calculation or Offset modifiers, but it is unable to access values from frames other than the current time.

The Expression modifier accepts nine value inputs and nine position inputs that are used as part of a user-defined mathematical expression to output a value.

To add the Expression modifier to a parameter, right-click the parameter in the Inspector and choose Modify With > Expression from the contextual menu. The type of value returned by the Expression depends entirely on the type of control it is modifying.

When used with a value control (like a slider), the Expression in the Number Out tab is evaluated to create the result. When used to modify a positional control (like Center), the Point Out tab controls the result.

The Inspector’s Modifiers tab contains the controls for the Expression modifier, described below.
Inspector

Controls Tab
This tab provides nine number controls and nine point controls. The values of the number controls can be referred to in an expression as n1 through n9. The X-coordinate of each point control can be referred to as p1x through p9x, while the Y-coordinate is p1y through p9y.

These values can be set manually, connected to other parameters, animated, and even connected to other Expressions or Calculations.

Number Out Tab
Mathematical formulas are entered using the Number In and Point In values from the Controls tab. The output modifies the control in which the Expression was applied. See below for the syntax to use in this field.
Point Out Tab

The two text boxes in this tab use mathematical formulas, accessing the Number In and Point In values from the Controls tab. The output value modifies the control in which the Expression was applied. The Expression in the top text box control is used to calculate the X-axis value, and the bottom text box is used to calculate the Y-axis control. See below for the syntax to use in this field.

Config Tab

A good expression is reused over and over again. As a result, it can be useful to provide more descriptive names for each parameter or control and to hide the unused ones. The Config Tab of the Expressions modifier can customize the visibility and name for each of the nine point and number controls.
Random Seed
The Random Seed control sets the starting number for the Rand() function. The rand(x, y) function produces a random value between X and Y, producing a new value for every frame. As long as the setting of this Random Seed slider remains the same, the values produced at frame x are always the same. Adjust the Seed slider to a new value to get a different value for that frame.

Show Number or Point X
There are eighteen of these checkbox controls, one for each of the nine Number and nine Point inputs. Enable this checkbox to display the control for Number x or Point x in the Controls tab.

Name for Number or Point X
There are eighteen of these edit controls, one for each of the nine Number and nine Point inputs. Type a new name for the input into this edit control to assign a new name for the Input’s label in the Controls tab.

Expression Syntax Formulas
Formulas are entered into the Number Out or Point Out tabs as part of an expression. They can be made up of the following functions:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n1...n9</td>
<td>The value of Number Input 1..9.</td>
</tr>
<tr>
<td>pfx...p9x</td>
<td>The X of Positional Control 1..9.</td>
</tr>
<tr>
<td>pfy...p9y</td>
<td>The Y of Positional Control 1..9.</td>
</tr>
<tr>
<td>time</td>
<td>The current time (frame number).</td>
</tr>
<tr>
<td>pi</td>
<td>The value of pi.</td>
</tr>
<tr>
<td>e</td>
<td>The value of e.</td>
</tr>
<tr>
<td>log(x)</td>
<td>The base-10 log of x.</td>
</tr>
<tr>
<td>ln(x)</td>
<td>The natural (base-e) log of x.</td>
</tr>
<tr>
<td>sin(x)</td>
<td>The sine of x (x is degrees).</td>
</tr>
<tr>
<td>cos(x)</td>
<td>The cosine of x (x is degrees).</td>
</tr>
<tr>
<td>tan(x)</td>
<td>The tangent of x (x is degrees).</td>
</tr>
<tr>
<td>asin(x)</td>
<td>The arcsine of x, in degrees.</td>
</tr>
<tr>
<td>acos(x)</td>
<td>The arccosine of x, in degrees.</td>
</tr>
<tr>
<td>atan(x)</td>
<td>The arctangent of x, in degrees.</td>
</tr>
<tr>
<td>atan2(x, y)</td>
<td>The arctangent of x,y, in degrees.</td>
</tr>
<tr>
<td>abs(x)</td>
<td>The absolute (positive) value of x.</td>
</tr>
<tr>
<td>int(x)</td>
<td>The integer (whole) value of x.</td>
</tr>
<tr>
<td>frac(x)</td>
<td>The fractional value of x.</td>
</tr>
<tr>
<td>sqrt(x)</td>
<td>The Square Root of x.</td>
</tr>
<tr>
<td>rand(x, y)</td>
<td>A random value between x and y.</td>
</tr>
<tr>
<td>rands(x, y, s)</td>
<td>A random value between x and y, based on seed s.</td>
</tr>
<tr>
<td>Operator</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------------------------------</td>
</tr>
<tr>
<td>min(x, y)</td>
<td>The minimum (lowest) of x and y.</td>
</tr>
<tr>
<td>max(x, y)</td>
<td>The maximum (highest) of x and y.</td>
</tr>
<tr>
<td>dist(x1, y1, x2, y2)</td>
<td>The distance between point x1,y2 and x2,y2.</td>
</tr>
<tr>
<td>dist3d(x1,y1,z1, x2,y2,z2)</td>
<td>The distance between 3D points x1,y2,z1 and x2,y2,z2.</td>
</tr>
<tr>
<td>noise(x)</td>
<td>A smoothly varying Perlin noise value based on x</td>
</tr>
<tr>
<td>noise2(x, y)</td>
<td>A smoothly varying Perlin noise value based on x and y</td>
</tr>
<tr>
<td>noise3(x, y, z)</td>
<td>A smoothly varying Perlin noise value based on x, y and z</td>
</tr>
<tr>
<td>if(c, x, y)</td>
<td>Returns x if c not 0, otherwise y.</td>
</tr>
</tbody>
</table>

**Expression Syntax Operators**

Operators are used to evaluate statements. They are combined with functions to perform logical and mathematical calculations in the Number Out and Point Out tabs.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x + y</td>
<td>x plus y.</td>
</tr>
<tr>
<td>x - y</td>
<td>x minus y.</td>
</tr>
<tr>
<td>x &gt;= y</td>
<td>1.0 if x is less than y, otherwise 0.0.</td>
</tr>
<tr>
<td>x &gt; y</td>
<td>1.0 if x is greater than y, otherwise 0.0.</td>
</tr>
<tr>
<td>!x</td>
<td>1.0 if x = 0, otherwise 0.0.</td>
</tr>
<tr>
<td>-x</td>
<td>(0.0 - x).</td>
</tr>
<tr>
<td>+x</td>
<td>(0.0 + x) (effectively does nothing).</td>
</tr>
<tr>
<td>x ^ y</td>
<td>x raised to the power of y.</td>
</tr>
<tr>
<td>x y</td>
<td>x multiplied by y.</td>
</tr>
<tr>
<td>x / y</td>
<td>x divided by y.</td>
</tr>
<tr>
<td>x % y</td>
<td>x modulo y, (remainder of (x divided by y)).</td>
</tr>
<tr>
<td>x &gt;= y</td>
<td>1.0 if x is less than or equal to y, otherwise 0.0.</td>
</tr>
<tr>
<td>x &gt; = y</td>
<td>1.0 if x is greater than or equal to y, otherwise 0.0.</td>
</tr>
<tr>
<td>x = y</td>
<td>1.0 if x is exactly equal to y, otherwise 0.0.</td>
</tr>
<tr>
<td>x == y</td>
<td>1.0 if x is exactly equal to y, otherwise 0.0 (identical to above).</td>
</tr>
<tr>
<td>x &lt;&gt; y</td>
<td>1.0 if x is not equal to y, otherwise 0.0.</td>
</tr>
<tr>
<td>x != y</td>
<td>1.0 if x is not equal to y, otherwise 0.0 (identical to above).</td>
</tr>
<tr>
<td>x &amp; y</td>
<td>1.0 if both x and y are not 0.0, otherwise 0.0.</td>
</tr>
<tr>
<td>x &amp;&amp; y</td>
<td>1.0 if both x and y are not 0.0, otherwise 0.0 (identical to above).</td>
</tr>
<tr>
<td>x</td>
<td>y</td>
</tr>
<tr>
<td>x</td>
<td></td>
</tr>
</tbody>
</table>
Example 1

To make a numeric control equal to the Y value of a motion path, add an expression to the desired target control and connect the Path to Point In 1. Enter the formula:

\[ p_{1y} \]

into the Number Out field.

Example 2

To make the result of the Expression’s Number Out be the largest of Number In 1 and Number In 2, multiplied by the cosine of Number In 3, plus the X coordinate of Point In 1, enter the formula:

\[ \max(n_1, n_2) \times \cos(n_3) + p_{1x} \]

into the Number Out field.

Example 3

Add a Background node set to solid black and a Hotspot node. Set the Hotspot size to 0.08 and set the Strength to maximum. Modify the Hotspot center with an expression. Change the current frame to 0.

Set \( n_1 \) to 0.0 and add a Bézier spline. At frame 29, set the value of \( n_1 \) to 1.0. Select both points and loop the spline using the Spline Editor. Now enter the following equations into the Point Out tab of the expression.

X-Axis Expression

\( n_1 \)

Y-Axis Expression

\[ 0.5 + \sin(\text{time} \times 50) \]

Render out a preview and look at the results. (Try this one with motion blur.)

From Image

The From Image modifier only works on gradients, like the gradient on a Background node. It takes samples of an image along a user-definable line and creates a gradient from those samples.

Unlike other modifiers, From Image is not located in the Modify With menu. This modifier can be applied by right-clicking a Gradient bar in the Inspector and selecting From Image.

Inspector
Controls Tab
The From Image controls tab in the Inspector is used to select the node that contains the image you want to sample. It allows you to define the starting and ending point in the image as well as how many color samples to use in creating the gradient.

Image to Scan
Drop into this box the node from the Node Editor that you want to be color sampled.

Start X/Y, End X/Y
These two point controls define the Start and End points of the line along which the samples are taken from the image defined in the Image to Scan box.
The points can also be moved directly in the viewer.

Number of Sample Steps
This defines how many individual color samples are taken along the line. You can also see the result of this setting when you look at the actual node’s Gradient control. The more sample steps you define here, the more individual color stops appear on the Gradient control. It is also possible to first create a gradient using the From Image modifier and then remove that modifier from the Gradient control again. The created gradient stays intact and can then be fine tuned by hand.

Edges
Edges determines how the edges of the image are treated when the sample line extends over the actual frame of the image to be sampled.

Black
This outputs black for every point on the sample line outside of the image bounds.

Wrap
This wraps the edges of the line around the borders of the image.

Duplicate
This causes the edges of the image to be duplicated as best as possible, continuing the image beyond its original size.

Color
This outputs a user-definable color instead of black for every point on the sample line outside of the image bounds.

Example
The source image on the left shows the color selection line in red. The image on the right shows the resulting gradient from that selection.
**Gradient Color**

The Gradient Color modifier allows you to create a customized gradient and map it into a specific time range to control a value. Use the Start and End time controls to set the frames for the animation. If the Start and End time values are set to 0, then the modifier returns the value at the starting point of the gradient. You can use the Offset control to animate the gradient manually.

It can be applied by right-clicking a parameter and selecting Modify With > Gradient Color.

**Inspector**

The Controls tab consists of a Gradient bar where you add and adjust points of the gradient. Start Time and End Time thumbwheels at the bottom of the Inspector determine the time range the gradient is mapped into.

**Gradient**

The Gradient control consists of a bar where it is possible to add, modify, and remove points of the gradient. Each point has its color. It is possible to animate the color as well as the position of the point. Furthermore, a From Image modifier can be applied to the gradient to evaluate it from an image.

**Gradient Interpolation Method**

The gradient is linearly interpolated from point to point in RGB color space by default. This can sometimes result in unwanted colors. Choosing another color space may provide a better result.
Repeat
Defines how the left and right borders of the gradient are treated.

Gradients set to Once, Repeat, and Ping Pong from top to bottom, respectively, and shifting the gradient to the left.

- **Once**: When using the Gradient Offset control to shift the gradient, the border colors keep their values. Shifting the default gradient to the left results in a white border on the left; shifting it to the right results in a black border on the right.

- **Repeat**: When using the Gradient Offset control to shift the gradient, the border colors are wrapped around. Shifting the default gradient to the left results in a sharp jump from white to black; shifting it to the right results in a sharp jump from black to white.

- **Ping Pong**: When using the Gradient Offset control to shift the gradient, the border colors ping-pong back and forth. Shifting the default gradient to the left results in the edge fading from white back to black; shifting it to the right results in the edge fading from black back to white.

**Gradient Offset**
Allows you to pan through the gradient.

**Time Controls**
The Start Time and End Time thumbwheels determine the time range the gradient is mapped into. This is set in frames. The same effect can be achieved by setting the Gradient to Once and animating the offset thumbwheel.

**Key Stretcher Modifier**

The Keyframe Stretcher modifier is primarily used when creating title templates in Fusion for use in DaVinci Resolve’s Edit page or Cut page. The Keyframe Stretcher modifier is added to an animated parameter, so the keyframes in the animated parameter stretch when the template is trimmed in the Timeline. It can be applied by right-clicking a parameter and selecting Modify with > KeyStretcher.

For more information on the Keyframe Stretcher Modifier controls, see the Keyframe Stretcher Node in Chapter 100, “Miscellaneous Nodes” in the DaVinci Resolve manual or chapter 49 in the Fusion Studio manual.
MIDI Extractor

The MIDI Extractor modifier provides the ability to modify the value of a control using the values stored in a MIDI file. This modifier relies on some knowledge of MIDI, which is beyond the scope of this manual.

The value produced by the modifier is extracted from the MIDI event selected in the Mode menu. Each mode can be trimmed so that only specific messages for that event are processed—for example, only some notes are processed, while others are ignored. The value of the event can be further scaled or modified by additional factors, such as Scale, Velocity, Attack, and Decay.

It can be applied by right-clicking a parameter and selecting Modify With > MIDI Extractor.

Inspector

Controls Tab

The Controls tab is used to load the MIDI file, modify its timing, and determine which MIDI messages and events trigger changes in the Fusion parameter.

MIDI File

This browser control is used to specify the MIDI file that is used as the input for the modifier.

Time Scale

Time Scale is used to specify the relationship between time as the MIDI file defines it and time as Fusion defines it. A value of 1.0 plays the MIDI events at normal speed, 2.0 plays at double speed, and so on.
Time Offset
Time Offset adjusts the sync between the MIDI file’s timing and Fusion’s timing. If there is an unexpected delay, or if the MIDI file should start partway into or before some animation in Fusion, this control can be used to offset the MIDI data as required.

Result Offset, Result Scale
These sliders adjust the range of values produced by the modifier. By default, values between 0 and 1 (or -1 and 1 for PitchBend mode) are generated. This does not always suit the node/parameter, and scale can be used to make this range larger (such as * 0.0 - 2.0). Offset is used to provide some constant value as a base.

Result Curve
The Result Curve can also be used to adjust the output. However, this adjusts the curve of the result. By default, for any input MIDI data, the results fall linearly between 0.1 and 1.0 (for example, a velocity 127 note generates 1.0, whereas 63 generates approximately 0.5).

The Result Curve applies a gamma-like curve so that middle values can produce higher or lower results while still maintaining the full scale.

Mode
This menu provides Beat, Note, Control Change, Poly AfterTouch, Channel AfterTouch, or PitchBend, indicating from which MIDI event the values are being read. Beat mode is slightly different in that it produces regular pulses based on the tempo of the MIDI file (including any tempo maps).

The Beat mode does not use any specific messages; it bases its event timing on the tempo map contained in the MIDI file.

Combine Events
This menu selects what happens when multiple events occur at the same time. In Notes mode, this can happen easily. For other events, this can happen if Multiple Channels are selected.

Use this to take the result from the most recent event to occur, the oldest event still happening, the highest or lowest valued event, the average, sum, or the median of all events currently occurring.

Beat (Quarters) (Beat Mode Only)
This defines how often a beat occurs when in Beat mode. This is in quarter notes, so a value of 1.0 gives a beat every quarter.

Note Range (Note and Poly Aftertouch Modes Only)
This defines what range of notes causes a value to be generated. For example, use this to pick out the kick drum from a GM drum track by setting the note range between 35–36.

Pitch Scale (Note Mode Only)
Pitch Scale defines how much the result changes with pitch. A value of 1.0 causes the result to vary from 0.0 to 1.0 over the entire range.

Velocity Scale (Note Mode Only)
This defines how much the result changes with velocity. A value of 1.0 causes the result to vary from 0.0 to 1.0 over the entire range. This is added to the result from Pitch Scale for the final result.

Control Number (Control Change Mode Only)
This specifies the MIDI controller number from which to extract events.
Envelope Controls (Note and Beat Modes Only)
These define an Envelope to follow for values before, during, and after the note or beat. Pre-Attack Time defines how long before the event it starts ramping up to the pre-attack level. Attack is the Time/Level to ramp to once the event has occurred, followed by the Decay ramp and Sustain, until the event stops. This stage is for Notes only. Beats have an instantaneous duration, so it goes straight to Release. Release is the ramp-down time after the event finishes. When trying to do a Beat, set Release to some value, or there likely will not be much of a beat. These values can be used to follow actual sounds in the MIDI sequence or just to create interesting effects. All time values used in the MIDI Extractor are in seconds.

Channels Tab
The Channels tab is used to select the Channels used in the modifier.

Channels
Channels checkboxes select which of the 16 channels in the MIDI file are actually considered for events. This is a good way to single out a specific instrument from an arrangement.

About MIDI
A single MIDI interface allows 16 channels. Typically, these are assigned to different instruments within a device or different devices. Usually, MIDI data is 7 bits, ranging from 0–127. In Fusion, this is represented as a value between 0–1 to be more consistent with how data is handled in Fusion.

There are numerous different MIDI messages and events, but the ones that are particularly useful with this modifier are detailed below.

MIDI Messages
- **Note On**: This indicates that a note (on a specific channel) is being turned on, has a pitch (0–127, with middle C being 60) and a Velocity (0–127, representing how fast the key or strings or whatever was hit).
- **Note Off**: This indicates that a note (on a specific channel) is being turned off, has a pitch (0–127, with middle C being 60) and a Velocity (0–127, representing how fast the key or strings or whatever was released).
- **Control Change**: This message indicates that some controller has changed. There are 128 controllers (0–127), each of which has data from 0–127. Controllers are used to set parameters such as Volume, Pan, amount of Reverb or Chorus, and generic things like foot controllers or breath controllers.
MIDI Events
- **Channel Aftertouch**: This event defines that pressure is being applied to the keys (or strings or whatever) during a note. This represents general, overall pressure for this channel, so it simply uses a pressure value (0–127).
- **Poly Aftertouch**: This event defines that pressure is being applied to the keys (or strings or whatever) during a note. It is specific to each particular note and therefore contains a note number as well as a pressure value (0–127).

**Pitch Bend**
The Pitch Bend controller generally specifies the degree of pitch bending or variation applied to the note. Because pitch bend values are transmitted as a 14-bit values, this control has a range between -1 and 1 and a correspondingly finer degree of resolution.

---

**Natural Cubic Spline**
The Natural Cubic Spline is one of the animation modifiers in Fusion and normally is applied to numerical values rather than point values. It can be applied by right-clicking a numerical control and selecting Modify With > Natural Cubic Spline.

**NOTE:** Unlike other spline types, Cubic splines have no control handles. They attempt to automatically provide a smooth curve through the control points.

**Usage**
Being an animation spline, this modifier has no actual Controls tab. However, its effect can be seen and influenced in the Spline Editor.
Offset (Angle, Distance, Position)

There are three Offset modifiers used to create variances between values. Depending on the modifier, these values relate to controls, paths, and points. The three types of Offset modifiers available in Fusion are:

- Offset Angle
- Offset Distance
- Offset Position

Offset Angle
The Offset Angle modifier outputs a value between 0 and 360 that is based on the angle between two positional controls. The Position and Offset parameters may be static, connected to other positional parameters, or connected to paths of their own. All offsets use the same set of controls, which behave differently depending on the offset type used. These controls are described below.

Offset Distance
The Offset Distance modifier outputs a value that is based on the distance between two positional controls. This modifier is capable of outputting a value based on a mathematical expression applied to a position.

Offset Position
The Offset Position modifier generates a position (X and Y coordinates) that is based on the relationship between positional controls. This modifier is the equivalent of a calculation control except that it outputs X and Y coordinates instead of a value.

It can be applied by right-clicking a control and selecting Modify With > Offset.

Inspector

The Inspector for all three Offset modifiers is identical. The Offset tab includes Position and Offset values as well as a Mode menu for selecting the mathematical operation performed by the offset control.
**Position X and Y**  
The X and Y values are used by the Position to generate the calculation.

**Offset X and Y**  
The X and Y values are used by the Offset to generate the calculation.

**Flip Position Horizontal and Vertical**  
When these controls are selected, the Position is mirrored along the vertical or horizontal axis of the image.

**Flip Offset Horizontal and Vertical**  
When these controls are selected, the Offset position is mirrored along the vertical or horizontal axis of the image.

**Mode**  
The Mode menu includes mathematical operations performed by the Offset control.  
Available options include:

- Offset
- Difference (Position - Offset)
- Difference (Offset - Position)
- Average
- Use Position Only
- Use Offset Only
- Maximum
- Minimum
- Invert Position
- Invert Offset
- Invert Sugar
- Random Offset

**Image Aspect**  
Adjust the modifier’s output to compensate for the image aspect (not pixel aspect) of the project. A square image of 500 x 500 would use an Image Aspect value of 1, and a rectangular image of 500 x 1000 would use an Aspect Value of 2. The default value is always based on the current frame format selected in the preferences. To calculate image aspect, divide the width by the height. This control can also be used to create the illusion of aspect.
Time Tab

**Position Time Scale**
This returns the value of the Position at the Time Scale specified (for example, 0.5 is the value at half the current frame time).

**Position Time Offset**
This returns the value of the Position at the Time Offset specified (for example, 10 is 10 frames back).

**Offset Time Scale**
This returns the value of the Offset at the Time Scale specified.

**Offset Time Offset**
This returns the value of the Offset at the Time Offset specified.

---

### Example

This is a simple comp to illustrate one potential use of offsets.

1. Create a new Comp 100 frames long.
2. Create a node tree consisting of a black background and a Text node foreground connected to a Merge.
3. In the Text Layout tab, use the Center X control to animate the text from the left side of the screen to the right.
4. Move to frame 0.
5. In the Text tab in the Inspector, right-click the Size control and select Modify With > Offset Distance from the contextual menu.
   - This adds two onscreen controls: a crosshair for the position and an X control for the offset. These onscreen controls represent the Position and Offset controls displayed in the Modifiers tab.
   - The size of the text is now determined by the distance, or offset, between the two onscreen controls.
6. Drag the X onscreen control in the viewer to see how the distance from the crosshair changes the size of the merge and by association the text.
   - Both the crosshair and the X onscreen controls are animatable and can be connected to other controls.
7. Position the X centered at the bottom of the viewer.
8. In the Inspector, select the Modifiers tab.
9. In the Offset on Text size section, right-click over Position and choose Connect To > PathConnect the position value of the Offset to the existing path by right-clicking the Position control and selecting Connect To > Path1 Position.
10. Play the comp to view the animation.
   - Now, the text shrinks near the center of the path (when the distance between the offset and the path is at its minimum) and grows at its ends (where the distance between the offset and the path is at its maximum).
Path

The Path modifier uses two splines to control the animation of points: an onscreen motion path (spacial) and a Time spline visible in the Spline Editor (temporal). To animate an object’s position control using a Path, right-click the Position control either in the Inspector or in the viewer and select Path from the contextual menu. This adds a keyframe at the current position. You can begin creating a path by moving the playhead and dragging the center position control in the viewer. The Spline Editor shows a displacement spline for editing the temporal value, or “acceleration,” of the path.

Controls

Controls Tab

The Controls tab for the path allows you to scale, reposition, and rotate the path. It also provides the Displacement parameter, allowing you to control the acceleration of an object attached to the path.

Center

The actual center of the path. This can be modified and animated as well to move the entire path around.

Size

The size of the path. Again, this allows for later modification of the animation.

X Y Z Rotation

The path can be rotated in all three dimensions to allow for sophisticated controls.

Displacement

Every motion path has an associated Displacement spline in the Spline Editor. The Displacement spline represents the position of the animated element along its path, represented as a value between 0.0 and 1.0. Displacement splines are used to control the speed or acceleration of an object’s movement along the path.
To slow down, speed up, stop, or even reverse the motion of the control along the path, adjust the values of the points for the path’s displacement in the Spline Editor or in the Inspector.

- A Displacement value of 0.0 in the Spline Editor indicates that the control is at the very beginning of a path.
- A value of 1.0 indicates that the control is positioned at the end of the path.
- Each locked point on the motion path in the viewer has an associated point on the Displacement spline.
- Unlocked points have a control point in the viewer but do not have a corresponding point on the Displacement spline.

**Heading Offset**

Connecting to the Heading adjusts the auto orientation of the object along the path. For instance, if a mask’s angle is connected to the path’s heading, the mask’s angle will adjust to follow the angle of the path.

**Right-Click Here for Shape Animation**

It’s possible to animate the shape of the path as well or to connect it to other path controls like Polyline Masks or Paint Strokes.

**TIP: Switching Default Paths**

You can change the default path type used when animating a position or center control to a path (if this is the preferred type of animation). Open the Preferences window and select the Global Settings. In the Default category, select the Point With menu and choose Path. The next time Animate is selected from a Position or Center control’s contextual menu, a path is used.

**Perturb**

The Perturb modifier generates smoothly varying random values for a given parameter based on Perlin noise. It can be used to add jitter, shake, or wobble to any animatable parameter, even if the parameter is already animated. Its results are similar to those of the Shake modifier, although it uses a different set of controls that may be more intuitive. Unlike other random modifiers, you can apply the Perturb modifier to polylines, shapes, grid meshes, and even color gradients.

For example, to add camera shake to an existing path, right-click the crosshair and choose Insert > Perturb, and then adjust the Strength down to suit. Alternatively, right-clicking the path’s “Right-click here for shape animation” label at the bottom of the Inspector lets you apply perturb to the path’s polyline. This works best if the polyline has many points—for example, if it has been tracked or hand-drawn with the Draw Append pencil tool. A third usage option is to use the Insert contextual menu to insert the modifier onto the Displacement control. This causes the motion along the path to jitter back and forth without actually leaving the path.

**NOTE:** Perturb can only add jitter; it cannot smooth out existing animation curves.
Inspector

Controls Tab
The Controls tab for Perturb is mainly used for controlling the Strength, Wobble, and Speed parameters of the random jitter.

**Value**
The content of this control depends on what type of control the modifier was applied to. If the Perturb modifier was added to a basic Slider control, the Value is a slider. If it was added to a Gradient control, then a Gradient control is displayed here. Use the control to set the default, or center value, for the Perturb modifier to work on.

**Jaggedness**
(Polylines and meshes only) This allows you to increase the amount of variation along the length of the polyline or mesh, rather than over time. Increasing Jaggedness gives a squigglier polyline or more tangled mesh, independent of its movement.
Phase
(Polylines and meshes only) Animating this can be used to move the ripple of a polyline or mesh along itself, from end to end. The effect can be most clearly seen when Speed is set to 0.0.

Random Seed Randomize
The Random Seed is used to “seed” the amount of jitter applied by the modifier. Two Perturb modifiers with identical settings, but different random seeds, produce two completely different results. Click the Randomize button to assign a random seed value.

Strength
Use this control to adjust the strength of the Perturb modifier’s output, or its maximum variation from the primary value specified above.

Wobble
Use the Wobble control to determine how smooth the resulting values are. Less wobble implies a smoother transition between values, while more wobble produces less predictable results.

Speed
Increasing the Speed slider value speeds up the rate at which the value changes. This can increase the apparent wobbliness in a more predictable fashion than the Wobble control and make the jitter more frantic or languorous in nature.

Probe
The Probe modifier is one of the most versatile modifiers in Fusion. It allows you to control any numeric parameter by the color or luminosity of a specific pixel or rectangular region of an image. Think of driving the Brightness node by probing the pixel values of flickering lights in a shot, or measuring graded LUTs to compare values.

It can be applied by right-clicking a parameter and selecting Modify With > Probe.

Inspector

Controls Tab
The Controls tab for the Probe modifier allows you to select the node to probe, define the channel used to drive the parameter, and control the size of the probed area.

Image to Probe
Drag a node from the Node Editor to populate this field and identify the image to probe.
**Channel**
Select the channel you want to probe. The usual options are:
- Red
- Green
- Blue
- Alpha

**Luma**
Once a Probe modifier is present somewhere in your comp, you can connect other node’s values to its outputs as well. The Probe allows you to connect to its values individually:
- Result
- Red
- Green
- Blue
- Alpha

**Position X Y**
The position in the image from where the probe samples the values.

**Probe Rectangle**
By default, the Probe samples only the value of a single pixel at its position. By using the Probe Rectangle mode, you can sample from a larger area of pixels based on the Evaluation method.

**Width Height Controls**
These determine the size of the area to be probed.

**Evaluation**
Sets how the pixels inside the rectangle are computed to generate the output value.
Options include:
- **Average**: All pixel values inside the rectangle are averaged.
- **Minimum**: The smallest value of all pixels inside the rectangle is used.
- **Maximum**: The highest value of all pixels inside the rectangle is used.

**Value Tab**
The Value tab controls the range or scale of the modifier adjustment, thereby adjusting the sensitivity of the Probe.
Scale Input
By default, the Probe generates the Black Value when the probed area results in a value of 0 (i.e., black), and it generates its White Value when the probed area results in a value of 1 (i.e., white). By using this range control, you can modify the sensitivity of the Probe.

Black Value
The value that is generated by the Probe if the probed area delivers the result set in Scale Input Black.

White Value
The value that is generated by the Probe if the probed area delivers the result set in Scale Input White.

Out of Image Value
The value that is generated by the Probe if the probed area is outside the frame boundaries of the probed image. If probing a rectangle, this value does not generate before the entire rectangle is outside the frame boundaries of the image to be probed.

Publish

Only parameters that are animated will be available from the Connect To menu. To connect to non-animated parameters, you must Publish them first. Animated controls are automatically published, whereas static controls must be published manually.

To publish a static control, right-click the control and select Publish from the contextual menu.

Controls Tab
The Controls tab shows the published control available for linking to other controls.

Published Value
The display of the published control is obviously dependent on which control is published from which node.

Resolve Parameter

The Resolve Parameter Modifier is used when creating a transition template in Fusion for use in DaVinci Resolve’s Edit page or Cut page. When building a transition in Fusion, the Resolve Parameter modifier is added to any control you want to animate. The Resolve Parameter modifier automatically animates the parameter for the duration of the transition, allowing you to trim the transition in the Edit page or Cut page.
For example, to create a cross dissolve, do the following:

1. From the Effects Library, add a Fusion Composition to the Edit page Timeline.
2. In Fusion, add a Dissolve node to the Node Editor.
3. In the Inspector, right-click the Background/Foreground parameter, and then choose Resolve Parameter from the Modifier contextual menu. Adding the modifier to the Background/Foreground parameter automatically updates the slider if the transition is modified back on the Edit/Cut page.
4. In the Node Editor, right-click the Dissolve node and choose Macro > Create Macro.
5. When creating a macro that’s to be used as a Fusion transition it’s important that two inputs and one output are selected in the Macro Editor. In this example, under the Dissolve heading, enable the Output, Background and Foreground check boxes.
6. Give the transition a name, then save the macro from the top File menu.
7. Save the macro in the following folder so it appears the Edit page or Cut page Effects Library:
   - For MacOS: $TEMPLATE_MAC_OS_PATH/Transitions or $TEMPLATE_MAC_USER_PATH/Transitions
   - For Windows: $TEMPLATE_WIN_OS_PATH\Transitions or $TEMPLATE_WIN_USER_PATH\Transitions
8. Quit and reopen DaVinci Resolve to update the list of transitions in the Effects Library.
9. On the Edit page, open the Effects Library. Navigate to Video Transitions Fusion Transitions, and the custom Fusion transition will be listed.

**Shake**

The Shake modifier is used to randomize a Position or Value control to create semi-random numeric inputs. The resulting shake can be entirely random. The motion can also be smoothed for a more gentle, organic feel.

To add the Shake modifier to a parameter, select Modify With > Shake from the parameter’s contextual menu. The Shake modifier uses the following controls to achieve its effect. It can be applied by right-clicking a parameter and selecting Modify With > Shake.

**Inspector**

![Shake Inspector](image-url)
Controls Tab

**Random Seed**
The Random Seed control contains the value used to seed the random number generator. Given the same seed, a random number generator always produces the same results. Change the seed if the results from the randomizer are not satisfying.

**Smoothness**
This control is used to smooth the overall randomness of the Shake. The higher the value, the smoother the motion appears. A value of zero generates completely random results, with no smoothing applied.

**Lock X/Y**
This checkbox is used to unlock the X- and Y-axis, revealing independent slider controls for each axis.

**Minimum and Maximum**
This control is used to determine the overall strength of the shake. The low values represent the lowest value that can be generated by the randomizer, and the high values represent the highest values. To create a Shake that moves a center crosshair anywhere within the image, set the Minimum to 0.0 and the Maximum to 1.0. To restrict the motion to a smaller shake in the bottom-right corner of the image, set the Minimum to 0.70 and the Maximum to 0.90.

---

**Example**

1. Create a new comp, and then add and view a Text node.
2. Type some text in the Text node.
3. In the viewer, right-click over the Center control of the text and choose Modify With > Shake Position.
4. In the Inspector, select the Modifiers tab and set the smoothing to 5.0.
5. Set the Minimum to 0.1 and the Maximum to 0.9.
   This adds some chaotic movement to the text. However, we can change this over Go to frame 0 and in the Inspector click the Keyframe button to the right of both the Minimum and the Maximum controls.
6. Go to frame 90 and adjust the Minimum to 0.45 and the Maximum to 0.55.
7. View the results.
   Now, the text starts out by flying all over the screen and tightens in toward the center of the screen as the comp plays.
Track

Although there is a standard Tracker node, you can also use a Tracker modifier to add a tracker directly to a parameter. To apply the Tracker modifier, in the viewer right-click the Center control of any transform, text, mask, or other positionable element. From the contextual menu, choose Object x Center > Modify With > Tracker. Then choose one of three options:

- **Tracker Position**: Tracks a point from the source.
- **Steady Position**: Stabilizes based on a single point in the source.
- **Unsteady Position**: Adds original motion back after stabilizing.

This adds a modifier in the Inspector with a set of controls almost identical to those found in the Tracker node itself.

Inspector

![Inspector](image)

For an in-depth explanation of this node, see chapter Chapter 107, “Tracker Nodes” in the DaVinci Resolve manual or Chapter 56 in the Fusion Studio manual.

**Tracker Modifier vs. Tracker Node**

The differences between a Tracker modifier and a Tracker node are as follows:

- The Tracker modifier can only track a single pattern.
- The Tracker modifier can only output a single value and cannot be used for complex stabilization or match-moving procedures.
- The default source image for the modifier is the node immediately upstream of the node that contains the modifier (i.e., when adding a Tracker modifier to a Glow node with a Loader as its input, the Tracker Source input defaults to the output of the Loader). Set a different source image for the Tracker modifier by typing in the name of the node. Alternatively, drag the source node from the Node Editor into the Text Box control.
Example
Imagine that you need to track an actor’s eyes so that an unearthly, alien glow can be applied to the eyes.

1. Select the Loader node.
2. Add a Glow node.
3. Add an Ellipse mask to the Glow in the shape of one of the eyes.
4. Right-click the center of that mask and select Modify With > Tracker > Position.
   Since the track is on the mask, the tracker takes the glow as the image for tracking. This could cause problems since the eye might be very obscured by the glow. A cleaner source will be the Loader that feeds the glow.
5. Drag the Loader into the modifier Inspector’s Track Source field.
6. Track the actor’s eye.
7. Perform the same steps on the other eye.

Vector Result
The Vector Result modifier is used to offset positional controls, such as crosshairs, by distance and angle. These can be static or animated values.

It can be applied by right-clicking a control and selecting Modify With > Vector.

Inspector

Controls Tab

**Origin**
This control is used to represent the position from which the vector’s distance and angle values originate.

**Distance**
This slider control is used to determine the distance of the vector from the origin.

**Angle**
This thumbwheel control is used to determine the angle of the vector relative to the origin.
Image Aspect
This slider control is used primarily to compensate for image aspect differences. A square image of 500 x 500 would use an Image Aspect value of 1, while a rectangular image of 500 x 1000 would use an Image Aspect value of 2. The default for this value is taken from the current Frame Format preferences using width/height. It may be necessary to modify this control to match the current image.

Example
1. Create a 100-frame comp.
2. Create a simple node tree consisting of a black background and a Text node foreground connected to a Merge.
3. Enter some text in the Text node.
4. Select the Merge node.
5. In the viewer, right-click the Center control of the Merge and choose Modify With > Vector Result.
   This adds a crosshair onscreen control for the Vector distance and angle. The onscreen control represents the Distance and Angle controls displayed in the Modifiers tab.
6. In the Modifiers tab of the Inspector, drag the Distance control to distance the text from the Vector origin.
7. Drag the Angle thumbwheel to rotate the text around the Vector origin.
   This is different from changing a pivot point, since the text itself is not rotating.
   These points are animatable and can be connected to other controls.
8. In the Inspector, right-click the Origin control and choose a path to add a motion path modifier to the Origin control.
9. Verify that the current frame is set to frame 0 (zero) and use the Origin controls in the Inspector or drag the Vector Origin crosshair to the bottom-left corner of the screen.
10. On the Vector Angle thumbwheel, click the Keyframe button to animate this control.
11. Set the Angle thumbwheel to a value of 10.
12. Go to frame 100 and click at the top-left corner of the screen to move the Vector Origin crosshair.
13. Set the Vector Angle thumbwheel to a value of 1000.
14. Play the comp to see the results.
   This causes the text to orbit around the path just created.
XY Path

The XY Path type uses two separate splines for the position along the X-axis and for the position along the Y-axis.

To animate a coordinate control using an XY path, right-click the control and select Modify With > XY Path from the contextual menu.

At first glance, XY paths work like Displacement paths. To describe the path, change frames and position the control where it should be on that frame, and then change frames again and move the control to its new position. Fusion automatically interpolates between the points. The difference is that no keyframes are created on the onscreen path.

Look in the Spline Editor to find the X and Y channel splines. Changes to the control's values are keyframed on these splines. The advantage to the XY path is that it becomes very easy to work with motion along an individual axis.

Inspector

X Y Z Values
These reflect the position of the animated control using X, Y, and Z values.

Center
The actual center of the path. This can be modified and animated as well to move the entire path around.

Size
The size of the path. Again, this allows for later modification of the animation.

Angle
The angle of the path. Again, this allows for later modification of the animation.

Heading Offset
If another control (for example, a mask’s Angle) is connected to the path’s heading, this control allows for adding or subtracting from the calculated angle.

Plot Path in View
Toggles whether or not the actual path is displayed in the views.

Switching Default Paths
You can change the Default Path type to XY path (if this is the preferred type of animation). Open the Default category in the Global Preferences and locate the Point With drop-down menu. Change this from the current value to XY Path. The next time Animate is selected from a Coordinate control’s contextual menu, an XY path is used instead of a Displacement path.
PART 9
Color
Chapter 112

Introduction to Color Grading

For over thirty years, DaVinci has pioneered the development of color correction hardware and software designed to enhance visual images acquired from film and video. This release of DaVinci Resolve possesses our newest and most evolved professional color correction tools yet. However, for all its technological sophistication, DaVinci Resolve is merely a tool that requires the hands of a skilled artist to realize its full potential.

Subsequent chapters of this user manual cover the DaVinci Resolve grading tools in the Color page in great detail, but before getting into the specifics of color balancing and contrast adjustment, Power Windows, and Custom Curves, it’s important to step back and consider what these tools are for, and why you’re learning to use this application in the first place.

This introduction is for those of you who are new to this process we call color correction, or color grading. If you’re a veteran colorist then you might want to skip ahead, but if you’re just starting out, the following sections are intended to describe the many goals of color correction, and how the DaVinci Resolve toolset has been designed to address them; making it fast and efficient to alter images in innumerable ways as we elevate raw footage to cinematic art.
# Contents

- The Goals of Color Correction 2545
- Maximizing the Look of Your Media 2545
- Emphasizing What’s Important 2548
- Audience Expectations 2550
- Balancing Scenes 2551
- Adding Style 2553
- Quality Control 2556
- Never Stop Experimenting 2557
The Goals of Color Correction

If reality is a fire hose of visual information, then digital cinema and broadcast would be represented by a garden hose. Color correction, therefore, could be considered the process of choosing which parts of the fire hose of raw image data to fit into the garden hose of our displays in order to create a pleasing image for the viewer.

Maximizing the Look of Your Media

Clearly, the most fundamental aspect of the color correction process is that of making every clip look its best. While the job of the cinematographer is to light and expose the image with an artistic intent, your job is to realize this intent by making adjustments to the color and contrast of the image, so that the final result is as close to what the director and cinematographer had in mind as is humanly possible. In the process, you have the opportunity to overcome inconsistencies with exposure and white balance that were, for various reasons, unavoidable. Furthermore, you can make subtle adjustments to add warmth or contrast that was not available during the shoot, but that the cinematographer would have liked.

Increasingly, color correction is seen as a critical stage in the post-production process. For example, the newer generation of digital cinema cameras are capable of shooting raw colorspace image data, or RGB image data with a log exposure, in order to preserve the maximum amount of image data for manipulation during the color correction process. However, when you acquire image data this way, it must be transformed into a viewable image via color correction in the same way that film negative must first be developed and printed to positive film.

Of course, there are also situations in which you may find it necessary to attempt to fix source media with far more substantial problems in color and exposure. In these cases, the tools exist to make far more involved adjustments to the image; however, the quality of your results will depend heavily on the data quality and "latitude" of your source media.
For example, Blackmagic URSA, ARRI ALEXA, and RED DRAGON cameras record quite a bit of image data, making extreme corrections far more possible than more heavily compressed camera formats such as the Canon 5D. However, in either case, DaVinci Resolve provides the tools to process images in many different ways to adjust the image for a better look.

Underexposed source

Balanced and gain corrected

Whether clips need changes large or small, the primary DaVinci Resolve toolset adjusts the characteristics of hue, saturation, and contrast in a variety of ways. In the Color Wheels palette, Color balance wheels let you adjust all three color channels at once, altering the color temperature of the scene at specific ranges of tonal detail referred to as lift, gamma, and gain. Alternately, the slider-based Primaries Bars mode lets you make the same kinds of controls via independently adjustable red, green, and blue lift, gamma, and gain controls.
All of these controls let you adjust the color tone of the shadows, midtones, and highlights independently from each other.

![Cool look](image1)

Meanwhile, the Master Lift, Gamma, and Gain wheels work together to let you alter image contrast in different ways: deepening shadows, lightening highlights, and brightening or darkening the midtones in between to create whatever image tonality you prefer for a given scene.

![High contrast](image2)

Source footage courtesy of Gianluca Bertone DP, www.bertonevisuals.com
Separate saturation controls let you increase or decrease color intensity throughout the scene, while the Lum vs. Sat and Sat vs. Sat curves give you the ability to fine-tune saturation very specifically.

For more information on these controls, which are essential to the color correction process, see Chapter 117, “Primary Grading Controls.”

**Emphasizing What’s Important**

Another important aspect of the color correction process is the ability to make adjustments to emphasize or de-emphasize specific elements within the frame. It’s similar in concept to equalization in audio mixing, in that you’re choosing which color values to boost or suppress using a variety of techniques.

This can be done to direct the viewer’s gaze, for example by surrounding a specific part of the image with a Power Window, which lets you restrict specific adjustments made to the inside and outside of the Window’s shape.
Specific alterations can also be made to prevent audience distraction. For example, a low-saturation monochromatic tint may be a pleasing look overall, but in the soft wash of color, the viewer might lose track of the watch that’s preoccupying the protagonist. Using tools such as the Hue curves and HSL Qualifier, you can quickly and easily tune the color of the woman’s hands and of the watch to guide the viewer’s eye, and bring some needed depth to the scene.

For more information on Power Windows, see Chapter 120, ”Secondary Windows and Tracking.” For more information on Hue curves, see Chapter 118, ”Curves.”
Audience Expectations

There is another family of tools, the HSL, RGB, and Luma Qualifiers, that provide even more specific control, and they’re useful for adjusting ranges of color to either play into or against the audience expectations for color in a scene. Substantial research into what has been termed “memory color” shows that people have finely tuned expectations for the hues of particular subjects, such as flesh tone, foliage greens, and sky blues. Deviation from these expectations can create a sense of something being not quite right, which can be either detrimental or beneficial, depending on your goals for a particular scene.

HSL Qualification is effectively a chroma keyer that lets you sample the image to create a key that’s used to define where to apply a specific correction. For example, if you’re happy with the rest of the image, but the skin tone of the actor has an unhealthy green tinge to it as a result, you can isolate the color of that actor’s skin and adjust it to a healthier hue.

Source Image

HSL qualification on the skin

Skin now has warmer grade

Another common example is the adjustment of skies. If you’re aiming for a gorgeous summer day, a washed out sky in the source media can be a bit of a bummer. However, using qualification it’s easy to isolate that wedge of blue, then push and pull it into just the right amount of summertime joy.
Balancing Scenes

It’s rare when the uncorrected shots of a scene match one another perfectly. Even the most carefully exposed angles of coverage can have small variances that need to be evened out. On the other end of the spectrum, run-and-gun programs using available light often result in edited scenes with huge changes in lighting and color as each shot cuts away to the next.

Small or large, unintended variations from one shot to the next can call undue attention to the editing, and jar the audience’s attention in ways that throw them out of the program. Evening out these differences and balancing the clips in each scene to match is another of the fundamental tasks of the colorist. You know you’re finished when the color in the scene flows unnoticeably from one clip to the next.

DaVinci Resolve has a variety of tools that you can use to help you compare images with one another, the most important of which is the Gallery, in which you can save still images of clips that you can then compare to other clips using an adjustable split screen.

For more information on using qualifiers, see Chapter 119, "Secondary Qualifiers."
Timeline thumbnail view of unbalanced clips

Thumbnail view of balanced clips

By using the Gallery to play stills, either split or whole (flipping back and forth between the clip you’re adjusting and the still), it becomes easier to use the extensive DaVinci Resolve toolset to match the color and exposure of every clip in a scene.

Split screen of two shots

Left image corrected to match right

An additional set of features let you manage grades by copying them from clip to clip, or by linking similar clips, either automatically, or manually using groups.

Link icon indicates clips are grouped for grading

For more information on using the Still Store, see Chapter 113, “Using the Color Page.” For more information on grade management, see Chapter 123, “Grade Management.”
Adding Style

Of course, it’s not all about subtlety and correction. It’s often appropriate, when grading music videos and commercials, for instance, to add some radical style to a piece. Here, too, DaVinci Resolve provides an abundance of features for manipulating unexpected aspects of the image; for example, by abusing the Custom Curves to create the illusion of chemical cross-processing.

DaVinci Resolve’s node-based image processing makes it possible to use more exotic node structures to create effects using composite modes, such as a colored glow generated by adding two differently graded versions of the same image together using a Layer node.
You can also create complex node trees to build specific mattes, to use for isolating specific elements of the image. For example, if you wanted to isolate an actor in color against a background turned monochromatic, you can create multiple keys (pulled via HSL Qualification) and combine them using a Key Mixer node to build that effect.
Node tree to isolate the man’s face and clothes

Original image

The final effect, desaturating everything except for the man

Finally, DaVinci Resolve doesn’t just have tools governing color and contrast. A Blur palette provides controls over blurring, sharpening, or adding mist to all or part of the image. When combined with the other tools that are available for isolation and color adjustment, these are powerful additions to your creative arsenal.

Defocus effect created in real time

For more information on all of these features, see Chapters 106 through 124 of this manual.
Quality Control

Lastly, it’s important to keep in mind that, for all the creative possibilities that DaVinci Resolve affords, it’s still important that the final deliverables that you give to your client has appropriate signal levels relative to their requirements. In particular, programs destined for broadcast have specific outer boundaries of luma and chroma that you must not exceed, or you’ll risk having a show rejected for QC (quality control) violations.

However, even if you’re not delivering a show for broadcast, it’s important to be aware of the mathematical limitations of a digital video signal to make sure you’re not clipping or crushing image detail through overzealous adjustments that you may, in fact, want to preserve.

For example, if you take a look at the next two images, you can see the perils of overzealous adjustments when compared to a clip that, while graded creatively, has been adjusted with respect to the mathematical boundaries of image data.

![Image graded to preserve detail in highlights](image1.png)

![Image graded with highlight detail blown out](image2.png)

Here, too, DaVinci Resolve provides tools designed to help you exercise control over the fine-tuning of the image. A Video Scopes window provides the standard Waveform, Parade, Vectorscope, and Histograms that are used to analyze your image data. These scopes let you see the boundaries of what’s possible, and make it easy to spot subtle problems, and compare the characteristics of one image to another.
When the time comes that you want to start clipping data in the highlights and shadows, as part of a creative look, the Soft Clip controls let you introduce a subtle or large roll-off, compressing the extremes of the signal so that what clipping you do is softer and more pleasing.

For more information about the video scopes and the Soft Clip controls, see Chapter 113, “Using the Color Page,” and Chapter 118, “Curves.”

Never Stop Experimenting

So now that you’ve gotten an extremely brief overview of the grading process as seen through the toolset of DaVinci Resolve, we invite you to use this manual to explore DaVinci Resolve more thoroughly. You may discover that, the more you work with the different features that are available, the more unexpected uses you’ll find for different controls that you thought you knew well.

Have fun.
Given the origin of DaVinci Resolve as a professional grading application, the Color page is at the heart of the DaVinci Resolve experience. Within the Color page are all of the controls available for manipulating color and contrast, reducing noise, creating limited secondary color corrections, building image effects of different kinds, adjusting clip geometry, and making many other corrective and stylistic adjustments.

In this chapter, you’ll learn how to understand the Color page interface, how to customize it, and how to work within it to play through and navigate your project’s timeline. You’ll also learn how to analyze and compare clips in preparation for grading using stills, playheads, and DaVinci Resolve’s own internal video scopes.

The Color Page Interface

The Color page is divided into seven main areas that work together to let you build a grade. This section provides an overview of what these areas are and how they function.

The default layout of the Color page

The Interface Toolbar

At the very top of the Color page is a toolbar with buttons that let you show and hide different parts of the user interface. These buttons are as follows, from left to right:

The Interface toolbar

- **Gallery**: Opens and closes the Gallery panel.
- **LUTs**: Opens and closes the LUT Browser.
- **Media Pool**: Opens and closes the Media Pool.
- **Timeline**: Opens and closes the Mini-Timeline.
- **Clips**: Opens and closes the Thumbnail timeline. To the right is a drop-down menu that lets you choose a timeline filtering option for the Thumbnail timeline.
- **Nodes**: Opens and closes the Node Editor
- **OpenFX**: Opens and closes the OpenFX panel.
- **Lightbox**: Opens and closes the Lightbox.

Showing Which Panel Has Focus

Whenever you click somewhere on the DaVinci Resolve interface using the pointer, or use a keyboard shortcut to “select” a particular panel (such as in the Edit page), you give that panel of the user interface “focus.” A panel with focus will capture specific keyboard shortcuts to do something within that panel, as opposed to doing something elsewhere in the interface.
A highlight appears at the top edge to show you which panel has focus so that you can keep track of which part of the current page is taking precedence, and you can switch focus as necessary to do what you need to do. You can turn the Focus Indicator on and off in Preferences > User > UI Settings > Show focus indicators in the user interface.

**Viewer**

The Viewer shows the frame at the current position of the playhead in the Timeline. At the top of the Viewer is a header that displays the Project and Timeline names, as well as a Viewer Timecode display that shows the source timecode of each clip by default. The Timeline name is also a drop-down display that lets you switch to any other timeline in the project. A scrubber bar underneath the image lets you drag the playhead across the entire duration of the clip, while transport controls underneath that let you control playback. A toolbar at the top provides controls governing Image Wipes, Split-Screen controls, and Highlight display. Additional controls let you loop playback, switch Unmix mode on and off, turn audio playback on and off, and choose which onscreen controls are currently displayed. More information about using the Viewer appears later in this chapter.

You can also put the Viewer into one of three alternate modes to be able to see a larger image as you work. All three of these modes are available from the Workspace > Viewer Mode submenu.
• **Enhanced Viewer** (Option-F to toggle this on and off) hides everything to the left and right of the Viewer, giving you a large working area for tasks such as window positioning and rotoscoping, while keeping the palettes and their controls visible as you work.

![The Color page in Enhanced Viewer mode](image)

• **Full Screen Viewer** (Shift-F to toggle this on and off) is available to provide more working area for tasks such as window positioning and rotoscoping. Full Screen Viewer also lets you display the OpenFX panel at full height, and you can turn the Node Editor on and off to access different effects controls while you work.

![The Color page in Full Screen Viewer mode](image)

• **Cinema Viewer** (P to toggle this on and off) expands the Viewer to fill your workstation’s entire monitor. This is useful if you want to play the current Timeline without any distractions. When you move the pointer over the image, transport controls and a jog bar appear to let you control playback. For DITs, a contextual menu is available by right-clicking anywhere on the image with which you can turn on and customize a video scope overlay (which can be dragged to different locations on the Viewer).
Gallery

The Gallery is used for storing still frames to use as reference, and grades you might like to copy; stills and grades are stored together. A button lets you open up the Album browser, used for organizing your stills. At the bottom of the Gallery, Memories let you store grade information that you can apply using a control panel or keyboard shortcuts. The Gallery on the Color page mirrors the contents of the Gallery page. For more information on the Gallery page, see Chapter 122, “Using the Gallery.”
LUT Browser

The LUT Browser provides a centralized area for browsing and previewing all of the LUTs installed on your workstation. All LUTs appear in the sidebar, by category.

By default, all LUTs appear with a test thumbnail that give a preview of that LUT’s effect, but you can also get a live preview of how the current clip looks with that LUT by hover scrubbing with the pointer over a particular LUT’s thumbnail (this is described in more detail below).

To open the LUT Browser:

Click the LUT Browser button in the UI Toolbar at the top of the Color page.

Methods of working with the LUT Browser:

- **To see the LUTs in any category:** Click on a LUT category to select it in the sidebar, and its LUTs will appear in the browser area.
- **To make a LUT a favorite:** Hover the mouse over a LUT and click the star badge that appears at the upper right-hand corner, or right-click any LUT and choose Add to Favorites. That LUT will then appear when you select the Favorites category.
- **To search or filter for specific LUTs:** Open a bin that has the LUT you’re looking for, then click the magnifying glass icon to open the search field, and type text that will identify the LUTs you’re looking for.
- **To see LUTs in Column or Thumbnail view:** Click the Column or Thumbnail buttons at the top right of the LUT Browser to choose how to view LUTs in the browser area.
- **To sort LUTs in Thumbnail view:** Click the Thumbnail Sort drop-down menu and choose which criteria you want to sort LUTs by. The options are Filename, Type, Relative Path, File Path, Usage, Date Modified. There are also options for ascending and descending sort modes.
- **To sort LUTs in Column view:** Click the column header to sort by that column. Click a header repeatedly to toggle between ascending and descending modes.
- **To update the thumbnail of a LUT with an image from a clip:** Choose a clip and frame that you want to use as the new thumbnail for a particular LUT, then right-click that LUT and choose Update Thumbnail With Timeline Frame.
• **To reset the thumbnail of a LUT to use the standard thumbnail:** Right-click a LUT and choose Reset Thumbnail to go back to using the standard test image.

• **To refresh a LUT category with new LUTs that may have been installed:** Select a LUT category, then right-click anywhere within the browser area and choose Refresh to refresh the contents of that category from disk.

**Methods of adding LUTs to a grade from the LUT Browser:**

• **To apply a LUT to the current node:** Select a clip in the Thumbnail timeline, then right-click a LUT and choose Apply LUT to Current Node from the contextual menu.

• **To apply a LUT to a specific node:** Drag a LUT from the LUT Browser and drop it onto the node you want to apply a LUT to. If you drag a LUT onto a node that already has a LUT, the previous LUT will be overwritten by the new one.

**Media Pool**

The Media Pool is available in the Color page, making it easy to drag and drop clips you want to use as external mattes right into the Node Editor, for easy and fast connection to create various Color page effects. When opened, the Media Pool replaces the Gallery, fitting into the same area. In most respects, the Media Pool in the Color page works the same as the Media Pool on nearly every other page of DaVinci Resolve.

When you drag a clip from the Color page Media Pool to the Node Editor, two things happen:

• That clip is turned into an external matte in the current grade, which you can use as a matte for secondary adjustments, or as a compositing layer (in conjunction with the Layer mixer) for mixing textures or images with your grade.

• That clip is also automatically attached to the Media Pool clip that corresponds to the clip you’re grading as a clip matte, to help you keep track of which clips are using other clips as mattes.

For more information about the Media Pool, see Chapter 11, “Adding and Organizing Media with the Media Pool.”
**Node Editor**

The Node Editor is where you assemble one or more individual corrections (nodes) together into a complete multi-correction grade (node tree). This is a powerful way of assembling grades, since different types of nodes let you create different combinations of corrections and very specific adjustments by reordering operations, combining keys, or changing the layer order of different adjustments. For more information about the Node Editor, see the “Node Editor Basics” section of Chapter 124, “Node Editing Basics.”

![Node Editor to construct your grade processing signal flow](image)

**Timeline**

The Timeline provides several ways of navigating the clips in your project, as well as keeping track of what has been done to which clips. The Timeline is divided into two parts, each of which shows different information and provides differing controls, and each of which can be opened or closed separately via the Clips and Timeline buttons on the Interface toolbar.

![The Thumbnail timeline with a Mini-Timeline below](image)

**Thumbnail Timeline**

At the top is the Thumbnail timeline, in which each clip is represented by a single frame. The Thumbnail timeline (or its alter-ego, the Lightbox) provides the easiest way of selecting which clip you want to work on and of making clip selections for various grade management operations. The currently selected clip that reveals its controls in the various palettes of the Color page is highlighted in orange.
Much valuable information appears above and below each thumbnail, such as each clip’s clip number, source timecode, track number, whether it’s been flagged, whether it’s automatically linked or part of a group, whether it’s been tracked, and so on.

What’s displayed underneath each thumbnail can be changed by double-clicking the space underneath each thumbnail. There are several options; you can keep double-clicking to cycle among them:

- Clip format or codec (the default)
- Clip Name (clip name or file name, depending on what View > Show File Name is set to) or Multicam Angle (if you’re working with multicam clips)
- Version name or number

Mini-Timeline
Underneath, the Mini-Timeline shows a small representation of the video tracks of the Timeline in the Edit page wherein each clip is as long as its actual duration. This provides the best representation of the structure of the current timeline, in which clip length shows duration and multiple tracks are displayed, so you can see which clips are superimposed. A Timeline Ruler lets you scrub the playhead across multiple clips and can be zoomed out enough to show every clip in your entire program.

Small track labels at the left of each track in the Mini-Timeline let you enable or disable tracks by clicking them (enabled tracks have white labels, disabled tracks have gray labels). Option-clicking one of these controls sets that track to be enabled but ignored by the playhead when you use the Next and Previous Clip commands, in the event you want to ignore clips you don’t need to grade (tracks in this mode show a red label).

Within the Mini-Timeline the currently selected clip is highlighted in orange, and you can click any clip to select it. A scroll bar at the bottom lets you navigate to the left and right, while using the scroll wheel of your mouse zooms in and out. The Mini-Timeline shows at most six tracks of video. If your project has more tracks than that, you can scroll up and down to reveal the hidden tracks. Any markers that were placed on clips or the Timeline in the Edit page appear here, and you can click any marker to reveal and edit its color and notes.
As seen above, a colored outline appears around the clip number of shots that have been graded, and this outline is doubled if there are additional versions applied to that clip.

For more detailed information about the Color page Timeline, see Chapter 115, “Color Page Timeline and Lightbox.”

**Palette Area**

Most everyday tools and functions for grading are distributed among a series of palettes found in the palette area of the Color page. These palettes can be accessed via a series of palette buttons running along the Palette bar at the top of this area.

![All palettes seen in the Palette bar](image)

These buttons also give you feedback about which palettes have adjustments for the current selected node in the Node Editor. Palettes with adjustments show a small orange dot in the corresponding palette button.

![An orange dot in a palette button lets you know there are adjustments in that palette](image)

**Left Palettes**

A series of palettes at the bottom left of the Color page provide access to different sets of grading tools, used principally for manipulating color, contrast, and raw media format settings. Each individual palette is opened by clicking the corresponding icon at the top of the Palette panel.

![Left palette selection buttons](image)

The five available palettes are the Camera Raw palette (for making metadata adjustments to raw media formats), the Color Match palette (automatic grading based using test charts), the Color Wheels (graphical color balance controls and master wheels, along with a Slider mode for adjusting YRGB Lift/Gamma/Gain), the RGB Mixer (for mixing color channels into one another), and the Motion Effects palette (with controls for noise reduction and artificial motion blur). These palettes can be used individually or together depending on what you’re trying to accomplish. For more information on most of these palettes, see Chapter 117, “Primary Grading Controls.” For more information on the Motion Effects palette, see Chapter 134, “The Motion Effects and Blur Palettes.”
Center Palettes
At 1920x1080 resolution or higher, a second set of palettes is organized at the bottom center of the Color page. These palettes span a wide range of functionality, and the adjustments you make with them can be combined with those made using the Color palettes.

NOTE: At lower resolutions, the Left and Center palettes are merged to fit the DaVinci Resolve interface into a smaller area.

The eight available Center palettes include the Curves palette, the Qualifiers palette, the Power Windows palette, the Tracker palette, the Blur palette, the Key palette, and the Sizing and Stereoscopic 3D palettes.

Keyframe Editor, Video Scopes, and Information
The bottom right of the Color page can be switched between one of three things:

• **Keyframe Editor**: Provides an interface for animating Color, Sizing, and Stereo Format adjustments over time. Each node in the Node Editor corresponds to a track in the Keyframe Editor, which lets you animate each node’s adjustments independently. Furthermore, each node’s track can be opened up to reveal parameter groups, so that you can animate subsets of an individual node’s functions independently of other functions within the same node. For more information about keyframing, see Chapter 128, “Keyframing in the Color Page.”

• **Video scopes**: Provides a docked area where you can expose one video scope at a time for reference while you work. You can also “undock” the video scopes into a stand-alone window, in which you can show four different scopes at a time. More information about using the video scopes appears later in this chapter.

• **Information**: Provides a way of seeing clip and system information while you work.

Dual Monitor Layout
The Color page has a dual monitor layout that provides maximum space for the Viewer, Node Editor, and Control palettes on the primary monitor, and a simultaneously displayed Gallery, Lightbox, Keyframe Editor, Metadata Editor, and Video Scope panel on the secondary monitor.
To enter dual screen mode:
Choose Workspace > Dual Screen > On.

The Color page in dual screen mode

To switch which UI elements appear on which monitors:
Choose Workspace > Primary Display > (Monitor Name), which reverses the contents of both monitors in dual screen mode.
The Info Palette and Clip Information

The Info palette is hidden by default. Clicking the Info palette button at the far right of the toolbar reveals it at the right of the Center palette. The Info palette has two tabs that display different information. There are no user-editable controls in the Info palette.

Clip Info

The first tab displays information about whichever clip is currently selected in the Timeline. This information is not editable, but is provided for reference, and includes:

- **File Name:** The name of the media file on disk. If the current clip is a Multicam clip, this shows the name of the currently selected angle.
- **Reel Name:** The reel name of that clip, if one is being read properly.
- **Start T/C:** The source timecode value of the first frame in the clip.
- **End T/C:** The source timecode value of the last frame in the clip.
- **Duration:** The duration of the clip, in timecode.
- **Frames:** The duration of the clip, in frames.
- **Version:** The name of the remote or local version used by that clip.
- **Frame Rate:** The frame rate used by that clip.
- **Source Res:** The native resolution of the source clip.
- **Codec:** The codec or format used by the source clip.
System Info
The second tab displays information about operational modes currently in use by DaVinci Resolve. It’s meant to provide the status of different DaVinci Resolve features that can be enabled, disabled, or cycled among various options. This information includes:

- **Clips**: The total number of clips in the Timeline.
- **Proxy**: The status of Proxy mode (On or Off).
- **Clip Cache**: The status of the Clip Cache mode (Off, All, Dissolves, User, User & D).
- **Ref Transform**: The status of Reference Still reposition.
- **Ref Mode**: The status of the Reference mode (Gallery, Timeline, Offline).
- **Wipe Style**: The currently selected Wipe Style for split screens (Wipe-H, Wipe-V, Wipe-M, Wipe-A).
- **Convergence**: The current Convergence setting (Linked Zoom, Opposite)
- **Stereo Grade**: The currently displayed Eye and Gang mode (Left or Right - Gang or Solo).
- **Stereo Display**: The current Stereo Display mode (Mono or Stereo).

Clip Details
You can right-click the currently selected clip in the Thumbnail Timeline and choose View Clip Details to show a small window with all of that clip’s information available at a glance. You can drag this window anywhere you like, even to another display.

![The Clip Details window](image)

This information is not editable, but is provided for easy reference, and includes:

- **File Name**: The name of the media file on disk appears at top.
- **Start Timecode**: The source timecode value of the first frame in the clip.
- **End Timecode**: The source timecode value of the last frame in the clip.
- **Duration**: The duration of the clip, in timecode.
- **Frames**: The duration of the clip, in frames.
- **Reel Name**: The reel name of that clip, if one is being read properly.
- **Version**: The name of the remote or local version used by that clip.
- **Format**: The format used by the source clip, along with the frame size and bit depth.
- **Codec**: The codec used by the source clip.
Customizing the Color Page

The various sections of the Color page can be resized, hidden, and rearranged as needed to accommodate different working styles. This section covers all of the methods that are available for Color page customization.

You can easily resize the Viewer, Gallery, and Nodes Editor relative to one another to make the Viewer larger, expand the width of the Node Editor to have more workspace, or to create more or less room for stills in the Gallery.

**To resize the Viewer, Gallery, and Node Editor:**
Move the pointer over the vertical divider between any two areas. When the resize icon appears, drag the divider to the left or right to make one area larger while making the other smaller.

You can also fully expand the Gallery, the Memories, the Node Editor, and the Keyframe Editor to replace completely whichever interface area is adjacent.

**To expand the Keyframe Editor, Viewer, and Gallery:**
Click the Expand control at the upper right of whichever interface area you want to expand. Once expanded, clicking the Expand control again will collapse that interface area back to its original size, revealing whatever was hidden.

In Display mode, you can completely hide the Viewer, pushing the Gallery all the way to the right side of the DaVinci Resolve window, and expanding the Node Editor to take the rest of the space.

**To toggle Display mode, do one of the following:**
- Right-click in the empty area of the Node Editor, and choose Toggle Display Mode from the contextual menu. Do this again to toggle Display Mode off and return the interface to the way it was.
- Press SHIFT UP and DISPLAY/CURSOR, above the fourth trackball of the Center panel of the DaVinci control panel.

**To show and hide the Mini-Timeline:**
Click the Timeline button at the right of the palette button bar.

**To show and hide the Color page Viewer upper toolbar:**
Click the Viewer option menu and choose Show Viewer Options to uncheck it.

**To return all pages to their default layout:**
Choose Workspace > Reset UI Layout.
Undo and Redo in DaVinci Resolve

No matter where you are in DaVinci Resolve, Undo and Redo commands let you back out of steps you’ve taken or commands you’ve executed, and reapply them if you change your mind. DaVinci Resolve is capable of undoing the entire history of things you’ve done since creating or opening a particular project. When you close a project, its entire undo history is purged. The next time you begin work on a project, its undo history starts anew.

Because DaVinci Resolve integrates so much functionality in one application, there are three separate sets of undo “stacks” to help you manage your work.

• The Media, Cut, Edit, and Fairlight pages share the same multiple-undo stack, which lets you backtrack out of changes made in the Media Pool, the Timeline, the Metadata Editor, and the Viewers.

• Each clip in the Fusion page has its own undo stack so that you can undo changes you make to the composition of each clip, independently.

• Each clip in the Color page has its own undo stack so that you can undo changes you make to grades in each clip, independently.

In all cases, there is no practical limit to the number of steps that are undoable (although there may be a limit to what you can remember). To take advantage of this, there are three ways you can undo work to go to a previous state of your project, no matter what page you’re in.

To simply undo or redo changes you’ve made one at a time:

• Choose Edit > Undo (Command-Z) to undo the previous change.

• Choose Edit > Redo (Shift-Command-Z) to redo to the next change.

• On the DaVinci control panel, press the UNDO and REDO buttons on the T-bar panel.

**TIP:** If you have the DaVinci control panel, there is one other control that lets you control the undo stack more directly when using the trackballs, rings, and pots. Pressing RESTORE POINT manually adds a memory of the current state of the grade to the undo stack. Since discrete undo states are difficult to predict when you’re making ongoing adjustments with the trackball and ring controls, pressing RESTORE POINT lets you set predictable states of the grade that you can fall back on.

You can also undo several steps at a time using the History submenu and window. At the time of this writing, this only works for multiple undo steps in the Media, Cut, Edit, and Fairlight pages.

To undo and redo using the History submenu:

1. Open the Edit > History submenu, which shows (up to) the last twenty things you’ve done.

2. Choose an item on the list to undo back to that point. The most recent thing you’ve done appears at the top of this list, and the change you’ve just made appears with a check next to it. Steps that have been undone but that can still be redone remain in this menu, so you can see what’s possible. However, if you’ve undone several changes at once and then you make a new change, you cannot undo any more and those steps disappear from the menu.
Once you've selected a step to undo to, the menu closes and the project updates to show you its current state.

**To undo and redo using the Undo window:**

1. Choose Edit > History > Open History Window.

2. When the History dialog appears, click an item on the list to undo back to that point. Unlike the menu, in this window the most recent thing you've done appears at the bottom of this list. Selecting a change here grays out changes that can still be redone, as the project updates to show you its current state.

3. When you're done, close the History window.
Viewers let you see what you’re working on, provide a UI for transport controls and image comparison, draw windows and drag on-screen controls, and provide a variety of warnings and information not found anywhere else. However, at the same time, professional workflows require real time monitoring via supported video I/O devices on a calibrated display. Lastly, video scopes provide a more precise analysis of the state of the video signal you’re viewing, and DaVinci Resolve has built-in scopes you can use for creative decision making and troubleshooting.

This chapter covers the Color page Viewer, external monitoring and display calibration, and video scopes in more detail.

Using the Viewer

The Viewer is your window into the Timeline. The clip and frame at the current position of the playhead appears in the Viewer. The Viewer also provides a workspace for picking colors, adjusting Windows, using split screen stills for reference, and many other display-oriented tasks. If you have a video out interface connected to a broadcast display or projector, then the contents of the Viewer are typically mirrored by the video output.

The Viewer Title Bar

The Viewer title bar has controls and indicators making it easy to control and keep track of what it is you’re looking at.

The Viewer title bar has the following controls:

- **Zoom and Fit menu**: Lets you zoom to a specific percentage, or choose Fit to fit the image to the total available area of the Viewer.
- **Playback frame rate indicator**: A dot shows green if playback performance matches the frame rate of the project, or red if playback performance drops below real time. To the right, the current frame rate is displayed.
- **Timeline name and selection drop-down**: The name of the currently open timeline is displayed. A drop-down to the right lets you open any other timeline in the current project to take its place.
- **Timecode viewer and drop-down**: A second timecode viewer lets you choose an alternate timecode/frame count/KeyKode value to display simultaneously to the timecode viewer next to the transport controls below. A drop-down lets you pick whether to display source (clip) or record (timeline) timecode.
- **Bypass Color and Fusion and drop-down**: Lets you disable grades and/or Fusion effects.
- **Expand Viewer drop-down**: Expands the Viewer to take up the full area of your workstation’s display above the palettes.
- **Option menu**: Has options that affect the Viewer’s functionality. Commands include: Gang timeline wipe with current clip, Gang viewer zoom with video output, Show clip flags on video output, Show Viewer Options, Show Marker Overlays, and the Marker list for navigating among all timeline markers in the currently open timeline.
Turning Grades and/or Fusion Effects Off

The Bypass Color Grades and Fusion Effects button/drop-down commands in the Viewer’s title bar are also available via View > Bypass Color and Fusion menu commands. Turning off Fusion effects in the Color page is an easy way to improve playback performance on low power systems when you just need to make a quick set of grading adjustments. Toggling grades off and on is also a convenient way to quickly get a before-and-after look at a shot where the “before” goes all the way back to the source.

If you choose Toggle Bypass or click the Viewer control, you’ll turn off whatever is checked in the optional menu, which lets you choose whether or not you want to bypass both Color and Fusion, or just one or the other.

TIP: If you’re giving your client a before and after look at work you’re doing on a grade, a more effective technique is to select the specific nodes (one or more) that you want to toggle on and off, and press Command-D (Enable/Disable Selected Nodes.)

Viewing Isolated Channels

Use the View > Viewer Channels submenu to switch the Color page Viewer among RGB, R, G, or B channels. This can be useful when evaluating a single channel of an image for noise or other artifacts, or for doing color matching by comparing and adjusting the individual red, green, and blue channels of two different clips.
The Viewer Toolbar

The Color page also exposes a toolbar at the top of the image (underneath the title bar) that makes it easy to enable and disable image wipe, split screen, and highlight viewing by clicking one of these three buttons, which then expose additional controls relating to each of these modes of operation (described elsewhere in this chapter). This toolbar can be shown or hidden by clicking the Viewer option menu and unchecking Show Viewer Options.

![The Color page Viewer toolbar showing the Wipe, Split Screen, and Highlight controls](image)

In the process, these buttons provide an easy reference for when a comparison mode is enabled. In each of these Viewer modes, the appropriate controls for customizing that view appear to the right of the Viewer toolbar.

The Onscreen Control (OSC) Menu

The Onscreen Control drop-down menu lets you choose which onscreen controls you want to display and adjust in the Viewer. Some palettes automatically enable corresponding onscreen controls when you open them. For example, opening the Window palette displays the Power Window onscreen controls, and opening the Qualifier palette displays the Qualifier onscreen controls.

![OnScreenControlMenu](image)

The onscreen control menu for the Viewer

There are a variety of choices, each corresponding to different adjustments you can make:

- **Off**: All onscreen controls are hidden from view, giving you an unimpeded display of the image in the Viewer.
- **Qualifier**: Turns on the Color Sample cursor, which lets you choose a color using the fourth trackball of the DaVinci control panel. For more about using Color Sample controls, see Chapter 119, “Secondary Qualifiers.”
- **Power Window**: Turns the Power Windows onscreen control on and off. For more about adjusting windows in the Viewer, see “Power Windows” in Chapter 120, “Secondary Windows and Tracking.”
Image Wipe: Toggles mouse control of dragging the split screen directly on the Viewer on and off. For more about working with split screens, see “Comparing Clips in the Viewer” later in this chapter.

Dust Removal: Activates the interactive Dirt and Dust tool. For more information, see Chapter 135, “Dust Removal.”

OpenFX: Shows and hides whatever onscreen controls are exposed by an OpenFX plug-in in the currently selected node.

Color Chart: Shows and hides the color chart overlay that lets you identify a color chart in the picture that you want to use with the Color Match palette to create an automatic grade.

TIP: As you work, you may find you want to temporarily hide or show the onscreen controls so you can get an uncluttered look at the image you're adjusting. You can toggle any set of onscreen controls off and on without selecting Off in the menu by pressing Shift-` (tilde).

Toggling Viewer Overlays On and Off

Pressing Shift-` (Tilde) turns the current Viewer overlay on and off. The View > Viewer Overlay submenu contains commands for showing, hiding, and switching different overlays in the Color page Viewer. While most of the options in this menu are unassigned by default, they can be assigned to keys using the Keyboard Customization window.

Onscreen Controls and External Displays

DaVinci Resolve has been designed for use with calibrated external displays connected to video output interfaces, and for most colorists working on broadcast or theatrical programs, this is the recommended way to work for color critical evaluation.

Because of this, many of the onscreen controls associated with tasks such as color sampling, window adjustment, and key manipulation are mirrored to your video output, making it possible to hide the Viewer on your computer’s monitor and work with only an external display.

To choose whether onscreen controls are mirrored to video out or disabled:
Choose an option from the View > Window Outline submenu. There are three options:

- Off: Hides the window outline on both the external display and the Viewer.
- On: The default, shows the window outline on both the external display and the Viewer.
- Only UI: Hides the window outline on your external display, but leaves it in the Viewer.

To show or hide window onscreen controls using the DaVinci control panel:
Press SHIFT UP and then DISPLAY/_CURSOR, above the fourth trackball on the Center panel. This command is a three-way toggle. The first use of this command hides the window outline on your external display, but leaves it in the Viewer. The second use of this command hides the window outline on both the external display and Viewer. The third use of this command shows the window outline on both the external display and Viewer.
Limitations When Grading With the Viewer on a Computer Display

Most computer displays do not operate at the color critical tolerances or specifications required for broadcast or theatrical delivery. An additional issue, however, is that the Viewer does not necessarily display each clip’s image data as it is displayed by the calibration that your operating system applies to your computer display, depending on which OS you’re running DaVinci Resolve on. This makes your computer display potentially unsuitable for monitoring projects destined for the sRGB standard of the web in its default state. For example, if you grade a project using the Color page Viewer on your computer display, the resulting clip may not look the same in the QuickTime player, or in other post-production applications.

You can address this in one of two ways:

- If you’re using DaVinci Resolve on macOS, you can turn on “Use Mac Display Color Profile for viewers” in the Hardware Configuration panel of the System Settings. This lets DaVinci Resolve use one whichever of the color profiles you choose in the Color tab of the Displays panel in the macOS System Preferences, thereby taking advantage of ColorSync on macOS to let DaVinci Resolve display color the way your computer monitor does. This now works for all color profiles that ship with macOS, even ones generated by calibration software, such as that available from X-rite, Datacolor, or other applications. On supported computers, there’s also an option to “Use 10-bit precision in viewers,” if available, that you can turn on. With this option enabled, rendered output displayed in QuickTime Player will match what is seen in the DaVinci Resolve Viewer.

- Alternately, you can apply a dedicated Color Viewer LUT for calibration, using the 1D/3D Color Viewer Lookup Table drop-down menu that’s found in the Color Management panel of the Project Settings. This lets you analyze your computer display for calibration in the same way you would calibrate an external display, using a probe and color management software, and apply the resulting calibration LUT in DaVinci Resolve. Keep in mind that monitor calibration can only make a high quality display standards compliant; it cannot make up for a display gamut that’s too small. For more information, see the “Lookup Tables” section of Chapter 3, “System and User Preferences.”

Strictly speaking, if you’re doing professional work, you should restrict your grading to a calibrated, 10- or 12-bit class A external broadcast display of some type, connected via a Blackmagic Design video interface. Assuming everything is running properly, an image that is output to video from DaVinci Resolve should match an image output to video from any other post-production application you’re using, and this should be your basis for comparison when examining the output of two different applications.
Zooming into the Viewer

When using the Viewer to sample tricky colors or draw a detailed PowerCurve, it can be advantageous to zoom into the image.

**To zoom into or out of the Viewer, do one of the following:**

- Move the pointer to within the Viewer, and then roll the scroll wheel to zoom in or out of the image.
- Press Command-Equal to zoom in, or Command-Minus to zoom out.

**To pan around the Viewer:**

- Move the pointer to within the Viewer, then middle-click and drag to pan around the image.

**To reset the size of the Viewer image:**

- Choose View > Viewer Actual Size (Option-Shift-Z).
- Choose View > Zoom > Zoom to Fit (Shift-Z).

**To enable or disable image zoom being sent to video out:**

- Choose “Gang viewer zoom with video output” from the Option menu of the Viewer to zoom the image shown on video out identically to the zoom level of the Viewer, enabling you to evaluate a zoomed-in portion of the image on your suite’s hero display.

Using the Jog Bar and Transport Controls

One of the principal uses of the Viewer is to control playback. The jog bar, directly underneath the image in the Viewer, contains a playhead that you can drag to the left and right to navigate quickly through the currently selected clip as fast as you can move the pointer. The playhead in the jog bar is locked to the playheads found in the Timeline and Keyframe Editor. Moving one playhead moves all three.

How much of the Timeline the jog bar navigates depends on whether the Node Editor is set to Clip or Timeline mode. In Clip mode, the jog bar width equals the duration of the currently selected clip. In Timeline mode, the jog bar width equals the total duration of the entire Timeline.

A row of transport controls below the jog bar provides more specific control over timeline playback.

- **Previous clip:** Moves the playhead to the first frame of the previous clip.
- **Reverse:** Initiates 100% playback in reverse.
- **Stop:** Stops playback.
- **Play:** Initiates 100% playback.
- **Next clip:** Moves the playhead to the first frame of the next clip.
- **Loop:** Lets you restrict playback to the current clip, looping to the first frame if you’re playing forward to the end of a clip, or looping to the last frame if you’re playing in reverse to the beginning of a clip.
Two other buttons let you control audio playback and clip display in the Viewer:

- **Unmix**: Turning on Unmix disables all transitions, composited superimpositions, and effects that mix two or more clips together. Unmix allows you to judge the appearance of a clip without distraction whenever you need to make an adjustment based on how the clip looks on its own, or whenever you need to make changes based on frames that would otherwise be hidden underneath a transition such as a dissolve or fade from black. When you're ready to see how your grades work in context with transitions and composites again, turn Unmix off.
- **Mute**: Lets you turn audio playback off and on for your current timeline.

### Navigating Using the Arrow Keys

You can use the Arrow Keys of the keyboard to navigate clips and the Timeline in different ways.

- **Up/Down Arrow**: Moves the playhead to the first frame of the previous or next clip.
- **Left/Right Arrow**: Moves the playhead back or forward one frame at a time.
- **Shift-Left/Right Arrow**: Moves the playhead back or forward one second at a time.

### Controlling Playback Using the Spacebar and JKL Keys

You can also use the spacebar to start and stop playback, or the JKL keyboard shortcut convention for controlling playback, where J plays in reverse, K stops playback, and L plays forward. There are many additional uses of these keyboard shortcuts; for more information see "Using JKL to Control Playback” in Chapter 27, “Preparing Clips for Editing and Viewer Playback.”

### Navigating Using Timecode

You can also use absolute or relative timecode entry to move the playhead in the Color page Viewer. When entering timecode, type each pair of hour, minute, second, and frame values consecutively, with a period representing a pair of zeros for fast entry. The last pair of timecode values (or period) you enter is always assumed to be the frame number, with any untyped values assumed to be zero. It’s not necessary to enter colons or semicolons. For more information, see "Moving the Playhead Using Timecode” in Chapter 27, “Preparing Clips for Editing and Viewer Playback.”

### Navigating Using the DaVinci Control Panel

It’s also possible to navigate the Timeline using the DaVinci control panel. A set of buttons on the Transport panel include:

- **PREV/NEXT SCENE**: Moves the playhead among the first frame of each clip.
- **STEP REV/FWD**: Moves the playhead from frame to frame.
- **FIRST FRAME/LAST FRAME**: Jumps the playhead to the first and last frame of any given clip.
- **RWD/FFWD**: Moves the playhead in rewind of fast forward.
- **REV/STOP/FWD**: The standard play reverse, stop, and play forward commands.

Another set of navigation controls is available by pressing the MODE button above the fourth trackball on the Center panel, and then pressing the CUE MODE soft key.
You can also use the jog wheel and shuttle control on the Transport panel. The jog wheel lets you scrub frame by frame, while the shuttle control moves among preset rewind and fast forward speeds.

**NOTE:** If a Gallery still is turned on for split screen comparison, the shuttle control will adjust the split screen center, and not the playhead position. Turning Reference Wipe off again frees up the shuttle control to affect playback again.

Finally, there are two additional methods of navigating using the DaVinci control panel that make it easy to jump to a specific clip or timecode value.

**To move the playhead to the first frame of a specifically numbered clip:**
On the Transport panel, enter a clip number using the number pad, then press **TAKE ENTER**.

**To move the playhead relative to its current position:**
1. Press + or – on the number pad.
2. Enter either a number of frames, or a timecode value using colons to divide each pair of digits (for example +01:00:23:12).
3. Press **TAKE ENTER**.

**To move the playhead to an exact timecode value:**
1. Using the number pad, enter a timecode value, using colons to divide each pair of digits (for example 01:00:23:12).
2. Press **TAKE ENTER**.

### Viewer and Transport Timecode Displays

The Viewer has two timecode displays, each of which defaults to a different timecode setting. A timecode display at the top, the Header timecode display, shows the Source timecode by default. The timecode display at the bottom, the Transport timecode display, shows the Record timecode by default.

The bottom timecode display can be changed to show one of four different options, which are similar to those found in the Data Burn-In palette.

**To change a timecode display to a different setting:**
The top timecode display is a drop-down menu that can be changed to whatever timecode, frame number, or KeyKode you want to display. The bottom timecode display can also be changed by right-clicking on it and choosing the type of value to show from the contextual menu that appears.

- **Timeline Timecode:** The timecode corresponding to the playhead’s position in the overall Timeline.
- **Source Timecode:** The timecode corresponding to the playhead’s position relative to the currently selected clip.
• **Timeline Frame**: The frame count corresponding to the playhead’s position in the overall Timeline.

• **Source Frame**: The frame count corresponding to the playhead’s position relative to the currently selected clip.

• **KeyKode**: The KeyKode number corresponding to the media’s KeyKode track, if there is one.

• **Show Timecode at 30 FPS**: Displays 24 fps timecode, via 3:2 pulldown, as 29.97 fps timecode. Has no effect on video playback.

In the same way, the top timecode display can alternately be changed to show KeyKode, if it’s available, within a DPX media file’s header.

### Enhanced, Full, and Cinema Viewing

You can expand the Viewer into Enhanced Viewing mode by choosing Workspace > Viewer Mode > Enhanced Viewer mode (Option-F), or by pressing CURRENT/VIEWER on the T-bar panel of the DaVinci control panel.

In Enhanced Viewing mode, the Viewer works exactly as it does at its regular size, but it expands to fill up the entire area of the screen above the palettes and Keyframe Editor. To exit Enhanced Viewing mode, press (Option-F) again.

This can be useful if you need a closer view of the image for purposes of making detailed corrections, examining noise patterns up close, making a tricky color selection, or drawing a complicated PowerCurve.

In Full Viewing mode (available by choosing Workspace > Viewer Mode > Full Page Viewer, pressing Shift-F, or Option-clicking the Enhanced Viewing mode button), the Viewer takes up even more room by hiding the palette controls, but leaves room for the transport controls, the Onscreen Control drop-down menu, the timecode display, and the page buttons along the bottom of the DaVinci Resolve UI. This mode is useful when you need an even closer look at the image, but you still want access to a minimal set of onscreen controls.
Another option, Cinema mode, allows for full-screen viewing. Cinema mode is available by choosing Workspace > Viewer Mode > Cinema Mode Viewer (P). In Cinema mode, the menu bar is hidden, and the image is presented full screen without any of the ordinary onscreen controls. Moving the pointer over the screen reveals a set of hidden onscreen controls that include a play button, jog bar, mute button, and exit button (which lets you turn off Cinema mode).

You also have the option of superimposing scopes over the image, which can be valuable in on-set situations.

Cinema mode is useful for doing detailed reviews of media in on-set and digital dailies workflows when working remotely without a secondary video display.
Safe Area Overlays in the Viewer

You can show or hide a series of safe area overlays in the Viewer. All safe area overlay options are found in the View > Safe Area menu. Each safe area overlay option can be individually enabled or disabled from this menu.

- **On/Off:** Turns all currently selected safe area marker options on or off at once.
- **Extents:** An outline showing the exact outer edge of the frame. Especially useful when the safe markers are set to an aspect ratio other than that currently used by the Viewer.
- **Action:** An outline showing the outer 90% action safe area of the frame.
- **Title:** An outline showing the outer 80% title safe area of the frame.
- **Center:** A crosshairs showing the center of the frame.
- **Aspect:** Enables use of the View > Select Aspect Ratio submenu to change the aspect ratio of the safe area markers. You can choose among the following aspect ratios: 1.33 (a.k.a. 4:3), 1.66, 1.77 (a.k.a. 16:9), 1.85, and 2.35.

You can also access these options directly using the DaVinci control panel.

**To customize safe area markers using the DaVinci control panel:**

1. Press MODES, above the fourth trackball on the Center panel.
2. Press the SAFE AREA soft key. The Center panel soft keys are remapped with all of the available safe area options.
3. When you’re finished, press EXIT.
Use Gray Background

Choosing View > Show Gray Backgrounds in Viewer sets the empty area of the Viewer (if there is any) to a lighter gray, making it easier to see which parts of the Viewer are black because of blanking, and which parts are simply empty because of the way the image is zoomed or panned.

Monitor Calibration

If you use Light Illusion's LightSpace CMS or SpectraCal's Calman for display calibration, you can now use DaVinci Resolve as a sync-able pattern generator. This means you can use DaVinci Resolve to output color patches, synchronized by LightSpace, to your display through whichever video interface is connected to your computer. These synchronized color patches will be analyzed by a monitor probe that's also controlled by LightSpace, which stores the probe data and compares it to the original color values of the output color values in order to characterize that display.

To use this feature, you must first have a licensed copy of LightSpace CMS, which is a Windows application. Synchronization depends on a wired or wireless LAN being available to connect the LightSpace application with DaVinci Resolve.

**To synchronize LightSpace CMS to DaVinci Resolve as a pattern generator client:**

1. Open LightSpace on the Windows computer that's running it.
2. When LightSpace is open, click the Network Manager button. A window appears displaying the two network IP addresses used by LightSpace. Note these, and click the Enable button.
4. When the LightSpace dialog opens, enter the second of the two network IP addresses LightSpace lists into the Remote Machine field, and make sure the Port number matches. Then click the Connect button.
The Calibration dialog in DaVinci Resolve, connected to LightSpace CMS via WiFi

If everything is working correctly, the LightSpace dialog in DaVinci Resolve should show the word “Connected,” and the Network Manager dialog in LightSpace should show that there is 1 available client/s.

You can now close the Network Manager dialog in LightSpace and follow the procedures outlined in the LightSpace CMS documentation for characterizing your display and building and exporting a display LUT (in the .cube format) that you can use as a display LUT in DaVinci Resolve. Alternately, you can export a display LUT from LightSpace that can be loaded onto an outboard video processing device.

When you’re finished, click Disconnect in the LightSpace dialog, and then click Cancel to close the window.

**Viewing Broadcast Safe Exceptions**

Choosing View > Display Broadcast Safe Exceptions sets the Color Page Viewer to show a false-color overlay that indicates in blue the regions of the picture that violate the currently selected broadcast safe level in the Color Management panel of the Project Settings.

Areas of the image that violate broadcast safe are highlighted in blue

More information about broadcast safe limiting in the Color Management panel of the Project Settings appears in Chapter 116, “Automatic Grading Commands and Imported Grades.”
Comparing Clips in the Viewer

The ability to compare different clips to one another is an important part of the color correction process. DaVinci Resolve provides three different ways of doing so. You can use the Gallery to display two clips for split screen comparison. You can also use different reference modes to see a timeline clip or reference movie directly as part of a split screen comparison. Finally, you can use the Split Screen controls to display multi-frame arrangements in the Viewer.

Saving and Wiping Stills in the Gallery and Timeline

The Gallery on the Color page provides fast access to stills that you’ve saved from various clips in the Timeline. While the dedicated Gallery page provides a more comprehensive interface for browsing presaved “looks,” as well as for importing stills from other projects, you can save, organize, and browse stills directly within the Gallery of the Color page.

Stills are saved in the DPX file format. Once you’ve saved one or more stills, you can set up split screen wipes in the Viewer, which will be mirrored to your external display.

To save a still, do one of the following:
- Choose View > Stills > Grab Still (Option-Command-G).
- Right-click on the Viewer and choose Grab Still.
- Press GRAB STILL on the Transport panel of the DaVinci control panel.

To wipe a still, do one of the following:
- Select a still in the Gallery, and click the Image Wipe button on the top Viewer toolbar.
- Choose View > Stills > Play Still (Command-W), or right-click in the Viewer and choose Toggle Wipe.
- Double-click a still in the Gallery.
- Press PREV STILL or NEXT STILL on the Transport panel of the DaVinci control panel to select a still, then press PLAY STILL.
To adjust a wipe in the Viewer, do one of the following:

- Drag the pointer within the Viewer to move the wipe.
- Push the T-bar control up and down on the T-bar panel of the DaVinci control panel.

To customize a wipe in the Viewer:

- Click one of the Wipe mode buttons in the Viewer toolbar.
- Choose one of the following from either the View menu or the Viewer contextual menu:
  - **Wipe Style:** Cycles among the Horizontal, Vertical, Mix, Alpha, Difference, and Box modes.
  - **Invert Wipe:** Reverses each half of the wipe.

Hover Scrub in the Gallery

When Live Preview is enabled in the Gallery option menu, the Hover Scrub Preview submenu lets you choose how you want Live Preview to be shown by a thumbnail in the Gallery and in the Viewer when you hover the pointer over a still or LUT in the LUT Browser:

- You can choose to scrub both the thumbnail you’re hovering over and the Viewer, letting you preview the current still’s grade or a LUT over the duration of the current clip in both the thumbnail and Viewer.
- You can choose to scrub just the thumbnail, leaving the Viewer to show just the grade or LUT over the frame at the position of the playhead.
- You can disable scrubbing altogether, in which case both the thumbnail and the Viewer will only show the grade or LUT over the frame at the position of the playhead.

Copying Grades from Stills in the Gallery

Stills also store the grade from the clip they came from, and can be used to copy grades from one clip to another, or to store grades that you might want to use later.

To copy a grade from a still to a clip, do one of the following:

- Select one or more clips in the Timeline, then right-click a still in the Gallery and choose Apply Grade.
- Select one or more clips in the Timeline, then middle-click a still in the Gallery.

When you copy a still in this way, the saved grade completely overwrites the grade in the target clip, unless you’ve used the “Preserve number of nodes” option, found in the contextual menu of the Gallery. For more detailed information on using the Gallery, including options for organizing the Gallery browser, instructions for using Albums, Power Grades, and Memories, as well as other methods of copying grades and performing advanced grade management tasks, see Chapter 116, “Using the Gallery” and Chapter 117, “Grade Management.”

Different Viewer Reference Modes for Wipes

While it’s common to use the Gallery to wipe against reference stills, by changing the reference mode you can also create a wipe against a clip in the Timeline, or against an Offline Reference Clip or Timeline, if one has been assigned to the current Timeline.
To change the Viewer reference mode, do one of the following:

- Choose an option from the View > Reference Wipe Mode submenu.
- Right-click the Viewer and choose an option from the Reference Mode submenu of the contextual menu.
- On the T-bar panel of the DaVinci control panel, press REF ON/OFF to toggle the reference mode immediately to Offline mode and back again, in order to split screen the current clip against an offline video.

There are three reference modes:

- **Gallery**: The default reference mode. Lets you wipe the current clip against a Gallery still.
- **Timeline**: Lets you wipe the current clip against another clip in the Timeline using the Wipe Timeline Clip command (see below).
- **Offline**: Lets you wipe the current clip against an offline video that’s been assigned to the current Timeline. For more information on assigning Offline References to a timeline for comparison, see Chapter 46, “Preparing Timelines for Import and Comparison.”

### Wiping Between Clips in the Timeline

If you want to wipe the current clip against another clip in the Timeline without saving a still to the Gallery first, there’s a special procedure you can follow.

**To wipe between two clips using the Timeline reference mode:**

1. Click the thumbnail of the first clip you want to compare.
2. (Optional) A “Gang timeline wipe with current clip” option, available from the Viewer option menu, lets you maintain the offset between the current clip and a timeline clip you’re wiping against when you move the current clip selection to other clips. With this option enabled, the offset between the timeline wiped clip and the current clip is maintained when you move the clip selection. You can step the timeline reference clip forward one frame by pressing Command-Option-Right Arrow, and back one frame by pressing Command-Option-Left Arrow. This allows for precise positioning. When this option is disabled, the timeline wiped clip stays where it is regardless of what clip you select.
3. Right-click the thumbnail of the second clip you want to compare against, and choose Wipe Timeline Clip from the contextual menu.

Both clips appear split screened against one another.

**NOTE:** Wipe Timeline Clip only appears in the contextual menu if you right-click on a thumbnail in the Timeline that has not been selected.

### Change a Timeline Wipe Using the Timelines Album of the Gallery

While you’re using the Wipe Timeline Clip to show a wipe of the current clip against any other clip in the Timeline, you can open the Timelines album of the Gallery and click different clips to change which timeline clip you’re wiping against (outlined in blue) without changing the current clip (outlined in orange).
Using Split Screen Modes

A set of split screen modes provides additional ways of comparing multiple images in the Viewer at the same time. These provide side-by-side and grid comparisons of multiple shots and multiple versions, all of which are output to video for monitoring on your external video display. For example, you can use the Split Screen Version mode to display every single version that’s applied to the current clip in a grid, for easy evaluation. The currently selected clip in the Timeline is highlighted in gray, so you can keep track of what you’re doing.

To enable a split screen mode, do one of the following:

- Click the Split Screen button on the top Viewer toolbar, and choose a split screen method from the drop-down menu that appears in the Viewer toolbar at the right.
- Choose an option from the View > Split Screen submenu.
- Press Option-Command-W to turn Split Screen on and off, using the last selected option.
- Right-click the Viewer and choose an option from the Split Screen submenu in the contextual menu.

**NOTE:** When any of the split screen modes are selected, you cannot see any other onscreen controls in the Viewer, such as Power Window shapes, until you first disable split screen.

Viewing and Choosing the Current Selection

In any of the split screen modes, the current selection is indicated by a gray outline. This outline can be disabled for a more direct comparison by choosing View > Split Screen > Show Outline to toggle the outline off and on.

In certain modes, you can also double-click a particular frame of the split screen view to change the current clip, choose the active version, or apply a gallery grade.
Available Split Screen Modes

You can choose from among the following split screen modes:

- **Current Group:** Shows up to 16 clips that share the same group as the current clip. Double-clicking a frame does nothing in this mode.

- **Highlight Modes:** Shows a four-up display that lets you simultaneously see (clockwise) the clip’s RGB image, the gray matte, the high contrast matte, and a difference matte generated by the node’s input compared against its output. Double-clicking a frame does nothing in this mode.

- **Neighbor Clips:** Shows four clips that immediately surround the current clip. The previous two clips appear as the upper left- and right-hand clips, the current clip appears at the lower left-hand corner, and the next clip appears at the lower right. Double-clicking a frame does nothing in this mode. The "Neighboring Clips in Split Screen" parameter in the Color panel of the User Preferences lets you customize how many neighboring clips appear in this mode.

- **Selected Album:** When you choose this option, a split screen of the grades of every still in that album are shown in the Viewer as they appear applied to the current clip. Double-clicking a frame applies that gallery grade to the current clip. Up to 16 grades will be shown.

- **Selected Clips:** Shows all currently selected clips in the Timeline, up to 16 at one time. Clicking a clip moves the playhead to the first frame of that clip.

- **Selected LUTs:** Lets you simultaneously display previews of different LUTs effect on the current clip as a split screen in the Viewer by using the LUTs browser to Command-click up to 16 LUTs you want to preview.
The Selected LUTs split screen option lets you preview a bunch of LUT looks at once.

- **Selected Still Grades:** When you choose this option, the act of selecting stills in the Gallery of the Color page shows each of the grades associated with those stills as they appear applied to the current clip, in a split screen arrangement. Double-clicking a frame applies that gallery grade to the current clip.

Previewing four gallery grades using the Split Screen > Gallery Grades mode

- **Selected Still Images:** Lets you view the current clip against a variety of other stills in the Gallery that you select. This is not a grading preview, you’re actually doing a split screen of the selected still images in the Gallery.

- **Version:** Shows up to 16 versions for the current clip, all at once, making it easy to evaluate a series of different versions in relation to one another. If you have more than 16 versions, you deserve some manner of award. Double-clicking a version changes the active version.

- **Versions and Original:** Shows up to the first 15 versions for the current clip, along with the original ungraded clip at the upper left-hand corner. Double-clicking a version changes the active version, but you cannot double-click to select the original.
Marker Overlays and Navigation

If you part the playhead on top of a marker in the Timeline of the Color page, that marker’s information appears in a Viewer overlay, just as in the Edit page, making it easier to read notes and see what information is available. These overlays can be easily hidden by clicking the Viewer option menu and turning off “Show marker overlays.”

Timeline Marker List Available in Color Page Viewer Option Menu

The Option menu of the Color page Viewer has a submenu that lists all Timeline Markers in the currently open timeline. This makes it easy to run down client notes.

Using Video Scopes

While not directly tied to use of the Viewers, video scopes nonetheless work hand in hand to help you evaluate the images you’re working on. DaVinci Resolve has a set of five real-time video scopes that you can use to monitor the internal data levels of clips in your project as you work. Each scope provides an unambiguous graphical analysis of different characteristics of the video signal, showing you the relative strength and range of individual color components including luma, chroma, saturation, hue, gamut, white point, and the red, green, and blue channels that, together, comprise the color and contrast of the images in your program.

Video Scope Location

By default, you can view any one of these scopes at a time at the bottom right corner of the Color page, by clicking the Video Scope button in the palette button bar.
Optionally, you can click the Expand button at the top right of the video scope to open the video scopes into a floating window, within which you can display all four video scopes together, or individually, on any monitor connected to your workstation.

Video scopes in a floating window

Additionally, the video scopes are available in many of the dual-screen layouts available in DaVinci Resolve. The video scopes aren’t just available in the Color page. They’re also available in the Media and Deliver pages for whenever you need to evaluate the video signal more objectively, such as when you’re setting up to capture from tape or scan from film, or when you’re setting up for output.

**To open video scopes from the Media, Color, or Deliver pages, do one of the following:**
- Choose Workspace > Video Scopes > On/Off (Command-Shift-W) to open video scopes into a floating window.
- Choose Workspace > Dual Screen > On to open video scopes as part of a dual screen layout.

**Video Scope Measurement**

Because you’re evaluating the internal state of the image data, by default the scales of the WFM and Parade scopes always reflect 10-bit full range data from 0–1023, regardless of the Video/Data Level setting you’ve selected in the Master Settings panel of the Project Settings. This gives you a window into how the image is being processed by DaVinci Resolve prior to being output via your computer’s video I/O interface.

If you’re working on an HDR (High Dynamic Range) grade, you can open the User Preferences and turn on Enable HDR Scopes for ST.2084 and HLG (this feature is only available in Studio version). This replaces the 10-bit scale of the Waveform, Parade, and Histogram video scopes with a scale based on nit values (or cd/m²) instead.
Video Scope Performance and Detail

All video scopes were updated for DaVinci Resolve 16 to show more detail with faster performance than in previous versions. While they’re GPU-accelerated, the video scopes require a certain amount of video processing power to operate. Depending on which combination of video scopes and scope options you have selected, you may notice your real time processing capabilities ever so slightly affected. Closing the video scopes frees up all processing for color correction and effects. On high-powered workstations, you probably won’t notice a difference, but on less powerful computers, closing the scopes might make a small difference.

Two global settings in the video scope option menu affect the performance and detail of all video scopes equally.

- On slower workstations, a quality submenu lets you choose High, Medium, or Low quality scope drawing, to trade off legibility for performance. High quality shows you the most information about the video signal, while an Auto option makes a selection based on your workstation’s capabilities.

- All video scopes have a Low Pass Filter setting in the Scopes Option menu that filters out a signal’s noise to make the scope graphs clearer to read. While this can act as an “x-ray” to better see detail in the scope graph interiors, it can make the highlight and shadow excursions on the graph seem a bit shy of where they actually are, so it’s recommended to enable the “Extents” option of whichever scope you’re using to get an unambiguous look at the maximum excursions in your scopes. Extents draws an outline highlighting all graph excursions to show you the true level of all overshoots and undershoots in the video signal, even when the Low Pass Filter is on.
Displaying Scopes With Data or Video Levels

For project being worked on at video levels, a setting in the video scope option menu lets you toggle between displaying video scopes scaled to either Data Levels (the default) or Video Levels (by turning on Video Level Scopes). This only affects how your scopes are displayed; it has no effect on monitored or rendered output.

Display Qualifier Focus in Video Scope Graphs

The Display Qualifier Focus setting in the video scope option menu helps you identify which features in the video image correspond to which parts of the video scopes. With Display Qualifier Focus turned on, choosing the Qualifier mode of the Viewer and moving the eyedropper around the image draws circles around the sampled pixels as they appear in the currently visible video scope graph. If multiple video scopes are visible, each scope will have an indication of the location of the sampled pixels that’s specific to each scope.
Explaination of Each Video Scope

There are five available video scopes, each of which shows a different analysis of the video signal you’re adjusting.

Waveform Monitor

Overlays waveform analyses of the Y (luma/luminance), CBCR (the color difference channels of Y’CBCR), or RGB (red, green, and blue) channels over one another so that you can see how they align.

The Y option presents a true Luma scope that can have Colorize enabled to show false color, which lets you see which colors in the Viewer image are where in the video scope graph.

For the RGB scopes, the relative heights of the red, green, and blue graphs indicate is identical to the description seen for the Parade scope below, and with color enabled the red, green, and blue graphs are tinted with the color they represent. This makes it easy to see where all three graphs align, by looking for where parts of the waveform monitor appear in white, which is the result of the red, green, and blue graphs lining up and adding their color together.

Parade

The Parade scope shows separate waveforms side by side that analyze the strength of individual video signal components. The Parade scope can be set to analyze RGB, YRGB, and Y’CBCR.

By showing a comparison of the intensity of the luma, red, green, and blue channels, the Parade scope makes it possible to detect and compare imbalances by comparing the relative heights of the RGB graphs in the highlights (the top of the R, G, and B graphs), shadows (the bottom of the R, G, and B graphs), and midtones (the middle of the R, G, and B graphs) for the purposes of identifying color casts and performing scene-by-scene correction.

When the YRGB channels are taken altogether, the bottom of all graphs indicates the black point of the image, while the tops of all graphs indicate the white point. It then follows that the difference between the height of the bottom and top of all graphs indicates the overall contrast ratio of the image you’re evaluating. Tall parade graphs indicate a wide contrast ratio, while short parade graphs indicate a narrow contrast ratio.
Vectorscope

Measures the overall range of hue and saturation within an image. Measurements are relative to a centered graticule that you can enable that’s overlaid on the scope, which provides a frame of reference via crosshairs. DaVinci Resolve has a traditional vectorscope, the graph of which emulates a trace-drawn graph, with 75 percent color bar targets indicating the angle of each of the primary and secondary colors around the edge of the graph, and an optional skin tone reference graticule (otherwise known as the in-phase reference).

The Vectorscope can have Colorize enabled to show false color which lets you see which colors in the Viewer image are where in the video scope graph.

More saturated colors in the frame stretch those parts of the graph farther toward the edge, while less saturated colors remain closer to the center of the vectorscope, which represents 0 saturation. By judging how many parts of the vectorscope graph stick out at different angles, you can see how many hues there are in the image, with the specific angle of each part of the graph showing you which hues they are. Furthermore, by judging how well centered the middle of the vectorscope graph is relative to the crosshairs, you can get an idea of whether there’s a color imbalance in the image. If the vectorscope graph is off-centered, the direction in which it leans lets you know that there’s a color cast (tint) in the image.
Histogram (RGB/YRGB parade histogram)
Displays a statistical analysis of how many pixels of each color channel lie at each percentage of tonality, plotted along a digital scale from 0 percent (black) to 100 percent (white). Comparing the left, middle, and right parts of the Y, R, G, and B graphs (Y is optional) lets you evaluate the color balance in the shadows, midtones, and highlights of the image.

Taken altogether, the left of all graphs indicates the black point of the image, while the right of all graphs indicate the white point. It then follows that the difference between the width of the left and right of all graphs indicates the overall contrast ratio of the image you’re evaluating. Wide histogram graphs indicate a wide contrast ratio, while narrow histogram graphs indicate a narrow contrast ratio.

CIE Chromaticity Scope
DaVinci Resolve contains CIE 1931 xy and CIE 1976 uv scopes, which let you see the current image analysis as a graph superimposed against a triangle that represents the tristimulus values of the color gamut you’re working within, along with an indication of the current white point. A label shows the currently selected gamut, with the specific coordinates of these Red, Green, and Blue values as well as the White point, while the overall “horseshoe” shape represents the entire range of visible light, all plotted against an xy graph.

You also have the option of showing a second gamut triangle, in cases where you want to compare the current analysis to two different gamuts. This can be useful when you need to create deliverables in multiple gamuts, and you want to see which parts of the video signal are safe in all gamuts and which parts are exceeding the smaller of the two. When you do this, both gamuts are labeled, and the coordinates of the Red, Green, and Blue values of both gamuts are listed to the side.
In a way, the Chromaticity scope is a 3D scope, but it’s drawn as if you’re looking down at the top of a 3D shape that plots every color value in an image in X, Y, Z space, but you can only perceive the 2D outline around the widest parts of this shape drawn on an X, Y plot. The graph does indeed represent every single value found within a 3D plot of the image data, but the triangle only indicates the widest “slice” of the current gamut and of this 3D shape within the mid-tones.

What this means is that while the Chromaticity scope’s graph gives you a rough idea of whether or not the current image is within gamut relative to your delivery spec, it’s not exact and it’s not foolproof, as part of the image data could fall within this wide triangle and yet overshoot the required gamut elsewhere in the highlights at the top or the shadows near the bottom of the 3D shape you’re looking down on. On the other hand, if any part of the graph does extend past the boundaries of the gamut triangle, then that definitely indicates a gamut violation. You can add an additional gamut triangle in the scope settings in order to compare the color space you’re working in to another color space, for reference.

Most people who’ve had any exposure to color grading concepts are familiar with the traditional CIE 1931 horseshoe graph, which plots the portion of the spectrum visible to the human eye according to studies done in the late 1920s (subsequent studies have confirmed this analysis). The optional CIE 1976 uv graph is based on an updated color space (CIELUV) that was an attempt by the International Commission on Illumination (CIE) to create a more perceptually uniform graph of color. Whereas the CIE 1931 analysis visually exaggerates certain parts of a color graph, the CIE 1976 graph draws all parts of a color graph more or less proportionally to one another. Overall, neither analysis is more “correct” than the other, it’s simply a matter of what you prefer to look

![The CIE 1976 scope showing both P3 and Rec.709 gamuts](image)

**Panning and Zooming the Video Scope Graphs**

If you want to examine any part of a video scope’s graph in more detail, you can do the following:

- **To zoom into a graph:** Hold the Option key down, and roll the scroll control.
- **To pan around a graph:** Click and drag with the middle pointer button.
Customizing the Video Scopes

Once you’ve opened the video scopes, there are a variety of ways you can customize how the scopes look, and expose additional onscreen graticule information to help you measure what you need.

Methods of customizing the Scopes window:

- **To change the size of the Scopes window:** Drag the lower right-hand corner to resize the Scopes window to the desired size.
- **To change how many scopes are displayed at once:** Click one of the buttons in the upper right-hand corner of the Scopes window to set 1, 2, or 4 up arrangements of the video scopes. You can also choose how many scopes are simultaneously displayed by choosing Workspace > Video Scopes > 1-Up, 2-Up, or 4-Up.
- **To change which scopes appear in which pane:** Click the Name drop-down at the upper left corner of each scope’s pane, and choose a different scope.

Once open, you can resize the Scopes window to make it as large or small as you require, positioning on a second display if you want to make it even larger.

To customize each video scope’s display options:

1. Click the Option button to the right of the Scope drop-down menu to expose the current scope’s Custom Controls window.

2. Adjust any of the available controls to customize the look of that particular scope.

3. Click anywhere outside of the Custom Controls window to make it disappear.

Parade Scope Display Options

The Parade scope has the following options:
• RGB, YRGB, and YCbCr modes, allowing you to evaluate more channels than before.
• A colorize checkbox lets you view graphs in monochrome or false-color (indicating red, green, and blue).
• An Extents checkbox draws an outline highlighting all graph excursions, to unambiguously show you all overshoots andundershoots in each waveform.
• The Parade slider makes that scope’s graph brighter or dimmer. Brighter graphs make it easier to see fine detail, but harder to see which parts of the graph are stronger and weaker.
• The Graticule slider makes that scope’s scale brighter or dimmer, making it more or less visible (or distracting) relative to the graph.
• The Show Reference Levels checkbox lets you turn on adjustable Low and High reference level markers by setting the low and high sliders to something other than their defaults. This is especially useful for HDR grading where you’re working within a specific peak luminance threshold.

Waveform Scope Display Options

The Waveform scope has the following options:

• Y (luma) and CbCr (chrominance) modes to show you the true luma or chroma signals in isolation, and RGB to show you only an RGB analysis.
• In RGB mode, R, G, and B buttons that can be individually toggled on and off to see any combination of graphs.
• A colorize checkbox lets you view overlaid graphs in monochrome or false-color (indicating red, green, and blue). If you’re only enabling the Y or C scopes, the different areas of these graphs are drawn with color taken from the image being analyzed, which makes it easier to see which part of the scope graph corresponds to which part of the image.
• An Extents checkbox draws an outline highlighting all graph excursions, to unambiguously show you all overshoots andundershoots in each waveform.
• The Waveform slider makes that scope’s graph brighter or dimmer. Brighter graphs make it easier to see fine detail, but harder to see which parts of the graph are stronger and weaker.

• The Graticule slider makes that scope’s scale brighter or dimmer, making it more or less visible (or distracting) relative to the graph.

• The Show Reference Levels checkbox lets you turn on adjustable Low and High reference level markers by setting the low and high sliders to something other than their defaults. This is especially useful for HDR grading where you’re working within a specific peak luminance threshold.

Vectorscope Display Options

The Vectorscope has the following options:

• Choose ALL to view the entire tonal range of the image as a Vectorscope graph analysis, or to selectively view just the shadows (Low), mid-tones (Mid), or highlights (High) of the image as a vectorscope graph analysis.

• A Colorize checkbox draws the different areas of these graphs with color taken from the image being analyzed, which makes it easier to see which part of the scope graph corresponds to which part of the image. With colorize turned off, graphs only appear white.

• An Extents checkbox draws an outline highlighting all graph excursions to unambiguously show you all overshoots and undershoots.

• A Combine checkbox lets you see simultaneous overlapping extents for the highlights, mid-tones, and shadows overlaid on one another.

• The Vectorscope slider makes that scope’s graph brighter or dimmer. Brighter graphs make it easier to see fine detail, but harder to see which parts of the graph are stronger and weaker.

• The Graticule slider makes that scope’s scale brighter or dimmer, making it more or less visible (or distracting) relative to the graph.
• Low Range and High Range sliders let you manually define the boundaries separating shadows from mid-tones and highlights. Low Range defaults to 0.30, and High Range defaults to 0.70.
• Show 2X Zoom zooms the vectorscope graph by 200%, making it easier to see fine detail and use the vectorscope with charts.
• Show Skin Tone Indicator checkbox shows a line at the traditional Inphase angle that is useful as a general guidepost for average skin tone hue.
• Show Graticule checkbox lets you show or hide the circular degrees indicator surrounding the outer edge and the cross hairs that indicate the center of the vectorscope.

Histogram Display Options
The Histogram has the following options:

• You can view either RGB or YRGB histograms.
• Gain slider scales that scope’s graph taller or shorter. Taller graphs expand to show greater detail in the histogram’s peaks, shorter graphs reduce the apparent detail.
• Graticule slider makes that scope’s scale brighter or dimmer, making it more or less visible (or distracting) relative to the graph.
• The Show Reference Levels checkbox lets you enable adjustable Low and High reference level markers by setting the Low and High sliders to something other than their defaults. These reference markers are especially useful for HDR grading where you’re working within a specific peak luminance threshold.
CIE Chromaticity Display Options

The CIE Chromaticity scope has the following options:

- You can view a chromaticity analysis in either a CIE 1931 xy graph, or a CIE 1976 uv graph.
- CIE Chromaticity slider makes that scope’s graph brighter or dimmer. Brighter graphs make it easier to see fine detail, but harder to see which parts of the graph are stronger and weaker.
- Graticule slider makes that scope’s scale brighter or dimmer, making it more or less visible (or distracting) relative to the graph.
- Additional Gamut drop-down menu lets you expose a second gamut triangle, for instances where you want to compare how an image fits into two different gamut ranges.
- Show 2X Zoom zooms the CIE graph and graticule by 200%, making it easier to see fine detail and use the vectorscope with the charts.
- Show Graticule checkbox lets you show or hide the circular degrees indicator surrounding the outer edge and the cross hairs that indicate the center of the vectorscope.
Chapter 115

Color Page Timeline and Lightbox

The Timeline in the Color page, consisting of the Thumbnail Timeline and the Mini-Timeline, is primarily used for navigating the current arrangement of clips, and for keeping track of clip properties such as whether they’re graded and ungraded, whether they use tracking, which version they’re using, and so on. It can also be used for quickly copying grades from one clip to another, for creating groups, and for comparing clips in the Viewer.

The Lightbox is the twin sibling of the Thumbnail Timeline, and provides an image-based method of comparing clips, managing grades, and performing a wide variety of organizational tasks.

This chapter covers the use of the Timeline and Lightbox.

Navigating Using the Color Page Timeline

The Color page Timeline consists of two parts that work together, the Thumbnail Timeline and the Mini Timeline. These work together to let you examine and navigate the Timeline of your program in different ways.

The scroll bar for the Mini-Timeline is independent of the scroll bar for the Thumbnail Timeline, and both can be set to show different ranges of clips. Using the scroll control of your pointing device lets you zoom into or out of the Mini-Timeline. When zoomed all the way out, the Mini-Timeline displays the entire timeline within the available width of the screen, making it a fast way of navigating the entire program from the beginning to the end. However, you can zoom into a particular section when you need more information about how an intricate arrangement of superimposed clips are organized while you’re grading.

**Thumbnail Timeline**

Provides a concise visual representation of your project where each clip is a single numbered thumbnail, regardless of its duration. Clicking a thumbnail moves the playhead to the first frame of that clip, while using the Up/Down Arrow keys moves the selection to the previous or next clip. Whichever clip is at the current position of the playhead appears with its thumbnail outlined in orange. The scroll wheel of your pointing device lets you scroll backward and forward through the thumbnail timeline.

Each thumbnail displays a variety of information above and below it, including a rainbow outline around the number of graded clips, the clip format, file name, or grading version text below each thumbnail, tracking or stabilization badges, flag badges, and link badges to indicate clip groups or automatic remote grade linking, where existent.

**Mini-Timeline**

Shows a miniature representation of the Timeline in the Edit page, where each clip’s width is proportional to its duration, and superimposed clips are shown on top of one another. The Mini-Timeline can show a maximum of six video tracks; if your edit uses more, a scroll bar lets you change which tracks are displayed. Clicking a clip in the Mini-Timeline selects that clip and moves the playhead to its first frame.
Scrolling, Zooming, and Navigation
A Timeline Ruler contains the top handle of the playhead, displays the record timecode of the current edit, and acts as a scrubber bar that typically spans a longer section of the Timeline. The scroll wheel of your mouse lets you zoom in and out of your edit, and if you zoom all the way out you can fit every clip in the Mini-Timeline into the available width of the ruler, letting you scrub through every clip in the Timeline quickly. Clicking anywhere within the ruler instantly jumps the playhead to that frame.

Enabling/Disabling Tracks
The far left of the Mini-Timeline shows numbers for each track, and hovering the pointer over the track number of any track in the Mini-Timeline of the Color page reveals a tooltip showing the name of that track. Clicking a track number enables/disables that track along with all clips on that track, similarly to using the Timeline > Enable/Disable Video Tracks submenu commands (Shift-Command-1 through 9). Clips on disabled tracks are not rendered in the Viewer or video output, and are hidden from the Thumbnail Timeline. If a track has been disabled in the Edit page, it will appear dimmed in the Mini-Timeline.

Option-clicking a track number in the Mini-Timeline turns that track number red, letting you hide clips from the Thumbnail Timeline without actually disabling the video in your program. This is useful in situations where you want to prevent clips in a particular track (such as motion graphics or titles rendered from another application) from intercepting the playhead when using the next/previous clip commands.

Setting In/Out Points for Looping
You can use the I and O keyboard shortcuts to set custom In and Out points in the Timeline. Once set, turning on Loop in the Viewer transport controls enables this range to be looped, whether it’s a partial range of one clip, or a range spanning multiple clips together.

Using Multiple Timeline Playheads
DaVinci Resolve supports creating up to four separate playheads in the Mini-Timeline, that you can use to jump back and forth among different parts of your timeline. Only one playhead can be selected at any given time, and the currently selected playhead corresponds to the current clip, highlighted in orange. Each playhead in the Mini-Timeline is labeled with a letter, A through D.
To add a new playhead to the Mini-Timeline:
Choose a playhead from the Color > Active Playheads submenu. That playhead will be placed at the same position as the original playhead, but it is now the one that is selected, so dragging the new playhead to a new position of the Mini-Timeline will reveal the original playhead you were using.

To select another playhead to view:
- Click on the top handle of any playhead to select it, making that the currently active playhead controlled by the transport controls. By default, no keyboard shortcuts are mapped to the four playheads that are available, but you can create a custom keyboard mapping that you can use to quickly switch among them.
- Using the DaVinci Advanced Control Panel, you can use the A, B, C, and D buttons on the jog/shuttle panel to switch to the playhead you want to control.

To eliminate all additional playheads from the Mini-Timeline:
Choose Color > Active Playheads > Reset Playheads.

Show Current Clip With Handles
If you’re working on a project that’s part of a round-trip workflow, and you know you’ll be rendering handles for each clip, it can be useful to temporarily expose these handles for the current clip that you’re grading, so you can easily apply tracking or keyframing effects to the full frame range of each clip.

To show or hide clip handles in the Mini-Timeline of the Color page:
Choose View > Show Current Clip With Handles.

(Left) The current clip in the Mini-Timeline,
(Right) The same clip shown with Show Current Clip With Handles enabled

While this mode is enabled, Unmix is turned on and cannot be disabled, in order to let you view the overlapping handles of each clip clearly. The duration of handles that are exposed is defined by the Default Handles Length parameter of the Editing panel in the User Preferences. Clip Handles can be shown or hidden at any time.

Thumbnail Info
The thumbnails make it easy to find the clips you’re looking for visually, and they always show the media as it’s currently graded. The most obvious piece of information is the frame that’s used for each clip’s thumbnail. If you feel that a particular clip’s thumbnail isn’t representative of its content, you can change it.

To change the current thumbnail:
Move the pointer over a thumbnail, drag to the left or right to scrub through the clip, and stop when you find a frame you want to use as the new thumbnail.
If media is replaced in the middle of a color correction timeline, or if you copy or ripple a grade to a range of clips, the thumbnails may not immediately update to accurately represent the current state of each clip. In this case, you can manually refresh the thumbnails.

**To refresh all thumbnails in the Timeline:**

- Right-click anywhere in the Thumbnail timeline and choose Update All Thumbnails.

You can also choose to display the codec, clip names, and version used by each clip in the Timeline.

**To switch the Thumbnail timeline between showing clip names, codecs, and versions:**

Double-click the thumbnail clip name of any clip to cycle through each clip’s codec, clip name, and version.

Additional information appears above and below each thumbnail, providing a way of keeping track of which clips have been graded, which clips are using different versions, which clips have been cached, and so on.

The following list explains each piece of information that can appear above, within, or below the thumbnails in the Timeline.

- **Clip number:** (top left) Each clip’s number appears above its thumbnail. Clips are numbered in ascending order according to the position of their first frame, from left to right, regardless of the video track in which they appear.

- **Grade indicator:** (top left) If a clip has been graded, a thin rainbow indicator surrounds the clip number.

- **Source Timecode:** (top center) The source timecode from the first frame of each clip appears above each thumbnail.

- **Cache indication:** (red timecode) Any clip that’s marked for caching, whether automatically via the Smart cache, or manually, has its timecode turn red to indicate that it will be cached. After it’s been cached, the timecode turns blue.
• **Track number:** (top right) The video track in which a clip is edited appears above the thumbnail.

• **Clip Color dot:** (upper right) If a clip has a clip color assigned to it, a colored dot appears on top of its thumbnail.

• **Flag icon:** (upper left) If a clip has been flagged, a flag icon of the appropriate color appears on top of its thumbnail. If a clip has multiple flags, as many as can be drawn appear along the top.

• **Linked media or group icon:** (bottom right) If clips are set to use remote versions, and if multiple clips share the same source media file, then by default their remote version 1 grade will be automatically linked. If the current clip is linked, a small link icon appears below the thumbnail of every clip in the Timeline that’s also linked to that clip. When you select another clip that’s not linked, the linked clip icons disappear.

• **Tracker icon:** (bottom right) If any node within a particular clip’s grade has been tracked, a small crosshairs tracker icon appears below the thumbnail.

• **3D indicator:** (bottom right) All stereo 3D clips in the Timeline appear with this icon below the thumbnail. The color indicates which eye you’re monitoring; red for the left eye, blue for the right eye.

• **Version name/Source format:** (bottom left) What text is displayed below each thumbnail can be changed by double-clicking the space underneath each thumbnail. There are several options; keep double-clicking to cycle among them:
  - **Clip format or codec:** This is what’s displayed by default.
  - **Clip Name:** Depending on what View > Show File Name is set to, the clip name or file name is displayed. If you’re working with multicam clips, the multicam angle or name is displayed.
  - **Version name or number:** Provides information about whether a clip is using a remote version, or a local version, indicated by an (L). If you’ve given the current version a name, it appears; otherwise the version will be labeled “Version” with its number.

### Thumbnail Contextual Menu Commands

Right-clicking a clip’s thumbnail in the Thumbnail Timeline reveals a contextual menu with many media and grade management commands that are available in the Color page. The available options are divided into the following rough categories:

• Commands for managing grade versions
• Commands for managing groups
• Commands for editing flags, markers, and clip colors
• A command for displaying the Node Graph of a clip’s grade
• Options for controlling the render cache
• Resolve Color Management clip assignments
• LUT Management commands
• A command to fix Black Sun artifacts
• Commands for viewing clip details, editing Clip Attributes, and finding clips in the Media Pool
• A command for updating clip thumbnails that are slow to update on their own
These capabilities are described in more detail in the other chapters of this manual, but it’s important to know that artists working on the Color page have many clip management options available to them, without needing to go to other pages.

## Sorting and Filtering Clips in the Thumbnail Timeline

By default, the Thumbnail Timeline displays every clip of the currently selected edit in the Edit page, sorted in A mode (the record order of your edit). However, the sort order and contents of the Timeline can be changed and filtered to make it easier for you to find specific groups of clips for grading.

### Changing Timelines

If you’re working on a project that has more than one timeline, you can switch timelines right from within the Color page.

**To switch timelines in the Color page:**
Choose another timeline from the Timelines drop-down menu at the top of the Viewer.

### A and C Mode Sorting

By default, the Timeline is set to Record mode sorting, otherwise known as A mode sorting. In this mode, clips appear in the Timeline according to the order in which they were edited. This lets you see the order of clips as they’ll appear in the final program.

However, you can change the sort order of the clips in the Timeline to Source mode, or C mode sorting. In C mode sorting, all clips are rearranged in ascending order from left to right according to their source timecode, and their record timecode is temporarily ignored.
C Mode sorting, i.e., source clip order

Sorting by C mode makes it easy to identify a range of similar clips. For example, if you're working on a narrative project, clips from each angle of coverage in the scene will naturally cluster together. In another example, sorting by C mode in a documentary will arrange all of a particular subject's head shots from a specific interview contiguously, one after another, since they all come from the same range of timecode on the same source tape. In both examples, the close proximity of similar clips to one another that C mode creates makes it easy to copy grades among them, ripple changes, or group them.

When you're finished, you can switch the Timeline back to A sort mode, and all of the clips will go back to being arranged in the order in which they were edited.

**To toggle between A and C mode sorting, do one of the following:**

- Choose an option from the View > Timeline Thumbnail Mode submenu.
- Press Command-Page Down to toggle to C mode sorting.
- Press A/C MODE on the T-bar panel of the DaVinci control panel.

While in C mode, the word “SOURCE” appears at the right in the Timeline Ruler of the Mini-Timeline.

A checkbox in the Conform Options group in the General Options panel of the Project Settings lets you change the behavior of C mode sorting. Opening the Settings window and clicking the General Options panel of the Project Settings reveals the Sort Timeline Using Reel Name and Timecode checkbox.

With this checkbox turned on (the default), all clips in the Timeline are sorted by reel name first, and then by source timecode. This way, clips with similar timecode from the same reel will appear next to one another in C mode.
If you turn this checkbox off, reel name is ignored, and all clips in the Timeline are sorted only by source timecode. This may result in clips from multiple sources being mixed together, but it is useful in specific situations.

For example, when grading dailies from a three camera shoot, you may want to see consecutive clips from all three cameras lined up one after the other on the Timeline, so that Cam1_Shot1, Cam2_Shot1, and Cam3_Shot1 appear first, followed by Cam1_Shot2, Cam2_Shot2, and Cam3_Shot2, and so on. In this situation, you don’t want clips from cameras 2 and 3 to be placed at the end of the Timeline simply because of their reel name.

**Flags, Clip Colors, and Markers**

You have the option of flagging or marking clips in the Color page just like you can in the Edit page, in order to keep track of specific media or frames that you may need to do something to later. For example, you could flag every closeup of a particular actor with a blemish that you want to spend some time fixing with a green flag.

**Methods of flagging, changing colors, and marking clips in the Color page:**

- **To add a flag to a clip:** Move the playhead to a clip in the Mini-Timeline, and choose a color from the Mark > Add Flag submenu, or Right-click any clip’s thumbnail, and choose a flag color from the Flags submenu. Flags are not frame-specific, so flagging one clip will result in flags also being placed on all other clips that share the same source media in the Media Pool.

- **To remove all of a clip’s flags:** Move the playhead to a clip in the Mini-Timeline, and choose Mark > Clear Flags, or right-click a clip’s thumbnail and choose Flags > Clear All.

- **To change the clip color:** Move the playhead to a clip in the Mini-Timeline, and choose a color from the Mark > Set Clip Color submenu, or Right-click any clip’s thumbnail, and choose a color from the Clip Color submenu. Clip Colors are clip-specific.

- **To remove a clip’s color:** Move the playhead to a clip in the Mini-Timeline, and choose Mark > Set Clip Color > Clear Color, or right-click a clip’s thumbnail and choose Clip Color > Clear Color.

- **To mark a frame of a clip:** Right-click a clip’s thumbnail and choose a marker color from the Marker submenu.

- **To remove a single marker:** Right-click a clip’s thumbnail and choose Delete Marker from the Marker’s submenu. Alternately, you can select the marker in the Mini-Timeline, and press the Delete key.

- **To remove all of a clip’s markers:** Right-click that clip and choose Clear All from the Markers submenu.

**Timeline Filtering**

A drop-down button to the right of the Clips button at the top right of the Color page Interface Toolbar presents preset options for dynamically filtering which clips are shown in the Timeline. This allows you hide all the other clips in the Timeline except for the subset on which you want to focus.
For example, once you've added flags or markers to clips, it's easy to hide every other clip in
the Timeline that doesn't fit the criteria; for example, hiding clips that don't have a green flag.
This does nothing to alter the original edit, and you can return the Timeline to its original state
at any time.

**To filter the Timeline:**
Click the Timeline Filtering drop-down button to the right of the Clips button at the top
left of the DaVinci Resolve UI, and choose an available option. While the timeline is
filtered, an orange line appears underneath the Clips button in the UI toolbar at the top
of the page.

**To return the Timeline to normal:**
Click the Timeline Filtering drop-down button, and choose All Clips.

You can use timeline filtering in conjunction with A or C mode sorting to arrange clips in
whatever way is best for the task you're trying to accomplish. Clip filtering can also be used in
the Lightbox, and a currently selected clip filtering method will simultaneously isolate clips in
the Timeline and Lightbox as you switch back and forth.

**Preset Timeline Filters**
DaVinci Resolve comes with several preset criteria by which you can filter the Timeline, which
cover many common organizational workflows:

- **All Clips:** No clips are filtered, and every clip in the current edit is shown.
- **Selected Clips:** Filters all currently selected clips.
- **Graded Clips:** Filters all clips that have been graded.
- **Clips with Fusion Composition:** Clips with Fusion page effects applied to them.
- **Ungraded clips:** Filters all clips that have not yet been graded.
- **Modified clips:** Submenu, filters all clips that have been modified within
  a specified time.
• **Unrendered clips**: Filters all clips that have not yet been rendered.
• **Flagged Clips**: Filters all clips that have a particular flag, a submenu presents each color.
• **Marked Clips**: Filters all clips that have a particular mark, a submenu presents each color.
• **Keywords**: Filters all clips that have a specific keyword assigned. A submenu presents a list with each keyword that’s used in the Media Pool of the current project.
• **People**: Filters all clips that have a specific person assigned from the People Management Window. A submenu presents a list of each person that’s been identified.
• **Stereoscopic**: Filters stereo 3D clips, a submenu presents options for filtering All Stereo Clips, or just Stereo clips that have been Autoaligned, those with Convergence adjustments, those with Floating Windows adjustments, or stereoscopic clips with swapped media for the left and right eyes.
• **Grouped**: Filters all clips belonging to a particular group, a submenu shows the available groups.
• **Tracked**: Filters all clips with motion tracking.
• **Noise Reduction**: Filters all clips using noise reduction.
• **OpenFX**: Filters all clips using OpenFX.
• **Different Frame Rate**: Filters all clips with frame rates that don’t match that of the project.
• **Edit Sizing**: Filters all clips that have had any Edit Sizing parameters adjusted.
• **Input Sizing**: Filters all clips that have had any Input Sizing parameters adjusted.
• **Common Media Pool Source**: Filters all clips sharing the same source in the Media Pool as the current clip.
• **Matte Nodes**: Filters all clips with an exposed Matte node in the Node Editor.
• **Mattes Available**: Filters all clips with a matte assigned to them, whether they’re used or not.
• **Collaborative Update Available**: (Only available in Collaborative Mode) Filters all clips that have been flagged as having been updated during a collaborative workflow.

### Creating and Using Smart Filters

If none of the preset filters does what you need, you can create your own custom Smart Filter in order to sift out clips based on any of the intrinsic or user-entered metadata that’s available in the Metadata Editor, Media Pool, and Color page timeline. Smart Filters work much the same way as Smart Bins, and they’re created and edited using the same procedures. For more information on Smart Bins, see Chapter 11, “Adding and Organizing Media with the Media Pool.”

In fact, Smart Filters can be very sophisticated, allowing you to filter the contents of the Thumbnail timeline by multiple criteria, and using multiple groups of multiple criteria for situations where you need to find clips that match all of one set of criteria, but only one of a second set of criteria. In this way, you can create Smart Filters to solve a wide variety of workflow needs as you work in the Color page.
It’s important to point out, however, that as much intrinsic metadata is available to every clip in DaVinci Resolve (clip properties including frame rate, frame size, codec, file name, and so on), the more time you take entering extra metadata in the Metadata Editor to prepare your project for work for editing and grading (for example, entering scene and take information, and keywords for things like character names, day and night, interior and exterior, framing, and so on), the more powerful Smart Filters can be in helping you to sift and sort through the contents of a program you’re grading.

Imagine being able to filter out all the closeups associated with a particular person in a program, or finding all the establishing shots corresponding to a particular location. If you or an assistant can take the time to enter metadata for the source material in a project that identifies these characteristics, you’ll be able to work even more quickly to match shots together and find the clips you need for any given situation.

**To create a Smart Filter:**

1. Click the Timeline Filtering drop-down button to the right of the Clips button at the top right of the DaVinci Resolve UI, and choose Create Smart Filter.

2. In the Create Smart Filter dialog, enter a name for the filter, and use the following controls to create one or more filter criteria (you can have as many filter criteria as you like):

   ![The Create Smart Filter dialog](image)

   - **Match options:** For multi-criteria filtering, choosing All ensures that every single criteria you specify is met for a clip to be filtered. Any means that if only one out of several criteria is met, that clip will be filtered.

   - **Filter criteria enable checkbox:** Lets you enable or disable any criteria without having to delete it.

   - **Metadata category drop-down:** Lets you choose which category of metadata you want to select a criteria from. Each category of metadata that’s available in the Metadata Editor is available from this drop-down menu. Additionally, Color Timeline Properties (containing many properties unique to the Color page timeline) and Media Pool Properties (containing every column in the Media Pool) provide access to additional metadata you can use for filtering.

   - **Metadata type drop-down:** For choosing which exact type of metadata to use, of the options available in the selected metadata category.

   - **Metadata criteria drop-down:** Lets you choose the criteria by which to filter, depending on the metadata you’ve selected. Options include “true/false,” integer ranges, date ranges, string searches, flag and marker colors, and so on.

   - **Add filter criteria button:** Lets you add additional criteria to create multi-criteria filters. You could use multiple criteria to, for example, find all clips from Scene 2, that also contain the keyword “Diana,” that also have the keyword “CU” in order to find all the Scene 2 close-ups of Diana. Additionally, if you Option-click this button, you can add a nested match option in order to create even more sophisticated filters, where the filter must match all of one set of criteria, and any of another set of criteria.
A complicated Smart Filter with multiple criteria and a second match option setting

As you’re editing the filter criteria, the Thumbnail timeline automatically updates to show you how the Smart Filter you’re creating is working.

When you’re done editing the filter criteria, click Create Smart Filter. The resulting Smart Filter appears at the bottom of the Filter drop-down menu, and is turned on by default.

**Methods of modifying existing Smart Filters:**

- **To rename a Smart Filter:** Click the Timeline Filtering drop-down and choose the Smart Filter you want to rename from the Rename Smart Filter submenu, then change the name in the Smart Filter Name dialog, and click OK.

- **To edit a Smart Filter:** Click the Timeline Filtering drop-down and choose the Smart Filter you want to edit from the Edit Smart Filter submenu, then edit the filter criteria, and click OK.

- **To delete a Smart Filter:** Click the Timeline Filtering drop-down and choose the Smart Filter you want to delete from the Delete Smart Filter submenu. It’s immediately deleted.
Using the Lightbox

The Lightbox shows you all clips in the Timeline as a grid of thumbnails, arranged in rows from left to right and top to bottom. This lets you quickly evaluate, compare, and search for clips you want to use when making selections, creating groups, flagging clips, or when scanning for a particular scene or looking for an individual clip.

At the right of the Lightbox is a vertically oriented Timeline Ruler letting you know the timecode value at the beginning of each row of clips. At the top right is a Zoom slider that lets you change the size of the thumbnails.

Selecting a clip in the Lightbox is the same as selecting a clip in the Timeline, and right-clicking a clip in the Lightbox shows the same contextual menu items you’d see if you right-clicked a clip in the Timeline. Furthermore, you can also grade the current clip in the Lightbox using a control panel, or by exposing the color controls to grade the current clip using a mouse or other input device.

Methods of using the Lightbox:

- **To show or hide the Lightbox:** Click the Lightbox button in the toolbar.
- **To show color controls in the Lightbox:** Click the Show Color Controls button in the UI control bar above the Lightbox.
- **To show thumbnail info in the Lightbox:** Click the Clip Info button, which is the second control at the upper left-hand corner of the Lightbox, to turn each clip’s thumbnail Info off and on.
• **To resize clips in the Lightbox:** Drag the Zoom slider to the right to increase thumbnail size, or to the left to decrease thumbnail size.

The contents of the Lightbox can be filtered using the same options that are available for filtering the Thumbnail timeline.

**To filter the Lightbox:**

1. Click the Show sidebar button at the upper left-hand corner of the Lightbox. This reveals all of the filtering options that are available in the Lightbox, including custom Smart Filters you’ve created.

2. Click one of the options appearing in the sidebar. The Lightbox should immediately update to show just those clips that match the selected criteria.

3. To go back to seeing every clip in the Timeline, click All Clips.

The Lightbox can also be output to video, in order to see its contents on a broadcast display or projector.
To output the contents of the Lightbox to video:

Click the Output Lightbox to Video button at the upper right-hand corner of the Lightbox.

The button for outputting the Lightbox to video

For more information about clip selections, groups, and grade management, see Chapter 123, “Grade Management.”
Chapter 116

Automated Grading Commands and Imported Grades

While DaVinci Resolve has a wide variety of manual grading controls that afford you control over just about every component of digital imagery, DaVinci has spent a lot of time investigating ways of increasing colorist efficiency by creating automated grading tools. Furthermore, with integrated editing bringing professional editors into the world of editing, grading, and finishing in DaVinci Resolve, the same automated tools being developed to help colorists go home earlier can also be used to give non-colorists a hand in taking care of simple grading tasks.

Color Match Palette

If the camera and lighting departments had the foresight to shoot a color test chart for each of the major lighting setups in the project you’re grading, DaVinci Resolve lets you superimpose a sampling grid over a chart in a clip and mathematically analyze the sampled colors to generate an automatic correction. Using controls in the Color Match palette, you can specify the Source Gamma, Target Gamma, and Target Color Space to make sure that the resulting correction is correct for the camera you used, and the project you’ve set up.

The Color Match palette works with several standardized color charts:

- Datacolor SpyderCheckr 24
- DSC Labs ChromaDumonde 24+4
- DSC Labs SMPTE OneShot
- X-Rite ColorChecker Classic
- X-Rite ColorChecker Classic - Legacy
- X-Rite ColorChecker Video
- X-Rite ColorChecker Passport Video

The result is analyzed to generate an automatic color correction to use to create a neutral grade for the image, to use as a starting point for the rest of your grade.
Tips for Properly Shooting a Color Chart

The results you get using Color Match are completely dependent on how the charts were shot in the field. If the charts were properly shot, you’ll get great results. If the charts were improperly shot, the results will be unpredictable.

To get the best results using Color Match, adhere to the following guidelines:

- The chart must be lit evenly such that the lighting on each patch is the same intensity (level) and color. Any shadows or changes in lighting color across the chart will result in Color Match trying to compensate for these changes, and an inaccurate match will result. When viewing a chart being lit prior to a shoot shooting via a waveform monitor, the top of each individual patch as seen on the scope should appear as a rectangle with a “flat top.”

(Left) Poorly lit chart with irregularly topped waveforms,  
(Right) Well lit chart with flat-topped waveforms

- No patches on the chart should be clipped in any of the RGB color channels. A clipped channel will force Color Match to use incorrect RGB values, and the resulting match will be inaccurate.

- The white patch on the recorded chart should be captured between 70–95 IRE. Correct exposure is essential to getting a good result, and while Color Match does allow for some adjustment via the White Level option, this will only give accurate results if the original chart is shot so that the white patch sits within the 70–95 IRE range when viewed on a waveform monitor. It is not recommended that a white patch be shot with a signal level above 95 IRE, since this usually means that one of the RGB channels is close to or actually clipping which will cause an inaccurate match.

- The Source Gamma setting must be set to match the encoded OETF (opto-electrical transfer function, or gamma) of the recorded image. To be able to create an accurate adjustment, the Color Match function requires image data that is scene linear (linear to light). Most captured or recorded image data is encoded with a tone curve (gamma...
To maximize the efficiency of the bit depth being used, and different cameras use different gamma curves to maximize the image data from different sensors. Since the Color Match algorithm converts image data into a scene linear space before creating an adjustment, it needs to undo the gamma curve created by the camera or debayering process. If the wrong Source Gamma setting is selected in the Match Color palette, then the data will not be linearized correctly and the resulting match will be inaccurate.

- Lighting in the scene with an unusual spectral response or a strong color cast can cause an inaccurate match. Scenes lit with lights that have an unusual spectral response (such as cheap fluorescent bulbs, or mercury vapor fixtures that exhibit a very narrow or spiky spectral power distribution) can cause metameric errors in both the camera’s response and the Color Match function, resulting in the creation of an inaccurate adjustment. The most accurate results are obtained when the scene uses lighting with a chromaticity that is close to the black body locus (with a highly correlated color temperature) and a relatively smooth spectral power distribution. In other words, use high-quality lighting that doesn’t have spikes in specific parts of the spectrum.

- Large differences between the color temperature of the lighting shining directly on the chart and ambient lighting elsewhere in the scene can cause perceptual errors. Often the problem is one of perception and not an incorrect color adjustment. For example, outdoor scenes being artificially lit with instruments shining extremely warm light (low color temperatures of 3200K or less) but that have cooler ambient lighting may appear overly blue if matched with a Target Color Temp of 6500K. This happens because the chart under direct lighting is lit at the lower (yellower) color temperature, but areas of the scene in shadow are much cooler because of the ambient “blue” light from the sky; the result is an automatic color adjustment that’s correct for the chart, but exaggerated in the background.

How to Use Color Match

The following procedure shows how to use the Color Match palette and overlay to create a color correction.

To sample a color chart to make an automatic correction:

1. Select the clip with a chart you want to sample. If necessary, you can use the View > Show Current Clip With Handles option to show additional frames at the beginning of the current clip to reveal a color chart in the leader of your media.

2. If necessary, choose an option from the Source Gamma drop-down menu that corresponds to the gamma with which the media was recorded.
3 Then, choose a target gamma and color space that corresponds to the format you want this clip to be matched to.

4 Click the Viewer tool drop-down, choose the Color Chart overlay, and use its corner-pin pinning controls to line the sampling boxes up with the color patches of the chart.

5 When you're finished, click the Match button, and the clip will be automatically corrected.

**TIP:** Keep in mind that not every shot needs to have a chart. If the lighting of the location used in a scene is consistent, you really only need a single chart analysis to generate a correction that you can copy to all other clips in the same scene. Of course, if you are using multiple cameras in a scene, you should have a chart analysis for each separate camera if you want to try and match them more closely together.

**Configuration Controls**
Here's a more detailed explanation of each of the parameters found in the Color Match palette.

- **Source Gamma:** Defines the source gamma the media was recorded with. You must select the correct gamma or the results will not be as accurate.

- **Target Gamma:** Lets you select a target gamma that you want the corrected clip to use. While this will most likely be the gamma you’re outputting the finished program at, you can choose other target gamma values for specialized workflows.
• **Target Color Space**: The color space you'll be outputting the finished program with.

• **Color Temp**: An adjustable color temperature control that lets you manually adjust the target color balance of the resulting correction to be warmer (lower values) or cooler (higher values). The default is 6500K.

• **White Level**: A checkbox that’s disabled by default, which lets you manually choose the target white point that the automatic correction should use. Raising or lowering this value will stretch or compress the contrast of the final correction.

• **Match button**: Once you've chosen the appropriate settings, and aligned the color match target with the chart that was recorded, click to execute the match.

• **Chart type drop-down menu**: You can choose from among the supported chart types in this drop-down. At the time of this writing, these include the Datacolor SpyderCheckr24, the ChromaDuMonde 24+4, the DSC Labs SMPTE OneShot, the X-Rite ColorChecker Classic, the X-Rite ColorChecker Classic - Legacy, the X-Rite ColorChecker Video, and the X-Rite ColorChecker Passport Video.

• **Reset All button**: Resets all controls and adjustments in this palette.

### Reset Controls

The Color Match option menu has a variety of commands you can use to reset your work in the Color Match palette.

- **Reset Match Configuration**: Resets the Configuration parameters described above.

- **Reset Applied Match**: Resets the matching operation without resetting the Configuration controls.

### Automatic Adjustments in the Color Wheels Palette

There are four controls found in the Color Wheels palette that can be used for automatically making different color adjustments, in order to give you a head start whenever you’re trying to neutralize a color cast in the image or choose better black and white points for exposure.

### White Balance Eyedropper

The White Balance eyedropper, found at the bottom-left corner of the Color Wheels palette next to the Automatic Correction button, provides an automated way of neutralizing a color cast in your image that you can guide by manually selecting a feature in the image that is supposed to be white.

**To auto white balance an image with an undesirable color cast or tint:**

1. Click the White Balance eyedropper button. The pointer turns into the White Balance eyedropper.
2 In the Viewer, click on any feature that is supposed to be white such as a white wall, white trim around a window, white blinds, a white shirt, and so on. As you drag the eyedropper around, the RGB values appear as a tooltip to give you a better idea of what the color is of the feature you’re about to click on. Make sure the feature you click on is (a) supposed to be white, and not off-white, and (b) that it corresponds to an image detail that’s not clipped, because that can make parts of the image seem white that aren’t really.

As a result, the white balance of the image should appear much more neutral than before. Note that this adjustment is not applied via any of the controls in the Color Wheels palette; it’s an invisible, self-contained adjustment.

Pick Black Point and Pick White Point

The Pick Black Point and Pick White Point eyedropper controls, found at the upper left-hand corner of the Lift and Gain controls of each mode of the Color Wheels palette, let you both adjust contrast by lowering the black point or raising the white point of the image, and also corrects for unwanted color casts in the shadows or highlights of the image.

Note: It’s easy, using the Pick Black and White Point controls, to inadvertently boost the highlights or lower the shadows so much that you end up clipping part of the image. To give these controls the best chance of succeeding, it’s advisable to find the absolute brightest or darkest parts of the image to sample, according to the following instructions.

To automatically adjust the black point of an image:

1 Click the Pick Black Point control. The pointer turns into the Black Point tool.

2 In the Viewer, click on any feature that is supposed to be black such as the deepest part of a shadow in the background or within a fold of clothing, black fabric, or something painted black. As you drag the Black Point tool around, the RGB values appear as a tooltip to give you a better idea of what the color is of the feature you’re about to click on. Make sure the feature you click on is (a) supposed to be black, and not some very dark hue, and (b) that it corresponds to an image detail that’s not clipped, because that can make parts of the image seem black that aren’t really.

As a result, the darkest parts of the image should appear much darker than before, and any color imbalance in the shadows should be neutralized. Unlike the White Balance eyedropper, this adjustment is applied via the Lift controls in the Color Wheels palette, which should appear with some manner of adjustment as a result.
To automatically adjust the white point of an image:

1. Click the White Point control. The pointer turns into the White Point tool.

The Auto Pick White Point control

2. In the Viewer, click on any feature that is supposed to be white such as a white wall, white trim around a window, white blinds, a white shirt, and so on. As you drag the White Point tool around, the RGB values appear as a tooltip to give you a better idea of what the color is of the feature you’re about to click on. Make sure the feature you click on is (a) supposed to be white, and not off-white, and (b) that it corresponds to an image detail that’s not clipped, because that can make parts of the image seem white that aren’t really.

As a result, the lightest parts of the image should appear much lighter than before, and any color imbalance in the highlights should be neutralized. Unlike the White Balance eyedropper, this adjustment is applied via the Gain controls in the Color Wheels palette, which should appear with some manner of adjustment as a result.

Auto Color

The Auto Color command provides a quick way to automatically balance the blacks and whites of a clip based on the current frame at the position of the playhead. As of DaVinci Resolve 16, the A button in the Color Wheels palette and the Shot Match command available from the Thumbnail Timeline contextual menu both now use advanced algorithms, based on the DaVinci Neural Engine, to provide superior results when automatically adjusting color balance and contrast. These controls have been developed to provide optimal results when working in the Rec.709 color space, and at a gamma of 2.4, so they work well in conjunction with using Resolve Color Management (RCM) to normalize media first.

- The A button performs an automatic analysis of the current frame at the playhead to give a more consistently useful neutral starting point for further adjustment.
- The Shot Match command matches one or more clips to the color and contrast of a graded or ungraded target clip. This updated version of Shot Match has been designed to be used after you’ve used the A button on each clip in the operation, the clips you’re matching and the clip you’re matching to.

If you’re in need of a fast neutral starting point for a range of clips, you can also use these commands together, grading a target clip using the A button, and then using Shot Match to match a range of clips in the same scene to the automatically graded example. Please note that these commands are intended to provide you with a reasonably neutral starting point for continued grading; they’re not meant to create creative or artistic grades.
To make an automatic correction, do one of the following:

- Open the Color Wheels palette to any mode, and click the A button in the lower left-hand corner.
- Choose Color > Auto Color (Option-Shift-C).
- Press the AUTO COLOR button on the T-bar panel.

The advantage of Auto Color is that it gives you an immediate result for any clip without the requirement for sampling the image or having a specific test pattern to analyze, but the disadvantage is that this lack of guidance makes the usefulness of this command somewhat hit-or-miss. When it works, it can work very well to give you a neutral starting point for further grading. When it fails, you're better off resetting the resulting adjustment and grading the old fashioned way.

Legacy Auto Color

The previous methods for doing Auto Color and Shot Match are available from the Color panel of the User Preferences, via two checkboxes named "Use Legacy Auto Color/Shot Match." With these enabled, DaVinci Resolve looks for the darkest levels in the image to neutralize the RGB color balance in the blacks, and the brightest levels to neutralize the RGB color balance in the highlights. Furthermore, Master Lift and Master Gain are adjusted to maximize image contrast at the outer boundaries of 0 and 100 percent. Using this control with the Primaries Bars mode open makes it easier to see what's been changed after these automatic adjustments are made.

Auto Color Using the DaVinci Control Panel

If you crave a bit more control over how the automatic color adjustment is made, and you have a DaVinci control panel, you can use the cursor to choose which color values to sample when making an automatic color balancing and contrast adjustment. It's like a cross between the Auto Color control and the White and Black Point controls found in the GUI. This additional bit of guidance can make the results a lot more predictable.

To use Auto Grade to sample a feature using the DaVinci control panel:

1. Press the CURSOR button, on the trackball panel.
2. Use the fourth trackball to move the cursor to a feature you want to use to define the automatic correction. Whichever color you move the cursor over will be sampled to form the basis of the resulting color and contrast adjustment. Ideally, you should place the cursor over a feature that's supposed to be neutral, such as a black shadow, gray wall, or white T-shirt. Don't place the cursor over a feature that actually consists of saturated color, or that's overexposed, as DaVinci Resolve will overcompensate and you'll get poor results.

3. With the cursor placed over the desired neutral feature, press AUTO COLOR on the T-bar panel.

DaVinci Resolve calculates an appropriate correction, which is applied to the selected node.
Shot Match

The previously available automated color correction commands, Auto Color and Color Match, are both useful for adjusting a selected clip to give it a clean, neutral starting point when you’re either in a hurry, or if you’re having trouble manually working out a solution. However, this is only the first step in grading a scene.

After you make a general adjustment to improve the color of a clip in a scene, one of the other principal tasks of the colorist is to adjust all of the clips in that scene so that they match the clip you started with, such that they all look like they were shot at the same time and in the same place. This is called scene-to-scene color correction, scene balancing, or shot matching. While there are abundant tools in DaVinci Resolve to ease the process of doing this manually, wouldn’t it be nice if you could just select a series of clips that you want to match, and have the software do the work?

That’s exactly what Shot Match has been designed to do. Whether you’re a colorist in a hurry, trying to blast through a low-budget feature with an absurd schedule, a DIT making best light dailies who just wants to make them match a little more closely before sending media off to editorial, or an editor who isn’t fast at color correction who needs to give a rough cut a quick color balance before showing the project to the client for the first time, the Shot Match feature of DaVinci Resolve has been created to quickly make different clips in a timeline match one another more closely, with a minimum of steps.

As of DaVinci Resolve 16, the Shot Match command available from the Thumbnail Timeline contextual menu uses an advanced algorithm, based on the DaVinci Neural Engine, to provide superior results when automatically adjusting color balance and contrast. This control has been developed to provide optimal results when working in the Rec.709 color space, and at a gamma of 2.4, so they work well in conjunction with using Resolve Color Management (RCM) to normalize media first.

The updated version of Shot Match has been designed to be used after you’ve used the A button on each clip in the operation, on both the clips you’re matching and the clip you’re matching to.
Legacy Auto Color

The previous methods for doing Auto Color and Shot Match are available from the Color panel of the User Preferences, via two checkboxes named “Use Legacy Auto Color/Shot Match.” With these enabled, DaVinci Resolve looks for the darkest levels in the image to neutralize the RGB color balance in the blacks, and the brightest levels to neutralize the RGB color balance in the highlights. Furthermore, Master Lift and Master Gain are adjusted to maximize image contrast at the outer boundaries of 0 and 100 percent. Using this control with the Primaries Bars mode open makes it easier to see what’s been changed after these automatic adjustments are made.

Shot Match Guidelines

Keep in mind that Shot Match isn’t supposed to make your clips look good, it’s supposed to make them look the same as the clip you choose to match to, or to at least get as close as possible without creating a color correction that will do harm to the image. The purpose of Shot Match is to make it easier for you to match a scene’s worth of clips together so you have a starting point for building the rest of the look you want for that scene, on top of this initial match.

The clip you choose to match to may have a correction applied to it, but for the best results, you should limit yourself to simple Lift/Gamma/Gain primary adjustments. If you make Custom curve or secondary adjustments to the image, it will be much more difficult for Shot Match to give you a good result.

Shot Match works best with normalized clips. If you’ve got a timeline edited with log-encoded clips, you may want to use DaVinci Color Management to normalize all the clips in the Timeline before you use Shot Match, to get the most accurate results. It’s certainly possible to use Shot Match with log-encoded media, but the flat color signal of log-encoded media may make it harder to get good results, depending on the scene.

Furthermore, Shot Match is not the right tool to use to try and match un-normalized log-encoded clips that use different types of log encoding, such as LogC and RedLogCine, or to try and match normalized and un-normalized clips. Because log-encoding is similar to a set of red, green, and blue curve operations, Shot Match is not equipped to achieve a successful result in this situation.

Shot Match is not designed to apply corrections to clips that already have node adjustments. The results will be unpredictable, and probably won’t match. While the clip you’re matching to may have simple primary adjustments applied to it, the other selected clips that are being matched should be completely ungraded.

Lastly, Shot Match has been designed to do no harm to the image. This means if you use Shot Match to try and match an underexposed interior shot to an exterior shot exposed at high noon on a sunlit day, the Shot Match algorithm will do its best to “split the difference” in order to make the difference between these two clips less jarring, while at the same time taking care not to stretch the color and contrast adjustments being made to the underexposed clips to the point where the image falls apart.

How to Use Shot Match

There’s no way to easily describe what Shot Match does. It’s a complex algorithm designed to try and deal with an impossibly varied number of different situations. As a result, Shot Match doesn’t apply adjustments to any of the user-editable controls in the Color page. Instead, the image adjustment created by Shot Match is applied invisibly, as the very last adjustment to the node that was selected when Shot Match was used, similar to a LUT.
The procedure for using Shot Match is deceptively simple. However, getting a good result requires some careful thought in terms of choosing which clips to match to one another.

To match one or more selected clips to a specific clip:

1. Following the guidelines presented in this section, Command-click or Shift-click one or more clips that you want to be matched. The clip you want to match to may or may not be part of the selection. You may select as few as one clip, or as many as you like.

2. Next, right-click the clip you want to match all of the selected clips to, and choose Shot Match to This Clip.

If the resulting automated match looks good and plays well, then congratulations, you’ve got an excellent starting point for additional grading. However, keep in mind that even if the resulting match isn’t perfect, it may have taken care of enough inconsistencies between the clip you’re matching to and the clips that are being matched, that you need only make smaller, easier-to-spot adjustments in order to nail the final match between the shots in a scene. Either way, you can save time.
Suggestions for Using Shot Match

It’s certainly possible to select every clip in a scene and use Shot Match, and the results may be wonderful depending on what kind of visuals are in the scene. However, for other scenes, this may not always get you the best results.

Be strategic about which clips you select to match to one another. Don’t use Shot Match on shots that you know already have the same lighting, as you’ll risk having Shot Match make a minor adjustment that may actually make the shots match less well. Think of Shot Match as a tool for matching clips that look different.

It can also help to use Shot Match an angle at a time, and to do a small test before committing yourself to matching a bunch of clips. For example, suppose you have a scene consisting of angle A (an over of character 1), angle B (an over of character 2), and angle C (a master shot), and you want to match the scene entire scene to angle C since it has the best lighting. First, match one shot from angle B to your favorite shot from angle C, and see how you like the result. If it’s good, then go ahead and select every angle B clip and match them to angle C, before moving on to test one shot from angle A. This way, if there’s ever an angle that doesn’t work well using Shot Match, you can try matching it to one of the other angles in the scene that you’ve already matched to see if you get a better result.

**NOTE:** Keep in mind that, since each clip in the Timeline has its own undo stack, you cannot undo a shot match operation applied to multiple clips all at once.

Beware of clips with large areas of color in the background that don’t match any of the other angles in a scene, such as a shot-reverse-shot sequence that cuts between someone standing in a back yard and someone standing against a purple wall. You can try it to see what happens, but this kind of color distribution can often throw Shot Match results off.

Broadcast Safe

If you regularly deliver to restrictive QC standards, then you can enable Broadcast Safe in the Color Management panel of the Project Settings while you grade to limit both the luma and chroma of the video signal to one of three levels of acceptable overshoots and undershoots.

The Broadcast Safe parameters in the Color Management panel of the Project Settings

- **Broadcast safe IRE (mV) levels:** A drop-down menu for choosing one of three levels of aggressiveness when limiting the signal. Choose the range that corresponds to your QC requirements. The options are “–20 - 120” (permissive), “–10 - 110” (conservative), and “0 - 100” (very conservative).
- **Make Broadcast Safe:** A checkbox that turns broadcast safe limiting on and off.

**NOTE:** The clipping imposed by Broadcast Safe itself does not have an inherently soft roll-off. For best results, Broadcast Safe should be used in conjunction with the Soft Clip controls in the Color page, or a Soft Clip LUT (for more information see Chapter 3, “System and User Preferences”).
Black Sun Highlight Correction

If your project uses media shot with one of the Blackmagic Cinema, Production, Pocket, or Ursa cameras, and you have clips that exhibit so-called “black sun” artifacts, where bright onscreen highlights appear with a dark magenta spot, a command exists to quickly and easily remove these artifacts.

To remove black sun artifacts from Blackmagic camera footage:

Right-click the affected clip’s thumbnail in the Thumbnail timeline of the Color page, and choose Black Sun Highlight Correction from the contextual menu.

Using CDL Grades

Only available in DaVinci Resolve Studio.

There are two instances where primary grading adjustments may be applied to a clip outside of adjustments that you make within the Node Editor of the Color page. If you import a CDL (Color Decision List), then the CDL adjustment for each clip is made available to you via a contextual menu command in the Thumbnail timeline of the Color page. For more information, see Chapter 129, “Copying and Importing Grades Using ColorTrace.”
Using ARRI Looks

Only available in DaVinci Resolve Studio.

If you’ve ingested ARRIRAW media or QuickTime-wrapped Apple ProRes from an Amira, Alexa SXT or Alexa LF, or MXF-wrapped Apple ProRes from Alexa Mini LF with embedded ARRI Look metadata (CDL + LUT), the embedded look can be copied to the currently selected node in the Color page.

To copy an ARRI look from the source media to the current node:

1. Select a node in the Node Editor to which you want to apply the look data.
2. Right-click that clip’s thumbnail and choose Apply ARRI CDL and LUT. A LUT and Color Wheels adjustment will be applied to the selected node.
Chapter 117

Primary Grading Controls

This chapter focuses on the core color adjustments that you’ll be making to create “primary” corrections that alter the overall color and contrast of the image. These include clip-specific Camera Raw adjustments and the Lift/Gamma/Gain/Offset adjustments available in the Color Wheels palette, as well as more esoteric adjustments such as mixing colors between channels using the RGB Mixer.

Color Controls Covered in This Chapter

The Left Palette panel contains four palettes that relate to color and contrast adjustments in different ways. The controls found within these palettes provide the foundation for any grade, and this chapter covers how you use the Camera Raw, Color Wheels, and RGB Mixer palettes. For more information on the Motion Effects palette, see Chapter 134, “The Motion Effects and Blur Palettes.”

NOTE: If you’re using DaVinci Resolve with a computer monitor that’s smaller than 1920x1080, then the Left and Center Palette panels are consolidated into a single panel, and all the buttons in the Palette toolbar appear together.

Camera Raw

When a timeline uses clips that are linked to camera raw source media recorded from cameras from Blackmagic Design, RED, ARRI, Sony, and Vision Research, all clips in raw media formats are initially debayered using the settings found in the Camera Raw panel of the Project Settings.

However, if there are individual clips that you want to apply different raw settings to, for example altering the ISO to pull more detail out of the highlights or shadows, then you can use the controls found in the Camera Raw palette to individually alter the parameters found within.

The Camera Raw palette showing the available parameters for Blackmagic RAW media.

The Camera Raw palette is automatically set to the mode (seen within the Mode drop-down menu) that is appropriate to the clip that’s currently selected. If the current clip is not in a raw format, then the parameters within the Camera Raw palette are disabled.

All settings that currently populate the Camera Raw palette are also accessible from the DaVinci control panel.
To access camera raw settings on the DaVinci control panel:

1. Press the CAMERA RAW soft key on the Center panel.
2. Use the Center panel knobs to make camera raw parameter adjustments.
3. When you’re finished, press the MAIN soft key to return to the main page of controls.

This section covers general use of the Camera Raw palette. For in-depth documentation about specific camera raw parameters, see Chapter 5, “Camera Raw Settings.”

Copying, Versioning, and Protecting Camera Raw Settings

Ordinarily, a clip’s camera raw settings are copied along with its grade, or saved inside stills grabbed from that clip, when you use the various grade management techniques covered in Chapter 123, “Grade Management.”

When you create new versions, you copy the current Camera Raw settings to the new version, but any changes you make are specific to that version, so each version can have individual Camera Raw adjustments. For example, you could compare the results of two different camera raw adjustments on the same clip.

If you’re copying and rippling grades among multiple clips, you can also protect each clip’s camera raw settings from being overwritten using the “Copy Grade: Preserve Camera Raw Settings” option found in the contextual menu of the Gallery. For more information on the Copy Grade settings, see Chapter 123, “Grade Management.”

Making Changes to Clip Camera Raw Settings

If you want to make individual adjustments to a particular clip’s camera raw settings, choose “Clip” from the Decode Using drop-down menu in the Camera Raw palette. This makes all the parameters in the Camera Raw palette editable, and changes you make override the project-wide camera raw settings.

Changes to the parameters in the Camera Raw palette can also be rippled across multiple clips at once.
To ripple camera raw adjustments across multiple clips:

1. First, you must select a range of clips in the Color page timeline.
2. Open the Camera Raw palette, and make whatever adjustments are necessary to the current clip. The name of each parameter you adjust changes to amber, showing you which parameters have been modified, and which have not.
3. To ripple your changes, do one of the following:
   - Click the Use Changes button to ripple only the altered parameters (in amber) to the other clips you’ve selected in the Timeline. This preserves differences between clips in the parameters you haven’t adjusted (in gray).
   - Click the Use Settings button to ripple every parameter of the current clip to the other clips you’ve selected, overwriting all the camera raw settings at once.

The Use Changes and Use Settings buttons in the Camera Raw palette

Clip Decoder Settings

There’s much more information on the various format-specific Master settings, as well as the occasionally format-specific Clip Decoder settings, in Chapter 5, “Camera Raw Settings.” However, with the exception of the RED Clip Decoder settings that appear for R3D clips, most other formats share a set of DaVinci Resolve-specific controls that provide wide-latitude access to the raw image data for purposes of making different kinds of adjustments.

While specific raw formats have individual controls, the standard controls include:

- **Color Temp**: Designed to alter the “warmth” of the image. Adjustable in degrees Kelvin. Lower values correct for “warmer” lighting, while higher values correct for “cool” lighting. +6500 is unity. The range is +2000 to +50,000.
- **Tint**: Color balance correction for images with a green or magenta color cast, such as fluorescent or sodium vapor bulbs. 0 is unity. The range is –150 to +150.
- **Exposure**: Increases or lowers image lightness in units relative to f-stops. If your intended exposure adjustment lifts image data above the maximum white level, don’t worry; all image data is preserved and can be retrieved in subsequent adjustments. 0 is unity. The range is –5 to +5.
• **Sharpness:** A debayer-specific sharpness filter applied to provide the appearance of enhanced image detail. 20 is unity. The range is 0 to 100.

• **Highlights:** Makes it easy to selectively retrieve blown-out highlight detail in high-dynamic-range media by lowering this parameter, and achieves a smooth blend between the retrieved highlights and the unadjusted midtones for a naturalistic result. 0 is unity. The range is –100 through +100.

• **Shadows:** Lets you selectively lighten or darken shadow detail. Raising this value retrieves shadow detail recorded below 0 percent, while leaving the midtones alone. 0 is unity. The range is –100 through +100.

• **Color Boost:** A non-uniform saturation operation that affects regions of low saturation more than regions of high saturation. This is sometimes referred to as a vibrance operation. 0 is unity, showing the original color values. Raising color boost from 0-100 increases color intensity, but low-saturation parts of the image are raised more aggressively. Lowering Color Boost from 0 to -100 decreases color intensity, but low-saturation parts of the image are lowered more aggressively. 0 is unity, showing unaltered saturation. The range is –100 through +100.

• **Saturation:** A uniform saturation operation that raises (above 50) or lowers (below 50) the color intensity of every color value within the image. 50 is unity, showing unaltered saturation. The range is -100 (completely desaturated) through +100 (saturation is doubled).

• **Midtone Detail:** When this parameter is raised, the contrast of regions of the image with high edge detail is raised to increase the perception of image sharpness, sometimes referred to as definition. When this parameter is lowered to a negative value, regions of the image with low amounts of detail are softened while areas of high-detail are left alone. 0 is unity. The range is –100 through +100.

• **Lift:** Adjusts the black point of the media, raising it or lowering it while scaling all midtone values between it and the white point. Regardless of how you adjust this control, all image data is preserved and can be retrieved in subsequent adjustments. The range is –100 to +100.

• **Gain:** Adjusts the white point of the media, raising or lowering it while scaling all midtone values between it and the black point. Regardless of how you adjust this control, all image data is preserved and can be retrieved in subsequent adjustments. 0 is unity. The range is –100 to +100.

• **Contrast:** Raising contrast reduces shadows and raises highlights, while leaving midtones at 50 percent unaffected. Regardless of how you adjust this control, all image data is preserved and can be retrieved in subsequent adjustments. 0 is unity. The range is –100 to +100.

### Resetting Camera Raw Settings

If you’ve made changes to the parameters of the Camera Raw palette and you decide you need to reset them, there are two options, found in the Options menu.

- **Reset:** Resets all parameters in the Camera Raw palette to their default settings.
- **Revert:** Similar to the “Original Memory” command, Revert changes all camera raw parameters back to the state they were at when you first selected the current clip.
Updating Sidecar Settings for Blackmagic RAW (BRAW) Clips

Blackmagic RAW clips support both embedded look metadata within the .braw media clip and external look metadata in .sidecar files. Ordinarily, these files travel in pairs whenever you manage BRAW media, and whenever a .sidecar file is present, its settings override those of the embedded metadata within the actual .braw clip. Since the .sidecar metadata is in human-readable JSON formatted text, it’s easy to edit and accommodates a wide variety of onset to post-production workflows.

If you like, you can make changes to the raw look metadata of a .braw clip and upgrade the .sidecar metadata from within the Color page of DaVinci Resolve, so the media on disk reflects these changes in any other BRAW compatible application.

To update the .sidecar raw look metadata:

1. Open the Color page, select a .braw clip in the Thumbnail timeline, and open the Camera Raw palette.
2. Set Decode Using to Clip to enable the palette controls.
3. Make whatever adjustments you want to make using the controls of the Camera Raw palette.
4. When you’re done, click the Update Sidecar button.
Color Wheels Palette

If you’ve had any exposure to color correction tools in any application, the controls found within the Color Wheels palette should look familiar. These controls correspond to the most basic color correction functionality available in DaVinci Resolve, and are designed to let users without control panels have easy access to color balance and YRGB contrast manipulation using a mouse, tablet, or trackpad.

![Color Wheels for primary grading, in Primaries mode](image)

The Color Wheels palette has three distinct modes of operation:

- **Primaries Wheels mode** contains the traditional DaVinci Lift/Gamma/Gain/Offset controls that allow tonally specific yet widely overlapping regions of adjustment.
- **Primaries Bars mode** affects the same Lift/Gamma/Gain/Offset controls as the Primaries Wheels mode, but the bars interface lets you make vertical slider-driven adjustments to YRGB lift, YRGB gamma, and YRGB gain, as well as providing a slider-driven interface for Offset.
- **Log mode** contains Shadow/Midtone/Highlight/Offset controls that offer more restrictive yet customizable regions of adjustment intended for making adjustments to log-encoded image data.

Which mode you use depends entirely on what kinds of adjustments you need to make.

Opening the Color Wheels Palette

**Using the DaVinci Control Panel**

You can open any mode of the Color Wheels palette by doing one of the following:

- **To open the Primaries Bars:** Press SHIFT DOWN and then PRIMARY.
- **To open the Color Wheels:** Press SHIFT UP and then PRIMARY.
- **To open the Log controls:** Press SHIFT DOWN and then PRIMARY. Alternately, you can open any of the other Color Wheels palette modes, and then press the LOG soft key on the Center panel of the DaVinci control panel. Press the MAIN soft key to return to the more traditional Lift/Gamma/Gain mode of adjustment.
HDR Grading Using Color Wheels Palette Controls

When using various grading controls in the Color page to grade wide-latitude images for HDR output, you may find it useful to enable the HDR Mode of the node you’re working on by right-clicking that node in the Node Editor and choosing HDR Mode from the contextual menu (only available in Resolve Studio).

This setting adapts that node’s controls to work within an expanded HDR range. Practically speaking, this makes it easier to work with wide-latitude signals using controls that operate by letting you make adjustments at different tonal ranges such as Lift/Gamma/Gain, Custom Curves, Soft Clip, and so on.

How to Use Color Balance Controls and Master Wheels

Each of the modes in the Color Wheels palette use the same controls, albeit in different ways. This section explains, in a generic way, how to use these controls to make adjustments.

Color Balance controls provide a way to adjust all three color channels simultaneously with a single move of the pointer, according to the mode that’s currently selected. These controls correspond to the trackballs found on the DaVinci control panel, but there are a variety of keyboard modifiers that let you make specific adjustments via the GUI.

To make adjustments using the Color Balance controls:

- **Click and drag anywhere within the color ring:** Moves the Color Balance indicator relative to its previous position, and rebalances the three color channels in whatever range of image tonality is governed by that control. You don’t need to drag the Color Balance indicator itself. This simulates the kind of relative control you get when using a trackball to manipulate these parameters. As the Color Balance indicator moves, the RGB parameters underneath change independently to reflect the independent adjustments being made to each channel.

- **Shift-click and drag within the color ring:** Jumps the Color Balance indicator to the absolute position of the pointer, letting you make faster, more extreme adjustments to the color balance governed by that control.

- **Double-click within the color ring:** Resets the color adjustment without resetting the corresponding contrast adjustment for that control.

- **Command-click and drag within the color ring:** Adjusts YRGB contrast identically as if you were dragging that control’s master ring.

- **Click the reset control at the upper-right of a color ring:** Resets both the Color Balance control and its corresponding master ring.
The Master Wheels, located below the Color Balance controls, let you adjust the YRGB channels together to adjust Lift, Gamma, and Gain by individually adjusting the black point, the white point, and distribution of midtones that fall in-between. This has the practical effect of letting you adjust image contrast when you manipulate any two of these wheels together.

The Master Wheels correspond to the rings surrounding the trackballs on the DaVinci control panel, which let you modify image contrast via YRGB adjustment (as opposed to modifying image contrast via Y-only adjustment, covered later in this chapter).

**To adjust a Master Wheel:**
- Dragging a Master Wheel to the left makes the corresponding tonal region of the image darker, and dragging it to the right makes that tonal region of the image lighter. The effect will vary according to the Color Wheels mode you’re in. As you make an adjustment, the YRGB parameters located underneath all change together to reflect the simultaneous adjustment you’re making to all channels.

Each Color Balance Control and Master Wheel pair also have a set of four YRGB number fields underneath that display the YRGB adjustment being made by both controls. These fields can be edited like any other parameter on the Color page. Even though these values display two decimal places of precision because of space restrictions in the interface, they really contain three decimal places of precision since these are floating point operations; you just can’t see the third decimal place.

**To edit YRGB values directly:**
- You can double-click on a field to edit its value numerically
- You can cut, copy, and paste values among fields
- You can click on the field and drag left or right to adjust its value with a virtual slider.

Understanding the Primaries Wheels Controls

The Color Wheel palette’s Primaries Wheels mode lets you rebalance color and adjust contrast via the traditional DaVinci controls, which govern three overlapping tonal ranges referred to as Lift, Gamma, and Gain. The Lift/Gamma/Gain color balance and Master Wheel controls are tied to the YRGB Lift/Gamma/Gain sliders found in the Primaries palette; adjustments made to one set of controls are mirrored in the other.
Though they may look different, the Primaries Wheels and Primaries Bars actually adjust the same components, but in different ways.

These tonal ranges are defined by image lightness, on a scale where 0 is absolute black and 1023 is absolute white. The following illustration shows an approximation of how the Lift, Gamma, and Gain tonal zones broadly overlap, and how each zone’s influence falls off towards the opposing extremes of image tonality.

The Lift color balance control region of influence starts at black, and then falls off through the middle grays to diminish to no influence at white. Meanwhile, the Gamma color balance control has its greatest influence over the image in the middle grays, and its influence diminishes towards black and white. Lastly, the Gain control is the inverse of Lift, having its greatest effect on the image at white, with its influence falling off to diminish at black.

Because these tonal ranges overlap so broadly, you can make very soft, subtle, naturalistic adjustments using these controls. Furthermore, you can capitalize on their overlap by moving an adjacent color balance control toward a color that’s complementary to an adjustment you’ve just made to restrict further how much of the image is affected.
The following image shows the interaction of extreme corrections made to a grayscale image using all three Color Balance controls. Lift has been pushed toward green, Gamma has been pushed toward blue, and Gain has been pushed toward red.

![Extreme adjustments showing the overlap of the Lift, Gamma, and Gain color balance controls](image)

Notice how, even though these corrections are extreme, the colors blend smoothly. This is the reason for the broad overlap among all three controls, and why Lift, Gamma, and Gain are so effective in making corrections to the ambient color temperature of a scene to account for inconsistencies in lighting or camera settings.

### 3-Way Master Wheel Adjustments

The Master Wheels located below the Color Balance controls let you precisely modify image contrast by YRGB adjustments, which individually alter the black point, the white point, and distribution of midtones that fall in-between.

These controls correspond to the rings surrounding the trackballs on the DaVinci control surface.

- **Lift**: Lets you adjust the perceived shadow density of the image by altering the black point of the image. Dragging the Lift master wheel to the left makes the darkest values in the image darker, increasing the distance between the black and white points of the image, and stretching all the midtone values in-between. Dragging the Lift master wheel to the right makes the darkest values in the image lighter, reducing contrast and squeezing all the midtone values between the black and white points.

- **Gamma**: Lets you adjust the overall perceived lightness of the image by altering the distribution of midtones that fall between the Lift and Gain master wheel settings. Dragging the Gamma master wheel to the left darkens the overall image, while dragging it to the right brightens it. Most Gamma contrast adjustments have a minimal effect on the black and white point of the image, but large adjustments may push either boundary of image lightness farther out. This interaction is described in more detail below.

- **Gain**: Lets you adjust the lightness of the highlights by altering the white point of the image. Dragging the Gain master wheel to the left makes the lightest values of the image darker, squeezing the midtones between the white and black points of the image. Dragging Gain to the right makes the lightest values even lighter, eventually clipping at maximum white.
These contrast adjustments are not limited by one another. For example, raising or lowering the Gamma master wheel by a large amount may push the highlights of the image higher or the shadows of the image lower, regardless of the current Lift or Gain contrast setting.

As a result, these controls are somewhat interactive, and you may find yourself going back and forth between controls as you make your final contrast adjustments. This is one of the reasons a control surface is valuable, as it allows you to adjust all three settings simultaneously.

**Offset Color and Master Controls**

The fourth set of Color Balance and Master Wheel controls is actually shared with the Log controls and with the Offset sliders in the Primaries palette. These are the Offset controls, which let you make linear adjustments to rebalance the entire tonal range of the RGB channels.

- **The Offset color balance control:** Works as a simultaneous adjustment to all three Offset sliders located in the Primaries palette; adjustments made to the Offset color balance control also alter the Offset sliders. Used subtly, this makes it easy to neutralize color imbalances in the darkest part of the image, while simultaneously rebalancing every other part of the image. Used more dramatically, this control makes it easy to add a color wash throughout the entire image.

- **The Offset master wheel:** Acts as a global adjustment to image lightness, an operation sometimes referred to as setup, raising or lowering all YRGB channels together.

When using a DaVinci control surface, the Offset color balance control is adjusted in either Lift/Gamma/Gain or Log modes via the fourth trackball, while the Offset wheel is adjusted via the ring surrounding the fourth trackball.

**Shared Adjustment Controls**

The three modes of the Color Wheels palette all share two pages of controls for making more specific adjustments to different aspects of the image such as Contrast, Saturation, Hue, Highlight retrieval, Color boost, and so on.

**Page 1 Adjustment Controls**

The shared Contrast, Pivot, Saturation, Hue, and Lum Mix controls are located in a set of "Page 1" controls found at the bottom of the Color Wheels palette.
The Contrast parameters let you quickly narrow or widen image contrast about a user-definable pivot point. Regardless of which mode you’re in, these parameters are identical. Contrast and pivot can also be adjusted using the DaVinci control surface via the CONTRAST and PIVOT knobs on the Center panel’s default page, regardless of whether you’re in Lift/Gamma/Gain or Log mode.

- **Contrast:** This one parameter lets you increase or reduce the distance between the darkest and lightest values of an image, raising or lowering image contrast. The effect is similar to using the Lift and Gain master controls to make simultaneous opposing adjustments. Bright and dark parts of the image are pushed apart or brought together about a center point defined by the Pivot parameter. The “Use S-curve for contrast” setting in the General Options panel of the Project Settings (on by default) sets the contrast control to apply an “S-curve” to the image, such that the shadows and highlights of a signal will not be clipped when you increase the value. If you would prefer for these contrast adjustments to be made linearly, and for the signal to be allowed to clip when you reach the upper and lower boundaries of the video signal, you can turn this checkbox off.

- **Pivot:** Changes the center of tonality about which dark and bright parts of the image are stretched or narrowed during a contrast adjustment. Darker images may require a lower Pivot value to avoid crushing the shadows too much when stretching image contrast, while lighter images may benefit from a higher Pivot value to increase shadow density adequately.

The Saturation, Hue, and Lum Mix parameters mirror the three knobs found at the right of the Center panel of the DaVinci control surface.

- **Saturation:** A uniform saturation operation that raises (above 50) or lowers (below 50) the color intensity of every color value within the image. 50 is unity, showing unaltered saturation. The range is 0 (completely desaturated) through +100 (saturation is doubled).

- **Hue:** Rotates all hues of the image around the full perimeter of the color wheel. The default setting of 50 shows the original distribution of hues. Raising or lowering this value rotates all hues forward or backward along the hue distribution as seen on a color wheel.

- **Lum Mix:** Lets you control the balance between YRGB contrast adjustments you’ve made using the Master Wheels or ganged Custom curves, and Y-only adjustments to contrast made using the Y channel Lift/Gamma/Gain controls of the Primaries palette or the unganged Luma curve. At the default of 100, YRGB and Y-only adjustments to contrast contribute equally. Reducing this value diminishes the effect of Y-only contrast adjustments until, at 0, Y-only contrast adjustments are turned off.

Additionally, you’ll notice that at the default Lum Mix setting of 100, individual adjustments to R, G, or B using the RGB sliders or unganged Custom curves result in automatic adjustments being made to the other two color channels in order to maintain constant Luma levels. At a Lum Mix setting of 0, individual color channel adjustments have no effect on the other color channels.

Like most parameters in DaVinci Resolve, clicking and dragging a parameter’s name or value to the left or right lowers and raises that parameter with a virtual slider, while double-clicking that parameter’s number lets you edit it numerically, and double-clicking that parameter’s name resets the parameter to its default position.
Page 2 Adjustments Controls

The “Page 2” section of the Color Wheels palette has the same kind of highlight and shadow recovery, Color Boost, and Midtone Detail controls that are found on the Camera Raw palette. If you’re grading a camera raw format, then these controls on the Camera Raw palette will give you greater latitude for adjustment. However, the identically named controls in the Color Wheels palette can be used for any media format you like.

The Page 2 adjustment controls

Even though you won’t have the kind of wide latitude that you do when using these controls with raw clips, you can still accomplish quite a lot, depending on the format you’re adjusting.

- **Temperature**: A specifically constrained Gain color balance adjustment that lets you adjust the image along a warm/orange to cool/blue axis corresponding to the naturalistic spectrum of color temperatures used for lighting. Raising this parameter performs a Gain color balance adjustment toward orange, while lowering this parameter to a negative value performs a Gain color balance adjustment toward a blue/cyan split. 0 is unity. The range is –4000 to +4000.

- **Tint**: A specifically constrained Gain color balance adjustment that lets you adjust the image along a magenta to green axis corresponding to the unnatural spectrum of color temperatures found in artificial lighting sources such as fluorescent and sodium vapor lighting fixtures. Raising this parameter performs a Gain color balance adjustment toward magenta (sometimes referred to as “minus green” to correct for fluorescent lighting), while lowering this parameter to a negative value performs a Gain color balance adjustment toward green (“plus green” to correct for other kinds of lighting). 0 is unity. The range is –100 to +100.

- **Midtone Detail (MD)**: When this parameter is raised, the contrast of regions of the image with high edge detail is raised to increase the perception of image sharpness, sometimes referred to as definition. When this parameter is lowered to a negative value, regions of the image with low amounts of detail are softened while areas of high-detail are left alone. 0 is unity. The range is –100 through +100.

- **Color Boost**: A non-uniform saturation operation that affects regions of low saturation more than regions of high saturation. This is sometimes referred to as a vibrance operation. 0 is unity, showing the original color values. Raising color boost from 0-100 increases color intensity, but low-saturation parts of the image are raised more aggressively. Lowering Color Boost from 0 to -100 decreases color intensity, but low-saturation parts of the image are lowered more aggressively. 0 is unity, showing unaltered saturation. The range is –100 through +100.

- **Shadows**: Lets you selectively lighten or darken shadow detail. Raising this value retrieves shadow detail recorded below 0 percent, while leaving the midtones alone. 0 is unity. The range is –100 through +100.

- **Highlights**: Makes it easy to selectively retrieve blown-out highlight detail in high-dynamic-range media by lowering this parameter, and achieves a smooth blend between the retrieved highlights and the unadjusted midtones for a naturalistic result. 0 is unity. The range is –100 through +100.
Auto Correction in the Primaries Mode Controls

The Auto Color command provides a quick way to automatically balance the blacks and whites of a clip based on the current frame at the position of the playhead. As of DaVinci Resolve 16, the A button in the Color Wheels palette and the Shot Match command available from the Thumbnail Timeline contextual menu both now use advanced algorithms, based on the DaVinci Neural Engine, to provide superior results when automatically adjusting color balance and contrast. These controls have been developed to provide optimal results when working in the Rec.709 color space, and at a gamma of 2.4, so they work well in conjunction with using Resolve Color Management (RCM) to normalize media first.

For more information on using these, see Chapter 116, “Automated Grading Commands and Imported Grades.”

The Log Mode of the Color Wheels Palette

The Shadow/Midtone/Highlight color balance and Master Wheel controls operate independently of the Lift/Gamma/Gain color balance and Master Wheel controls found in the Primaries mode. While the Log mode uses the same types of controls as the Primaries mode, the way each control affects the image is very different.

To switch between the Primaries and Log modes of the Color Wheels:
Choose an option from the mode drop-down, click the right mode button, or press Option-Z.

Log color wheels, with behavior that is very different from the Primaries mode color wheels

There are two ways of using the Log mode controls. The first takes advantage of the way these controls work to make fast, filmic adjustments to log-encoded media while it’s being normalized or “de-logged” by operations that are performed using nodes appearing after it in the image processing pipeline of your node tree. Normalizing or de-logging the image can be done via Color Space Transform operations, LUTs, and manual adjustments if you’re grading using DaVinci YRGB color science. If you’re using color management, they can be done via the Output Color Space setting of Resolve Color Management (RCM), or via the ACES Output Device Transform (ODT).

The other way of using the Log controls is to take advantage of the more restrictive, but adjustable tonal range of the Shadow/Midtone/Highlight controls to stylize normalized clips by tinting or adjusting the contrast of tonally-specific regions of the image.
Whether or Not to Use Legacy Log Grading Ranges and Curve

DaVinci Resolve 12.5 introduced a modification to the Log grading controls that provides smoother, more pleasing results using the same controls. To maintain backward compatibility with older projects, a "Use legacy Log grading ranges and curve" checkbox in the General Options panel of the Project Settings lets you switch your project between the older Log control behavior and the newer one. Older projects that are opened in DaVinci Resolve have this checkbox turned on by default, while new projects have this turned off by default.

Using the Log Mode Controls to Grade Log-Encoded Media

The Log controls are so named because they’re designed to work specifically with media with Log-C or similar gamma and color encoding, derived from the Cineon Log gamma curve, developed by Kodak to digitally store flat-contrast, wide-gamut image data that preserves image detail with a wide latitude for adjustment.

You can debayer most raw formats to a log-encoded image in order to derive the maximum amount of image data and adjustable latitude from that source (for more information, see Chapter 5, “Camera Raw Settings”). However, the resulting image needs to be normalized to occupy the final range of color and contrast that you intend for the final result. You can do this one of two ways:

- You can make a very careful curves adjustment in a second node to stretch the log-encoded image out to fit the contrast profile you want. By making this adjustment in Node 2, you make room for a customizing adjustment made using the Log controls in Node 1, prior to the normalization adjustment. This is key.
- You can also apply a 1D Output or 3D LUT to the first node of a clip to normalize the image. This is a faster, if less flexible operation, but a smooth tonal range may be easier to obtain. Since a LUT applied within a node is always the last adjustment within that node’s order of operations, you can also use Node 1’s Log controls to customize the look of the footage.
In either case, it's important that the normalizing adjustment happens after your Log control adjustments, for the Log control adjustments to work as they should. With your node tree set up in this way, you'll be monitoring an ordinary-looking image, but taking advantage of the Log mode controls' unique tonal ranges to manipulate the log-encoded image data with great specificity.

When using the Log mode controls, here's a workflow to consider as you learn how they work:

- **First,** use the Offset master wheel to set the black point, and use the Contrast and Pivot parameters to stretch or compress contrast as necessary to achieve the tonal range you require.
- **Second,** use the Offset color balance control to adjust the overall color balance of the image to your liking.
- **Third,** use the Shadow/Midtone/Highlight color balance and Master Wheel controls to make specific, targeted adjustments to the color and contrast of the image in tonal ranges that match where that data is in the log-encoded image.

Working in this way, you'll find that adjustments made with the Offset color balance and Master Wheel controls and Contrast controls control the log-encoded image very nicely to create an overall adjustment, while the Shadow, Midtone, and Highlight controls allow you to fix specific issues, such as shadow balance and density, after your main adjustment has been set.

The following illustration shows an approximation of how the default ranges of the Shadow, Midtone, and Highlight controls divide the tonal range of a log-encoded image.

As you can see, when used with a log-encoded image the color interactions between each adjustment overlap very softly, while still allowing more specific adjustments than those made by the Lift/Gamma/Gain controls.

Furthermore, the boundaries of the Shadows, Midtones, and Highlights Log controls can be customized using the Low and High Range parameters. This gives you added flexibility to apply more specific contrast and color adjustments.

Once you’ve made an adjustment using Log mode controls along with a normalizing LUT or curve adjustment, you can always apply additional nodes and use the Primaries mode of the Color Wheels palette to make further alterations to the now normalized image, working as you normally would with any of the other tools in DaVinci Resolve.
Using the Log Mode Controls to Stylize Normalized Media

You can also use the Log mode controls on normalized images. Although the results you get will be somewhat different, this can be a fast way to create interesting stylizations. Whereas the broadly overlapping tonal ranges of the Lift, Gamma, and Gain color balance controls allow subtle adjustments to be made very easily, the Log palette’s color balance controls affect much more restrictive tonal zones that overlap much less when used on normalized images.

The following illustration shows an approximation of how the Shadows, Midtones, and Highlights, by default, divide the tonal range of the image into non-overlapping thirds. As you saw in the previous section, these divisions were originally intended to map to log-encoded media. However, with normalized media these divisions provide a different, and potentially useful, set of ranges from the Primaries mode controls.

With normalized media, the Shadows really do only affect the darkest shadows, falling off at approximately the bottom third of image tonality. The Midtones affect only the middle third of grays, and the Highlights affect the brightest top third of image values. However, these default ranges of image tonality can be adjusted using the Low Range and High Range controls, which are described in more detail later.

The following image shows the default interaction of extreme corrections made to a grayscale image using the Log mode controls. The Shadows have been pushed toward green, the Midtones have been pushed toward blue, and the Highlights have been pushed toward red.

As you can see, with normalized media the color interaction between each adjustment is very subtle. The darkest shadows end up bright green, the midtone values are vivid blue, and the highlights are almost pure red. This restrictiveness is useful when you want to limit a correction to a specific tonal range within the image without needing to use a Luma qualifier. It’s also quite useful for making bold, stylistic color adjustments when creating a non-naturalistic look.
Adjusting Tone Ranges in Log Mode

Two parameters let you modify the range of Shadows and Highlights that each Color Balance control affects, in turn narrowing and widening the range of Midtones. Keep in mind that while the ranges can be customized, the amount of overlap between each range cannot.

- **Low Range**: Moves the border where the Shadows and Midtones meet. Lowering this parameter widens the range affected by the Midtones, and narrows the range affected by the Shadows. Raising this parameter narrows the Midtones and widens the Shadows.

- **High Range**: Moves the border where the Midtones and Highlights meet. Lowering the High Range parameter narrows the range affected by the Midtones, and widens the range affected by the Highlights. Raising this parameter narrows the Highlights and widens the Midtones.

There are also Saturation and Hue parameters which mimic these settings found within other palettes and modes.

Adjusting Contrast in Log Mode

When using the Log mode controls, your primary tools for adjusting image contrast will usually be the Offset master wheel and Contrast and Pivot parameters. Using these three controls, you can set a black point and adjust the overall contrast very quickly.

The Shadow, Midtone, and Highlight master wheels let you adjust image lightness within the same restrictive ranges of image tonality that are defined by the Low Range, High Range, and Pivot parameters. These adjustments should appear smooth, if somewhat narrower than the Lift/Gamma/Gain controls, when used with log-encoded media. However, when used with normalized images, severe adjustments made with one master wheel may not always make a smooth transition to the next adjacent range of image lightness.

**NOTE:** Because these controls are so restrictive when used with normalized images, it’s easy to create solarization effects by raising the shadows to be higher than the Midtones, or lowering the Highlights to fall below the Midtones, to give two examples.

Log Offset Color and Master Controls

The Log controls also share the same Offset color balance and Master Wheel controls that appear in the Lift/Gamma/Gain mode of the Color Wheels palette (which are tied to the Offset controls of the Primaries palette).

- **The Offset color balance control**: Works as a simultaneous adjustment to all three Offset sliders located in the Primaries palette; adjustments made to the Offset color balance control also alter the Offset sliders. Used subtly, this makes it easy to neutralize color imbalances in the darkest part of the image, while simultaneously rebalancing every other part of the image. Used more dramatically, this control makes it easy to add a color wash throughout the entire image.

- **The Offset wheel**: Acts as a global adjustment to image lightness, an operation sometimes referred to as setup, raising or lowering all YRGB channels together.
Switching to Log Mode Using the DaVinci Control Surface

You can switch to the Log grading mode of the currently selected node by doing one of the following:

- Press SHIFT DOWN and then PRIMARY.
- Press the LOG soft key on the Center panel of the DaVinci control surface. Press the MAIN soft key to return to the more traditional Lift/Gamma/Gain mode of adjustment.

The Primaries Bars Mode of the Color Wheels Palette

The Primaries Bars palette contains the original set of DaVinci Resolve color adjustment sliders. These sliders serve two uses. First, they’re highly visible indicators of the individual YRGB channel adjustments that are made using the trackballs, rings, and knobs of a control surface. Second, they provide control of individual YRGB Lift/Gamma/Gain parameters using a mouse, tablet, or trackpad.

RGB Lift/Gamma/Gain Sliders

The main controls of the Primaries Bars mode are the individual Luma (or Y), Red, Green, and Blue sliders, four each for Lift, Gamma, and Gain. These sliders correspond to a set of knobs on the POTS page of the DaVinci control surface, and provide precise Lift/Gamma/Gain style control over each of the YRGB channels of the image. When used in conjunction with a Parade Scope video analysis of the image, these controls can enable you to fix irregular color imbalances in specific channels quickly.

Additionally, the Luma (Y) Lift/Gamma/Gain sliders correspond to the three knobs arranged vertically to the left of the Center panel of the DaVinci control surface. These three controls allow easy Y-only adjustments to contrast, where an increase in contrast results in perceptually diminished color saturation.

Making Y-only adjustments to contrast is a great way to increase contrast when you’re going for muted saturation or a gritty look. This kind of adjustment is also useful in situations where you’re trying to increase shadow density without increasing image colorfulness.

Four Master Wheel controls appear underneath each group of Lift/Gamma/Gain sliders. The first three of these controls are identical to the Lift/Gamma/Gain master wheels in the Primaries mode of the Color Wheel palette, and control YRGB contrast, while the fourth is identical to the Offset master wheel found in the Log mode of the Color Wheel palette.
Finally, each group of Lift/Gamma/Gain sliders has its own reset button. To reset individual
cannels, double-click the single-letter label underneath that slider.

**To adjust RGB Lift/Gamma/Gain using the DaVinci control surface:**

1. Press the POTS soft key on the main page of the Center panel.
2. Use the variously identified LUM/RED/GREEN/BLUE and OFFSET/BLACK/GAMMA/
   GAIN knobs to make the required adjustments.
3. Press the MAIN soft key to return to the Center panel's main page.

### Offset Sliders, Offset Wheel, and Printer Points

These vertical sliders mirror the settings of the Offset color balance controls in the Color Wheel
palette, except that they provide individual control over the Red, Green, and Blue color
channels. When you drag one of the Offset sliders up or down, you raise or lower that color
channel in its entirety, which can be useful for adjusting color channels that are particularly
problematic, or for imposing the kind of traditional linear color adjustments that color timers of
film have employed for decades. In fact, many colorists consider the simplicity of these controls
a virtue, and embrace the slight shadow or highlight contamination that can result from color
balancing in this linear way as a creative hallmark of traditional cinema color adjustment.

**NOTE:** Unlike the other Color Wheels control adjustments described in this chapter,
the Offset controls do not use the Lum Mix parameter to control whether individual
adjustments to the R, G, or B channels result in automatic adjustments being made to
the other two color channels in order to maintain constant Luma levels. All Offset and
printer points adjustments made to a specific color channel affect only that
color channel.

### Adjusting Printer Points in the Primaries Bars Palette

Each Offset slider also has a pair of arrow buttons, one at the top and one at the bottom. These
buttons provide “Printer Point” adjustment of these values, which let you adjust each Offset
channel in discrete increments. Printer Points can be useful for projects that have tight
integration with a film lab, and are designed to emulate color adjustments made using
optical printers.
The "plus" and "minus" red, green, and blue buttons for making printer point adjustments

The Offset wheel control underneath the Offset sliders lets you adjust all three sliders at once, performing a setup adjustment. The Offset sliders, Printer Point buttons, and Offset wheel can be adjusted using the DaVinci control surface.

Adjusting Printer Points Using the DaVinci Control Panel

The DaVinci Resolve Advanced and Mini color grading panels have support for adjusting printer points using rotary controls for the Red, Green, and Blue channels, as well as All channels together.

To adjust the Offset sliders individually using the DaVinci Resolve Advanced or Mini panels:
Use the MASTER OFFSET, RED OFFSET, GREEN OFFSET, and BLUE OFFSET knobs on the main page of the Center panel.

If you have the DaVinci Resolve Advanced panel, there are dedicated printer points buttons you can use.

To adjust Offset Printer Points using the DaVinci control surface:
1. Press the PRINTER LITES soft key on the main page of the Center panel to display the Printer Points controls page on the Transport panel.
2. Use the + and – MASTER, RED, GREEN, and BLUE buttons that appear on the Transport panel.
3. Press PRINTER LITES again to return the Transport panel controls to their previous state.

There’s also a special set of keyboard shortcuts, mapped to the numeric keypad of an extended keyboard, that lets you make Printer Point adjustments in discrete increments, adding or subtracting a point at a time.

Adjusting Printer Points Via Keyboard Shortcuts

One of the best ways of using printer points if you don’t have a color control panel that supports them is to enable the numeric keypad to use dedicated keyboard shortcuts just for printer points.

To use the Printer Lights Hotkeys:
Choose Color > Printer Lights Hotkeys, or press Option-Command-Grave Accent (’)

When you enable Printer Lights Hotkeys, there are two sets of shortcuts you can use to manipulate printer points. First, if you want to directly manipulate RGB in whole increments, there’s one set for that.
Red | Green | Blue
---|---|---
7 - Plus Red | 8 - Plus Green | 9 - Plus Blue
4 - Minus Red | 5 - Minus Green | 6 - Minus Blue

However, if you want to work in the classic way by manipulating cyan, magenta, and yellow in whole increments, there's another set of shortcuts for that, using the remaining keys on the numeric keypad.

Cyan | Magenta | Yellow
---|---|---
1 - Plus Cyan | 2 - Plus Magenta | 3 - Plus Yellow
Minus (–) - Minus Cyan | 0 - Minus Magenta | Period (.) - Minus Yellow

The increments used by the Printer Point buttons are defined by the Printer Light Step Calibration parameters, found in the Color panel of the User Preferences. The default settings are designed to emulate traditional film printer adjustments, but these settings can be customized to align DaVinci Resolve’s printer points adjustments with those of a particular film lab’s equipment. However, if you’re not working with a lab, you can change the Step and Density settings to alter how much of an adjustment each printer point makes. For more information, see Chapter 3, “System and User Preferences.”

There are also a pair of keyboard modifiers that give you finer control over printer points adjustments made with these special keyboard shortcuts, while retaining the coarser default adjustments that let you make bigger changes more quickly:

- Hold down Command while using these key shortcuts to adjust printer points in quarter-increments.
- You can use half-increments as well, but you will need to assign the keyboard shortcuts for these manually.

**TIP:** If you’re feeling left out because all the cool kids are using printer points and you’re unfamiliar with them, making the Parade scope visible is a great way to learn how these adjustments work while seeing their specific effects on the red, green, and blue channels of the video signal.
RGB Mixer Palette

The RGB Mixer palette lets you remix different amounts of image data from one channel to another, and has a wide variety of creative and utilitarian uses. Furthermore, the RGB Mixer can be used either to remix the color channels, or to add different proportions of each color channel into a monochrome image.

By default, the RGB Mixer palette is set to mix any amount of the Red, Green, and Blue color channels into any of the other channels. Each color channel has a dedicated control group of Red, Green, and Blue sliders that you use to do the mixing, and the default values of these can be seen in the screenshot above.

![RGB Mixer palette](image)

Each slider has an overall range of –2.00 to +2.00. This means that you also have the option of subtracting any combination of color channel values from a particular channel. For example, you can lower the Red control group’s Green slider to –.24 to subtract 24 percent of the Green channel from the Red channel.

Preserve Luminance

With the “Preserve Luminance” checkbox turned on, any channel adjustment you make is prevented from altering the luma of the image by automatically raising or lowering the other two channels to compensate. In the following example, you can see that when “Preserve Luminance” is turned on, lowering the Green control group’s Green slider results in the Red and Blue channels being raised by the same amount (as seen in the Parade scope). Conversely, raising a color channel’s slider ends up lowering the other two channels by the same amount to keep overall image luminosity the same.

![The result of an RGB Mixer adjustment with “With luminance level preserved” turned on. You can see that lowering the green channel slider also raises red and blue.](image)
Resetting the RGB Mixer

Clicking the Reset button at the top right-hand corner of the RGB Mixer resets each slider to its default position, where Red = 1.00 for Red output, Green = 1.00 for Green output, Blue = 1.00 for Blue output, and all other sliders = 0.

Swap Channels Buttons

A set of three buttons at the bottom of the RGB Mixer lets you easily swap two channels with one another. This can be useful as part of a creative look, or corrective in instances where two channels are accidentally reversed.

- **Swap Red and Green**: Swaps these two color channels.
- **Swap Green and Blue**: Swaps these two color channels.
- **Swap Red and Blue**: Swaps these two color channels.

Using the RGB Mixer in Monochrome Mode

When you turn on the Monochrome checkbox, two of the sliders within each Output group are disabled. This leaves the Red > Red slider, the Green > Green slider, and the Blue > Blue slider as the only available controls.

Keeping in mind that each of the color channels that makes up an image is itself a grayscale channel, the RGB sliders in Monochrome mode let you add different proportions of the Red, Green, and Blue color channels together to create custom grayscale versions of a shot.

To understand why this is useful, let’s consider the default values of the Red, Green, and Blue sliders. To emulate the human eye’s sensitivity to the wavelengths of light, the Rec. 709 video standard defines an isolated Luma (Y’) component as consisting of 0.2126 of the Red channel, 0.7152 of the Green channel, and 0.0722 of the Blue channels added together. This can be seen in the default values (rounded to the nearest integer percentage) of 21, 71, and 7.

This is the standard method of deriving a black and white version of a color image, and in fact produces identical results to those obtained by setting the Saturation parameter to 0.

However, there have traditionally been other ways of mixing the colors of life into different grayscale interpretations. For example, photographers often use colored filters in conjunction with black & white film stocks, such as a yellow/green filter to emphasize pleasing skin tone for lightly complexioned people. A much older example is the use of black & white film stocks with different sensitivities (old orthochromatic stocks were not sensitive to red wavelengths, recording only blue and green to create an image).
Using the RGB Mixer with Monochrome mode turned on gives you the ability to mix your own custom blends of all three color channels to emphasize the creative characteristics you require. For instance, increasing the mix of blue and decreasing red and green can give skin tones a darker, metallic sheen. The following screenshots show multiple versions of the same image with different monochrome mixes.

Like the parameters in Color mode, you can use the RGB Mixer’s Monochrome mode to subtract one color channel from the others, for even more creative effects.

**RGB Mixer Controls on the DaVinci Control Surface**

All of the RGB Mixer palette controls are available from the DaVinci Resolve control surface.

To open the RGB Mixer curve controls on the DaVinci Resolve control surface:

Press the CURVES soft key on the main page of the Center panel.

To exit the RGB Mixer curve controls:

Press the MAIN soft key on the Center panel.
To adjust the principle color regions using knobs:

- Adjust one of the four groups of knobs on the Center panel. All are labeled to identify which RED/GREEN/BLUE source channels are paired with RED/GREEN/BLUE destination channels. For example GREEN->BLUE adds or subtracts an amount of the Green color channel from the Blue color channel.

- Press the PRESERVE LUM soft key to turn on the “With luminance level preserved” checkbox.

- Press MONO to turn on the Monochrome checkbox.

- Press COLOR to turn off the Monochrome checkbox.
Chapter 118

Curves

The Color page has a powerful curves interface that provides controls for adjusting color and contrast with the Custom Curves, as well as a variety of “Hue” or “HSL” curves that let you make more targeted adjustments to hue, saturation, and luminance in a variety of ways.

Using HSL Curves with the DaVinci Control Panel 2692
Introduction to Curves

The Curves palette, selectable via one of the toolbar buttons above the Center Palette panel of the Color page, has six modes that provide different curve-based methods of manipulating the color and contrast of an image. Each curve lets you adjust a customizable region of the image based either on image tonality (zones of lightness or darkness), hue (specific colors), or saturation (intensity of color). All curves can be adjusted using either the pointer, or knobs on the DaVinci control panel.

**TIP:** All curves in DaVinci Resolve can be used to affect the overall image, or limited to affect only a specific portion of the image as a part of a secondary operation using qualifiers, windows, imported mattes, or any combination of the three.

Adjusting Curves Using the Mouse

All Color curves in DaVinci Resolve use the following controls for basic on-screen adjustment using the pointer, controlled either with your mouse, pen, or other input device of choice.

**Methods of adjusting curves using the on-screen interface:**

- **To add a control point:** Click anywhere on a curve. A control point is added at the position of the mouse where you clicked, and the curve is altered, if necessary, to match the new control point's position.

- **To add a control point without altering the curve:** Hold the Shift key down, and click anywhere on or around a curve. A control point is added to the curve at the position of the pointer where you clicked, but the curve is not altered.

- **To snap a control point to the neutral diagonal of the curve:** (Custom curve only) Hold the Option key down while dragging any control point on the curve. A diagonal line appears indicating the neutral state of the image, and the control point will snap to it. When you release the Option key and then press the Option key again after releasing, the diagonal guide line disappears.

- **To remove a control point:** Right-click any control point to make it disappear.

- **To reset a single color channel curve to a completely neutral setting:** Click the reset button to the right of that color channel's intensity slider.

- **To reset all color channel curves:** Click the Reset Custom Curve button at the upper right-hand corner of the Curves palette.
By default, a control point influences the portion of each curve that falls between its neighboring two control points.

Control point adjustments affect the entire portion of a curve between adjacent control points.

In the top screenshot, you can see that the control point at the position of the pointer is affecting the larger part of the curve that falls between the lower left-hand control point (which is there by default), and a user-created control point placed up within the highlights of the curve.

In the bottom screenshot, an additional control point to the left of the one being adjusted limits the area of the curve that is adjusted. By careful placement of additional control points, you can make extremely targeted adjustments to images using the Custom curves.

This example highlights the importance of using control points to “lock off” portions of a curve at a neutral or nearly neutral position to prevent changes to specific portions of an image, even while using other control points to make changes.

**NOTE:** The HSL curves also have an optional adjustment mode using Bezier curves that will be covered in those sections.

### Sampling Images to Place Control Points on Curves

Another way you can add control points to curves is to move the pointer to the Viewer, and click to sample a color value and place a control point at the position on the currently open curve that corresponds to that value. This works with Custom, Hue, and HSL curves.
Showing Picker RGB Values

While you’re dragging the pointer over the Viewer and looking for a feature to sample, you can enable a tooltip that shows you the RGB Value of the pixel under the pointer by right-clicking the Viewer and choosing Show Picker RGB Value to toggle this feature on and off. When you turn this feature on, the View > Show RGB Picker Values In submenu has options for displaying either 8- or 10-bit tristimulus values.

Curves Histograms

The Custom curves and HSL curves all show a histogram that represents the input of the currently selected Correction node, which you can use to guide your adjustments. The Histograms submenu of the Curves palette’s Option menu lets you choose to disable these histograms, or to switch the histograms between showing the input or the output of the node. If you switch to Output, the histograms will update to show you the result of your adjustments, at the expense of seeing the image data that the curve is actually working upon.

The Custom curves show a YRGB histogram:
Each Hue or HSL curve shows a histogram analysis of the two color channels that Curve acts upon: hue against saturation level, luminance against saturation level, or saturation level against saturation level, to give three different examples. In the case of Hue or HSL curves, these histograms make it easy to see which parts of the Curve controls will actually affect image data.

![Histogram under Hue vs Sat curve](image)

The histogram appearing underneath the Hue vs Sat curve plots all saturation levels at each value of hue.

**Custom Curves**

DaVinci’s Custom curves provide smooth adjustment of each clip’s Y, R, G, and B channels. The Custom curve mode of the Curves palette is divided into two areas, the Curve Editor to the left, and the Curve controls to the right. The editor contains the actual Curve controls you use to adjust the image. The controls at the right let you choose which curves you’re adjusting, and adjust their intensity.

![Custom Curve Editor](image)

The Custom curves seen used to create a gentle “S” curve adjustment with four additional control points added; the left point is selected.

The Custom curves are useful for making more tonally specific, channel-by-channel adjustments to an image than can be accomplished using the Color Balance controls. They’re also useful for making strange and wonderful stylistic adjustments through unusual alterations to different combinations of color channels.

Although the ganged Custom curves appear to be a single curve control, the Custom curve editor is actually presented as a series of overlaid curves, and the YRGB curves all appear within a single editor. The default, neutral position of the Custom curves is a diagonal line that runs from the lower-left black point of the image through the upper-right white point.
The neutral diagonal position of the curve at which no adjustment is made

The horizontal axis represents the range of image tonality in the original image, from black (at the left) to white (at the right), while the vertical axis represents the range of alteration you can make. By adding control points to the surface of the curve and raising or lowering it at different regions, you are actually remapping the original horizontal “input” value of a color channel to an “output” value of your choosing.

Additional controls appear to the right of the curve editor itself. A top row of buttons let you select the curve corresponding to an individual color channel for isolated adjustment, while a vertical stack of four sliders let you adjust the intensity of each color channel’s curve.

**Editing the Top and Bottom Control Points of Curves**

You can also edit curves using the default two control points that the curve control starts out with in the Curve Editor. The Black Point control (at the lower-left) and the White Point control (at the upper-right) let you expand and compress the video signal similarly to using the Lift and Gain Master Wheel controls in the Color Wheels palette.
You can use the Black and White Point controls in the following ways:

- **Using the Black Point control:** Dragging this control up makes a lift adjustment to raise the black point of the signal. Dragging this control to the right makes a lift adjustment to lower the black point of the signal.

- **Using the White Point control:** Dragging this control down makes a gain adjustment to lower the white point of the signal. Dragging this control to the left makes a gain adjustment to raise the white point of the signal.

**HDR Grading Using Curves**

When using various grading controls in the Color page to grade wide-latitude images for HDR output, you may find it useful to enable the HDR mode of the node you’re working on by right-clicking that node in the Node Editor and choosing HDR mode from the contextual menu (only available in Resolve Studio).

This setting adapts that node’s controls to work within an expanded HDR range. Practically speaking, this makes it easier to work with wide-latitude signals using controls that operate by letting you make adjustments at different tonal ranges such as Lift/Gamma/Gain, Custom Curves, Soft Clip, and so on.

**Enabling Editable Splines in the Custom Curves**

When the Curve palette is in Custom mode, you can choose Editable Splines from the option menu to expose Bezier spline handles on any selected control point, which let you make more precise curve adjustments whenever necessary.

**NOTE:** Beware of making curve adjustments that are too sharp, or with control points that are too close together, as they can introduce unwanted contouring within the image, causing flattening or solarization in parts of the image that you may not want.
Adding Default Anchors to the Custom Curves

You can also choose Default Anchors from the option menu of the Curve palette in Custom mode to place three additional control points on the curve, dividing the curve into five segments that affect the shadows, low midtones, medium midtones, high midtones, and highlights of the image.

Ganging and Unganging Custom Curves

By default, the Custom curves are ganged, so that curve adjustments affect a clip’s YRGB channels all together, resulting in an adjustment to image contrast that’s similar to using the Master Wheels in the Color Wheels palette, or the ring controls of the DaVinci control panel. When making this type of adjustment, increasing contrast also increases image saturation, while reducing contrast also reduces image saturation. Since curves can be manipulated with greater specificity than the three Master Wheels, you can make much finer contrast adjustments using the YRGB curves than when using the Master Wheels only.

Turning ganging off lets you use the full power of Custom curves to alter the image. Unlike the Color Balance controls, each of which adjust all three color channels simultaneously, the Curve controls let you adjust each channel individually when Gang Custom Curves is turned off.

To disable Custom curve ganging:
Click the Curve Edit button that corresponds to the curve channel you want to edit. Clicking any Curve Edit button highlights that curve to make it easy for editing when curves overlap one another. Once one or more curves is offset from the others, you can freely edit any curve by dragging its control points.

To re-enable Custom curve ganging:
Click the Gang button to the left of the Curve Edit buttons.
Editing color channels via individual curve adjustments lets you make smooth color-channel specific corrections, or you can make radically individual adjustments to create a wide number of creative effects.

Turning off curve ganging lets you independently adjust each curve.

**Tip:** When curve ganging is disabled, the Luma curve allows you to adjust the Y channel by itself, which is similar to using the Y-only Lift/Gamma/Gain knobs of the DaVinci control panel. When making this type of adjustment, increasing luma contrast results in a perceptual decrease of image saturation.

**Copying Custom Curves From One Color Channel to Another**

Even if you’ve unganged the Custom curves, you can still mirror one curve’s adjustments to another by copying it using the “Copy to Red/Green/Blue” commands in the Curve palette’s option menu.

**Curve Intensity Sliders**

Four Curve Intensity sliders to the right of the Curve Editor, one for each channel, let you mix between the current curve’s effect on the clip, and the original state of the image before you altered the curve. The default Intensity of 100 results in that curve exerting its full effect on the image, while an intensity of 0 results in that curve having no effect on the image. The Intensity sliders provide an easy way to “split the difference” between a curve adjustment and the previous state of the image.
YSFX Sliders

Each of the Custom curves (Y', R, G, and B) has a vertical YSFX slider at the upper left-hand corner of the Curve Editor that lets you invert any or all color channels by any amount you want, to create different types of stylized effects.

As with all other adjustments in the Color page, YSFX may be combined with Power Windows or HSL qualification to limit channel inversions to specific portions of the image for creative purposes.

Adjusting Custom Curves with the DaVinci Control Panel

The controls that correspond to the Custom curves on the DaVinci control panel are available by default when you first open DaVinci Resolve (the rotary knobs on the Center panel will be labeled PRIMARIES). If these buttons are not visible, you need to switch to the Primaries controls using the soft keys.

To open the Primary Curve controls of the DaVinci Resolve control panel:

- Press the PRIMARIES soft key on the Center panel.
- If the Center panel is currently in CURVES mode, then press the MAIN soft key on the Center panel.

The rotary knobs on the Center panel update to show the CHANNEL OFFSET/CUSTOM CURVES and YSFX controls.
To make curve adjustments:

Adjust the 0% LUM, 20% LUM, 40% LUM, 60% LUM, 80% LUM, or 100% LUM rotary knobs.

By default, all adjustments you make using these controls are ganged across all four YRGB curve controls. However, if you turn Custom curve ganging off, then these controls only affect the Luminance curve.

These controls correspond to the following default control point positions on the Curve controls.

Each rotary curve control on the DaVinci control surface corresponds to one of these six default control point positions.

You also have the option of using the fourth trackball from the left to adjust individual control points on curves to any position you like. This works for all curves in DaVinci Resolve that have control surface mappings.

Methods of selecting and adjusting individual control points using the master trackball of the Center panel:

- **To select a control point to adjust:** Spin the fourth ring control to the left or right to select the next control point in that direction (it takes about half of a turn to select another control point).
  
  Selected control points are highlighted in cyan.

- **To move a selected control point:** Adjust the fourth trackball to move the control point up, down, left, or right. Selected control points are constrained between whichever control points are to the left and right.

Another set of rotary knobs let you adjust Curve Mix and YSFX parameters.

**To adjust the Curve Intensity sliders:**

Adjust the LUM CURVE, RED CURVE, GREEN CURVE, or BLUE CURVE rotary knobs.

**To make YSFX adjustments:**

Adjust the LUM YSFX, RED YSFX, GREEN YSFX, or BLUE YSFX rotary knobs.
Soft Clip

The Soft Clip controls consist of four sliders underneath the Curve controls of the Custom curves, and give you an interface for adjusting highlight and shadow soft clipping either overall, with Ganging enabled, or on a per-channel basis. The Soft Clip controls are intended to provide clip-by-clip adjustment, as opposed to the Generate Soft Clip LUT settings, which let you set one soft-clipping setting for the entire program. For more information on the Soft Clip LUT setting, see Chapter 3, “System and User Preferences.”

Soft clipping lets you apply a “knee” to any clipping that occurs at the upper or lower extremes of the image, and can be used to quickly ease off any unpleasantly harsh loss of detail that occurs as a result of blowing out the highlights or crushing the shadows too aggressively.

In the following example, the screenshot at top has had the highlights deliberately blown out by excessively boosting the highlight contrast. As you can see, the edges of the clipped area lack detail. The screenshot at bottom shows the same image with soft clipping increased for all three color channels. The result retrieves detail, compressing the highlights to bring the tops of each color channel back within the allowable range.
Ganging and Unganging Soft Clip Controls

Soft clipping can be simultaneously applied to all three color channels by enabling the Ganging control (on by default), or you can disable Soft Clip ganging to individually adjust each channel. For example, using soft clipping on individual channels can be useful for legalizing RGB out-of-gamut errors for channels that over- or undershoot your QC standards.

To disable Soft Clip ganging and edit soft clipping for individual color channels:
Click the channel control button corresponding to the color channel you want to edit, and then drag the sliders to create the desired adjustment.

To re-enable Soft Clip ganging:
Click the Ganging control to the left of the Soft Clip channel controls.

Tip: Applying too much soft clipping to individual color channels may add an unwanted color tint to the corresponding highlights or shadows of an image. To avoid this, use the soft clipping parameters with ganging enabled to clip all three color channels equally.

Soft Clip Controls

Whether all channels are ganged or not, soft clipping is controlled via two sliders and two additional parameters for each color channel.

High
The High Clipping Point slider lets you adjust the maximum signal level above which the signal is clipped. Any pixels above the clipping level are made equal to the clipping level.

The High Clipping Point defaults to a digital level of 1023 relative to the DaVinci Resolve internal video scopes. Dragging this slider to the left causes the highlights of the image to clip at a lower level, resulting in lower, dimmer maximum levels.

Selecting and adjusting the high clip

RGB Parade displays the clipped image
At the default position, no clipping occurs and image data that you push above 1023 on the internal scopes is preserved and passed through the image processing pipeline to subsequent nodes. For example, in the following two screenshots, the highlights in the screenshot at top are blown out raising the gain dramatically in Node 1. In the screenshot at bottom, a subsequent adjustment in Node 2 lowers the gain and retrieves all the previously clipped values.

The image is clipped using the Gain control in Node 2.

The image data that was clipped in Node 1 is retrieved in Node 3 by lowering the Gain control. This illustrates the preservation of deliberately clipped data.

However, if at any point in a node tree you drag the High Clip slider to the left, even by a single digit, all image data above the new clipping threshold is discarded from that node forward. In the following example, the High Clip slider in Node 1 is lowered. The result is that all clipped image data is discarded. As a result, when Node 2 lowers the gain, there is no image detail left to retrieve, and all three channels exhibit flattening.

Lowering the High Clip slider in Node 1 forces all image data above the new High Clip threshold to be irretrievably discarded. Clipped data cannot be brought back by subsequent nodes.
High Soft
The High Soft slider sets the threshold, below the clipping point, at which highlights begin to compress before hard clipping. At unity, no soft clipping occurs. As you raise this value, more and more of the clipped highlight values are compressed, rather than clipped, resulting in softer, more pleasant “glowing” highlights.

**IMPORTANT** Image data that was clipped “in camera” is not necessarily retrievable using the Soft Clip controls, although there may be some preserved overhead in the super-white highlights of Y’CbCr-encoded video data.

Low
The Low Soft Clipping Point slider lets you adjust the minimum signal level at which the signal clips. This defaults to a digital level of 0 relative to the DaVinci Resolve internal video scopes. Dragging this slider to the right causes the shadows of the image to clip at a higher level, resulting in lighter minimum levels, and a lower-contrast image with lighter (possibly milky) shadows.

Low Soft
The Low Soft slider sets the threshold, above the minimum clipping point, at which shadows begin to compress before hard clipping. At unity, no soft clipping occurs. As you drag this slider to the right, more and more of the clipped shadow values are compressed, rather than clipped, resulting in a softer, more pleasant rolloff in the shadows.

Using Soft Clipping Controls with the DaVinci Control Panel
The soft clipping controls can also be manipulated using the DaVinci control panel, which provides separate controls for ganged and individual color channels.

**To open the soft clipping control on the DaVinci Resolve control panel:**
Press the CLIPS soft key on the Center panel.

**To exit the soft clipping controls:**
Press the MAIN soft key on the Center panel.

**To make a ganged soft clipping adjustment:**
- Adjust the MASTER CLIP or MASTER SOFT rotary knobs of the SCENE WHITE CLIPS or SCENE BLACK CLIPS control groups (there are four individual knobs).
- These controls adjust all four corresponding YRGB High Soft, High Clip, Low Soft, or Low Clip parameters simultaneously.

**To adjust soft clipping for individual color channels:**
- Adjust the RED/GREEN/BLUE CLIP or RED/GREEN/BLUE SOFT rotary knobs of the SCENE WHITE CLIPS or SCENE BLACK CLIPS control groups (there are 12 individual knobs).
- Each control adjusts an individual YRGB color channel.
The HSL Curves

Three sets of Hue curves, and additional Lum vs. Sat and Sat vs. Sat curves, let you make different types of curve-based alterations to the image. Whereas the Custom curves let you make adjustments to the color channels of an image based on tonality (for example, boosting the Red channel in the highlights while lowering it in the shadows), the Hue curves let you make adjustments to the hue, saturation, or luma of elements in an image based on their hue.

For example, you could use the Hue vs. Sat curve to selectively lower the saturation of everything that’s blue, while raising the saturation of everything that’s red.

You can use these curves to make adjustments similar to those made using HSL qualification, but with one critical difference. Curve adjustments are mathematically smoother than the matte-limited adjustments of HSL qualifiers, so it can sometimes be easier to make specific alterations that blend smoothly with the rest of the image, without the potential for artifacts at the edges of qualified keys that can sometimes defeat a seamless result.

On the other hand, it is often easier to define more distinct boundaries between separate elements using HSL qualification. Only time and experience will help you determine which tools are best for which situations.
Unlike the Custom curves, which default to a diagonal position where lower left represents the black point and upper right represents the white point, Hue and Sat curves are flat. In the case of the Hue vs. Hue/Sat/Lum curves, the horizontal range of the curve from left to right represents the overall range of possible hues, from red through green through blue and then cycling back to red.

Because the range of hues cycle smoothly from the left to the right edge, changes that affect the curve near the left boundary of these curves loop smoothly around to the right boundary, and vice versa, such that the left and right sides of the curve always move together (as you can see in the above screenshot).

**IMPORTANT** When using Hue curves, the range of hue that you isolate with control points is always relative to the RGB input connected to that node. That means if you change the hue of a shirt from blue to red using Hue vs. Hue and you then want to raise the same shirt’s saturation with the Hue vs. Sat curve within the same node, you need to add control points to the same range of blue for both curves.

**Image Sampling for Hue and Sat Curves**

There’s an additional way to use Hue curves in DaVinci Resolve. Whenever one of the Hue vs. Hue, Hue vs. Sat, Hue vs. Lum, Lum vs. Sat, or Sat vs. Sat curve tabs are open, clicking or clicking and dragging over any range of pixels within the Viewer area samples the hues and/or image tonality of that region of the picture, and automatically places three control points on the currently open curve that correspond to the range of color and contrast you sampled. This also works if you use the cursor from the DaVinci control panel with the fourth trackball to sample a range of color.

**Additional Controls in the Hue and Sat Curves**

While the Hue vs. Hue, Hue vs. Sat, Hue vs. Lum, Lum vs. Sat, and Sat vs. Sat curves can be adjusted similarly to the Custom curves, they have additional controls running underneath the curve graph.

- **Enable Bezier button:** Turning this button on forces a curve to use Bezier control handles, rather than the default DaVinci Resolve Curve Control points, to manipulate each control point on the curve. With Bezier handles enabled, click any control point to reveal its two Bezier handles. Drag either handle to alter the shape of the curve at that control point.

- **Six-Vector Color Patches:** The Hue curves each have six buttons for automatically adding control points to manipulate the red/yellow/green/cyan/blue/magenta ranges of hue. Clicking any of these buttons adds three control points; two to define the outer range of hue to be adjusted, and a middle control point that you use to make the adjustment.

- **Input and Output (Hue Rotate/Saturation/Lum) fields:** These two number fields correspond to the horizontal and vertical adjustment values for the currently selected control point. Click any control point on a curve to view or alter these values. The label of the second field depends on the curve that’s selected.

The following sections describe each available curve in more detail.
Hue vs. Hue

The Hue vs. Hue curve lets you change any hue to any other hue. In the following example, the image on the left is the unadjusted original. The image on the right has had the orange jacket shifted to an olive green via a set of three control points.

Changing the hue of the woman’s jacket using the Hue vs. Hue curve; Left—original image, Right—altered image

One excellent use of the Hue vs. Hue curve is to quickly and subtly alter elements that require only minor adjustments. For example, a sky that appears a bit too cyan can be made into a richer shade of blue with a small adjustment.

Hue vs. Hue is also useful for making more radical changes to elements that might be too noisy to key successfully using the HSL qualifier controls. For example, red autumnal foliage blowing in the wind might result in a chattery matte, but you can use the Hue vs. Hue curve to change reds to greens, without having to worry about aliased matte edges giving your correction away.

Hue vs. Sat

The Hue vs. Sat curve lets you selectively alter the saturation of any hue within the image. This is a terrific tool for creative effect, allowing you to quickly and easily boost the saturation of elements you want to catch the viewer’s eye, while reducing the saturation of elements you’d prefer the audience not dwell upon.

This can be extremely useful for legalizing over-saturated overshoots or undershoots during a QC pass. For example, desaturating reds that are off the charts while leaving everything else alone.

Lowering the saturation of the woman’s jacket using the Hue vs. Sat curve; Left—original image, Right—altered image

The Hue vs. Sat curve can also be a powerful tool for increasing the color contrast of images that seem lackluster and flat. By boosting the saturation of colorful elements that are distinct from the dominant palette of a scene, you can add variety to an otherwise monochromatic image.
**Hue vs. Lum**

The Hue vs. Lum curve lets you increase or decrease the lightness of elements of specific colors.

[Image showing original and altered images of a woman's jacket]

This is a tricky curve to use with highly compressed footage, as it can quickly reveal artifacts in the image if you aren’t careful. However, if you’re working with very high-quality footage, this can be a great tool to darken specific hues to add richness and depth, or to lighten colorful elements to which you want to draw attention.

**Lum vs. Sat**

The Lum vs. Sat curve is similar to the Custom curves in that alterations to the saturation of an image are based on user-definable ranges of image tonality, rather than hue. In the following example, the Lum vs. Sat curve is being used to decrease selectively the saturation of everything falling into the highlights and shadows of the image, while increasing the saturation of everything within the midtones.

In the following example, a vividly saturated treatment results in shadows that seem artificially colorful. Using the Lum vs. Sat curve, it’s easy to gradually desaturate everything below a certain range, with a nice smooth falloff.

This is an outstanding curve to use for creative effect, for example, slightly boosting saturation within the midtones while reducing saturation in the shadows to increase the depth of the darkest portions of the image. It’s also a great curve to use to solve QC violations. For example, if you have illegal saturation in the highlights of an image, you can use the Lum vs. Sat curve cleanly and smoothly to lower the specific values that are causing problems.
Selective desaturation in the shadows and highlights using the Lum vs. Sat curve; Right–original image, Left–altered image

**Sat vs. Sat**

The Saturation vs. Saturation curve lets you selectively manipulate image saturation within specific regions defined by the image’s original image saturation. Control points added to the left of this curve affect areas of progressively lower saturation, effectively letting you increase or decrease the saturation of lower-saturated features. Control points added to the right affect areas of progressively higher saturation, letting you increase or decrease the most saturated features of an image.

Like all curves, this operation is extremely useful for stylizing the image. You can create custom vibrance operations, where you selectively increase the saturation of low-saturated regions of the image in different ways to give the picture more “pop.” It’s also an excellent tool for taking care of over-saturated areas of the picture when adhering to conservative QC requirements. You can specifically desaturate only the most over-saturated parts of the picture, without affecting similar hues at lower levels of saturation.

In the following example, you can see that the portion of the image with the highest saturation has been desaturated, while the rest of the image has been left alone.

Desaturating only the highest saturated elements in the picture by lower control points at the right of the Sat vs. Sat curve
Using HSL Curves with the DaVinci Control Panel

Using these curves with the DaVinci control panel unlocks their speed, letting you make fast, controlled adjustments to specific elements within each scene.

**To open the Hue and Sat curve controls on the DaVinci Resolve control panel:**
Press the CURVES soft key on the Center panel.

**To exit the Hue and Sat curve controls:**
Press the MAIN soft key on the Center panel.

**To adjust the principle color regions using knobs:**
Adjust one of the 18 knobs in the PRIMARIES CURVE GRADE control groups corresponding to the RED/YELLOW/GREEN/CYAN/BLUE/MAGENTA colors paired with HUE/SAT/LUM.

**To sample a region of a shot to place curve control points:**
1. Press the soft key corresponding to the curve you want to adjust (HUE - HUE, HUE - SAT, HUE - LUM, LUM - SAT).
2. Press the CURSOR button (located above the fourth trackball).
3. Use the fourth trackball to move the onscreen cursor to the pixel you want to sample.
4. Press the first of the three buttons underneath the fourth trackball to sample the color at the position of the cursor.
   Three control points appear on the currently selected curve. The outer two control points define the region of the curve you’re adjusting, and the center control point (selected by default) lets you make the actual adjustment.
5. To hide the cursor when you’re finished sampling, press the CURSOR button again.

**To select and adjust control points using the fourth trackball of the Center panel:**
- **To select a control point to adjust:** Spin the fourth ring control to the right or left to select the next control point in that direction (it takes about half of a turn to select another control point). Selected control points are highlighted in cyan.
- **To move a selected control point:** Adjust the fourth trackball to move the control point up, down, left, or right. Selected control points are constrained between whichever control points are to the left and right.
Secondary correction describes isolating a specific part of the image, or a specific subject, using a key. Keys in DaVinci Resolve are grayscale images that define which areas of the picture you want to alter (in white) and which parts of the picture you want to leave alone (in black). Keys can be generated either using the controls in the Qualifier palette, by using a Power Window, or by importing an external matte (for more information on how to use external mattes, see Chapter 126, “Combining Keys and Using Mattes”). This chapter focuses on how you can use qualifiers to key a range of color values (similarly to doing a green screen key) in order to create a matte with which to do this kind of isolated adjustment.

Secondary Qualifiers

This section covers the use of the Qualifier palette, which lets you pull a 3D, HSL, RGB, or Luma key, with which to isolate the correction you need. The Qualifier controls are fast and flexible when you need to isolate an irregularly shaped subject with a distinct range of color or lightness. Since you're generating a key by sampling the image, there's no need for tracking or keyframing, so in the right situation qualifiers can be your fastest solution. In the following example, the client likes the slightly cool treatment overall, but wishes that the skin tones were a little more vibrant. This is exactly the sort of situation where qualifiers can help out. Adding a second node, and using the 3D or HSL Qualifier to isolate the face makes it relatively simple to add color exactly where you want it.

Just about every control in the Color page can be limited using the Qualifier modes available in DaVinci Resolve. This makes the Qualifier palette a jack-of-all-trades tool with 101 uses. A few practical examples include keying a red element that’s too intense for broadcast, in order to darken it or desaturate it; keying a range of green foliage, so you can shift its hue to a more attractive color; keying an actor’s skin tone in a commercial, to apply some selective softening to it; or keying a range of sky, in which to add blue.
Adding a Secondary Operation to the Node Editor

Any node can be switched between functioning as a primary correction, where the adjustments you make affect the entire image, and a secondary correction, where you're adjusting a specific element in the scene. The only difference is that nodes being used for secondary corrections are limited using a qualifier, Power Windows, or an external matte.

If you're planning to add a secondary operation to the current grade, you'll need to first add another node in the Node Editor. When pulling a key to qualify part of the image, it's important to understand that you'll be sampling the YRGB values being fed to that node from any previous nodes in the tree. That means that the state of the image being fed to a node you're qualifying affects the key you're pulling.

For example, if the image coming out of Node 1 is well saturated and has a neutral color balance with a wide range of colors, but the image coming out of Node 2 applies a low saturation, monochromatically orange color wash, you may find it more difficult to pull a detailed key from Node 2 than you would from Node 1.

This is important because you have the flexibility of determining from what image you want to try pulling a qualified key. By connecting the node that's outputting the best YRGB image for the key you're trying to create to the node you're qualifying, you can control what you're keying. For more information about choosing which node to use for setting up a qualifier, see Chapter 126, "Combining Keys and Using Mattes."

The Qualifier Interfaces

The DaVinci Resolve Qualifier palette interface is straightforward. To the left, graphical controls above numeric parameters let you manually adjust what ranges of each color component contributes to the key you're creating. To the right, Selection Range tools below let you define a key by sampling pixels of the image, either using the pointer, or by using the fourth trackball of a DaVinci control panel, while below a set of Matte Finesse parameters let you alter the shape of the key that's been pulled.
The default qualification mode is the HSL Qualifier, which uses three color components, hue, saturation, and luma, to define a key. However, you can also use the RGB or LUM (Luma) qualification modes to pull keys using other combinations of color components. The LUM qualifier mode, in particular, lets you make targeted adjustments to specific ranges of image lightness. This is a technique employed by many colorists to alter color temperature within a specific range of image highlights or shadows.

Alternately, you can use the 3D qualifier to quickly and easily pull well-refined keys by drawing lines to sample colors from the image that correspond to volumes of color within a three-dimensional gamut. While the underlying technology is sophisticated, all you have to do is to draw blue lines to sample colors you want to isolate, or red lines to sample colors you want to subtract from the isolation you’re creating, all of which automatically generate a high-quality key. Each line you draw adds a sample to the selection list; you can turn each sample off and on to evaluate its contribution to the resulting key, or delete samples that don’t make a positive contribution.

No matter which qualifier mode you use, the Matte Finesse controls make it easy to refine the resulting key to be even cleaner and more usable. In some instances, you can even take a marginal key that would otherwise be unusable, and squeeze it into something useful using the Clean Black, Clean White, and Blur Radius controls.

**Which Qualifier Do I Use?**

The Qualifier palette’s four modes offer you the flexibility to use the best keyer for the job when it comes to isolating a range of color or brightness values. In some cases, keys that are difficult to pull using some modes are easier to pull using others. Here’s a brief summary:

- **3D:** The 3D keyer is a good one to start with if you’re trying to isolate a range of color such as a blue shirt, a cyan sky, a performer’s skin tone, or the orange leaves of a tree in autumn. Its interface of drawing lines over the part of the image you want to isolate, coupled with its high quality and extreme specificity, make it a fast and accurate tool to use in a variety of circumstances. However, the 3D keyer always samples every color component of the image; it’s not useful when you want to isolate specific color components, such as luma only, or hue and saturation without luma. The 3D keyer’s greatest strength, the speed with which you can sample areas of the picture to include (or exclude) from the final key, is also occasionally a weakness with images where your initial samples aren’t giving you satisfactory results, because there aren’t many ways to fine tune the key as it’s being generated (although you can manipulate the result). On the other hand, for most images you would want to qualify, two or three samples is all you need, in conjunction with using the Matte Finesse controls to adjust the resulting key. If you need to do some compositing in the Color page, the 3D keyer also does an excellent job doing blue and green screen keying to create transparency, and has a built-in Despill control as well.
• **HSL:** In many instances, the HSL keyer is not as immediately accurate as the 3D keyer, and will include a broader portion of the image for any given sample. On the other hand, if the 3D keyer is not giving you satisfactory results for a particular shot, the HSL keyer can sometimes do a better job. Because of its interface, the HSL keyer makes it easier to “fine-tune” the range and softness of each individual color component that’s sampled, in order to improve the result. The HSL keyer also gives you the option of disabling color components that you don’t want to contribute to the final key, so that you can pull a saturation-only key, or a hue-only key, for instances where that may solve the issue at hand.

• **RGB:** The RGB keyer shares many of the limitations and advantages of the HSL keyer, but since you’re sampling and adjusting red, green, and blue color components, the specificity with which you can fine-tune the resulting key works much differently.

• **LUM:** The LUM keyer works specifically to isolate parts of the image based on image tonality, lightness, or darkness. This is the perfect tool when you’re trying to isolate highlights or shadows in the image, which let you solve a multitude of different creative and technical issues. The LUM keyer is identical to using the HSL keyer with the Hue and Saturation qualifier controls turned off.

The following two sections provide an overview of how to use the 3D and HSL keyer modes in DaVinci Resolve.

**Basic Qualification Using the 3D Keyer**

The 3D Qualifier mode offers a fast, simple way of pulling a key to isolate a range of color in the image, by drawing lines over the parts of the image you want to key. Each line you draw over the image adds to or subtracts from the cloud of values you’re carving out of a three-dimensional representation of all available colors; you don’t see this representation, but this “under the hood” functionality is what gives the 3D keyer its name.

The 3D keyer is a general-purpose keyer, letting you isolate any color you like. However, the 3D keyer is not good at pulling luma-only keys. If you’re looking to isolate a range of luma values in the image, you should use the LUM mode.

**To use the 3D mode to isolate a subject in the Viewer:**

1. Open the Qualifier palette, choose 3D from the mode drop-down, and click the eyedropper.

2. Click and drag across the part of the image you want to isolate to draw a line. Lines that add to the key are colored blue.

3. To see the key you’re creating as you work, click the Highlight button in the Viewer Options toolbar at the top of the Viewer.
With the Highlight turned on, the lines you draw become invisible. They’ll reappear whenever you turn the Highlight off.

If necessary, draw additional lines to add more of the image to the key you’re creating. Ordinarily, it’s a good idea to not to draw more than two or three lines to sample the part of the image you’re trying to isolate. Ideally, you want the key you’re pulling to have a somewhat soft edge, which makes it easier to use the Matte Finesse controls to fine-tune your result later on. If you draw too many lines to sample the image, the result can be a key with hard, jagged edges that can sometimes be more difficult to adjust later on.
5. Alternately, if there are parts of the image that are included in the key that you want to omit, hold the Option key down and draw a line over these areas. When you turn the Highlight button off, you can see that Option-drawn lines are red, and these subtract areas from the key you’re creating. Again, try not to overdo drawing subtractive red lines, as you can end up with an overly hard-edged key that’s difficult to adjust using other controls in the next few steps.

Blue lines add to the key and a red line subtracts the grass from the key, as seen with the highlight turned off

6. If you find yourself wondering whether a particular sample in the list at left is doing any good, you can click the color patch at the left of any entry in the list to toggle that sample off and on. If you decide you don’t need a particular sample, click the trash can button at the right to delete it.

Controls for toggling samples off and on, and deleting them from the list

7. When you’re satisfied that the key is good enough to start fine-tuning, stop drawing lines. It’s all right if there’s a bit of noise, speckling, or if there are small holes in the key you’re creating, because you can take care of these using the Matte Finesse controls.

A sampled key that’s ready for further refinement
Nearly every key you pull will benefit from some further “post-key” refinement. What this means is that, once you’ve created the best key you can procedurally through sampling the image, you can now adjust the resulting key itself, which is just a grayscale image, to improve the isolated result. This is what the Matte Finesse controls are for.

The three most common methods of key refinement using the Matte Finesse controls are to increase Clean Black to fill in “holes” in the parts of the image you’re omitting (the background), increase Clean White to close holes in the part of the image you’re isolating (the foreground), and then use Blur Radius and In/Out Ratio controls to blur the edge of the key and push it in and out. Using these controls, you can vastly improve nearly any key without the need to endlessly readjust the Qualifier controls.

When you’re finished, click the Highlight control to turn the highlight off, and make whatever adjustment you need. In this example, the orange of the helicopter will be adjusted using the Hue control to make it blue instead.
Basic Qualification Using the HSL Keyer

The HSL qualifier is one of the most flexible tools in DaVinci Resolve. Using any combination of sampled hue, saturation, and luma, you can isolate different ranges of color and contrast for specific adjustment. HSL is a general-purpose keyer, meaning you can key any color you like; it’s not restricted to blue or green.

The most straightforward way to use any qualifier is to sample the image in the Viewer. A set of four controls let you sample pixels within the image in different ways. When you sample one or more pixels, the Hue, Saturation, and Luma values are analyzed, and set different ranges in each of the Hue, Saturation, and Luma qualifier controls. There are a number of different eyedropper controls available to control how you sample color in the image.

- **Sample Eyedropper:** The first control you use whenever sampling the image. It defines the initial range of the qualification; you must use this tool before any of the others. Clicking once with this tool selects a single pixel value, while clicking and dragging selects a range of image values that add together.

![Color Picker button]

- **Add/Subtract Color Range:** These two controls let you add areas of the image to, or subtract them from, the currently selected inner range of values that define the core of the key. As with the eyedropper, you can click on single pixels, or drag over a range of color.

![Add and Subtract color buttons]

- **Add/Subtract Softness:** These two controls let you redefine the softness that transitions from the inner range of the key, falling off towards the outer edge of the key. Just like the other controls, you can click on single pixels, or drag over a range of color.

![Add and Subtract qualifier softness]

**NOTE:** When you select one of the sampling controls, it remains selected until you select another sampling control. If you select another clip in the Timeline, then click in the Viewer to sample a key and nothing happens, make sure that you select the Eyedropper control in the Qualifier palette.

If you’re working with the DaVinci Resolve onscreen interface, the easiest way to qualify a subject is to use the pointer in conjunction with the sampling controls.
To use the HSL Qualifier mode to isolate a subject in the Viewer:

1. Open the Qualifier palette, choose HSL from the mode drop-down, and click the eyedropper.

2. Either click a pixel of the part of the image you want to isolate, or click and drag across a range of pixels within that subject.

3. To see the key you’re creating as you work, click the Highlight button in the Viewer Options toolbar at the top of the Viewer.

   By default, the area of the image you’re isolating appears in color, while the area of the image being excluded appears solid gray.

4. To subtract from the inner range of the key you’re creating, click the minus Color Range control, and click or drag across the portion of the keyed image that you’d like to exclude.
To add softness to the outer range of the key you’re creating, click the plus Softness control and then click or drag across the portion of the image you’d like to include as a soft edge.

Once you’ve finished using the range and softness sampling controls to refine the key you’re using to isolate the subject, nearly every key you pull will benefit from some further “post-key” refinement. What this means is that, once you’ve created the best key you can procedurally through sampling the image, you can now adjust the resulting key itself, which is just a grayscale image, to improve the isolated result. This is what the Matte Finesse controls are for.

The three most common methods of key refinement using the Matte Finesse controls are to increase Clean Black to fill in “holes” in the parts of the image you’re omitting (the background), increase Clean White to close holes in the part of the image you’re isolating (the foreground), and then use Blur Radius and In/Out Ratio controls to blur the edge of the key and push it in and out. Using these controls, you can vastly improve nearly any key without the need to endlessly readjust the Qualifier controls.

More information about using the Matte Finesse controls appears later in this chapter.

When you’re finished, click the Highlight control to turn the highlight off, and make whatever adjustment you need. In this example, the saturation has been raised and the color balance changed to make the adjustment obvious.

If you have a DaVinci control panel, you can use the fourth trackball to sample the image, referring to either the Viewer or the display connected to the video output of your DaVinci workstation.
To sample a subject using the DaVinci control panel:

1. Press VECTORS on the T-bar panel to open the Qualifier palette, which defaults to the HSL Qualifier controls.
2. Press CURSOR (the third button above the fourth trackball) on the Center panel, to display the small cursor crosshairs in both the Viewer and the video output display.
3. Use the fourth trackball to position the cursor over the subject you want to sample, and press the leftmost of the three buttons appearing underneath the fourth trackball to sample the image.
4. Press HILITE on the Transport panel to turn on the highlight so you can see the key you’re creating, and then use the knobs at the top of the Center panel to adjust the range and softness parameters to obtain the most accurate key for your purposes.

HSL Qualifier Presets

There is a set of HSL Qualifier presets, or Six Vector presets, that you can use to isolate automatically a predefined wedge of color (green, blue, red, magenta, yellow, or cyan) or chroma intensity (chroma light, chroma dark, or both). These presets are available either from the Color > Presets menu, or from the DaVinci control panel.

The Color > Presets menu

Selecting one of these presets automatically sets the HSL Qualifier to the corresponding range or color or lightness. Afterwards you can continue modifying the HSL Qualifier to suit your purpose.

To choose a Six Vector preset from the DaVinci control panel:

1. Press the PRESETS soft key on the Center panel. The Center panel’s soft keys update with all the available lightness and color presets.
2. Press the soft key corresponding to the preset you want to use. The HSL Qualifier updates with the new settings, and the Center panel goes back to the main page of soft key controls.
Using Highlight to See What You’re Isolating

The Highlight control at the top of the Viewer (revealed by turning on Viewer Options in the Viewer’s Option menu) lets you overlay a representation of the key you’re creating over the current image in the Viewer. Overlays are also mirrored to your video output, so they’ll show up on an external display as well, in the event that you’re hiding the onscreen Viewer.

There are two types of highlights with which you can evaluate a qualification you’re creating. Each is useful for different tasks.

- **Flat-Gray**: The default highlight that DaVinci Resolve uses shows the selected portion of the image with the original colors, and the unselected portion of the image with a flat gray. It is useful for seeing the subject you’re isolating even while you’re adjusting the Qualifier controls, which lets you also see the color or contrast adjustments you’re applying at the same time.

- **High-Contrast**: Pressing Option-Shift-H, you can show what’s called a “high-contrast” highlight, which should be familiar to you if you’ve used other color correction applications and plug-ins; it’s a more typical display wherein the selected portion of the image is white, and the unselected portion of the image is black. The high-contrast highlight is useful in situations where you need to eliminate holes in a key, or evaluate how “chattery” a key is since irregularities are easier to spot when divorced from the original image.
To enable or disable a highlight, do one of the following:

- In the Viewer Options toolbar at the top of the Viewer, click the Highlight control, and choose the type of highlight you want from the buttons that appear at the right.
- Choose an option from the View > Highlight submenu; a regular Highlight is Shift-H.
- On the T-bar panel of the DaVinci control panel, press HILITE.

To enable or disable a high-contrast highlight, do one of the following:

- Choose View > Highlight > Highlight BW (Option-Shift-H).
- On the T-bar panel of the DaVinci control panel, press SHIFT DOWN and then press HILITE.

To make high-contrast black and white the default highlight:

1. Open the Preferences > User > Color window.
2. Check “Mattes display high contrast black and white.”
3. Click Save.

The next time you click the Highlight control in the Qualifier palette, or press HILITE on the DaVinci control panel, the high-contrast highlight will display.

Using Highlight to Solo Nodes

There’s one other use of the Highlight control, and that’s to solo individual nodes in the Viewer and video out, rather than outputting the sum of the entire node tree. For example, if you’re trying to adjust a stack of nodes attached to a Parallel or Layer Mixer node, it’s difficult to see what you’re doing while adjusting one of the stack of nodes, because only the final result is being output.

However, if you turn on Highlight while you’re selecting a node with no key, then only the currently selected node is output, making it easy to view just one node as you adjust it. Just make sure you turn Highlight off before moving on, or you may confuse yourself.

Showing Picker RGB Values

While you’re dragging the pointer over the Viewer and looking for a feature to sample, you can enable a tooltip that shows you the RGB Value of the pixel under the pointer by right-clicking the Viewer and choosing Show Picker RGB Value to toggle this feature on and off. When you turn this feature on, the View > Show RGB Picker Values In submenu has options for displaying either 8- or 10-bit tristimulus values.

The Color Picker tooltip that appears when you turn on show RGB Picker Values
Qualifier Parameters

Each of the Qualifier modes, except for the 3D qualifier, has parameters that correspond to the relevant color components for that mode, with which you can identify a range and softness, similar to using the sample tools. These parameters can be edited precisely with virtual sliders using the pointer, or using the knobs of a supported grading control panel. However, mouse and tablet users can take advantage of each qualifier’s draggable white overlays, for more direct adjustment.

- Drag the left and right edges of any qualifier control overlay to adjust the Low and High values (or the Width value of the Hue control).
- Drag the center of any qualifier control to change the center or to simultaneously change the Low and High parameters together.
- Option-drag the left and right edges of any qualifier overlay to adjust softness.

These draggable controls work for the HSL, RGB, and LUMA qualifier controls (the 3D qualifier works differently).

HSL Qualification Controls

The HSL Qualifier is by far the most versatile mode of the Qualifier palette. It’s also the qualifier that’s easiest to understand, and the easiest to adjust by hand if you don’t feel the need to sample the image. By selecting range and softness for each of three different color components, hue, saturation, and luma, you can isolate a wide variety of colorful subjects, or ranges of image lightness and saturation.
One of the HSL Qualifier’s key strengths, and one of its most underutilized features, is that you can enable or disable each of the three HSL components using the Hue, Sat, and Lum buttons, using toggle controls found at the left of each qualifier range control’s name. This lets you ignore specific color components, while focusing on others that are more important.

For example, if you’re trying to isolate the saturated parts of an image, regardless of the hue or brightness, you can turn off the Hue and Lum qualifiers so that only Sat is used to sample the image.

Qualification with saturation only to isolate the most saturated portion of the picture

The HSL parameters include:

- **Hue Center**: Defines the center of the range of Hue being isolated.
- **Hue Width**: Defines the width of the range of hue being isolated. Widening or narrowing this parameter widens and narrows the range of hue about the current Hue Center.
- **Hue Soft**: Widens or narrows the falloff at both sides of the currently selected range of hue.
- **Hue Symmetry**: Lets you selectively alter the angle of Hue Soft falloff at either the right or left side. Lowering this parameter makes the softness to the right of the hue range grow steeper. Raising this parameter makes the softness to the left of the hue range grow steeper.
- **Sat Low/High**: Two parameters let you define the upper and lower range of saturation being isolated.
• **Sat Low Soft/High Soft**: Two parameters let you define the upper and lower softness falling off outside the current range of saturation.

• **Lum Low/High**: Two parameters let you define the upper and lower range of luma being isolated.

• **Lum Low Soft/High Soft**: Two parameters let you define the upper and lower softness falling off outside the current range of luma.

**RGB Qualification Controls**

The RGB Qualifier mode lets you isolate range and softness in the Red, Green, and Blue channels of an image. While this is not necessarily an intuitive way of manually creating a qualification from scratch, it can provide a different way of isolating potentially trickier ranges of the RGB color space.

If you start by sampling the image, then you can widen and narrow each color channel’s isolated range of values. In some cases, you may find it’s faster to isolate a specific range of continuous color by adjusting these controls.

The RGB parameters include:

• **Red Low/High**: Two parameters let you define the upper and lower range of the Red channel being isolated.

• **Red Low Soft/High Soft**: Two parameters let you define the upper and lower softness falling off outside the current range of red.

• **Blue Low/High**: Two parameters let you define the upper and lower range of the Blue channel being isolated.

• **Blue Low Soft/High Soft**: Two parameters let you define the upper and lower softness falling off outside the current range of blue.

• **Green Low/High**: Two parameters let you define the upper and lower range of the Green channel being isolated.

• **Green Low Soft/High Soft**: Two parameters let you define the upper and lower softness falling off outside the current range of green.
Luma Qualification Controls

The Luma Qualifier mode simply pulls a key from the Luma channel all by itself. It’s identical to the HSL qualifier with H and S turned off. This single-component keyer is more useful than you might think; it’s a common technique to isolate a range of highlights, midtones, or shadows throughout the image to alter the color temperature selectively.

Also, keep in mind that the luma component is the sharpest keyable component when you’re working with heavily compressed video. Keys that are noisy or chunky with HSL qualification may be sharper if you just use the Luma Qualifier, although you won’t be able to be chromatically specific.

The Luma Qualifier has four parameters:

- **Lum Low/High**: Two parameters let you define the upper and lower range of the luma component being isolated.
- **Lum Low Soft/High Soft**: Two parameters let you define the upper and lower softness falling off outside the current range of luma.

3D Keyer Controls

As discussed earlier in this chapter, the 3D Keyer works much differently than the other qualifiers in DaVinci Resolve. In this mode, drawing lines over parts of the image you want to isolate adds samples to the Sample list, some of which add to the key (when you drag with the pointer) and some of which subtract from the key (when you Option-drag with the pointer). While this functionality is very simple to use, there are other controls that are available.
The 3D parameters include:

- **Show Paths**: A checkbox that lets you turn the visibility of the lines you’re drawing to sample the image on and off. Turning lines off does not affect the key in any way.
- **Colorspace**: A drop-down menu that lets you choose whether you’re sampling colors in YUV colorspace or HSL colorspace. YUV is the default, but if you find you’re not getting satisfactory results, you can reset the Qualifier palette and switch to HSL to see if that works any better.
- **Softness**: A single parameter lets you adjust the overall softness of the key you’re creating. The default value is 50. Raising this value increases key softness, lowering it decreases key softness.
- **Despill**: If you’re using the 3D keyer to pull a blue or green screen key to create transparency in conjunction with the optional Alpha output in the Node Editor, this checkbox lets you turn on an automatic color correction that eliminates blue or green spill from the image, while retaining the image’s original color.
- **Sample list**: A list shows each line you drew as a sampled entry. A color patch at the left shows you the average color you sampled, clicking the color patch lets you temporarily turn any color sample off to evaluate its contribution to the overall key. A plus or minus icon shows you whether that patch is adding to or subtracting from the key. The average red, green, and blue color values are shown next, and a trash can icon at the right lets you delete any sample from the list.

**Matte Finesse Controls**

After you’ve used the sample controls and qualifier parameters to create the most useful key for your purposes, you may find that it has problems that cannot be overcome easily by the available adjustments. Issues such as chattery edges, holes, or noisy bits can sometimes be easily fixed using the Matte Finesse controls. These controls filter the output of the Qualifier controls and are adjustments that are made to the matte itself, so they may work well in some instances, and poorly in others, depending on what you’re trying to do.

**Matte Finesse Controls, Page 1**

Denoise has been re-added to the Matte Finesse controls, providing a distinct way to post-process extracted keys to selectively reduce the noise in a key, getting rid of stray areas of qualification and softly filling “holes” in a matte.
Denoise
Denoise provides a distinct way to post-process extracted keys to selectively reduce the noise in a key, getting rid of stray areas of qualification and softly filling holes in a matte.

Before/after raising Denoise, viewing the high contrast matte

Clean Black
Clean Black is a specialized operation that eliminates noise (seen as white speckling when viewing a high-contrast highlight) in the black area of a key that omits the regions of the image you don’t want to isolate, and shrinks the key by making the dark parts of a key darker the higher you raise this parameter, pushing dark gray areas of the key toward black. The practical result is that raising Clean Black lets you “fill holes” in the background portion of a key and erode translucent edges.

Before/after raising Clean Black, viewing the high contrast matte

Clean White
Clean White is another specialized operation that eliminates noise (seen as black speckling when viewing a high-contrast highlight) in the white portion of a key that include areas of the image you’re isolating, and expands the key by making light parts of a key lighter the higher you raise this parameter, pushing light gray areas of the key toward white. The practical result is that raising Clean White lets you “fill holes” in the foreground portion of a key and grow translucent edges.

Before/after raising Clean White, viewing the high contrast matte
Blur Radius

In small amounts, blurring a key does well to take the edge off problem edges. However, blurring a key can also feather the edges of a key past the border of the subject you’re keying, with the result being a visible “halo” around your subject depending on the adjustment you’re making. The range is 0 to 2000, with 0 being the default. With such a large maximum blur radius, combined with the capabilities that the In/Out Ratio provides in customizing the direction of spread, you can turn some pretty precarious mattes into surprisingly smooth and useful results.

**TIP:** If haloing is a problem, you can try adjusting the In/Out Ratio parameter, or you may want to consider using the Qualifier Softness parameters to feather the edges of the key, instead.

In/Out Ratio

Controls whether the “Blur Radius” is applied equally to the inside and outside of the edge of the matte (zero), applied only within the matte (negative values), or applied only outside the matte (positive values). Using In/Out Ratio can help eliminate fringing when using the Blur Radius parameter.

(Right) In/Out Ratio lowered so blurring ends at the edge of the matte and feathers inward, (Right) In/Out Ratio raised so that blurring starts at the edge of the matte and feathers outward

However, you can also use In/Out Ratio even in situations where no Blur Radius is applied at all. Raising In/Out Ratio will fill in small black holes in the matte, while lowering In/Out Ratio below 0 will eliminate speckling by pushing small white bits of the matte toward black.

(left) In/Out Ratio controls lowered to expand holes in the matte, (Right) In/Out Ratio controls raised to fill in small black holes in the matte
Matte Finesse Controls, Page 2

The second page of Matte Finesse controls expose controls for shrink, grow, opening, and closing functionality, with control over the shape of the operation, the radius, and iterations. The previously available Black Clip and White Clip controls have also been moved into this second page.

Shrink/Grow controls in page 2 of the Matte Finesse controls

Shrink/Grow/Opening/Closing

The Mode, Shape, Radius, and Iterations controls let you refine the edges of mattes in a variety of ways, shrinking and growing a matte with problem edges, or opening and closing holes that appear within a matte.

- **Mode:** Lets you choose how you want to modify the alpha channel/key. You can choose Shrink or Grow to dilate or erode the edges of the matte with great accuracy. Or, you can choose Opening or Closing to plug or expand holes to clean up a ragged matte.
- **Shape:** Lets you choose how corners and angles in the edges of the key are handled when you grow or shrink it. Circle is the default, and results in even expansion around the surface of the key that eventually averages all angles into a circular shape if you use extreme radius settings. Square averages all angles into a more rectangular shape if you use extreme radius settings. Diamond averages all angles into a diamond shape if you use extreme radius settings.
- **Radius:** Adjusts how much to shrink, grow, open, or close the key.
- **Iterations:** Alters the effect of the Operator Radius setting to create more extreme adjustments.

(Left) A matte with small holes in the face. (Right) Mode set to Shrink, Shape set to Circle, Radius set to 3, Iterations set to 3; used to close holes in a matte
Black Clip
Raising Black Clip applies a “lift” adjustment such that translucent areas of the matte (gray areas when viewing a high-contrast highlight) are pushed towards black. The range is 0 to 100, with 0 being the default setting.

Before/after raising Black Clip

White Clip
Lowering White Clip applies a “gain” adjustment such that translucent areas of the matte (gray areas when viewing a high-contrast highlight) are pushed towards white. The range is 0 to 100, with 100 being the default setting.

Before/after lowering White Clip

The Many Ways to Invert a Key
Sometimes, you’ll need to isolate a subject or range of values in an image, and then make a change to everything else. One way to do this is to add an Outside node after the node in which you’ve created the key. This lets you make one set of adjustments to what you’ve keyed, and another set of adjustments to everything outside the key.

If you just need to make a simple adjustment, you can invert the key from within the Qualifier palette. However, there are three other ways to invert a key.

- The Qualifier Invert button: Clicking this control simply inverts the key being generated by all of the controls within the Qualifier palette.
- Key Palette Qualifier Invert: The Qualifier Invert control within the Key palette provides another control with which you can invert the key that’s generated by the Qualifier palette.
- Key Palette Output Invert: The Output Invert control within the Key palette is notable because it inverts the sum of all keys applied within that node. For example, if you’re using a Qualifier in conjunction with a Window, the two invert controls mentioned previously will only invert the Qualifier key; the Window key remains unaffected. However, using the Output Invert control inverts the overall combination of the Qualifier key and the Window, all together.
Combining Qualifiers and Windows

This is covered in more detail in a subsequent section, but if you create a key using one of the Qualifier modes, and you then add a Window, the final key that’s output by that node is limited to the intersection of the Qualifier key and the Window. This makes it easy to use a Window to “garbage matte” out bits of a key that you don’t want, that can’t be eliminated by further adjustment of the Qualifier controls.

(Top) The woman’s skin tone is too close to other elements in the scene. (Bottom) A Circular Power Window is used to further isolate the woman being isolated.

Manipulating Keys Using Additional Nodes

If you need to make more adjustments to a qualified key than the Matte Finesse controls will allow, you can use the Node Editor to feed the key output of one node to the RGB input of another, at which point you can use all of the second node’s color adjustment controls to manipulate the grayscale image that constitutes that key, to improve it.

Connecting a key output to an RGB input, and then connecting the RGB output back to the next node’s KEY input again.
You can also use the Key Mixer node to combine multiple keys in several different ways, adding keys together, or subtracting them from one another, in order to create exactly the key you need.

Adding multiple keys together using a Key Mixer

For more information about these techniques, see Chapter 126, “Combining Keys and Using Mattes.”
Secondary correction describes isolating a specific part of the image, or a specific subject, using a key. Keys in DaVinci Resolve are grayscale images that define which areas of the picture you want to alter (in white) and which parts of the picture you want to leave alone (in black). Keys are generated either using the controls in the Qualifier palette, by using a Power Window, or by importing an external matte (for more information on how to use external mattes, see Chapter 126, “Combining Keys and Using Mattes”). This chapter shows you how to use Power Windows to create shapes with which you can isolate parts of the image in different ways in order to do these kinds of targeted corrections.

Power Windows

Power Windows are another way of making secondary correction, being essentially shapes you can use to isolate regions of the image. Different controls let you use oval, rectangular, polygonal, or custom curved shapes. Because you can isolate regions of the image by drawing, Power Windows produce exceptionally clean results, with edges that can be precisely positioned and feathered to achieve a variety of effects.

Before/after Curve Power Window isolates the sky area for a targeted correction

Power Windows (also referred to as simply "windows") are excellent when what you need to adjust can be encompassed within a clearly defined geometrical area. For example, the oval of a person’s face, the front of a car, or a wide expanse of sky are all good candidates for windowed adjustments. A drawback of windows can be that they must be animated to follow whatever subject they’re isolating. Fortunately, this is where DaVinci Resolve’s powerful tracker comes in, making it easy to track Power Windows quickly and accurately to follow along with the subject being isolated.

Circular Power Window to focus attention to the skin
DaVinci Resolve makes it easy to combine multiple Power Windows in different ways, to intersect with one another and create even more sophisticated shapes. For example, multiple windows can be added together, or one window can be used to cut out part of another window, which saves you from the need to make complicated keyframing operations to animate that window’s shape.

This section covers the use of Power Windows, how to create and modify them, as well as how to combine multiple windows, and combine windows and qualifiers to create highly specific isolations.

**Adding Nodes with Windows**

As with qualifiers, you must first add a node to a grade’s node tree before you begin windowing a correction. This is because all of the windows within a particular node work together to limit that node’s grade. As a reminder, any node can be changed from a primary operation that affects the entire image, to a more targeted secondary operation, simply by turning on a window, using a qualifier, or enabling an external matte.

If you don’t create a new node before creating a window, you’ll discover you’ve inappropriately changed a primary correction into a secondary correction. If you create a new serial node, you’ll then need to use the controls found within the Window palette to turn on a window to customize for your purposes. However, there are also a set of commands you can use to add serial nodes with a window already turned on, saving you a few clicks or button presses in the process.

**To add a new node with a window already turned on:**

- Choose Color > Nodes > Add Serial Node + CPW (Option-C), or press the button of the same name on the T-bar panel of the DaVinci control panel to create a new serial node with a circular window.
- Choose Color > Nodes > Add Serial Node + LPW (Option-Q), or press the button of the same name on the T-bar panel of the DaVinci control panel to create a new serial node with a linear window.
Choose Color > Nodes > Add Serial Node + PPW (Option-G), or press the button of the same name on the T-bar panel of the DaVinci control panel to create a new serial node with a polygonal window.

Choose Color > Nodes > Add Serial Node + PCW (Option-B), or press the button of the same name on the T-bar panel of the DaVinci control panel to create a new serial node with a Curve window.

When you add a node with a Power Window, the Window palette automatically opens up, ready for editing.

The Window palette

The Window palette is divided into three sets of controls: the Window list, the Presets, and the Transform and Softness controls.

The Window Palette Interface

Once you’ve created a node with which to apply a Power Window correction, you need to open the Window palette if it hasn’t been opened already.

To open the Window palette:

- Click the Window palette button.
- Press the WNDWS button on the T-bar panel of the DaVinci control panel.

The majority of the Window palette is occupied by the Window list, within which you can create as many windows as you need for the task at hand. There are five types of windows you can create, each of which has a different geometry. You can use these windows individually, or you can combine them to create even more complex shapes and interactions. The Window palette has four groups of controls that let you use these windows in different ways.
• **Window list:** A row of buttons at the top of this list lets you add new windows, which you can then customize as necessary. Each window in the list exposes an On/Off button that shows the shape type, a Layer Name field (blank until you add some text) that you can use to identify what each window is for, an Invert button, and a Mask button that governs how that window interacts with the other windows that are currently enabled (adding to other windows by default, or subtracting from other windows in Mask mode).

• **Transform parameters:** Controls the overall size, aspect ratio, position, and rotation of the currently selected window.

• **Softness parameters:** Controls the edge softness of the currently selected window. Different window shapes have different softness options.

• **Option drop-down menu:** The Option drop-down menu has commands for creating and modifying custom window presets for easy recall later, resetting windows, deleting windows, saving and managing window presets, and copying and pasting track data.

Using buttons along the top of the Window palette, there are five types of windows you can create:

• **Linear:** A four-point shape that can be edited into any kind of rectangle or trapezoid you might need. In addition to the center and corner controls, you can also drag any of the four sides to change the shape.

• **Circular:** An oval that can be shaped, sized, and feathered to solve an amazing number of problems.

• **Polygonal:** A four-point shape that can be expanded with additional control points to create complex sharp-cornered polygonal shapes.

• **Curve:** A Bezier drawing tool that you can use to create any kind of shape, curved, polygonal, or mixed, that you require.

• **Gradient:** A simple two-handled control for dividing the screen into two halves, with options for the center, angle, and feathering of the shape. Good for fast sky adjustments.

**Managing Windows**

To manipulate a window, first you need to create the type of window you want to use, or if you’ve got a group of windows created already, you need to select the window you want to work on.

**Methods of creating and selecting windows:**

• **To create a new window:** Click the Shape icon button or click the Create Window button (at the top of the Window list) that corresponds to the window you want to create.

• **To create a new window using the DaVinci control panel:** Press WINDOWS on the T-bar panel, then use the UP and DOWN buttons on the Trackball panel to select the window type you want to apply, and press ADD.

• **To select a window using the onscreen controls:** Click anywhere within a window to select it in the Viewer.

• **To select a window from the Window list:** Click the Shape icon button corresponding to the window you want to select.
To delete a window you no longer want:
Select a window, then click the Delete button.

To reset a window:
• To reset one window to its default shape: Select a window, then choose Reset Selected Window from the Option drop-down.

Showing and Hiding Onscreen Window Controls

When you open the Window palette, the Viewer goes into Power Window mode. Enabling a window makes that window’s onscreen controls appear within the Viewer, and are mirrored to video out so you can see the window controls on your external display. If you like, you can change how and where the onscreen controls appear.

To choose whether onscreen controls are mirrored to video out, or disabled, do one of the following:
Choose an option from the View > Window Outline submenu.

There are three options:
• Off: Hides the window outline on both the external display and the Viewer.
• On: The default, shows the window outline on both the external display and the Viewer.
• Only UI: Hides the window outline on your external display, but leaves it in the Viewer.

Press Option-H to toggle among all three of the above modes.

To show or hide window on-screen controls using the DaVinci control panel:
• Press SHIFT UP and then DISPLAY/CURSOR, above the fourth trackball on the Center panel.

This command is a three-way toggle. The first use of this command hides the window outline on your external display, but leaves it in the Viewer. The second use of this command hides the window outline on both the external display and Viewer. The third use of this command shows the window outline on both the external display and Viewer.

TIP: If you leave the onscreen controls visible in the Viewer, you may find that as you work you want to temporarily hide or show the onscreen controls in the Viewer so you can get an uncluttered look at the image you’re adjusting. You can quickly toggle any set of onscreen controls off and on without selecting Off in the menu by pressing Shift-’ (tilde).

Using the High-Visibility Power Window Outline Option

Ordinarily, Power Window outlines are white (for the center shape) and gray (for the softness shapes). However, sometimes this color scheme can be difficult to see, so the Color panel of the User Preferences has an option in the General Settings section called “High visibility Power Window outlines.” Turning this on sets Power Window outlines to be drawn as green (for the center shape) and yellow (for the softness shapes), to make these windows easier to see in certain circumstances.
Window Transform Controls

Windows have transform parameters that are similar to those found in the Sizing palette. These parameters let you alter the window, affecting all of its control points together.

- **Size**: Scales the entire window up or down. 50.00 is the default size.
- **Aspect**: Alters the aspect ratio of the window. 50.00 is the default value, larger values make the window wider, and smaller values make the window taller.
- **Pan**: Repositions the window along the X axis. 50.00 is the default position, larger values move the window to the right, smaller values move the window to the left.
- **Tilt**: Repositions the window along the Y axis. 50.00 is the default position, larger values move the window up, smaller values move the window down.
- **Rotate**: The default value is 0. Increasing this parameter rotates the shape clockwise, decreasing this parameter rotates the shape counterclockwise.
- **Opacity**: Lets you vary the transparency of an individual window’s contribution to a node’s key.
- **Convergence**: When “Apply stereoscopic convergence to windows and effects” is enabled in the General Options of the Project Settings, this additional Transform parameter appears that lets you create properly aligned convergence for a window placed onto a stereoscopic 3D clip. For more information about working with Stereoscopic 3D projects, see Chapter 172, “Stereoscopic Workflows.”
The transform parameters also correspond to onscreen controls found in the Viewer, which can be manipulated directly using the pointer.

Manipulating the window position on the Viewer

While many of the onscreen controls correspond to parameters within the Window palette, some onscreen controls, such as the control points that govern reshaping linear, polygonal, and Curve windows, are only adjustable via the pointer.

**Onscreen controls for window transforms:**

- **To select any window:** Click on one of an arrangement of many windows to select it, making that window’s controls active.
- **To reposition any window:** Drag anywhere within the window’s onscreen control. Window position corresponds to the Window palette’s Pan and Tilt parameters. For a Gradient window, drag the center control point.
- **To resize a Circular window while locking its aspect ratio:** Drag one of the four blue corner points out to enlarge, or inwards to shrink. This corresponds to the Window palette’s Size parameter.
- **To squash or stretch a Circular window, altering its aspect ratio:** Drag one of the blue top, bottom, left, or right control points. These adjustments correspond to the Window palette’s Aspect parameter.
- **To rotate a window:** Drag the top inner white rotate handle, in the middle of the window. For a gradient, drag the bottom arrow handle.
- **To alter window softness:** Drag any one of the magenta softness handles. Different window shapes have different sets of handles, which correspond to the Softness parameters.
- **To reshape a linear window:** Drag any of the white corner handles to corner pin the window, or drag one of the white top, bottom, or side handles to move an entire side segment of the window around.
- **To reshape a polygonal window:** Turning on a polygonal window reveals a simple white rectangle with four corner control points. Click anywhere on the surface of the rectangle to add additional control points with which to reshape the polygon, and drag any control point to alter its shape. Polygonal windows are limited to a maximum of 128 control points.
- **To change the size and aspect of a curve:** Shift-drag a bounding box around the control points you want to transform, and then adjust the corners of the box to resize the points while maintaining the aspect ratio of the shape, or adjust the top, bottom, left, or right points to squash or stretch the shape.
- **To remove control points from polygonal or Curve windows:** Middle-click the control point you want to remove.
NOTE: Removing a control point from a polygonal window that’s already been animated using the Keyframe Editor results in that point abruptly popping on and off at the keyframes creating the animation.

Window Softness

Each type of window has different Softness parameters, depending on how adjustable that window is.

- **Circular**: A single parameter, Soft 1, lets you adjust the uniform softness of the oval’s edge.
- **Linear**: Four parameters, Soft 1–4, let you adjust the softness of each of the four sides of the linear window independently. Magenta softness control points on the top, bottom, left, and right let you adjust the softness of each side of the linear shape independently.
- **Polygon**: Two parameters, Inside Softness and Outside Softness, let you adjust the overall softness of a polygonal window. There are no onscreen softness control points.
- **Curve**: Two parameters, Inside Softness and Outside Softness, let you adjust the overall softness of a curve. Using the onscreen controls, you can adjust the magenta inside and outside softness control points independently, creating any softness shape you need.
- **Gradient**: A single parameter, Soft 1, lets you adjust the uniform softness of the gradient window’s edge.

Drawing Curves

The Curve window is the only window that doesn’t display any onscreen controls when it’s first turned on. Instead, you must click within the Viewer to add control points, drawing your own custom shape to isolate whatever region you want.

Curve window to isolate a car

**TIP**: Turning on the Viewer’s full-screen mode can make it easier to draw detailed shapes. You can also zoom into and out of the Viewer while you’re drawing, using either the scroll wheel of a mouse or by pressing Command-Plus or Command-Minus.
To draw a curve:

1. Turn on the Curve window style control.
2. Click anywhere in the Viewer to start adding control points and drawing the shape you need.
3. Click and drag to add and shape Bezier curves, or just click and release to add a hard angle.
4. To finish drawing and close the shape, click the first control point you created to create a corner, or click and drag on the first control point you created to create a Bezier curve.

Once you’ve drawn a curve, there are many ways of manipulating it.

Simple methods of modifying a curve:

- **To add points:** Click anywhere on a curve to add control points.
- **To reshape a curve:** Drag any control point to a new location.
- **To move a curve:** Drag anywhere within or just outside a curve to move it.
- **To symmetrically alter a Bezier curve:** Drag any Bezier handle. The opposite handle automatically moves in the other direction.
- **To asymmetrically alter a Bezier curve:** Option-drag any Bezier handle. The opposite handle stays in place while you drag the current handle. Once you’ve created an asymmetric pair of Bezier handles, they move together as one if you simply drag a handle. You need to Option-drag to change the angle.
- **To change a curve into a corner:** Option-double-click any Bezier curve control point to change it to a sharp-angled corner point.
- **To change a corner into a curve:** Option-click any corner point and drag to pull out a Bezier handle, changing it to a curve.
- **To remove points:** Middle-click the control point you want to remove.

**NOTE:** Removing a control point from a Polygonal window that’s already been animated using the Keyframe Editor results in that point abruptly popping on and off at the keyframes creating the animation.

You can also Shift-drag a bounding box to select multiple control points on a curve to move, delete, or transform them all at once.
To select multiple control points on a curve:

1. Hold the Shift key down and drag a bounding box around the control points you want to manipulate or delete. All included control points will become highlighted.

2. Do one of the following:
   - To move the control points: Drag anywhere within the bounding box.
   - To transform the control points: Drag one of the outer corners to resize all control points symmetrically, drag the top, bottom, or side handles to squish or stretch the control points relative to one another, or move the pointer to one of the corners until the rotate cursor appears, and then drag to rotate the control points.
   - To delete the control points: Press the Backspace key.

3. When you’re finished, press the Escape key to deselect the control points.

Converting Linear, Circular, and Polygon Windows into Bezier Curves

If you start out isolating a subject using one of the simple Linear, Circular, or Polygon shape windows and you realize that you need a more complex shape to accomplish the task at hand, you can easily convert them to a more complex Bezier curve by choosing Convert to Bezier from the Window palette Option menu.

Once you’ve converted a simple shape to a Bezier window, you can add control points and manipulate the shape in any way you need to make it better conform to the subject, just as you would with any curve.

Resetting the Window Palette

The entire Window palette can be reset using the Option menu’s Reset command.
Combining Power Windows with the Mask Control

Adding multiple windows to a single node is an easy way to create composite keys. When combining windows, the Mask control defines whether one window adds to another window, or subtracts from that window.

In the following example, Circular and Curve windows have both been created, and each window’s Mask control is also turned on (by default), resulting in both masks being added together so that the sunset look correction affects both the sky and the woman’s face.

The two images show the combination of the key mattes.

By turning the Mask control of the Circular window off, the Circular window is subtracted from the curve.

Turning off the Mask control of the Circular window

Now, the woman’s face is being protected from the aggressive sky treatment.

The two images show the result of subtracting the circular window.
Since windows can be individually tracked and keyframed, you can quickly set up complex interactions of windows to solve common problems you’ll encounter. For example, when you’re tracking a window to follow a moving subject that moves behind something in the frame, you can use a second window with Mask turned off to cover the object in front. Now, when the tracked window intersects the subtractive window, the correction will disappear along with the subject.

You can also use the Mask control to create more complex shapes than you can with a single window.

Mattes and mask used together to make complex shapes

Furthermore, once you reach the limits of what shapes you can create using the four available windows, you can combine multiple nodes containing multiple shapes and qualifiers using the Key Mixer.

**Copying and Pasting Windows**

If there’s a particular window you’ve created that you want to either duplicate within the current node, or apply to another node, you can copy and paste an individual window’s shape from one item in the Window list to another.

**Methods of copying and pasting windows:**

- **To copy a window:** Click any enabled window in the Window list, then click the Window palette option menu and choose Copy Window.
- **To duplicate a window:** After copying a window, create another window of the same type that you copied, and then click the Window palette option menu and choose Paste Window.
- **To paste a window to another node:** Double-click or otherwise select another node, open the Window palette, choose the same type of window that you copied in the Window list, and then click the Window palette option menu and choose Paste Window.
- **To paste a window to the same node:** Click any enabled window in the Window list, then click the Window palette option menu and choose Copy Window, then click Paste Append Window in the Window Option menu.
Saving Window Presets

If you find that there's a particular window shape or combination of windows that you use frequently, you can save one or more windows as a preset for easy recall whenever needed. For example, if you're working on a documentary within which you find you need to do a lot of face brightening, you can create preset face ovals for close-up, medium, and wide shots, to save you from having to customize a stock circular window for every single new shot. You can also save groups of windows together as a single preset, in order to reuse complicated multi-window shapes.

Window presets are available from a group of Presets controls in the option menu in the upper right-hand corner of the Window palette.

Methods of working with Power Window presets:

- **To save a window preset:** Once you've created one or more windows you want to save, click the Save as New Preset option in the Window palette’s option menu. Type a name into the resulting dialog, and click OK. That preset is now available in the Preset section of the option menu.

- **To recall a window preset:** Click to open the Window palette’s option menu, and choose a preset from the list. Loaded window presets overwrite whatever other windows were set up in that node.

- **To update an already saved preset:** Recall a preset, change the resulting window(s), then click to open the Window palette’s option menu. Select Update Preset, then select the preset name. This will overwrite the selected preset with the altered window arrangement.

- **To delete a window preset:** Click to open the Window palette’s option menu, and choose Delete Preset, then choose a preset from the list. Make sure you chose the correct preset name; there is no warning before the deletion, and you cannot undo the deletion once it's done.

Once recalled, windows created by presets can be modified and tracked just like any other window.
Using Windows and Qualifiers Together

Another use of windows is to act as a “garbage matte” when used together with a qualifier. By default, when you use a window and qualifier together, a key is only output where both the window and qualifier intersect. This makes it easy to exclude unwanted parts of a key that are too difficult to eliminate by further refinement of the qualifier controls.

For example, the following qualification is intended to isolate the woman’s face, but some of the similarly colored wood and sky in the background is also included.

Instead of driving yourself crazy trying to eliminate the unwanted parts of the key by modifying the current qualification, which is doing a great job of isolating the skin tones, you could instead use a window to isolate her face, excluding everything outside the window, and simplifying your job considerably.

![A qualified image with highlight on](image1)

If she moves, then you can simply track the window to follow. Simple tracking is covered in Chapter 121, “Motion Tracking Windows.”

![Now with additional Power Window isolation](image2)

Furthermore, you can use the window’s Invert control to do the reverse, excluding all qualified portions of the key inside the window, and including all qualified portions of the key outside the window.

If you need to build more complex qualifier/window combinations than this, you can add more windows, or you can use multiple qualifiers and windows with the Key Mixer node, which is discussed in Chapter 126, “Combining Keys and Using Mattes.”
Manipulating Windows Using a Control Panel

Window shape and position can also be manipulated using the DaVinci control panel. All Windows controls are located on the T-bar panel, except for the ADJ WINDOW button above the fourth trackball of the Center panel.

To enable, mask, or disable a window:
1. Press WNDWS on the T-bar panel. The Window palette should appear.
2. Press the soft key that corresponds to the type of window you want to turn on, CPW (Circular Power window), LPW (Linear Power window), PPW (Polygonal Power window), or PCW (PowerCurve window). The appropriate window controls should appear with an orange highlight.
3. Press the MATTE/MASK soft key to toggle among turning the window on, turning Mask on, and turning the window off.

To reposition a window using the Pan and Tilt knobs:
1. Press the unlabeled soft key at the bottom-right of the T-bar panel to toggle between the current knob mappings on the T-bar panel, and the PAN and TILT mappings.
2. Use the Pan and Tilt knobs to adjust the window’s position.

To reposition a window using the fourth trackball:
1. If necessary, press WNDWS on the T-bar panel to open the Window palette.
2. Press ADJ WNDW, above the fourth trackball on the Center panel.
3. Use the fourth trackball to reposition the window.
4. When you’re finished, press ADJ WNDW again to exit adjust window mode.

To alter a window’s Zoom, Aspect, or Rotation:
Use the ZOOM, ASPECT, and ROTATE knobs on the T-bar panel.

To alter a window’s softness, do one of the following:
- For Circular and Linear windows: use the SOFTNESS knob on the T-bar panel.
- For Polygonal and PowerCurve windows: press the unlabeled soft key at the bottom-right of the T-bar panel to toggle between the current knob mappings, and the PAN, TILT, INSIDE SOFT, and OUTSIDE SOFT knob mappings.

To invert a window:
Press the INVERT soft key on the T-bar panel.
Chapter 121

Motion Tracking Windows

While Power Windows can be manually keyframed to follow a moving subject you want to isolate, this chapter shows how you can use the powerful cloud and point-based motion tracking controls in DaVinci Resolve to make Power Windows follow along with the motion of subjects and the camera in the fastest, easiest way possible. Then, numerous techniques are presented for dealing with complicated tracking scenarios and common problems that arise for subjects that are difficult to track.

Motion Tracking Windows

The Tracker palette has three modes, available from the Palette menu.

- In Window mode, the tracking controls let you match the motion of a window to that of a moving feature in the frame.
- In Stabilizer mode, the same underlying technology is used to smooth or stabilize the motion within the entire frame.
- In FX mode a Point Tracker can be used to animate ResolveFX or OFX plug-ins with positioning controls. For more information about the FX and Stabilizer modes, see Chapter 133, “Sizing and Image Stabilization.”

DaVinci Resolve has an incredibly simple, yet powerful, 3D cloud tracker that allows you to track quickly and accurately any Power Window (Circular, Linear, Polygonal, Curve, or Gradient) to follow any moving feature. This avoids the need to use dynamic keyframes to manually animate a window’s position.

In particular, you can use the tracker to match a window’s position, size, rotation, and its pitch and yaw in 3D space to either foreground or background elements that move within the frame.

Simple Tracking Using the Tracker Menu

The simplest way to track a feature using a Power Window is to use the commands found in the Color > Tracker menu. These commands include:

- **Track Forward (Command-T):** Tracks a window to a feature from the current position of the playhead forward, ending at the last frame of a clip.
- **Track Reverse (Option-T):** Tracks a window to a feature from the current position of the playhead backward, ending at the first frame of a clip.
- **Track Stop (Command-Option-T):** Interrupts any track. This is useful for letting you cancel a long track that goes wrong (the Stop button of a control panel stops tracking as well).

Most window tracks are easy to accomplish using these three commands.
To track any Power Window to match a moving feature within the frame:

1. Move the playhead to the frame of the current shot where you want to begin (you don’t have to start tracking at the first frame of a shot).

2. Turn on any window, and adjust it to surround the feature you want to track.
   Typically, you’ll have done this anyway, for example, framing someone’s moving face with a Circular window to lighten their highlights.

3. To initiate tracking, do one of the following:
   - Choose Color > Tracker > Track Forward (press Command-T).
   - Choose Color > Tracker > Track Reverse (Option-T).
   - On the T-bar panel of the DaVinci control panel, press OBJECT TRACK MODE, and then press either the TRACK FWD or TRACK REV soft keys on the Center panel.

DaVinci Resolve automatically opens the Viewer page, places a series of tracking points within the window you’ve created, and performs the track from the current frame; forward to the last frame or backward to the first frame.

DaVinci Resolve analyzes a cloud of tracking points that follow the vectors of every trackable group of pixels within the window you’ve created, and the results are fast and accurate. After tracking, the window you’ve placed automatically moves, resizes, rotates, and skews to match the motion of the feature you’re tracking.

Once a clip has tracking data applied to one of its windows, a small tracking icon appears within that clip’s icon in the Thumbnail timeline.

If the track you’ve performed is unsuitable, you can reposition the window to cover a different area of the subject you’re trying to track, and initiate tracking again. New tracking data overwrites any previous tracking data applied to that window.
Once you’re satisfied with your track, you can continue to resize, reposition, or reshape the window being tracked. Tracking data is separate from the window transform parameters (which can be keyframed), so changes you make to a window offset it from the originally tracked path.

**Tracking Windows When You’ll Be Exporting Media With Handles**

When you track windows to match moving features in a clip, the windows are only transformed on frames with tracking data. In Round Trip workflows where you add handles to the graded clips you render for editorial flexibility in the footage you deliver, you need to make sure that you track all windows from the beginning to the end of these handles to make sure that, if an editor actually trims any of the clips you give them to use the handles, all windows are doing what they should.

An easy way to do this is to choose View > Show Current Clips With Handles to display each clip you select in the Timeline with handles defined by the “Default handles length” setting in the Editing panel of the User Preferences. Make sure that the “Default handles length” is equal to the handles you export using the “Add X Frame handles” option in the Render Settings list of the Deliver page. With each clip’s handles made visible in this way, you can easily track windows along every frame you’ll be rendering.

**Simple Ways of Working With Existing Tracking Data**

If there’s a portion of a shot that you haven’t tracked (for example, you started tracking at a later frame, or you ended tracking before the end of the shot), then the window you’re tracking remains wherever it was at the first or last frame that was tracked. If you want to fill in these gaps, you can always move the playhead to the first or last frame that was tracked, and then use the Track Backward or Track Forward command to track the rest of the frames in that shot.

**Tips for Better Tracking**

In situations where a feature changes shape in such a way as to confuse the tracker, you can try tracking a smaller part of the feature by using a smaller window. Once you’ve achieved a successful track, you can resize the window as necessary, and it will have no effect on the track that’s already been made.

Also, if you’re tracking a feature that moves behind something onscreen and disappears for the rest of the shot, there’s an easy way to avoid having an awkward window sitting in the middle of the scene. You can use dynamic keyframes to animate the Key Output Gain parameter (in the Key tab of the Color page) to fade from the correction’s full strength of 1.0 down to 0, the value at which the correction disappears, along with the window itself.

**Tracking One Frame at a Time**

You can click the “track one frame forward” or “track one frame backward” buttons in the Tracker palette to track a moving feature one frame at a time, making it easier to make adjustments to follow a difficult track when you’ve set tracking to Frame mode (by clicking the Frame button).

In Frame mode, you can keyframe window transformations to more faithfully conform to troublesome motion as you’re moving one frame at a time through the track; manual changes to a window’s position will be keyframed to create frame-specific transformations, rather than used to offset the entire tracked motion path as in Clip mode. When you add multiple keyframes in the Tracker graph, animation will be automatically interpolated from keyframe to keyframe.
Copying and Pasting Tracking

There will be plenty of times you’ll apply multiple windows to a single moving subject, such as a car, when you can use a single motion track for all the windows. Commands in the Option menu let you copy and paste track data from one window to another within the same node, saving time when you want several windows tracking together as one.

To copy track data from one window to another:

1. Open the Window palette, then select a window that has tracking applied to it (indicated by a tracking badge in the corner of the shape icon), and choose Copy Track Data from the Option pop-up.

2. Select another window, and choose Paste Track Data from the Option pop-up. Once you’ve copied track data from one window, you can paste it to as many other windows as you like.

You can also copy tracking from the FX mode of the Tracker palette and paste it to a window, in case you want to use the same tracking data for both an effect and a window.

To copy track data from an FX track to a window:

1. Open the Tracker palette, choose the FX mode that contains the tracking data you want to copy, and choose Copy Track Data from the Option pop-up.

Open the Window palette, select a window, and choose Paste Track Data from the Option pop-up. Once you’ve copied track data from one window, you can paste it to as many other windows as you like.

Tracker Palette Controls in More Detail

You can easily combine object tracking and keyframing to animate windows. For example, you’ll typically use object tracking to make a window follow the position and orientation of a moving feature, but you can add dynamic marks to the window track of the correction in the Color page with which to alter its size and shape to better conform to a feature’s changing form.

Controls in the Window Tracker Palette

Occasionally, you’ll run into a shot that doesn’t quite track well enough using the Tracker menu’s simple controls. In these cases, the Viewer page provides the complete set of object tracking controls that can be used to modify tracking operations in different situations.

The Tracker palette

The object tracking controls are divided into seven groups.
Tracker Palette Modes
The Tracker palette’s Option drop-down menu lets you choose between Window mode (for matching a window to the motion of a feature in the frame), Stabilizer mode (for subduing unwanted camera motion; for more information on Stabilizer mode, see Chapter 133, “Sizing and Image Stabilization”), and FX mode (for tracking position to be used with ResolveFX or OpenFX plug-ins).

Types of Tracking
A pop-up menu below the Tracker graph lets you choose whether to use the Cloud Tracker or the Point Tracker.

There are two options:

- **The Cloud Tracker**: Automatically analyzes all parts of the image for trackable points, and uses these to automatically figure out the motion in the shot that you want to use to move a Power Window or stabilize a shot. This tracker type is great for quickly tracking a window to match the movement of almost any feature, with a minimum of work.

- **The Point Tracker**: Lets you create one or more tracker crosshairs that you can manually position in order to track specific features in the shot. The more crosshairs you create and position, the more accurate the track can be. The Point Tracker is incredibly useful in situations where you need to follow the motion of a very specific feature in the frame. It can also be useful in cases where you want to stabilize a shot that has many subjects moving in different directions, and it’s difficult to obtain a good result with the Cloud Tracker.

Object Tracking
The object tracking controls provide the most basic tracking functions, some of which are mirrored within the Color > Tracker menu.

A series of five checkboxes let you turn on and off which transforms you'd like motion tracking to apply automatically to the window. These checkboxes must be selected before you perform a track in order to restrict the transforms that are used.

- **Pan and Tilt**: Enables tracking of horizontal and vertical position, when you want to transform a window to follow the location of a tracked subject.
- **Zoom**: Enables tracking of size, when you want to transform a window to resize to follow a tracked subject.
- **Rotate**: Enables tracking of orientation, when you want to transform a window to rotate with a tracked subject.
- **Perspective 3D**: Enables tracking of pitch and yaw in 3D space, when you want a window to skew to follow the orientation of a tracked subject within the scene. Good when you want the window to “stick” to a surface.
NOTE: Once tracking or stabilization has been done, disabling these checkboxes does nothing to alter the result. To make changes, you need to enable or disable the necessary checkboxes first, and then reanalyze the clip.

After you’ve defined the transforms you want to use for the track, the analyze controls let you proceed with the analysis of the subject being tracked.

- **Track One Frame Reverse button**: Motion tracks a single frame in reverse. Useful for slow tracking of difficult subjects that may require frequent correction.
- **Track Reverse button**: Initiates tracking from the current frame backward, ending at the first frame of the clip. Good for tracking backward when your best starting point is somewhere within the middle of the shot.
- **Pause button**: Stops tracking (if you’re fast enough to click this button before tracking is finished).
- **Track Forward button**: Initiates tracking from the current frame forward, ending at the last frame of the clip.
- **Track One Frame Forward button**: Motion tracks a single frame forward. Useful for slow tracking of difficult subjects that may require frequent correction.

**Clip/Frame Controls**

Two buttons let you set how manual adjustments to the position of tracked windows affect the overall track.

- **Clip**: The default mode, in which changes you make to the position of a window are globally applied to the entire track. For example, if you track a feature, and then move the window, the window moves along a motion path that’s consistently offset from the original track for the duration of the clip. Use this mode if you’re happy with the track, but you want to modify the window’s overall shape and position relative to the motion path it’s following.
- **Frame**: In this mode, changes you make to the position or shape of a window create a keyframe at the frame at the position of the playhead. Multiple keyframes are interpolated to create animation with which you can manually transform a window to solve a variety of problems. This mode is useful for rotoscoping the shape and position of windows to match a subject that’s tough to automatically track. Frame mode is also useful for making corrections to individual frames that were badly tracked, for animating windows to go all the way out of frame along with a subject, or for making manual, frame-by-frame adjustments to window position to cover untrackable sections.

**The Tracker Graph**

The Tracker graph provides a visual display of the tracking data that’s being analyzed. Each of the transform controls that can be tracked has an individual curve, which lets you evaluate each tracked parameter on its own, and each curve is color-coded to match the corresponding label of the tracking transforms listed above.
The Tracker graph showing a curve for each transform control

A vertical slider to the right of the Tracker graph lets you scale the height of the curve data within to make it easier to see it all within the graph. A horizontal slider at the bottom of the graph allows you to zoom in and out of the tracker curves, allowing you to see finer detail of the tracking paths. Above the Tracker graph, a Timeline ruler contains a playhead that’s locked to the playheads in the Viewer and Keyframe Editor.

You can draw a bounding box in the Tracker graph with which to select a portion of one or more curves to delete sections of low-quality tracking data using the Clear Selected Keyframes command found in the Tracker Options menu. To eliminate the current bounding box from the Tracker graph, click once anywhere within the graph.

Interactive Mode Controls

The Interactive controls, at the bottom-left of the Tracker palette, let you make manual changes to the automatically generated tracking point cloud that DaVinci Resolve creates when you’re tracking with the Cloud Tracker, so you can try different ways of obtaining better tracking results in challenging situations.

- **Interactive Mode checkbox**: Turns the Interactive tracking mode on and off. When you enter Interactive mode, you can manually alter the point cloud that DaVinci Resolve uses to track the feature within the current window. You’ll then make your track while in Interactive mode.

- **Insert**: Lets you add tracking points to whatever trackable features exist within a bounding box that you’ve drawn in the Viewer. Inserted tracking points are automatically placed based on trackable pixels in the image.

- **Set Point**: Lets you use the cursor (using the DaVinci Resolve control panel), to manually place individual tracking points, one by one, with which to track a feature. If there is no trackable pixel group at the coordinates where you placed the cursor, a tracking point will be placed at the nearest trackable pixel group.

  You must place at least two tracking points at different pixel groups to track rotation, and at least three to track zoom.

- **Delete**: Eliminates all tracking points within a bounding box that you’ve drawn in the Viewer.
Point Tracker Controls

If you’re using the Point Tracker, then the Interactive Mode controls disappear, replaced by the two controls of the Point Tracker.

- **Add Tracker**: Click to create a new tracker that’s automatically positioned in the center of the frame. Once created, you can drag it using the pointer to line up with the feature you want to track. You can create as many trackers as you like. Multiple trackers are all tracked at once.
- **Delete Tracker**: Select any tracker (selected trackers are red, deselected trackers are blue), and click this button to remove it.

Additional Commands in the Tracker Options Menu

There are some additional commands located in the Palette Options pop-up menu.

- **Reset Track Data on Active Window**: Lets you delete the tracking data corresponding to the currently selected window.
- **Clear Selected Track Data**: When you drag a bounding box over parts of one or more curves in the Tracker graph, this command lets you delete that part of the graph. This is useful when you want to eliminate sections of low-quality track data. Portions of curves that are cleared in this way have linear interpolation automatically applied to them, similar to if you used the Keyframes Interpolation controls.
- **Delete Keyframe**: Deletes tracker graph keyframes at the current position of the playhead.
- **Clear All Tracking Points**: Clears the tracking points in the Power Window at the frame you are on.
- **Show Track**: Turn this checkbox on to show the motion path produced by the tracking you’ve done.
- **Copy Track Data**: Lets you copy track data from the currently selected window. Windows can be selected directly in the Viewer while the Tracker palette is open.
- **Paste Track Data**: Pastes copied track data to the currently selected window. Windows can be selected directly in the Viewer while the Tracker palette is open.

Cloud Tracker Workflows

The next few examples illustrate how to use the Tracker palette’s controls in practical situations. In many circumstances, objects passing in front of a tracked subject, known as “occlusions,” can cause problems. While the tracker in DaVinci Resolve is highly occlusion-resistant, the following sections show a variety of techniques you can use when an occlusion prevents you from getting a useful track.
Using Interactive Mode to Manually Choose Tracking Features

Interactive mode lets you manually remove or add tracking points to improve tracking performance in situations where the automatic image analysis in DaVinci Resolve provides unsatisfactory results.

For example, you can delete tracking points within a window that correspond to overlapping features you don’t want to track. Suppose a car that you’re tracking drives by a sign that partially obscures the car. Without intervention, the PowerCurve that’s isolating the car will deform improperly when the car moves along and then away from the sign.

Using Interactive mode, you can delete the tracking points that will overlap the sign you don’t want to track, improving the result.

To eliminate specific, unwanted tracking points from a track:

1. Open the Tracker palette.
2. Turn on the Interactive Mode checkbox.
3. In the Viewer, drag a box around the tracking points you want to eliminate within the window.
4. Click the Delete button.
The points within the selection area are deleted.

5 While Interactive mode is still on, click Track Forward or Track Reverse to track the subject using the remaining tracking points.

6 When you’re finished tracking, turn off the Interactive Mode checkbox.

DaVinci Resolve goes back to using automatically placed tracking points.

In another interactive tracking example, you may sometimes run into situations where you want to eliminate all automatically placed tracking points altogether, placing your own in specific regions of the image.

To eliminate automatic tracking points, adding your own instead:

1 Open the Tracker palette.

2 Turn on the Interactive Mode checkbox.

3 In the Viewer, drag a box around all the tracking points in the window, and click the Delete button to eliminate all tracking points from the image.
4 Click the Delete button to eliminate all tracking points from the image.

5 Drag a box around the specific area where you’d like to add new tracking points. In this case, you only want to track the top half of the woman’s face, since the bottom half is cut off by the fence posts.

6 Now, click the Insert Track Points button.

NOTE: If no appropriate tracking features can be found, no points will be added.
While in Interactive Object Tracking mode you may also choose to add tracking points one by one.

**To add a single tracking point:**
1. Open the Tracker palette.
2. Turn on the Interactive Mode checkbox.
3. Using the DaVinci control panel, press the CURSOR button above the fourth trackball of the Center panel, and move the onscreen cursor to the detail of the image that you want to add a tracking point to.
4. Click the Set Point button, within the Interactive mode controls of the Tracker palette.
   This adds a tracking point corresponding to the feature of the image that you clicked, and you’re ready to start tracking.

**Dealing With Occlusions When Tracking**

Sometimes you’ll find that you need to deal with a gap in the useful tracking data. For example, objects in the frame that pass in front of the feature you’re trying to track cause gaps in the tracking information for a clip.

In situations where a subject being tracked becomes totally occluded by another object in the frame, there’s an easy method of interpolating to cover holes in the available tracking data. In the following example, the woman walks behind another fence post, this time one that’s taller than she is. The window tracking her face will become completely lost at this point, but interpolation will help to salvage this shot.

Interpolating between two sets of tracking data to track past an occlusion:
1. Move the playhead to the first trackable frame of the moving feature you’re correcting, and create a Power Window that surrounds it.
2. Use Track Forward to track the feature as far as you can before it becomes obscured behind something else in the frame.

3. When the Power Window stops tracking the feature reliably, stop the track.

![The Power Window is obscured by the post](image1.png)

4. Open the Tracker palette.

5. Click the Frame button to put the Tracker controls into frame-by-frame adjustment mode. This is an important step.

![Selecting Frame mode](image2.png)

6. Move the playhead to the frame where the feature you’re tracking reappears from behind the occlusion, then drag the window so that it again overlaps the feature.

![Moving the playhead and position the window](image3.png)

7. Use Track Forward to continue tracking the feature until the end of the clip. Alternately, you could have started from the end of the clip and used Track Reverse to track the feature as far as possible, if that’s easier.

Now that you’ve identified the gap in reliable tracking data for this clip, it’s time to set up the interpolation.

![Notice the gap in the tracking data where the window was behind the post](image4.png)
Drag a bounding box over the portion of the curves in the Tracker graph that fall between the good tracking data at the beginning and end of the shot.

Click the Tracker palette option pop-up menu, and choose Clear Selected Track Data.

The portions of curves that you selected are deleted, and have linear interpolation automatically applied to them so that there's no hole in the track data or the motion of the window, which now moves smoothly from the last outgoing frame of reliable tracking data to the first incoming frame of new reliable tracking data.

Point Tracker Workflows

As advanced as the Cloud Tracking that is the default in DaVinci Resolve is, there are times when it may be simpler to track using good old-fashioned crosshairs. The Point Tracker makes it easy to track very specific features of a subject with motion you need to follow. Unlike the Cloud Tracker, which automatically looks for all trackable points within a region of the image that you identify using a window, the Point Tracker lets you create one or more crosshairs that you must manually position to overlap with whatever high-contrast features you want to track. This section covers the three main workflows you need to know to use the Point Tracker.

Tracking a Window Using the Point Tracker

The following procedure describes, in a general way, how to use the Point Tracker to track a moving subject and apply that motion to a Power Window.

1. Move the playhead to the frame of the current shot where you want to begin (you don’t have to start tracking at the first frame of a shot, since you can always track backward).

2. Turn on any window, and adjust it to surround the feature you want to track. Typically, you’ll have done this anyway, for example, framing someone’s moving face with a Circular window to lighten their highlights. You want to make sure that the window you want to apply the tracked motion to is selected before you begin tracking. In this example, we’ll be tracking a Circular window to follow the woman’s face.
3 Open the Tracker palette, and choose Point Tracker from the bottom right pop-up.

Choosing the Point Tracker

4 Before you start tracking, choose what types of motion you want to track and apply to the window you're working on. You can choose from among Pan, Tilt, Zoom, Rotate or Perspective 3D. Which methods of transformation can be applied depend on how many points you add to track.

Choosing what type of motion to analyze

5 Click the Add Tracker button. A new tracker crosshairs appears in the Viewer in the center of the frame.

Clicking the Add Tracker Point icon

6 Move the pointer directly over the tracker crosshairs, and when it turns into the move cursor, click and drag to move the crosshairs to line up on top of the feature you want to track. For the best results, this should be a high-contrast detail such as a corner, the end of a line, a small shape like a pebble, or a jagged detail. Unlike other point trackers, there is no inside or outside region to separately adjust, there's only the one crosshairs that you need to align. In this example, this first crosshairs is placed at the inside of her stage left eyebrow (the corner of her eye would introduce too much jitter as the tracker will pick up her blinks).
7 If you want to improve the accuracy of your track, you can create more tracker crosshairs and position them on top of other details within the subject you’re tracking. For the best results, make sure that all crosshairs are placed onto details that are in the same plane of motion. In other words, don’t put some crosshairs on a person’s face in the foreground, and other crosshairs on a tree that’s far in the background, since both these features will have very different vectors of motion. In this example, trackers are placed at her inside eyebrows and at the corner of her lips.

8 When you’re done placing crosshairs, click the Track Forward or Track Backward buttons to initiate tracking. The clip will be analyzed, and the Tracker graph will update with the tracking data, and the window you had selected automatically moves to match the motion of the feature you’re tracking.
Removing Trackers

If you find that a particular tracker is causing problems, you can remove it by selecting it in the Viewer, and clicking the Delete Tracker icon, before retracking the subject.

![Clicking the Delete Tracker icon](image)

Using Frame Mode to Offset Track

A common issue when point tracking is how to deal with occlusions and times when the tracked feature moves off screen. In DaVinci Resolve, the solution is to use the Tracker palette’s Frame mode to move the tracker crosshairs onto another feature to track, while offsetting the resulting motion so that it continues to follow the original motion path.

1 In this example, a point tracker crosshairs has been positioned at a corner of a window of a building that’s being separately adjusted using a Power Window. The window is being used because, as the woman turns to leave, she covers up most of the other trackable outer edges of the building, which would ruin the track.

![Setting up to track a building moving off screen](image)

2 As the camera pans, the feature being tracked is about to go off frame, which is about to ruin the track. As this happens, click the Stop Track button.

![Stopping the track on the last good frame of the track, before the tracker goes off screen](image)
3. Move the playhead back to the last good frame of tracking, and then click the Frame button in the Tracker palette to go into Frame mode.

4. In Frame mode, you can now drag the tracker to another feature of the building, this time the outer edge of the roof, that will be better to follow as the building goes out of frame to the left, since the Power Window will go out of frame before the rightmost corner of the building’s roof does.

5. Now, click the Track Forward button again, and the crosshairs will begin tracking the new feature, but the motion will be offset, so the movement of the Power Window continues to follow the original motion path.

6. If you turn on the track path (in the Tracker Option menu), and move the playhead to the frame where you moved the tracker, you can see that the motion before you moved the tracker and the motion after continues smoothly along the same path, with no sudden breaks. When you’re finished, click the Clip button to get out of Frame mode.
Rotoscoping Window Shapes After Tracking

While the DaVinci Resolve trackers are pretty miraculous when it comes to making a window follow moving subjects, or elements within a moving scene, there will be plenty of times when the final track isn’t quite perfect. For example, if you’re trying to isolate someone’s face with a very specific window, and the person turns their head, then the resulting change of shape is almost certainly going to require you to make animated adjustments to the window in order to continue making such a specific isolation.
Fortunately, the Tracker palette’s Frame mode makes it easy to animate shape changes you make to windows in order to better follow a moving subject, a task often referred to as rotoscoping. By following the motion of a moving subject, and making a series of automatically keyframed adjustments to the window at every point the subject changes speed or direction, you can make a window isolate a moving target with surprising precision.

Furthermore, you can also use Frame mode to repair imprecise tracks where the window is veering off course because of quickly or irregularly moving features. In these cases, you have the option of manually tracking the window in Frame mode to fit the trajectory of the feature, frame by frame.

Lastly, you don’t even have to have performed a track to use the Tracker graph in Frame mode to keyframe animated changes to a window. In fact, using the Tracker graph in Frame mode can sometimes be more convenient than using the Keyframe Editor in Auto Keyframe mode, depending on what you’re doing.

**Rotoscopying Controls**

The Clip/Frame buttons determine whether or not you’re rotoscoping a shape.

- **In Clip mode**: Any changes you make to a window transform it over the entire duration of that clip. In other words, you can track a window to a moving feature, and in Clip mode any changes you make to the size, rotation, position, or shape of the window occur equally from the beginning to the end of that clip.

- **In Frame mode**: Changes you make to a window automatically create a keyframe at the bottom of the ruler in the Tracker graph. Making two or more changes to a window in Frame mode results in automatically interpolated animation from one keyframed window transformation to the next.

You can freely move back and forth between Clip to Frame modes to make changes to a window. Even if you’ve keyframed a window to change shape, you can turn on Clip mode and make an overall change to the window, enlarging it for example, that results in the window being equally enlarged at every keyframe.
Keyframing in Frame Mode

Once you’ve added keyframes to the Tracker palette, there are a number of ways you can edit them.

Methods of working with keyframes in the Tracker graph:

- **To add a keyframe:** Click the Add Keyframe icon at the upper right-hand corner of the Tracker graph. It looks similar to the Keyframe icons found in the Edit page Inspector. This is useful for adding a keyframe to a frame where the window fits the subject well, prior to moving forward a few frames and making an alteration to the window to follow the subject that will generate another keyframe.

- **To move the playhead from one keyframe to another:** Click the Previous Keyframe and Next Keyframe icons at the upper right-hand corner of the Tracker graph. These controls look similar to those found in the Edit page Inspector.

- **To delete a keyframe:** With the playhead on the same frame as the keyframe you want to delete, open the Tracker option menu, and choose Delete Keyframe.

A Rotoscoping Workflow

The following procedure demonstrates how to use a window to rotoscope an onscreen feature that you want to isolate. In the process, it shows how to set up a window for rotoscoping using the Tracker palette, and discusses some best practices for rotoscoping efficiently.

To rotoscope or manually track a window using automatic keyframing:

1. Create a window to isolate the feature you’re wanting to adjust, and use the tracker to make it follow the motion of the subject. If the window doesn’t follow the contours of the subject as precisely as you require, then you can begin manually keyframing its shape on top of the tracking you’ve done to rotoscope the subject.

2. With the Tracker palette open, click Frame to change the tracking mode.

3. With the playhead at either the first or last frame where the window fits the subject you’re isolating, you can either click the Add Keyframe icon at the upper right-hand corner of the Tracker graph, or wiggle any control point by a pixel or two, to add a keyframe at that frame.

   With the playhead at either the first or last frame where the window fits the subject you’re isolating, you can either click the Add Keyframe button at the upper right-hand corner of the Tracker graph, or wiggle any control point by a pixel or two, to add a keyframe at that frame.
Clicking the Add Keyframe icon in the Tracker graph

Adding a keyframe at the last frame where the window follows the subject’s motion well means that any future animated changes you make interpolate from this frame forward, rather than from previous frames where there’s no need for alterations.

Adjusting the window in Frame mode adds a keyframe

While you’re in Frame mode, the changes you make to the window automatically generate a keyframe in the Tracker palette, which appears at the bottom of the Tracker graph’s timeline.

Keyframes appear in the Tracker graph ruler

It’s frequently essential to add a keyframe at the last frame where a window conforms well to the subject you’re trying to isolate, in order to limit window animation from that frame to the next keyframed transformation, rather than accidentally animating from the beginning of the clip, or from the next or previous keyframe in the Tracker graph.

4 Next, move the playhead to the next frame where the window requires adjustment to better fit the moving subject, and adjust the position of the window, the control points of the window, or both to isolate the subject as necessary.

Readjusting the window in Frame mode to follow the subject’s motion
This results in a second keyframe being placed in the ruler of the Tracker graph.

Two keyframes creating rotoscoped animation in addition to any motion tracking that’s applied

5. With your first two keyframes placed, scrub the playhead back and forth between them to evaluate how well the window’s animation is automatically interpolating to fit the motion of the subject you’re isolating. If the window doesn’t follow the motion of your subject well enough, move the playhead to the frame where the window divergence is the most pronounced and make another adjustment to correct the shape.

A frame between the two keyframes you’ve rotoscoped that needs further adjustment

This creates another keyframe.

After adjusting the in-between frame

6. When you’re finished making adjustments between your first two keyframes, move the playhead farther along and add keyframes as necessary to make the window follow the motion of your subject.

In general, look for the frames where your subject’s motion starts, stops, speeds up, slows down, or changes direction. As you work, it’s good to try and add the fewest number of keyframes you can to ensure smooth motion from one to another. Too many keyframed adjustments made too close together for a smoothly moving subject risks adding jerky motion if you’re not careful. On the other hand, if you have an erratically moving subject, you may have to add more keyframes, possibly frame by frame, to achieve the desired result.
**TIP:** If you’re isolating a subject with a complex shape that moves quite a lot, you might consider using multiple simple overlapping shapes to track and rotoscope it, rather than a single complicated one, to make the task easier.

When you’re finished rotoscoping the window, be sure to click the Clip button to switch back to Clip mode, so you can trim the window’s shape across every keyframe you’ve just created, if necessary. This will also prevent you from accidentally adding more keyframes if you select other shapes.

This technique requires a bit more work than simply using the Tracker, but it’ll let you quickly adjust the animation of a window to more tightly conform to a moving subject when you need an adjustment to be specific to the subject alone. You can also use this technique to reposition specific motion path points in the middle of an otherwise successful track to make them fit better, or to add keyframes to the beginning or end of a track when the subject moves offscreen but the window does not.

**Viewing a Window’s Motion Path**

You can turn on the motion path of the window you’re tracking by choosing Show Track from the Tracker Option menu, or by pressing the SHOW TRACK soft key on the Center panel of the DaVinci control panel when you’re in OBJECT TRACK MODE.
Chapter 122

Using the Gallery

The Gallery provides a way to save, browse, and use saved still frames from different clips in a program. Each project is saved with its own individual set of stills, and each still you save consists of a DPX image of the saved frame, and the grade metadata. You can use saved stills for reference when matching one clip to another, or you can use them to copy grades to other clips, or other timelines.

There are two ways to work with the contents of the Gallery. The Color page has a small Gallery, to the left of the Viewer, that provides quick access to saved stills and grades as you work. The Gallery window, which can be opened via a button at the top right of the Gallery, provides a dedicated interface for organizing your grades, copying grades and memories between projects, and for accessing a dedicated collection of DaVinci Resolve looks.
Using the Gallery

The Gallery in the Color page and the expanded Gallery window environment share many of the same commands for organizing stills. However, the commands for saving stills and customizing split-screen views are restricted to the Color page.

Saving Stills

One of the most common operations is to save a clip as a still (with that clip’s embedded grade) for future reference and use.

To save an individual still in the Color page, do one of the following:

- Choose View > Stills > Grab Still (Option-Command-G).
- Right-click on the Viewer and choose Grab Still.
- Press GRAB STILL on the Transport panel of the DaVinci control panel.

It’s also possible to save stills automatically for every clip in the entire Timeline. This can be useful if you’re planning to export a set of grades to hand off to another colorist, or if you need to apply a series of grades manually from one project to another when ColorTrace™ won’t work.

To save a still for every clip in the current timeline, right-click the Viewer, and choose one of the following:

- Grab All Stills > From First Frame: The first frame of each clip is saved to the Gallery.
- Grab All Stills > From Middle Frame: The middle frame of each clip is saved to the Gallery.
- Grab Missing Stills > From First Frame: Only the first frame of clips with no stills in the Gallery are saved to the Gallery.
- Grab Missing Stills > From Middle Frame: Only the middle frame of clips with no stills in the Gallery are saved to the Gallery.

By default, when you save one or more stills, they’re named “TrackNumber.ShotNumber.VersionNumber” with dots separating each number. If you like, you can choose an option from the General Options panel of the Project Settings to “Automatically label Gallery stills” in different ways. This is covered in more detail later in this chapter.
Selecting Stills

To select a range of stills, do one of the following:

- Click one still, then Shift-click another to select a contiguous range of stills.
- Command-click any stills you like to make a noncontiguous selection.
- Right-click any still, and choose one of the following commands:
  - Select All: Selects every clip in the Gallery.
  - Select Current to Last: Selects every still from the one you’ve clicked through the last still in the Gallery.
  - Select First to Current: Selects every still from the one you’ve clicked through the first still in the Gallery.

Deleting Stills

If you need to remove one or more stills, this can only be done using the Gallery’s contextual menu.

To delete one or more stills, do one of the following:

1. Select one or more stills in the Gallery.
2. Right-click one of the selected stills and choose Delete Selected.

Each still is also saved with a variety of metadata that is used by DaVinci Resolve to manage the contents of the Gallery in different ways. This metadata can also be used for searching and sorting, and is viewable by opening the Still Properties window.

To display a still’s properties:

Right-click a still in the Gallery and choose Properties.

A floating translucent window appears displaying the date the still was created, what clip it was grabbed from, when it was grabbed, and the source and record timecode values of the frame it came from.
Where are Stills Saved?

By default, all grades/stills you save are saved in the DPX format, and are placed in the directory path defined in the “Gallery stills location” field in the Working Folders section of the Master Settings panel of the Project Settings. This path defaults to a hidden “.gallery” directory that’s created at the location of the first Media Storage Volume you specify in the Media Storage panel of the System Preferences window.

Changing the PowerGrade Still Directory

Optionally, you can change the location where PowerGrade stills are saved by opening the Gallery Option menu and choosing Change PowerGrades Path. You’ll be prompted via a “Select PowerGrades Folder” dialog to choose a directory where all PowerGrades will be saved.

Live Previews of Gallery Stills

The Live Preview option, found in the Gallery option menu, lets you preview how the current clip would look with a particular Gallery Still grade applied to the currently selected clip simply by moving the pointer over the still you want to preview.

Enabling and Disabling the Gallery Live Preview:

1. Open the Gallery option menu and choose Live Preview.

The Live Preview option for the Gallery browser lets you hover over a saved grade to preview it on the current clip in the Viewer.

2. Click a node in the Node Editor you want to preview applying the grade from a still to. The live preview will display how the current clip will appear with the grade of the still you select applied to the currently selected node of current grade, which will affect the result.

3. Move the pointer over the still you want to preview.

The Viewer image updates to show how that clip would look with that still’s grade applied to the currently selected node.
Hover Scrub in the Gallery

When Live Preview is enabled in the Gallery option menu, the Hover Scrub Preview submenu lets you choose how you want Live Preview to be shown by a thumbnail in the Gallery and in the Viewer when you hover the pointer over a still or LUT in the LUT Browser:

- You can choose to scrub both the thumbnail you’re hovering over and the Viewer, letting you preview the current still’s grade or a LUT over the duration of the current clip in both the thumbnail and Viewer.
- You can choose to scrub just the thumbnail, leaving the Viewer to show just the grade or LUT over the frame at the position of the playhead.
- You can disable scrubbing altogether, in which case both the thumbnail and the Viewer will only show the grade or LUT over the frame at the position of the playhead.

The Hover Scrub Preview options when Live Preview is enabled

Playing Stills and Setting Up Image Wipes

There are many ways to play a still in the Color page, making it visible as an image wipe in the Viewer and on the external display connected to your video interface.

To play a still, displaying it as an image wipe or full screen, do one of the following:

- Double-click a still in the Gallery.
- Select a still in the Gallery, and click the Image Wipe button on the top Viewer toolbar.
- Click a still in the Gallery, then right-click in the Viewer and choose Show Reference Wipe.
- From the View > Stills menu, choose Next Still (Option-Command-N) or Previous Still (Option-Command-B) to select a still in the Gallery, and then choose Wipe On/Off (Command-W) to play it.
- Press PREV STILL or NEXT STILL on the Transport panel of the DaVinci control panel to select a still, then press PLAY STILL. Press PLAY STILL again to dismiss the still.

Whenever you play a still, the Viewer mode’s drop-down menu changes to Split mode. Once displayed, the wipe between the current clip and the still being referenced can be moved and reoriented in different ways. If you want a full-screen view so you can flip back and forth between the still and the current clip, simply adjust the split until the still fills the entire Viewer.
To adjust a wipe in the Viewer, do one of the following:

- Drag the pointer within the Color page’s Viewer to move the wipe.
- Push the T-bar lever up and down on the T-bar panel of the DaVinci control panel.

To customize the type of image wipe that’s displayed in the Viewer, do one of the following:

- Click any of the controls at the top right of the Viewer toolbar to choose Horizontal, Vertical, Mix, Alpha, Box, and Difference types of wipe.
- Choose Gallery, Timeline, or Offline from the View > Reference Wipe Mode submenu, or the Viewer contextual menu.
- Choose Horizontal, Vertical, Mix, Alpha, Difference, and Box from either the View > Wipe Style submenu, or the Viewer contextual menu.
- Choose View > Invert Wipe (Option-W), or right-click the Source Viewer and choose Invert Wipe from the contextual menu to reverse each half of the wipe.

Timeline Wipes

A timeline wipe is when you use the Wipe Timeline Clip command in the Thumbnail timeline (it’s found in the contextual menu when you right-click a clip other than the current clip) to wipe the current clip against another clip in the Timeline, without needing to save a still first. When you turn a timeline wipe on, the clip in the timeline that’s being wiped is outlined in blue.

Gang Timeline Wipe With Current Clip

A “Gang timeline wipe with current clip” option, available from the Viewer option menu, lets you maintain the offset between the current clip and a timeline clip you’re wiping against when you move the current clip selection to other clips. With this option enabled, the offset between the timeline wiped clip and the current clip is maintained when you move the clip selection. When this option is disabled, the timeline wiped clip stays where it is regardless of what clip you select.

Change a Timeline Wipe Using the Timelines Album of the Gallery

While you’re using the Wipe Timeline Clip to show a wipe of the current clip against any other clip in the Timeline, you can open the Timelines album of the Gallery and click different clips to change which Timeline clip you’re wiping against (outlined in blue) without changing the current clip (outlined in orange). Make sure you have selected the same timeline in both the Timeline album, and the Color page.
Labeling and Searching for Stills and Sources

By default, all stills are identified by a three-number code. The first number is the video track the clip is on, the second number is the clip’s position number in the current Timeline, and the third number is the version number of the grade.

All stills are numbered Track.Shot.Version

If you’ve saved many stills, it can help to label the important ones with whatever text you find helpful. Once labeled, you can search for stills by label using the Search field, at the upper right-hand corner of the Gallery.

Automatic Labeling

If you like, you can choose an option from the Color group in the General Options panel of the Project Settings to “Automatically label Gallery stills” in different ways. There are many options:

- **Clip Name**: Saves the Clip Name, which defaults to the File Name unless you’ve customized it.
- **Clip Version Name**: Automatically saves the name of the current version.
- **Source timecode (HH.MM.SS.FF)**: Saves the source timecode of the current frame.
- **Timeline timecode (HH.MM.SS.FF)**: Saves the timecode for the playhead’s position in the Timeline.
- **Timeline Name**: Saves the name of the currently open Timeline.
- **Display LUT Name**: Saves the name of the currently used Display LUT, if one is applied.
- **Custom label using tags**: Choosing this option reveals a field you can use to either type custom text into, or in which you can use metadata variables to save automatically updated information relating to the currently selected clip and timeline. For more information about using metadata variables, see Chapter 173, “Using Variables and Keywords.”

For all options, there’s also a checkbox you can toggle:

- **Append still number on export**: Turning this checkbox on lets you choose how to include the default still number when exporting stills with the “Use labels on export” option enabled, either as a prefix or suffix.
Manual Labeling

Sometimes the easiest thing to do is to just give a particular still a custom name that’s representative of what that still represents, such as “SeemedLikeAGoodIdea.” When naming stills manually, it’s best to avoid using the forward slash character in case you find yourself exporting these stills with file names. In fact, it’s a good idea to avoid using the forward slash character for just about any text that you add in DaVinci Resolve.

To manually label a still:

1. Right-click a still in the Gallery and choose Change Label or double-click directly under the Still ID.

2. Type a name into the Change Still Label dialog, and click OK.

   The new label appears underneath the still number.

Searching For Stills

Once labeled, you can search for stills you need in the Gallery.

To search for a still by label:

   Click the Magnifying Glass button to open the Search field, click to place the cursor within, and then type the name or description you are searching for.

As soon as you start typing, DaVinci Resolve automatically begins to filter the results of the currently selected album in the Gallery to match what’s been typed.

Match Reference Wipe Frame

You can right-click any Gallery still and choose Match Reference Wipe Frame to automatically move the playhead to the exact frame that corresponds to that still, and select that clip in the Color page Timeline.
Gallery Options

In the upper right corner of the Gallery palette there are several options that let you adjust the view and organization of your stills.

- **Still Size Slider**: Dragging this slider to the left makes the still thumbnails smaller, dragging it to the right makes them larger.

- **Sort Stills**: Choosing an option from this submenu changes the sort order of all clips in the Gallery. The options are:
  - **Still ID**: Sorts all stills by their assigned ID number (track, clip number, grade version).
  - **Label**: Sorts all stills by their text label.
  - **Record Timecode**: Sorts all stills by their position in the program.
  - **Source Timecode**: Sorts all stills by the timecode of the source clip they came from.
  - **Grab Date**: Sorts all stills by the date they were originally grabbed.
  - **Create Time**: Sorts stills based on when you saved each still.

- **Thumbnail View**: Pressing this icon puts the gallery in Thumbnail view; each still is represented by an image.

- **List View**: Pressing this icon puts the gallery in List view; each still is represented by columns of text attributes.

- **Search**: Opens up a search dialog box, to find stills based on their text label.

- **Gallery View**: Opens up the full Gallery Management window.

When you right-click the gray area of the Gallery, behind the Still icons, you can open a contextual menu that provides a variety of additional options for controlling how many stills are saved, how they’re displayed, and how they’re arranged in the Gallery. There are the following options:

- **Switch Wipe Mode**: Switches the Reference mode between showing a “Gallery” still, a “Timeline” clip, or an “Offline” reference movie.

- **Trace Timeline**: When enabled, selecting a clip in the Timeline also automatically selects the first still that was saved from that clip to the Gallery.

- **One Still Per Scene**: When enabled, restricts the Gallery to save only a single still for each clip in the Timeline. If multiple stills have already been saved before turning this option on, those stills will remain in the Gallery until you save another still from the same clip, at which time all other stills from that clip will disappear.

- **Apply Display LUT**: If you have a Display LUT selected in the Lookup Tables panel of the Color Management panel of the Project Settings, it’s applied to the video output via a connected video interface, and also to the Viewer. Ordinarily, you don’t also want the Display LUT applied to stills you’re saving since it’s meant to be temporary. Accordingly, stills are saved with a LUT-free image. However, in instances where you may also want to save a reference to the currently used Display LUT, turning on “Apply Display LUT” saves the Display LUT along with the still, and applies that LUT when that still is used for split-screen reference. Keep in mind that the internally saved Display LUT is only used when playing that still in the Viewer; the DPX image that’s saved remains unaffected.
• **Sort Stills By**: Choosing an option from this submenu changes the sort order of all clips in the Gallery. The options are:
  - **Record Timecode**: Sorts all stills by their position in the program.
  - **Source Timecode**: Sorts all stills by the timecode of the source clip they came from.
  - **Create Time**: Sorts stills based on when you saved each still.
  - **Clip and Create Time**: A two-level sort; stills are sorted primarily based on the ID number of the clips they came from, and secondarily based on the time they were created.

• **Apply Grades Using**: This submenu contains three options for how to apply the keyframes that are automatically saved within each saved grade.
  - **No Keyframes**: No keyframes are copied. The state of the grade at the frame used to save the still is what is applied to the target clip or clips.
  - **Keyframes Aligning Source Timecode**: Keyframes are copied aligning the source timecode of the saved grade with the source timecode of the target clip. This is the ideal setting when you're copying a grade back to the clip it came from originally, or to a duplicate of that clip elsewhere in the Timeline, and you want the keyframes to align with the same frames as before. If there is no source timecode overlap, keyframes will be pasted aligning with the start frame of the edit, the same as the third option (below).
  - **Keyframes Aligning Start Frames**: Keyframes are copied aligning the start frame of the clip that still was saved from with the start frame of the target clip. This is the ideal setting when you're copying a grade with keyframes from one clip to a completely different clip, with different timecode.

• **Use labels on still export**: Lets you use labels that you've added to stills in the file name of exported stills.

• **Show All Stills**: This command shows all available stills in the current album if any have been hidden, for example by searching or by using the Show Current Timeline Only command.

• **Show Current Timeline Only**: Choosing this option restricts the Gallery to only showing the stills that were saved from the currently selected Timeline. All other stills from other Timelines are hidden until you switch to that Timeline.

**NOTE**: There are a variety of other commands available in this contextual menu that are covered elsewhere in this chapter.
Organizing Stills Using Albums

All stills you save are always placed into the currently open album of the Gallery, which defaults for new projects to “Stills 1.” However, you can create additional albums with which to organize your stills into whatever categories you require. Albums can be shown, created, and removed using the Gallery in either the Color page or Gallery windows.

To show or hide the Albums list:
Click the Album button, at the top left of the Gallery.

If the Albums list was hidden, clicking the Album button will make the Albums list appear, to the left of the Gallery, containing all albums that are currently available in the project that’s open, as well as the PowerGrade album at the bottom. If the Albums list is already visible, then it becomes hidden, making more room for still thumbnails in the Gallery.

Once you’ve displayed the Albums list, there are a variety of ways you can quickly and easily work with albums.

Methods of working with albums:

- **To add a new album:** Right-click the Albums list, and choose Add Still Album from the contextual menu. A new album is created, numbered incrementally.
- **To add a new PowerGrade album:** Right-click the Albums list, and choose Add PowerGrade Album from the contextual menu. A new album is created, numbered incrementally.
- **To rename an album:** Double-click any album in the list, and when it is selected, type a new name and press Return.
- **To navigate albums:** Click any album to make it the current album. Using the DaVinci control panel, you can use the PG UP/GALLERY/PG DOWN button; press SHIFT UP and GALLERY to move to the next album up the list, or press SHIFT DOWN and GALLERY to move to the next album down the list.
- **To move clips from one album to another:** Drag and drop a still from the Gallery to an album.
- **To remove an album:** Right-click any album, choose Remove Current Album, and click Delete at the prompt. All clips inside that album will be deleted along with the album, so use this carefully.
PowerGrade Albums

PowerGrade albums are meant to be repositories for grades you want to reuse frequently, or for stills that you need to reference from multiple projects, such as when grading a series that shares common looks from episode to episode.

Unlike stills saved to the other albums in the list, which are ordinarily available only to the project in which they were saved, stills saved to a PowerGrade album are shared among all projects that have been stored within a particular database. Each database has its own unique PowerGrade album.

Creating a new database creates a new PowerGrade album, which starts out as a clean slate. However, you can always use the Gallery window to copy PowerGrade stills from other projects and databases to the current one, and you can create as many PowerGrade albums as you need to organize your grades. For more information about project management and databases, see Chapter 2, “Managing Projects and Databases.”

Functionally, PowerGrade albums are identical to any other album, and you can save, organize, and use stills in PowerGrade albums as you would with other albums. Since PowerGrade albums are special in that they’re maintained by DaVinci Resolve, the last PowerGrade album cannot be deleted.

Browse all Grades from the Current Timeline

The Gallery has a Timelines album, available at the bottom of the Album list, that lets you browse all the grades in the current timeline, or in other timelines of the current project (using a drop-down menu that appears at the top of the Gallery browser area), making it easy to copy grades from earlier or later in your timeline, or from other timelines that share the same media.

This is particularly useful for reality shows or documentaries where the same clips can appear multiple times in different parts of a program. Being able to simply show all existing grades in the Gallery frees you from having to save a still for every grade you think you might eventually reuse.
The Timelines grade browser in the Gallery automatically shows all grades in the current timeline.

The Gallery Management Window

While you can do quite a lot of stills management using the Gallery as it appears in the Color page, the Gallery window provides additional functionality for copying stills among different projects and databases, for organizing your stills and memories, and for accessing the DaVinci Resolve looks that accompany the application.

To open the Gallery window:
Click the Gallery View button at the upper right-hand corner of the Gallery or select Workspace > Gallery.
The Gallery opens into a floating window, divided into four areas:

- **Stills navigator**: Lets you navigate the contents of other projects and databases that are available. Independent projects, as well as database > user > project relationships, appear in this hierarchical list. Click the disclosure triangle next to any item on this list to reveal its contents. Click any project in the list to reveal its albums and stills in the Group Stills browser.

- **Group Stills browser**: Displays the contents of the currently selected item in the Stills navigator. One or more selected stills can be copied to the current project by selecting an album in the Project Stills browser, and dragging and dropping the selected stills to the Project Stills browsing area.

- **Project Stills browser**: Contains the same Album list and Project Stills browser that’s visible in the Color page Gallery.

- **Project Memories**: Provides a larger view of the project memories that are visible in the Color page Gallery.

**To resize different areas of the Gallery window:**

Move the pointer to the border between any areas of the Gallery. When the pointer changes to the resize cursor, drag the border to resize the adjacent interface areas to whatever size you need. Dragging all the way to the edge of the screen hides that interface area completely.

**What’s Available in the Stills Navigator**

The Stills Navigator accesses a variety of content via a hierarchical list. Disclosure triangles to the left of each item in the Stills browser let you access the contents of each item, and many items have several nested levels of content within, each accessed by its own disclosure triangle.

- **DaVinci Resolve looks**: A collection of predefined grades, categorized by type, that provides excellent examples of different looks available in DaVinci Resolve. These grades are installed with DaVinci Resolve and cannot be altered.
- **Databases**: Each database that’s available appears within this list. Each database has a nested series of users, projects, and timelines within, as well as one nested PowerGrade item for each user, which provides access to the saved stills within.

- **Orphans**: Stills are saved to a separate directory which is defined in the Master Settings panel of the Project Settings. Whenever you delete a database, the stills that corresponded to that database become orphaned. All orphaned stills that lack a connection to any current database appear within the Orphan item in the Stills Navigator.

### Browse and Import Timeline Grades From Other Projects

The Gallery window lets you see and import grades in the timelines of other projects, even if they weren’t saved as stills first. When you open the Gallery Window and use the hierarchical disclosure controls of the Stills panel to open up and select a specific Database > User > Project > Timeline, you’ll see at least three browsable albums to the right: the Stills galleries that were created, the Memories, and at the bottom an album called Timeline Media. The Timeline Media album lets you browse the currently used grades for every clip in that timeline, making it easy to copy the ones you need to the current project’s Stills album or Memories.

This is particularly useful if you’re working on a series where and you find that you want to re-use different grades, looks, adjustments, or fixes from previous episodes in the current one. Previously, you’d have to remember to save every clip as a still to be able to browse the grades in this way. Now you can simply browse the clips in the Timeline directly.

![Browsing the timeline grades for another project in the database](image-url)
Importing and Exporting Stills

It’s possible to import still images in different graphics formats into the Gallery, which can be particularly useful when a client provides reference images to which they’d like you to refer. It’s also possible to export stills from the Gallery, which is good for sending a series of reference stills for approval to a remote client. In both cases, you can choose whether to import or export images with an accompanying LUT.

For both import and export, DaVinci Resolve supports the following file formats: DPX, CIN, TIFF, JPEG, PNG, PPM, BMP, and XPM.

To import one or more still images:

1. Right-click anywhere on the gray background of the Gallery.
2. Choose one of the following commands:
   - Import: Imports image files, along with a matching DRX file, if one is present in the selected directory.
   - Import With Output LUT: Imports an image and DRX file, along with a matching LUT file, if one is present in the selected directory.
3. When the Import Stills dialog appears, choose the type of files you want to import from the “Files of type” drop-down menu, then navigate to the files you want to import, select them, and click Import.

To export one or more still images:

1. If you want to export Gallery stills with labels that have been added to them, right-click anywhere in the background of the Gallery and choose “Use labels on still export” in the contextual menu so it becomes checked.
2. Select one or more stills in the Gallery.
3. Right-click one of the selected stills, and choose one of the following commands:
   - Export: Two files are saved for each still you selected. An image file in the format of your choice, and a DRX (DaVinci Resolve eXchange) file that contains the grading metadata that was saved with that Gallery still.
   - Export With Display LUT: If you have a Video Monitor Lookup Table specified for the current project in the Color Management panel of the Project Settings, this command will output the image as it is processed by the specified LUT. A DRX file is also output containing the grading metadata that was saved with that Gallery still.
4. When the Export Stills dialog appears, choose a file format to export to from the “Files of type” drop-down menu, then choose a location, type a name into the Save As field, and click Save.

Each of the selected stills is exported with all accompanying files. Each file uses as its prefix the name you typed into the Export Stills dialog, followed by an underscore, the still ID number of the selected still, and the three-letter file extension.
Using and Organizing Memories

Stills and memories contain identical information, and can be split screened, copied, appended, exported, and can display their node graph just like any other still. However, stills that are assigned as a memory make them easier to access via keyboard shortcuts, and from dedicated buttons on the DaVinci control panel.

Memories are hidden by default, but you can reveal them by clicking the Memories button, to the right of the Gallery list button at the top-left of the Gallery.

The Memories thumbnail display makes it easy to keep track of which stills have been assigned to which memories in situations where you’re using multiple memories to copy grades throughout a program.

To copy stills and memories back and forth, do one of the following:

- Drag a still onto a memory bank.
- Drag a memory into the Gallery.

**TIP:** In this way, memories can be used to copy stills from one album to another.

To save the current clip’s grade to a memory for future use, do one of the following:

- Choose Color > Memories > Save Memory A–H (Option-1 through 8).
- Using the DaVinci control panel, press CRNT on the Transport or T-bar panel, then press the letter of the memory bank you want to save to. Use the SHIFT UP button to save to another memory sharing the same button.
- If you save a grade to a memory that already contains something, the previous memory is overwritten.

To apply a memory to the current clip in a timeline, do one of the following:

- Right-click a memory and choose Apply Grade.
- Choose Color > Memories > Load Memory A–H (Command-1–8).
- Using the DaVinci control panel, press the letter of the memory bank you want to apply. Use the SHIFT UP button to apply a memory that shares the same button.

To clear a memory:

Right-click a memory, then choose Clear.
The Color page offers numerous ways of saving grades, copying grades, creating and altering groups of clips to share grades, rippling grades and adjustments, and managing multiple versions of grades. All of these procedures enable you to work faster by leveraging work you’ve already done to apply to other clips that can benefit from the same adjustments, or by applying changes across multiple clips all at once.

Using Versions to Manage Grades

Working quickly requires a mastery of the numerous grade management features built into DaVinci Resolve. These features are designed to help you copy and ripple grades to individual clips, among manually defined groups of clips via the Node Editor’s Clip mode, or among automatically linked clips that share the same source clip in the Media Pool (when using Remote versions). Multiple versions of grades are supported for every clip, as are various options for previewing, overwriting, and appending these versions.

Choosing to Copy Grades Manually or Automatically Using Versions

Each grade you apply to a clip is a version. Each clip can have multiple versions, although only one version can be applied at a time. By default, the first grade applied to every clip in a timeline is a local version named “Version 1.” A clip’s version name and/or number appears underneath the clip thumbnail, to the right. You can also see the version name, along with a list of all the other versions that are currently available to that clip, by right-clicking a clip in the Timeline and looking for the version names that appear underneath the Local Versions submenu.

NOTE: Double-clicking the version name underneath a clip’s thumbnail in the Timeline cycles the version names, the clip names, and the codec used by each clip.

There are two different types of versions in DaVinci Resolve, each of which provides a different method of grade management and linking among the clips and timelines of a project.

- **Local versions**: The default mode of grade management. Clips using local versions are unlinked, so each clip has its own grade which is not shared with any other clips in any other timelines. Changing the grade of a clip using a local version has no effect on any other clip in that project.

- **Remote versions**: An alternate mode of grade management that you can enable. All clips using remote versions that share the same source clip in the Media Pool are automatically linked, in all timelines, and share the same set of grades.

If you use local versions to grade all your clips, you don’t have to worry about one clip’s grade being accidentally copied to other clips that happen to come from the same file in the Media Pool, which can make it easier to work. On the other hand, you need to manually copy every grade that you want to duplicate, even among clips that clearly come from the same take or angle. You can always create a group to share a grade among clips using local versions, but that’s an extra step.
Switching to use remote versions, instead, puts you into a mode where clips using remote versions that share the same media file are automatically linked together. This gives you a convenient shortcut for grading your program, since a grade that’s applied to one linked clip is automatically copied to every other clip it’s linked to, which can be convenient when grading a series of headshots appearing throughout a program that come from the same interview take. Another use of remote versions is when you’re importing a new edit of an already graded timeline. Using remote versions, you can set your project up so that new incoming timelines are automatically relinked to the previous timeline’s grades.

The only disadvantage to using remote versions is that when you find you need to make individual adjustments to clips that are linked, it’s an extra step to either create another version, or switch that clip to use a local version, in order to keep its adjustment separate. This will be discussed in more detail later in this chapter.

### Mixing Versions
Each clip is capable of having multiple local and remote versions at the same time; you get to choose which to apply. Which type of versioning is best depends on the type of project you’re working on, the way in which the media was shot, and how you like to work. The following sections explain the differences in workflow.

#### Using Local Versions by Default
Since local versions are the default method of grading when you first create a new project (unless you’ve edited your settings presets), you don’t need to do anything to enable this mode at first. As the name implies, local versions are local to the Timeline in which they appear, so local versions are not rippled to linked clips, and they’re not shared among different timelines. This makes it easy to avoid accidentally having grades copied when you don’t want them to be, but you lose the conveniences that automatic linking can provide.

However, you can always switch the clips in a timeline to use remote versions if you change your mind, either individually, or all together.

#### Using Remote Versions to Enable Automatic Linking
Remote versions let all clips from the same source media file in the Media Pool share their grades automatically, either within a single timeline, or across multiple timelines in the same project. However, to enable the convenience of remote grades, you need to put DaVinci Resolve into this mode of working using the Settings window.

**To enable remote grades to be used:**

Open the Project Settings, open the General Options panel, and turn off “Use local version for new clips in timeline” in the Color section.

Turning this option off only affects clips that are added to Timelines from that point onward. You can keep track of which clips use remote versions by the (R) that appears when you double-click the area underneath the thumbnail to hide the codec name in the Thumbnail timeline.
Turning off “Use local version for new clips in timeline” to enable remote grades to be used by default

How Automatic Linking Works

When clips using remote versions have been added to a timeline, any other clips in any timeline that (a) use remote versions also, and (b) refer to the same file in the Media Pool are linked. Selecting a clip using a remote grade in the Color page that is automatically linked to one or more clips displays a small “linked” badge at the right of that clip’s timecode in the Thumbnail timeline.

The linking arrow shows this clip has the same source as the one selected on the Timeline

**TIP:** The Timeline Filtering drop-down in the Color Page toolbar has an option named “Common Media Pool Clips” that only shows clips in the Timeline that are linked to the currently selected clip.

Adjustments that you apply to a remote version of one linked clip are automatically rippled to every other clip it’s linked to, which can save you an enormous amount of time when you’re getting started with a new program. For example, if every reverse angle from the same take in a particular angle of coverage is automatically linked using remote versions, then the grade you apply to one reverse angle clip will ripple to every other reverse angle clip throughout the Timeline.

Timeline with three automatically linked clips shown, and codec names hidden to reveal the (R) that shows these clips are using remote grades
So long as remote versions are enabled, there are other ways that linked clip relationships are formed. If, after conforming an AAF, XML, or EDL, you used the Split Clips button in the Color page to split one conformed clip into many, each of the clips you split would be linked, since they too would share the same source media in the Media Pool.

Finally, automated linking also occurs for clips that appear in multiple timelines that also use remote versions. As a result, the grade you apply to one linked clip is automatically rippled to every other clip it’s linked to.

**NOTE:** Media management or media consolidation operations that split large source media files into many individual media files will defeat automatic linking within the same timeline, since each clip will be conformed to its own individual media file.

**Starting with Remote Versions, Then Switching to Local Versions**

It’s possible to combine the best aspects of remote and local versions into a single workflow, taking advantage of your ability to freely switch from one to the other. Since remote versions make it easy to copy grades among clips that are similar, you can switch to using remote versions first, and then grade your way through the Timeline until you get to the point where you need to start making much more specific changes to individual clips. Then, it’s easy to either switch each linked clip that needs individual adjustment to use a local version, or to use the Copy Remote Grades To Local command (described later) to copy the current remote version of each and every clip to a local version, at which point you can make all the specific tweaks you need to without worrying about changes being accidentally copied.

**Creating a Master Timeline**

DaVinci Resolve version 9 and earlier would automatically create a Master Timeline whenever you added clips to the Media Pool. This changed in versions 10 and later, which by default have no Master Timeline. However, if you want to create a Master Timeline in order to use it as you would have before, this is easy to do.

If you want a Master Timeline to have a single timeline that always contains all clips currently in the Media Pool, there’s a way you can create one. However, you need to do it immediately upon creating a new project, before adding any media to the Media Pool. Once you’ve added one or more clips to the Media Pool, the option you need to do so will be disabled.

**To create a new Master Timeline:**

1. Create a new project, open the General Options panel of the Project Settings, and turn on the “Automatically match master timeline with media pool” checkbox in the Color section. If you also want all clips to use Remote versions as you grade by default as in previous versions of DaVinci Resolve, you can turn off the “Store grade with local version by default” checkbox.

2. Click Save.

4. When the New Timeline Properties window appears, turn the Empty Timeline checkbox off, and click Create New Timeline.

Now, in addition to the new Timeline, a Master Timeline appears in the Timeline list.
Once created, the Master Timeline contains every clip in the Media Pool of the current project. If you color correct the clips in the Master Timeline, you’ll find there’s only one set of versions available, found underneath the Local submenu of the Color Page timeline’s contextual menu. It’s important to understand that local versions within the Master Timeline are in fact the remote versions found in every other timeline of that project.

In fact, it would be fair to say that the remote versions found in other timelines are actually the Master Timeline’s versions. When you grade a clip in the Master Timeline, those grades ripple out to every other instance of that clip, in every other timeline within that project, via remote versions.

Sharing of remote versions among the Master Timeline and newly conformed timelines is why you can grade a collection of clips that you import into DaVinci Resolve without any editorial structure, grade and output offline media, and then reimport a project file that relinks to the original clips along with their grades. It’s also why you can grade clips in one timeline, and then import additional re-edited timelines via AAF, XML, or EDL, which automatically inherit all remote versions of grades that were created in previous timelines.

Differentiating Clips with Individual Versions

If you’ve enabled DaVinci Resolve to add clips with remote versions, there are times when you may want to suspend automatic linking. As convenient as automatic grade rippling among linked remote versions is, there are many instances where you may need to stop it. For example, if the Media Pool contains a source media file with the entire content of an interview, then every clip that has been conformed to that source media will be linked, which is ordinarily good since you’d expect they’d all share the same grade. However, if the DP fiddled with the exposure of the camera in the middle of the interview, such that some clips are lighter and others are darker, you may find yourself needing to make different adjustments to clips from different parts of the interview.

One way of doing this, which can be useful in timelines where you only need to make a few of these kinds of changes, is to create a new remote version for every clip to which you need to make an individual adjustment. Since each version is its own grade, and differently named versions don’t link to one another, this is a simple solution.

**To suspend linking by creating a new remote version:**

1. Move the playhead to the clip you need to alter individually.
2. Do one of the following:
   - Choose Color > Grade Version > Add (Command-Y).
   - Right-click the thumbnail in the Timeline, and choose Remote Versions > Create New Version.
   - Using the DaVinci control panel, press ADD VERSION on the T-bar panel.
3. Grade the new version that’s appeared.

While this method works well, keep in mind that multiple linked clips using the same version number will always be linked with one another. In other words, suppose Clip 1, Clip 3, and Clip 5 are linked using the default Version 1, which has a strong blue grade applied.
Three clips automatically linked, sharing a blue grade.

Then, you set Clip 3 to use Version 2 with a different grade, tinted red. Clip 3 is now unlinked from Clips 1 and 5.

Setting the second of the three clips to use another version with a different remote grade sets it apart.

However, switching Clip 5 to also use the red-tinted Version 2 means that Clip 3 and Clip 5 are now linked together, but Clip 1 is no longer linked.

Setting the third of these clips to share the same remote version as the second clip now links those two together, omitting the first clip.

Every new remote version you create, and every change you make, becomes available to all other clips in all other timelines that come from the same source Media Pool clip as the shot you’re working on. However, any clip can use any version, and which version is used by a linked clip is not rippled.

For example, Timeline 1 contains a clip named Max CU, which has three remote versions. Timeline 5 also contains Max CU, which is currently set to use Version 2. If you open Timeline 1 and add one more remote version to Max CU, that new version will also be available to Max CU in Timeline 5, but it will still be set to use Version 2.

Switching Clips Between Local and Remote Versions

You can also suspend remote version grade linking by switching individual clips to use local versions. This makes it easy to create a situation where some clips are linked, and other clips are not. Keep in mind that each clip has both local and remote versions, so you can switch from one to the other without losing anything.

To suspend linking by setting individual clips to use a local version:

Right-click a clip thumbnail, choose the submenu of the corresponding remote version you want to copy, and choose Copy to Local. The remote version is copied to a local version, which now appears as the current version that’s used.
You can also set every clip in the entire timeline to use local versions. If you switch an entire timeline to local versions, then no clip in that timeline will be linked to any other unless you create a group (covered later in this chapter). This is the default state, but it’s useful even when you’ve switched to using remote versions when you want to grade one timeline differently from the others in a project, for example when doing a trim pass for another video or stereo 3D format, or when grading another cut, such as a trailer, that uses the same media but requires a different look.

**To suspend linking by switching from remote versions to local versions:**
Right-click any clip thumbnail, and choose one of the following commands:

- **Use Local Grades:** Switches all clips to their local versions. If there are already local versions defined for each clip, those will appear. If there are no local versions yet defined, each clip will be ungraded.

- **Copy Remote Grades to Local:** Copies the currently assigned remote version of each clip to a local version.

Because Undo is used only for individual clip operations, the Use Local Grades and Copy Remote Grades To Local commands cannot be undone. However, switching a timeline from remote to local versions is not a one-way trip. You can select Use Remote Grades to switch every clip in a timeline back to the remote versions at any time.

**To switch a timeline back to using remote versions:**
Right-click any clip thumbnail, and choose Use Remote Grades.

Furthermore, you can also copy the local grades you made to be remote grades, for instances where you started grading with local grades, and you want to switch to remote grading using your local grades as a starting point. Be aware that when you do this in a timeline with many clips that share the same source media, the grade of the very last shared clip in the Timeline will be the only remote grade that’s used for those auto-linked clips.

**To copy each clip’s local grade to a remote grade for every clip in the current timeline:**
Right-click any clip thumbnail, and choose Copy Local Grades to Remote.

If you’re switching back and forth between local and remote versions, keep the following rules in mind:

- If you select Use Remote Grades, change your remote grades, and then Copy Remote Grades To Local on that timeline again, you’ll overwrite all of your previously graded local versions. This is a good workflow if you don’t like what you’ve done with your local versions, and you want to start over by recopying the remote versions.

- If you select Use Remote Grades, change your remote grades, and then select Use Local Grades, you’ll return to your previously graded local versions, as they were before you selected Use Remote Grades. This is a good workflow if you just want to switch back to your remote versions in order to copy the remote versions of specific clips to local versions.

**Working with Versions**

Each clip can have as many local and remote versions as you like. There are commands for creating, renaming, and deleting the versions that are available to each clip when using the pointer, keyboard shortcuts, or the DaVinci control panel. When using the DaVinci control panel, the buttons affect whichever type of version (remote or local) is currently applied to the current clip.
Additionally, DaVinci Resolve 15 introduced the ability to batch create, rename, load, and delete versions for multiple clips that are selected at the same time.

To create a new local or remote version quickly for one or more selected clips, do one of the following:

- Choose Color > Grade Version > Add (Command-Y).
- Using the DaVinci control panel, press ADD VERSION on the T-bar panel.

A new version is created, identical to the type of version that was previously selected (remote or local), named “Version x” where x is the number of the versions that have been created. All keyframes and motion tracking are copied from the previously selected version to the new one.

To create a new version for one or more selected clips, with the option to set a name and whether to copy keyframes:

1. Right-click one of the selected clip thumbnails, and choose one of the following:
   - Local Versions > Create New Version
   - Remote Versions > Create New Version

2. Type a name for the version in the dialog that appears, and choose either “Copy all marks” or “Copy the first mark only,” depending on whether or not you want to copy all the keyframes into the new version.

   **NOTE:** Motion tracking will be copied regardless of whether “Copy all marks” is selected or not.

3. Optionally, you can choose one of the preset version names from the drop-down list. These names are defined in the Versions section of the General Options panel of the Project Settings.

4. Click OK.

To delete a specific version for one or more selected clips:

Right-click one of the selected clip thumbnails, choose the submenu of the remote version you want to delete (it can’t be the currently selected version), and choose Delete.

To delete all versions for one or more selected clips:

Right-click one of the selected clip thumbnails, and choose one of the following commands from the contextual menu corresponding to the scope of the versions you want to delete:

- Local Versions > Delete All Versions
- Remote Versions > Delete All Versions
- Delete All Versions

All versions are deleted as specified, except for the currently selected version, which is now the only one remaining.
To load a particular remote or local version for one or more selected clips, do one of the following:

Right-click one of the selected clip thumbnails, choose the submenu of the corresponding remote version you want to copy, and choose Load.

To rename the version of one or more selected clips:

1. Right-click one of the selected clip thumbnails, choose the submenu of the corresponding remote version you want to rename, and choose Rename.

2. In the Version Name dialog, type a name into the text field. Optionally, you can choose one of the preset version names from the drop-down list. These names are defined in the Versions section of the General Options panel of the Project Settings.

3. Click OK.

That name now appears underneath the clip thumbnail in the Timeline.

If you’re going to use predefined names for versions, you need to define these in the Versions group of the General Options panel of the Project Settings. Ten drop-down menus let you choose from preset version names, or enter your own. These names will appear in the drop-down menu of the Version Name dialog.
The Importance of “Version 1”

There are specific operations in DaVinci Resolve where “Version 1,” otherwise known as “the default version,” is the only version that’s used, regardless of how many other versions are available, or which version was previously selected. The default version can be named anything you want, but whatever its name, the default version is the first version in the list, and it’s important.

Here are some examples:

- **Importing additional timelines that use the same clips:** In this case, if you’re importing timelines and “Use local version for new clips in timeline” is disabled in the Color section of the General Options panel of the Project Settings, then only the default version of each clip is relinked.

- **Whenever you switch a timeline between local and remote versions:** In this case, every clip in the Timeline will be switched to the default version, regardless of what you had selected previously.

Consequently, if you plan to reconform your clips to a newer version of the edit that you’re importing, or pursue other workflows that are off the beaten path, it’s a good idea to make sure, no matter how many versions you end up creating, that the most important grade is always copied back to the default version.

**To copy any version quickly to the default version:**

1. Choose Color > Memories > Save Memory A (Option-1). You can use any memory you want, but Memory A is convenient for this example.
2. Choose Color > Grade Version > Default (Command-U).
3. Choose Color > Memories > Load Memory A (Command-1) to apply the saved memory to the default

**To copy any version quickly to the default version using the DaVinci control panel:**

1. Press CRNT and then press A (or any memory button you like). These controls are available on either the Transport or T-bar panel.
2. Press DEFAULT VERSION on the T-bar panel.
3. Press A (or whichever Memory button you used) to apply the saved memory.

**To jump immediately to the default version, do one of the following:**

- Choose Color > Grade Version > Default Command-U).
- Press DEFAULT VERSION on the T-bar panel.

**Deleting Unused Versions**

In cases where you want to make absolutely sure there’s no alternative to the grade you want a clip to have, there’s an easy way to delete all versions except for the version that’s currently in use, thereby making it the default version.

**To eliminate either local or remote versions except for the current version:**

1. Choose the local or remote version you want a clip to use.
2. Right-click the thumbnail of the clip you want to eliminate extra versions from, and choose Delete Unused Versions from the contextual menu.
If you selected a local version, all unused local versions will be deleted, but remote versions will be left alone. Similarly, if you selected a remote version, all unused remote versions will be deleted, but local versions will be left alone.

**To eliminate all other local and remote versions except for the current version:**

1. Choose the version you want a clip to use.
2. Right-click the thumbnail of the clip you want to eliminate extra versions from, and choose Delete All Versions from the contextual menu.

Regardless of whether you selected a local or remote version, all other local and remote versions not in use will be deleted.

**Rendering Versions**

When the time comes to render your clips in the Deliver page, each clip’s currently selected version will be rendered. If you need to render a different version for a given clip, you can either make sure it’s selected in the Color Page timeline before you open the Deliver page, or use the Versions submenu in the Color mode of the Deliver page Thumbnail timeline. This contextual menu also provides access to the Stereo 3D commands, the Edit PAR (Pixel Aspect Ratio) command, and a command for updating the Render Window Timeline thumbnails to reflect any changes you’ve made in case they haven’t updated automatically.

Additionally, the Commercial Workflow output option, located in the Deliver page, provides a method of rendering multiple versions for each clip when outputting your project in Source Order (as individual media files). There are two additional options in the Version submenus of each clip in the Thumbnail timeline contextual menu that let you control which versions are rendered when you use Commercial Workflow.

- **Render Disabled:** Turning this option on excludes that version from being rendered when Commercial Workflow is enabled.
- **Enable Flat Pass:** Turning this option on forces the selected version to render with the grade turned off, essentially outputting the original media.

For more information on rendering versions using the Commercial Workflow option, see Chapter 166, “Rendering Media.”

**Copying Grades**

There are various methods you can use to copy grades from one clip to another. Which is appropriate to your need depends on your style of working with DaVinci Resolve.

**Protecting Adjustments with the Copy Grade Options**

Before going into the myriad of ways that grades can be copied from one clip to another, you should know of a series of options, available from the contextual menu of the Gallery (right-click anywhere in the gray area of the Gallery), that let you carefully specify grading, sizing, and stereo data to be preserved when overwriting grades in clips you’re copying to. There are three options:

- **Copy Grade: Preserve number of nodes:** Lets you choose 0–10 nodes to be protected when applying a grade. When set to 1, the first node of the copied grade is ignored, but all other nodes are copied. When set to 5, the first five nodes of a copied grade are ignored, as long as there are at least five nodes in the grade of the clip you’re copying to. This option is useful for colorists who routinely use the first few nodes...
for shot matching and scene balancing, with additional nodes applying individual or stylistic adjustments.

- **Copy Grade: Preserve Camera Raw Settings**: When enabled, the camera raw Source settings of the current clip are preserved, letting you apply stylistic grades from unrelated clips without overwriting clip-specific source settings.
- **Copy Grade: Preserve Input Sizing**: When enabled, Input Sizing adjustments are not overwritten by those of the copied grade.
- **Copy Grade: Preserve Convergence**: When enabled, Convergence adjustments in the Stereo 3D palette are not overwritten by those of the copied grade.
- **Copy Grade: Preserve Floating Windows**: When enabled, Floating Windows adjustments in the Stereo 3D palette are not overwritten by those of the copied grade.
- **Copy Grade: Preserve Auto Align**: When enabled, Auto Alignment adjustments in the Stereo 3D palette are not overwritten by those of the copied grade.
- **Copy Grade: Preserve Dolby Vision™ Analysis Metadata**: When enabled, Dolby Vision Analysis Metadata is not overwritten by that of the copied grade. Only available if you’re set up to do Dolby Vision grading. For more information, see Chapter 7, “Data Levels, Color Management, and ACES.”
- **Copy Grade: Preserve Dolby Vision™ Trim Metadata**: When enabled, Dolby Vision Trim Metadata in the Dolby Vision palette is not overwritten by that of the copied grade. Only available if you’re set up to do Dolby Vision grading. For more information, see Chapter 7, “Data Levels, Color Management, and ACES.”

### Clip Grades and Timeline Grades in Saved Stills

Every time you save a still into the Gallery or a memory, it contains both the Clip grade, and the Timeline grade, if one is applied. Which grade is applied when you copy from a still depends on which mode you’re in, which is selectable from the drop-down menu in the upper right-hand corner of the Node Editor.

Choose the mode you wish to copy from:

- **Node Editor Clip and Track selector**

  If you’re in Clip mode, you’ll only copy the saved clip grade. If you’re in Timeline mode, you’ll only copy the saved timeline grade.

### Choosing Which Aspect of a Grade to Copy with All/Color/Sizing

When copying grades using the techniques described in this section, you can use the All/Color/Sizing setting that are available via the Keyframe Timeline Mode submenu of the Mark menu, the drop-down menu that’s visible at the upper-right of the Keyframes Editor, or your control panel. When copying a grade in conjunction with the settings in this menu, the following rules apply:

- **All**: When All is selected, both the grade and the sizing are copied.
- **Color**: Only the grade is copied, the target clip retains its original Input Sizing settings.
- **Sizing**: Only the Input Sizing is copied, the target clip retains its original grade.
Choosing How to Copy Keyframes

When working with saved grades that have keyframes, you can choose how these keyframes are copied via a setting in the Gallery contextual menu. There are three options:

- **No Keyframes:** No keyframes are copied. The state of the grade at the frame used to save the still is what is applied to the target clip or clips.

- **Keyframes Aligning Source Timecode:** Keyframes are copied aligning the source timecode of the saved grade with the source timecode of the target clip. This is the ideal setting when you're copying a grade back to the clip it came from originally, or to a duplicate of that clip elsewhere in the Timeline, and you want the keyframes to align with the same frames as before. If there is no source timecode overlap, keyframes will be pasted aligning with the start frame of the edit, the same as the third option (below).

- **Keyframes Aligning Start Frame:** Keyframes are copied aligning the start frame of the clip that still was saved from with the start frame of the target clip. This is the ideal setting when you're copying a grade with keyframes from one clip to a completely different clip, with different timecode.

**To control how keyframes are copied when you're copying grades:**

Right-click anywhere in the gray background area of the Gallery, and choose one of these options from the Apply Grades Using submenu.

From that point on, keyframes, should they exist, will be copied using the selected method whenever you copy a grade using any of the previously described methods.

Copying Grades Using the Mouse

An incredibly easy way of copying a grade from one clip to another, or from a still or memory in the Gallery to a clip, is by using the third button of your mouse, usually mapped as the “middle-click” of the mouse scroll wheel.

**To copy a grade from a clip or still to one or more clips using the pointer:**

1. Select the clip thumbnail you want to copy the grade to in the Timeline; a single selected clip appears highlighted orange. If you want to copy a grade to several clips, you can either Command-click multiple non-adjacent clips, or Shift-click a continuous range of clips; multiple selected clips appear highlighted red.

2. Middle-click the clip thumbnail, Gallery still, or memory you want to copy the grade from.

   The grade of the clip you middle-clicked is copied to the previously selected clip or clips.

**TIP:** If you're using a trackpad, third-party software may allow you to define a “three-finger-click” that works the same as mouse button 3. If you're a pen and tablet or trackball user, you may be able to define a stylus or other button to perform the same button-3 action.

If you don’t have access to a middle-click on the pointing device you’re using, there’s another way of doing this using a contextual menu command.
To copy a grade from a clip or still to one or more clips using the Apply Grade command:

1. Select the clip thumbnail you want to copy the grade to in the Timeline; a single selected clip appears highlighted orange. If you want to copy a grade to several clips, you can either Command-click multiple non-adjacent clips, or Shift-click a continuous range of clips; multiple selected clips appear highlighted red.

2. Right-click the clip thumbnail, Gallery still, or memory you want to copy the grade from, and choose Apply Grade from the contextual menu.

The grade of the clip you middle-clicked is copied to the previously selected clip or clips.

Copy Forward Commands

Another simple way of copying grades is to use the equals (=) and minus (–) keys on the keyboard to copy grades forward from one or two clips behind the currently selected clip. This is a great way to copy grades in scenes with a shot-reverse-shot structure, where you’re cutting between two angles of coverage, each of which uses the same grade.

To copy grades forward:

- **To copy a grade from one clip back:** Choose Color > Apply Grade From One Clip Prior, or press Equals (=).
- **To copy a grade from two clips back:** Choose Color > Apply Grade From Two Clips Prior, or press Minus (–).

To copy grades forward using the DaVinci control panel:

- **To copy a grade from one clip back:** Press Comma (,).
- **To copy a grade from two clips back:** Press Colon (:).

Copying Using Memories

Memories are virtually identical to stills, except that they’re labeled with a letter (A–Z) for easy access via keyboard shortcuts or DaVinci control panel buttons. A memory bank above the Gallery browser provides a visual reference of which saved grade is assigned to which letter. This makes it easy to keep track of multiple saved memories in instances where you’re copying them to several different clips throughout a scene or program.

For example, you might save a memory for each angle of coverage in a complicated scene, making it easy to copy grades forward. In another example, you might save a memory for the grade applied to each interview subject’s headshot in a documentary, so you can copy that grade forward as you work through the documentary.

To save the current clip’s grade to a memory for future use, do one of the following:

- Choose Color > Memories > Save Memory A–H (Option-1–8).
- Using the DaVinci control panel, press CRNT on the Transport or T-bar panel, then press the letter of the memory bank you want to save to. Use the SHIFT UP button to save to another memory sharing the same button.

If you save a grade to a memory that already contains something, the previous memory is overwritten.
To apply a memory to one or more clips in a timeline, do one of the following:

1. Choose one or more clips in the Thumbnail timeline to copy to. This can be the current clip, or it can be a range of clips that you select by Command-Clicking or Shift-Clicking.

2. Do one of the following to copy a grade to the selected clips:
   - Right-click a memory and choose Apply Grade.
   - Choose Color > Memories > Load Memory A–H (Command-1–8).
   - Using the DaVinci control panel, press the letter of the memory bank you want to apply. Use the SHIFT UP button to apply a memory that shares the same button.

To clear a memory:
Right-click a memory, then choose Clear.

Copying Using Preview Memory

You can also preview the effect of a memory or saved grade on the current clip, with the option to either keep it if it works, or go back to the previous grade if it doesn’t.

To Preview Memory:

1. Move the playhead to a clip for which you want to preview a memory.
2. Choose Color > Preview Memory (Option-Shift-P).
3. Do one of the following:
   - Right-click any saved still in the Gallery and choose Apply Grade.
   - Choose Memories > Load > Memory A–H (Command-1–8).
   The selected grade or memory is now being previewed.
4. Now, do one of the following to either accept or reject the memory:
   - If you like the effect, then you can leave it be and move on to another clip.
   - If you don’t like the effect, then choosing Color > Preview Memory (Option-Shift-P) again reverts the clip to the original grade.

To Preview Memory using the DaVinci control panel:

1. Move the playhead to a clip on which you want to preview a memory. You can use the PREV SCENE and NEXT SCENE buttons to move quickly.
2. Press PVW MEM on the T-bar panel, and then press the letter of the memory bank you want to preview. Use the SHIFT UP button to apply a memory that shares the same button.
3. Do one of the following:
   - If you like the grade you’re previewing, there’s no need to do anything else. Simply move to another clip and continue working.
   - If you don’t like the grade you’re previewing, press PVW MEM again and the clip’s grade will revert to its original state. Pressing PVW MEM repeatedly toggles the current clip between its original and the previewed grade.
Copying from Stills in the Gallery

As mentioned previously, each still you store in the Gallery contains the grading information as well as the image of the frame it was saved from. This saved grade can be applied to any clip in the Timeline.

IMPORTANT Copied grades overwrite any previously existing grades on the clip or clips you copy to.

To apply a grade from a still to one or more selected clips in a timeline:

1. Choose one or more clips in the Thumbnail timeline to copy to. This can be the current clip, or it can be a range of clips that you select by Command-clicking or Shift-clicking.

2. Do one of the following to copy a grade to the selected clips:
   - Right-click a still in the Gallery and choose Apply Grade.
   - Middle-click a still in the Gallery.
   - Double-click a still to wipe it in the Viewer against the current clip in the Timeline, then right-click the Viewer and choose one of the options from the Apply Grade submenu.

To apply a grade from a still to the current clip using the DaVinci control panel:

1. Select the clip you want to copy a grade to using the PREV SCENE or NEXT SCENE buttons of the Jog/Shuttle panel.

2. Press NEXT STILL or PREV STILL to select the still with a grade that you want copy from.

3. Press PLAY STILL to wipe the selected still against the current clip.

4. Press SHIFT UP and then press PLAY STILL to copy the grade from the selected still to the current clip.

Append Node Graph

You can also append a saved grade to any clip in a timeline. This adds the entire node graph of the saved still to the end of the node tree of the current clip. In other words, the current clip's grade isn't overwritten, the applied grade is added to the end of it.

By planning ahead, you can save fragmentary grades that create specific effects or adjustments using only a few nodes. You can then use these fragmentary grades as a toolkit that you can add to other grades in order to mix and match different adjustments and effects.

For example, you could create a three-node glow effect, save it, and then apply that effect at the end of a completely different clip's grade.
Appending grades places them after the original nodes.

**To append a saved grade or memory as individual nodes, do one of the following:**

- Drag a still or memory from the Gallery onto a connection line in the Node Editor; when the plus icon appears, drop it and its nodes will be appended within the node tree starting at that connection.
- Right-click a still or memory in the Gallery, and choose Append Node Graph.

Ordinarily, when you append the node graph from a memory or still to another node graph, you end up adding a whole shedload of new nodes. This may be exactly what you need, but in situations where you want to keep things a bit tidier, you also have the option of appending node graphs as compound nodes.

**To append a saved grade or memory as a compound node:**

Command-drag a still or memory from the Gallery onto a connection line in the Node Editor; when the plus icon appears, drop it and its nodes will be appended to the node tree as a single compound node.

**NOTE:** When you append the nodes from a gallery still to a grade, how keyframes are applied depends on the “Apply Grades Using” setting of the Gallery. For more information, see Chapter 122, “Using the Gallery.”
To append a saved grade or memory using the DaVinci control panel:

1. Select the clip you want to append a grade to using the PREV SCENE or NEXT SCENE buttons of the Jog/Shuttle panel.
2. Press NEXT STILL or PREV STILL to select the still with a grade that you want to append.
3. Press PLAY STILL to wipe the selected still against the current clip.
4. Press SHIFT UP and then press NEXT STILL to append the nodes of the grade from the selected still to the current clip.

Once you’ve appended a compound node, you can open it up to access and modify its contents as you would any other compound node. For more information on compound nodes, see Chapter 124, “Node Editing Basics.”

Aligning Keyframes to a Specific Frame While Copying Grades

If you need to copy a grade with keyframes so that the start keyframe of the copied grade aligns with a specific frame of the Timeline, you can do so using the following procedure:

To copy a grade and align its keyframes to a specific frame of the Timeline:

1. Save a grade with keyframes as a Gallery still by right-clicking the Viewer and choosing Grab Still.
2. Choose the clip you want to copy the saved grade to in the Thumbnail timeline.
3. Double-click the Gallery still to wipe it against the current clip in the Viewer.
4. Move the playhead to the frame of this clip you want the first keyframe of the saved grade to be aligned with.
5. Right-click the Viewer and choose Apply Grade > Align Keyframes to Current Frame.

Copying Individual Nodes and Settings

Copying grades from clip to clip copies everything except for keyframes and motion tracking. However, there is one way you can copy the motion tracking from one clip to another, and that’s by copying and pasting individual node settings. This can save time when you’re assembling complicated node trees by recycling specific nodes or node settings from previous grades.

Copying and Pasting All Settings From One Node to Another

The simplest thing you can do is to copy all of a node’s settings, and paste them into another node. This makes it easy to duplicate things like windows, qualifier settings, keyframing, or motion tracking that you want to reuse in another node as the basis for another operation. This is also a quick way to manually ripple a change you make in a node to that same node in another clip’s grade.
To copy a node's settings from one clip to another, do one of the following:

- Option-drag one node onto another. When you drop it, the settings of the node you dragged overwrite those of the node you dropped onto.
- Select a node with settings you want to copy and choose Edit > Copy (Command-C). Then, select a node you want to paste these settings to either in the current grade or in the grade of another clip, or create a new node, and choose Edit > Paste (Command-V) to paste the settings you copied. These pasted node settings overwrite any other settings that node previously used.

Paste Attributes on the Color Page

You can copy the settings of one node and paste a subset of those settings to another selected node by choosing Edit > Paste Attributes (Option-V). A Paste Attributes window appears that shows you which node you’re copying from, and which node you’re pasting to, and provides controls for choosing whether you want to paste keyframes and how to align them (Start Frames or Source Timecode), as well as a series of checkboxes for choosing which palettes, windows, and OFX/ResolveFX you want to apply. You can only paste all parameters from a specified palette; there’s no current provision for pasting specific parameters from within a given palette, with the exception of pasting specific windows and their accompanying trackers.

Copying from the Node Graph of Other Clips or Gallery Stills

When constructing new grades, you may sometimes find it convenient to copy existing nodes or node settings from the grade of another clip or gallery still. This can be easily accomplished by exposing the node tree of any still that’s saved in the Gallery, or any clip in the Thumbnail timeline, and using the controls found in the floating node graph to copy individual nodes or node adjustments to the current clip’s grade shown in the Node Editor.

Copying Clip Settings Using Display Node Graph

In Clip mode, the floating Node Graph window has four sets of controls you can use to choose how to copy nodes and adjustments:
• **Clip Node Graph:** By default, the Clip node graph is displayed at the left. You can drag any node from the floating node graph to the current grade shown in the Node Editor, and drop it onto an existing node to overwrite that node’s settings or onto a connection line to insert it as a new node.

• **Timeline Node Graph:** (Only available if there is a Timeline grade) You can switch to the Timeline grade, if there is one, by either clicking the second button in the Node Graph title bar, or by choosing Timeline from the drop-down menu at the upper right-hand corner of the floating Node Graph window.

• **Apply Color/PTZR/Source/All buttons:** With the Clip panel selected, four buttons let you selectively copy the entire grade, the sizing, the source settings, or all settings at once to the current clip.

---

**Copying Node Settings Using Display Node Graph**

In Node mode, the floating Node Graph window displays all of the available Color Attributes found within each node, instead of the Apply Color/PTZR/Source/All buttons:

• **Node Settings:** Use the checkboxes to choose which node adjustments get copied and which do not. After you’ve checked the settings you want to selectively copy, dragging a node from the floating node graph onto nodes in the Node Editor copies or appends the selected attributes into the target node, leaving all other attributes alone. For Windows and OpenFX, you have the option of also copying any motion tracking that’s available.
Ability to Open Compound Nodes in “Display Node Graph”

When you right-click a Gallery still or a thumbnail and choose Display Node Graph for a grade that uses compound nodes, you can right-click any compound node and choose “Show compound node,” or Command-double-click a compound node to open it and see its individual nodes.

Opening a compound node in a floating Node Graph window

How to Copy Nodes Using Display Node Graph

The following procedures describe how to open the floating node graph in different situations.

**To copy individual nodes or settings from any still in the Gallery:**

1. Click the thumbnail in the Timeline of the clip you want to copy nodes to. Its node graph will appear in the Node Editor.

2. Right-click a still in the Gallery you want to copy nodes from, and choose Display Node Graph. A floating Node Graph window appears displaying that still’s node tree.

3. (Optional) While the Gallery Node Graph window is open, you can select any other still, and this window will update to show the currently selected still’s node graph, ready for you to copy from.

4. In the floating Node Graph window, choose Clip if you want to copy overall clip attributes, or choose Node to copy individual node attributes.

5. Do one of the following to copy nodes or settings to the Node Editor.

   - In Clip mode, drag any node from the floating node graph to the current grade shown in the Node Editor, and drop it onto an existing node to overwrite that node’s settings. If you open the Node panel and choose specific attributes, only those attributes will be copied to the node you drag onto.

   - In Clip mode, drag any node from the floating node graph to the current grade shown in the Node Editor, and drop it onto a connection line to insert it as a new node. If you open the Node panel and choose specific attributes, only those attributes will be copied to the new node that’s created.

   - In Clip mode, click Apply Color to copy the entire grade from the floating node graph to overwrite the current grade in the Node Editor.
- In Clip mode, click Apply PTZR to copy the sizing from the floating node graph to overwrite that of the current clip.

- In Clip mode, click Apply Source to copy the source settings from the floating node graph to overwrite those of the current clip.

- In Clip mode, click Apply All to copy every setting from the floating node graph to the current clip.

- In Node mode, select which attributes you want to copy, and then drag any node from the floating node graph to the current grade shown in the Node Editor, and drop it onto an existing node to overwrite the settings of that node that you selected.

- In Node mode, select which attributes you want to copy, and then drag any node from the floating node graph to the current grade shown in the Node Editor, and drop it onto a connection line to insert it as a new node with only the settings that you selected.

6 While the floating Node Graph window is open, you can also select any clip in the Thumbnail timeline to change the grade that's displayed in the Node Editor, ready for you to copy to.

7 Click Close when you’re finished.

**To copy individual nodes or settings from any clip in the Timeline:**

1 Click the thumbnail in the Timeline of the clip you want to copy nodes to. Its node graph will appear in the Node Editor.

2 Right-click the thumbnail of another clip you want to copy nodes from, and choose Display Node Graph.

- (Optional) In the floating Node Graph window, choose Clip if you want to copy overall clip attributes, or choose Node to copy individual node attributes.

4 Do one of the following to copy nodes or settings to the Node Editor.

- In Clip mode, drag any node from the floating node graph to the current grade shown in the Node Editor, and drop it onto an existing node to overwrite that node’s settings. If you open the Node panel and choose specific attributes, only those attributes will be copied to the node you drag onto.

- In Clip mode, drag any node from the floating node graph to the current grade shown in the Node Editor, and drop it onto a connection line to insert it as a new node. If you open the Node panel and choose specific attributes, only those attributes will be copied to the new node that's created.

- In Clip mode, click Apply Color to copy the entire grade from the floating node graph to overwrite the current grade in the Node Editor.

- In Clip mode, click Apply PTZR to copy the sizing from the floating node graph to overwrite that of the current clip.

- In Clip mode, click Apply Source to copy the source settings from the floating node graph to overwrite those of the current clip.

- In Clip mode, click Apply All to copy every setting from the floating node graph to the current clip.
– In Node mode, select which attributes you want to copy, and then drag any node from the floating node graph to the current grade shown in the Node Editor, and drop it onto an existing node to overwrite the settings of that node that you selected.

– In Node mode, select which attributes you want to copy, and then drag any node from the floating node graph to the current grade shown in the Node Editor, and drop it onto a connection line to insert it as a new node with only the settings that you selected.

5 (Optional) While the floating Node Graph window is open, you can also select any clip in the Thumbnail timeline to change the grade that's displayed in the Node Editor, ready for you to copy to.

6 Click Close when you’re finished.

Rippling Adjustments Among Multiple Clips

If you’ve graded a sequence of clips and find yourself needing to make a quick change to several clips all at once, you can use the Color > Ripple Node Changes to Selected Clips/Current Group commands to quickly copy changes made to one clip to several others. However, these commands require that you follow certain rules in order to get the results you want.

Node rippling uses the number of each node to determine what changes should ripple to which nodes. In other words, changes made to Node 3 will ripple to Node 3 of every other selected clip, or to Node 3 of every other clip in the current group (depending on which command you use).

Rippling changes from one clip to several others requires that all clips share the same number of nodes, at least for the nodes you’re rippling. If you try to ripple a change to one or more clips that don’t have a node with the same number as the one you’re rippling, then no change will be rippled to those clips.

To ripple a change in one node to several selected clips:

1 Select the clip you want to use to make the change so that it’s the current clip, outlined in orange.

2 Now, Command-click or Shift-click to select the range of clips you want to ripple your change to, so that they’re all selected red.

The orange outlined clip is the current clip you’re modifying, and the clips highlighted in red are the ones you’re rippling this change to.

You don’t have to select the clips you’re going to ripple your change to prior to making the change, but it may be easier to keep track of what you’re doing if you set everything up in advance. The clip you’re changing should be outlined in orange, and the clips you’re rippling the change to should be highlighted in red.
3 Select a node to modify. Ideally, every selected clip should have a node sharing the same number as the one you’re modifying. If some clips don’t, then those clips won’t inherit the change you’re going to be rippling.

4 Make whatever changes you need to, adjusting any of the palette controls in the Color page you need to, except for Camera Raw, Sizing, and Data Burn, which aren’t node-specific.

5 When you’re happy with the change you’ve made, choose Color > Ripple Node Changes to Selected Clips.

The change you’ve made should ripple to every other selected clip with a node of the same number, and in a few moments the thumbnails of those clips should update to show the change.

If you’ve created a group, it’s even easier to ripple node adjustments to the other clips in the group.

To ripple a change in one node to the current group:

1 Select the clip you want to use to make the change so that it’s the current clip, outlined in orange. It must be part of a group for this to work.

2 Select a node to modify. Ideally, every selected clip should have a node sharing the same number as the one you’re modifying. If some clips don’t, then those clips won’t inherit the change you’re going to be rippling.

3 Make whatever changes you need to, adjusting any of the palette controls in the Color page you need to, except for Camera Raw, Sizing, and Data Burn, which aren’t node-specific.

4 When you’re happy with the change you’ve made, choose Color > Ripple Node Changes to Current Group.

The change you’ve made should ripple to every other clip in the current group that has a node of the same number, and in a few moments the thumbnails of those clips should update to show the change.

Appending a Node to Multiple Clips

If you’ve made an adjustment to a node in one clip that you’d like to apply to several other clips, you can quickly do that using the Color > Append Node to Selected Clips command. You can do this as a prelude to using one of the Ripple Node Change commands, as it’s a quick way to make sure several previously ungraded clips have the same nodes, but you can also do this as a quick way to apply the same node change to several clips, regardless of whether they have matching node trees.

To append a node to other selected clips:

1 Select the clip you want to use to make the change so that it’s the current clip, outlined in orange.

2 Select the node you want to append to other clips.

3 Now, Command-click or Shift-click to select the range of clips you want to ripple your change to, so that they’re all selected red.

The clip you’re copying from should be outlined in orange, and the clips you’re rippling the change to should be highlighted in red.

4 Choose Color > Append Node to Selected Clips.
The selected node should be appended to the end of the node tree of each selected clip, and in a few moments the thumbnails of those clips should update to show the change.

**Scroll Copy Grades Using the DaVinci Control Panel**

Scroll mode lets you quickly preview the effects of many different grades applied to clips in the Timeline on the currently selected clip, with the option to either accept or reject the previewed grade to which you’ve “scrolled.” This can be useful for checking to see if any of the previous grades you’ve created in a scene will work for the currently selected clip.

**To use Scroll mode:**

1. Move the playhead to the clip to which you potentially want to copy a new grade. You can use the PREV SCENE and NEXT SCENE buttons to move quickly.

2. Do one of the following to enter Scroll mode:
   - Press SCROLL on the Transport panel.
   - Press MODES, above the fourth trackball on the Center panel, then press the SCROLL MODE soft key.

3. Now, do one of the following to preview different grades from other clips:
   - Press the PREVIOUS SCENE and NEXT SCENE soft keys to move from clip to clip in the Timeline, previewing each grade to the current clip.
   - Turn the SCROLL SCENES knob to scroll smoothly along multiple clips in the Timeline.
   - Turn the SCROLL FRAMES knob to scroll along different frames of any clip, previewing the effects of keyframed grades at different points in time.
   - Press the TOGGLE DECK KEYS soft key to use the transport controls on the Transport panel to play through the Timeline, previewing grades as you go.
   - Press a number on the keypad of the Transport panel, and then the SCENE NUMBER soft key, to jump to a clip and preview its grade.

As you scroll from clip to clip, a red outline indicates the clip with the grade being previewed, and an orange outline indicates the current clip to which you’re previewing each scrolled grade.

4. When you’re finished, do one of the following to either accept or reject a scrolled grade:
   - Press EXIT AS WAS if none of the grades you scrolled through was suitable. This exits Scroll mode and leaves the clip as it was previously.
   - Press EXIT AS IS if you’ve found a grade that works for the current clip. This exits Scroll mode and copies the scrolled grade.
When you press the TOGGLE DECK KEYS soft key in Scroll mode, each of the Transport Control buttons on the Transport panel functions as a means of previewing the grades of other clips in the Timeline.

- **STEP FWD**: Move to the next clip and preview its grade.
- **STEP REV**: Move to the previous clip and preview its grade.
- **FWD**: Plays (scrolls) forward at 1 scene per second, previewing each new grade as it appears.
- **REV**: Play (scrolls) the clips in reverse at 1 scene per second, previewing each new grade as it appears.
- **FFWD**: Shuttles (scrolls) forward through the Timeline at 4 scenes per second, previewing each new grade as it appears.
- **RWD**: Shuttles (scrolls) reverse through the Timeline at 4 scenes per second, previewing each new grade as it appears.

Rippling Changes Using the DaVinci Control Panel

DaVinci Resolve has a mechanism for rippling specific changes made to one clip to a range of other clips in the Timeline. This is only possible using the controls of the DaVinci control panel.

The general idea of the ripple function is that you select a clip, make a change, and then ripple that change to a range of other clips. This rippled change can be applied to the same node in each clip, or the change can be added as an appended node within each rippled clip.

The Ripple mode that’s used when you press the RIPPLE VALUE button can be changed in the Color panel of the User Preferences. There are four options.

- **Exact values changed**: Changes made to the current clip are rippled to the specified clips using the exact parameters that were changed. For example, if Lift in the current clip is changed to 0.75 of its range, each clip you ripple will have a Master Gain setting of 0.75. Only parameters you adjust are rippled.

- **Percent value changed**: Changes made to the current clip are rippled to the specified clips by the percentage of change you made to the altered parameters. For example, if the current clip has a Lift level of 1.00 and is changed to 0.90 units, then the Lift setting of each clip you ripple will have a relative reduction of 10% relative to its previous value.

- **Unit value changed**: Changes made to the current clip are rippled to the specified clips by the same delta of change, using whichever units make sense for the effected parameter. For example, if the current clip had a Lift of 0.80 and you increased it to 0.90, each rippled scene’s master gain level increases by 0.10.

- **All values are copied**: The current clip’s grade is rippled to the specified clips in its entirety. No comparison is made with the original clip’s parameters, and all memory parameters are rippled.

The following procedure describes in detail how you can use the DaVinci control panel to ripple a change to a range of other clips. While this procedure may appear complicated, it’s just that there are several options. Once you learn the sequence of commands, this process is actually quite fast.
To ripple a change using the Ripple Mode soft key commands:

1. (Optional) Press MODES, then press RIPPLE MODES. Four commands appear mapped to the middle soft keys of the Center panel, which can be used later to execute different types of ripple operations.

2. Move the playhead to the clip you want to adjust.

3. Adjust the current clip that you want to ripple to other clips in the Timeline.

4. Define the range of clips you want to ripple to using the number pad on the Transport panel. The following combinations will work:
   - An absolute range of clips is defined by entering two clip numbers separated by a comma. For example, if you want to ripple the current change to clips 10 through 15, you'd press “10 , 15”
   - To specify every clip from the beginning of the Timeline, use the Minus (–) key. For example, to specify a range of clips from the beginning to clip 20, you’d press “– , 20”
   - To specify every clip to the end of the Timeline, use the Plus (+) key. For example, to specify a range of clips from the clip 50 to the end, you’d press “50 , +”
   - To specify every clip in the whole Timeline, press “– , +”

5. (Optional) You can control whether the rippled change is applied in an appended node, or an existing node, in every rippled clip:
   - If you want to apply the rippled change as a new node that’s appended to the end of every rippled clip’s grade, press SHIFT DOWN.
   - Otherwise, the rippled change will be applied to the same node in every rippled clip that you made your adjustment to in the current clip. In other words, if you made a change to Node 2, it would be rippled to Node 2 of all the clips you specified. If one of the rippled clips doesn’t have the same number of nodes, you may get an error.

6. To execute the ripple, do one of the following:
   - Press RIPPLE VALUE on the Transport panel to ripple a change using the currently selected Ripple Mode in the User Preferences.
   - Press one of the Center panel soft keys corresponding to the ripple function you want to perform. There are four soft keys;
     - STATIC RIPPLE: Changes made to the current clip are ripple to the specified clips using the exact parameters that were changed. For example, if Lift in the current clip is changed to 0.75 of its range, each clip you ripple will have a Master Gain setting of 0.75. Only parameters you adjust are rippled. Identical to the “Exact values changed” ripple setting.
     - RELATIVE RIPPLE: Changes made to the current clip are ripple to the specified clips by the percentage of change you made to the altered parameters. For example, if the current clip has a Lift level of 1.00 and is changed to 0.90 units, then the Lift setting of each clip you ripple will have a relative reduction of 10% relative to its previous value. Identical to the “Percent value changed” ripple setting.
     - ABSOLUTE RIPPLE: Changes made to the current clip are ripple to the specified clips by the same delta of change, using whichever units make sense for the affected parameter. For example, if the current clip had a Lift of 0.80 and you increased it to 0.90, each rippled scene’s master gain level increases by 0.10. Identical to the “Unit value changed” ripple setting.
     - FORCED RIPPLE: The current clip’s grade is ripple to the specified clips in its entirety, overwriting all previous nodes and parameters in the rippled clips.
The adjustment you made in step 4 is applied to the designated range of clips.

Admittedly, that was a long and detailed procedure, but the actual button sequences are straightforward once you put them together. Here are some examples of button sequences that ripple an adjustment you’ve just made in different ways:

- **“10, 15” then **SHIFT DOWN **then RIPPLE VALUE**: Copies the change you’ve made to the current clip, and applies it as a new node that’s appended to the end of clips ten through fifteen.

- **MODES then RIPPLE MODES then “34, 45” then FORCED RIPPLE**: Copies the entire grade of the current clip, using it to overwrite the grade of clips 34 through 45.

- **MODES then RIPPLE MODES then “–, +” then **SHIFT DOWN **then RELATIVE RIPPLE**: Copies the change you’ve made to the current clip as a relative percentage, and applies it as a new node appended to the end of every single clip in the entire Timeline.

**WARNING** Once you ripple a change in this manner, there is no going back. Since undo is a per-clip operation, there is no global undo for changes made to the entire Timeline. Proceed with caution.

### Using Shared Nodes

Shared nodes are meant to be a way to extend the benefits of automatically rippled changes among different clips to colorists that prefer a flatter node structure than Group Grading allows. By turning individual Corrector nodes into Shared nodes, and copying these to multiple clips, you enable linked adjustments right from within the clip grade. This means that the clip grade can freely mix both clip-specific nodes and Shared nodes, all within the same node tree. This makes Shared nodes fast to use as there’s no need to create groups or switch to a group node tree (covered in the next section) to reap the benefits of linked adjustments among multiple clips.

A grade with an Unshared (at left) and Shared node (at center), a badge indicates the Shared node, which is also locked

### What Are Shared Nodes Good For?

Shared nodes are similar to group grades, except that they don’t require grouping and can be added to any normal grade. Changes made to a Shared node are automatically rippled to all other instances of that node in the grades of other clips. Furthermore, you can add as many Shared nodes to a grade as you like, and you can arrange them in any order to control the order of the operations they apply. And, of course, you can intersperse them with ordinary Corrector nodes.
Shared nodes are extremely flexible. For example, you can use Shared nodes to:

- Add a Color Space Transform Resolve FX or a LUT to the beginning of every clip from a particular source
- Add a base correction to every talking head shot of a particular interviewee
- Add a shot matching adjustment to each clip from a particular angle of coverage within a scene
- Add a stylistic adjustment to every clip in a specific scene
- Make your base adjustments when grading with remote versions, so those adjustments remain linked when you copy your remote versions to local versions for fine tuning

In fact, you can mix and match Shared nodes among differently overlapping sets of clips to accomplish any or all of the above at once. For example, you can add one Shared node to make an adjustment to every clip from a particular camera, add a second Shared node to each of those clips that are in a particular scene, and then add a third Shared node to whichever of those clips happen to be a closeup of the lead actress, before adding one or two regular Corrector nodes that aren’t shared to make clip-specific tweaks.

**IMPORTANT:** At the time of this writing, there is a limitation when using Shared nodes. Grades using shared nodes cannot be used in collaborative workflows. It is hoped that this limitation is temporary.

### Creating Shared Nodes

Creating a Shared node is easy, assuming you’ve created a node that has an adjustment you’d like to share among multiple clips.

**To create a Shared node:**

- Right-click any Corrector node and choose Save as Shared node.

### Locking Shared Nodes

Once you turn a node into a Shared node, that node is automatically locked, preventing you from accidentally making adjustments to it that would affect all other grades using that same Shared node.

**To toggle the locked status of a Shared node, do one of the following:**

- Right-click any Shared node and choose Lock Node from the contextual menu.
- Open the Keyframe Editor, and click the Lock icon in the track header of that node’s keyframe track.

### Copying Shared Nodes

Because Shared nodes are essentially Corrector nodes within clip grades, they’re easy to work with. Once you’ve created one or more Shared nodes, there are a variety of ways you can copy them to the grades of other clips in your program to take advantage of the linked adjustments they let you make.
Ways of copying Shared nodes among multiple clips:

- **Add a Shared node to another clip’s grade using the Node Editor contextual menu:** Once you save a node as a Shared node, it becomes available from the bottom of the Add Node submenu of the Node Editor contextual menu, making it easy to add any Shared node to any clip. If you customize the label of the Shared node, that custom label appears in the contextual menu, making it easier to find what you’re looking for.

- **Add Shared nodes to a basic grade you’ll be copying to other clips:** If you create one or more Shared nodes when you initially build a grade, copying that grade to other clips naturally copies the Shared nodes as well.

- **Save a Shared node as a Gallery still and apply it to other clips:** If you save a grade with a Shared node in it to the Gallery, then every time you copy that Gallery still to another clip, you copy its Shared node.

- **Create a Shared node and append it to a selection of additional clips:** If you’ve already graded several clips in a scene, you can add a Shared node to the end of one of the clips grades and make sure it’s selected, then select all of the other clips in the scene and choose Append Node to Selected Clips.

- **Use Shared nodes to preserve linked adjustments when copying remote grades to local grades:** If you use Shared nodes to make your base adjustments when you grade using Remote Versions to automatically copy those grades to other clips that come from the same source media, those adjustments will remain linked when you copy your remote versions to local versions for fine tuning.

You can also choose options in the Gallery that dictate what happens when you copy a grade that has shared nodes within it.

**Converting Shared Nodes Back to Corrector Nodes**

Sometimes you need to stop a node from being shared. For example, if you want to copy a grade from another scene to use as the starting point for a new grade, chances are you don’t want any shared nodes to continue being shared as you customize that grade for the new scene. In this instance, you can convert the Shared node back to a regular Corrector node, make any adjustments you need to customize it for the new scene, and then turn that node into a brand new Shared node that’s specific to the new scene.

**To convert a Shared node back to a Corrector node:**

- Right-click any Shared node, and choose Convert to Corrector from the contextual menu.

**Deleting Shared Nodes**

If you’ve created a Shared node that’s being used in multiple clips, and you decide you want to eliminate the linked relationship among these nodes so they all work independently, you can “delete” a specific Shared node. This leaves the now unlinked nodes intact within each node tree in which they appear, but clears their effect. Additionally, that Shared node is removed from the Add Node submenu.

**To Delete a Shared node:**

- Right-click any Shared node, and choose a node to delete from the Delete Shared Node submenu.
Using Adjustment Clips

You can also apply a single grade to multiple clips in the Timeline using Adjustment clips that have been superimposed over numerous other clips in the Timeline. They can be used to apply a single grade to all clips in a scene, or to add further color adjustments or trims to a section of clips via a second grade that’s applied on top of the individual clip grades that are already applied.

Adjustment clips are a great way to add adjustments to multiple clips that you may be making frequent changes to. If you make changes to a grade in an Adjustment clip, that change is automatically applied to all clips underneath it in the Timeline. Additionally, grades applied via adjustment layers can be turned off by disabling the adjustment layers, either one at a time, or by disabling an entire track with adjustment layers in it.

Adjustment clips can be edited into the Timeline on the Edit page, and are available from the Effects bin of the toolbox in the Effects Library. When an Adjustment clip is superimposed above one or more clips in the Timeline, all effects that are applied to the Adjustment clip are also applied to all clips underneath it.

Adjustment clips can be used to apply the following types of effects:

- ResolveFX and OpenFX plug-ins
- Inspector parameters, including Composite, Transform, Cropping, and Dynamic Zoom
- Fusion page effects
- Color page grading and sizing
Effects clips are a fast and easily revised way to apply one or more grades and effects to a range of clips.

**TIP:** Multiple adjustment layers can be grouped together so that you can apply Group and Clip grades to adjustment layers, linking multiple adjustment layers together in situations where you want to apply the exact same trim or stylistic adjustment to multiple scenes in non-contiguous areas of the Timeline.

### Using Groups

Grouping is one of DaVinci Resolve’s most powerful features for organizing grades amongst multiple clips. Groups are manually created collections of clips with automatic linking relationships that make it easy for you to control the rippling of grades among sets of clips that you define. When clips have been grouped together, selecting one member of the group reveals a group “linked” badge at the top-right of each clip’s thumbnail belonging to the group.

![Image](image_url)

The green link icon indicates this clip is in a group.

You can create as many groups within a single project as you need. You can add or remove shots from the current group, and the current group is defined by the last shot you’ve selected (if it belongs to a group, that’s the new current group).

As introduced in DaVinci Resolve 11, the grading of grouped clips is easier than it has ever been. Once grouped, you can choose from one of four Node Editor modes to grade the current clip. Which mode you choose determines whether that grade will automatically ripple to every other member of that group, or whether the grade will only affect that one clip. In this way, you can combine multiple node trees, some which will ripple, and one which won’t, to create the final look of each clip in that group.

For example, you might group together every clip from the same angle of coverage in a scene. You might also group together every clip from a particular section of B-roll that will be graded with the same treatment. This way, whenever you make a change or otherwise update one member of the group using one of the rippled Node Editor modes, every clip in the group will be changed together.

This section discusses how to create and manage groups, how best to use them, and what issues you need to be aware of to use groups to best advantage.
Creating and Managing Groups

The following procedures describe how to create, load, modify, and delete groups.

To create a new group:
1. Select one or more clip thumbnails in the Timeline. You can select a contiguous range of clips by clicking one and then Shift-clicking another, or you can make a noncontiguous selection by Command-clicking individual clip thumbnails anywhere in the Timeline.
2. Right-click one of the selected clip thumbnails, and choose Add Into New Group.
3. Type a name into the field of the Group Name dialog, and click OK.

The new group is created, and the clips you had selected now appear with the "linked" group badge above the thumbnails.

To load a different group, do one of the following:
- Move the playhead to another clip that’s a member of that group.
- Right-click any clip belonging to any group, and choose Group > "Name of group" > Load.

The selected group now becomes the current group. Using the Add Into Current Group command will add a clip to the newly loaded group.

To add one or more clips to an existing group:
1. Load the group you want to add clips to.
2. Select one or more clip thumbnails in the Timeline. You can select a contiguous range of clips by clicking one and then Shift-clicking another, or you can make a noncontiguous selection by Command-clicking individual clip thumbnails anywhere in the Timeline.
3. Right-click one of the selected clip thumbnails, and choose Group > "Name of group" > Assign to Group.

The selected clips now appear with the "linked" group badge above the thumbnails.

To remove one or more clips from an existing group:
1. Select one or more clip thumbnails in the Timeline that you want to remove from a group. You can select a contiguous range of clips by clicking one and then Shift-clicking another, or you can make a discontinuous selection by Command-clicking individual clip thumbnails anywhere in the Timeline.
2. Right-click one of the selected clip thumbnails, and choose Remove From Group.

To rename a group:
1. Right-click any clip belonging to any group, and choose Group > "Name of group" > Rename.
2. Type a new name into the field of the Group Name dialog, and click OK.

The group is renamed. The new name appears as a new submenu of the Timeline contextual menu.
To delete a group:
- Right-click a clip belonging to the group you want to delete, and choose Group > "Name of group" > Delete.
- This clears the group, while preserving the last applied grade within each clip.

Using Group Modes to Control Which Grades Ripple and Which Don’t

When you create a group and then select any clip that is a member of that group, additional Node Editor modes become available that let you apply multiple levels of grades to the clips in that group.

For clips that aren’t grouped, two dots at the top of the Node Editor let you switch between Clip and Timeline modes via a single click. If you’re working on a clip that’s part of a group, four dots will be displayed to allow fast access to the Pre-Clip and Post-Clip Group modes as well.

Node trees you create using the Group Pre-Clip and Group Post-Clip modes automatically ripple changes to every member of a group. Node trees created with the Clip mode are specific to each clip. Node trees created with the Timeline grade affect the entire Timeline, all at once. Combining node trees made using these different modes makes it easy combine clip-specific changes with group-wide changes that make grading faster.

- **Group Pre-Clip**: Node trees assembled in this mode affect every clip in the group simultaneously. Pre-Clip adjustments are useful for creating an overall grade that you want to use as a starting point for the scene, such as when you need to normalize a group of log-encoded clips in a specific way, or when you want to create a base grade that generally improves every clip in a scene.
- **Clip**: The Clip grade corresponds to the local or remote version associated with that clip. Node trees assembled in the Clip mode only affect the specific clip that’s selected. All Local and Remote versions you create are in Clip mode. Clip adjustments are useful for matching clips to one another in a scene, doing clip-specific secondary adjustments, or making any other sort of adjustment that you only want applied to the current clip, rather than to the group as a whole. Clip adjustments are applied after Pre-Clip adjustments.
Group Post-Clip: Node trees assembled in this mode also affect every clip in the group simultaneously, but these adjustments are applied after the Clip adjustments. Post-Clip adjustments can be useful for applying a creative look to an overall scene, so that later revisions to a scene’s look can be accomplished with a single set of adjustments that automatically affect the entire group.

Timeline: Node trees assembled in this mode affect every single clip in the entire Timeline. Timeline adjustments are useful when you have a single change that you want to apply to every single clip at once.

The image processing of each Node Editor mode is sequential, making it easy to keep track of the order of operations affecting a particular clip.

An Example of Grading a Group of Clips
This section shows an example of how you might approach grading a group of clips using the different Node Editor modes that are available. Keep in mind that this is only one of many possible approaches you could take to the use of groups, and was chosen because it exercises everything you can do to a single grade.

To get started, select a series of clips that you want to group, and right-click one of them and choose Create New Group to group them together, entering a name and clicking OK when prompted. One convenient advantage of simply creating groups from a selection is that you’re not limited to selecting a continuous range of clips in the Timeline. Another advantage is that you can use the View > Timeline Thumbnail Mode > Source (C-mode) command, or Timeline filtering, to isolate the range of clips you want to use for creating a group.

There are different ways you might choose to group clips together:

- All clips within a particular scene
- All clips recorded from a specific camera
- All headshots of a particular person
- All clips from a particular angle of coverage
- All exteriors of a particular location

The list could go on and on, but you get the idea. You can group any selection of clips together that have reason to share a common grade. In this example, a series of shots from an exterior scene are selected and made into a group.

Once you’ve created a group, choose Group Pre-Clip from the Node Editor mode drop-down. This is the first grade that’s applied, as the underlying grade that affects the entire group. Using this node tree, adding a LUT to normalize the clips, a Color Wheel adjustment, and some Curve adjustments to tune the color provide a primary grade that now affects every single clip in the group.
A primary adjustment applied to the Group Pre-Clip mode

With this accomplished, you can see there's some variation among the clips in the scene that needs to be corrected in order for every clip to match. Choose Clip from the Node Editor mode drop-down. Grades that you make in Clip mode only affect the clip to which they're applied, so now you can work clip by clip using the Image Wipe and Split-Screen controls to compare clips and make whatever adjustments are necessary to make each one match the main look for the scene.

Scene balancing adjustments made using the Clip mode

Once all the clips are balanced with one another, you can choose Post-Clip Group from the Node Editor mode drop-down. This lets you add one more grade on top of the Pre-Clip and Clip grades that you've already applied, that you can use for any number of things. In this example, a single stylistic adjustment is applied that now affects all of the clips at once. If a client wants to see something different, you can easily make the necessary changes to one clip, and all other clips in that group will immediately be altered as well.
A stylistic adjustment applied to the Group Post-Clip mode

At this point, the scene is graded via a well organized set of corrections. If the client later wants a change affecting the underlying primary grade that everything is built on, you can adjust the Pre-Clip grade. If you spot an inconsistency with your shot matching at any point, you can make a fast tweak to the relevant Clip grade. And if the client wants a stylistic change, you can make any necessary adjustments to the Post-Clip grade to change the overall look of the whole scene. In each case, groups give you total control over which adjustments will ripple across the whole group, and which adjustments will be clip-specific.

**Using Undo in Groups**
Each Node Editor mode has a separate undo stack, meaning that separate multiple-level undo is saved for Group Pre-Clip, Clip, and Group Post-Clip.

**Saving Stills and Grades in Groups**
When you save a still for a clip that’s part of a group, the result is that the still reflects the look of the combined Pre-Clip, Clip, and Post-Clip node trees, but the grade that’s saved within depends on the Node Editor mode you had selected when saving the still. For example, if the Node Editor is set to Group Pre-Clip, then you’ll only save the Pre-Clip grade; the Clip, Group Post-Clip, and Track grades will be ignored. Copying a saved grade to a clip in a group results in that grade being copied to the node tree of whichever Node Editor mode is currently open.

**Collapse Group Grades**
If you want to take a clip out of a group, but you want its grade to continue incorporating all adjustments made in the Pre-Group and Post-Group Node Editor modes, you can use the Collapse Group Grades command to copy all nodes in the Pre-Group and Post-Group grades to the Clip grade. When you do this, Pre-Group nodes are added before any pre-existing nodes in the Clip grade, and all Post-Group nodes are added after, in order to maintain the correct order of operations.
To flatten all group grades into a single Clip mode node tree:

- Right-click a clip’s thumbnail in the Thumbnail timeline, and choose Collapse Group Grades from the contextual menu.

Using Collapse Group Grades on a clip always removes that clip from whatever group it was previously a member of. This can also be an easy way of creating a single flat node tree in preparation for saving a grade to the Gallery for applying to other clips that aren’t themselves in groups.

Groups and Versions

Local or Remote versions you create relate only to the Clip grade. Group Pre-Clip and Group Post-Clip grades cannot be versioned.
Exporting Grades and LUTs

If you find it necessary to exchange grades with other workstations, there are two ways you can do so directly: by exporting grades, or LUTs. This section discusses the export of Grades; for more information about exporting LUTs, see Chapter 130, “Using LUTs.”

To export a grade:

1. Save the grade you want to export as a still in the Gallery.
2. Right-click the saved still in the Gallery, and choose Export.
3. Select the image format you want to save the still as. Choices include: DPX, Cineon, TIFF, JPEG, PNG, PPM, BMP, and XPM.
4. Choose a location for the resulting still image and saved grade files, type a name into the Save As field, and click Save.

Two files are saved. The image file contains the still image of the frame that was stored. A DRX (DaVinci Resolve eXchange) file contains all the grading information.

To Import a grade:

1. Right-click anywhere in the gray area of the Gallery, and choose Import.
2. Click the Options button to select the specific file type you want to import, or select “All Files” for multiple formats.
3. Choose the image file that was exported from your DaVinci Resolve workstation, or someone else’s. The accompanying DRX file must be in the same location. If you lose the original image file, you can still import the DRX file by itself. It will preserve the node structure of the still, but you will not be able to wipe against it.

The still you imported appears in the Gallery, containing the grading information you wanted to import.
Chapter 124

Node Editing Basics

This chapter covers the basics of using the Node Editor in DaVinci Resolve to manage all of the adjustments you decide to apply to a clip, as well as the fundamental procedures for editing and organizing nodes within a tree that are the basis for creating more sophisticated effects.
## Contents

**Node Editor Basics**

- Thumbnail-Optional Nodes 2824
- The Node Editor Interface 2825
- The Components of a Node Tree 2826
- Node Badges and Labels 2828

**Identifying Nodes** 2840

**Putting Nodes into HDR Mode** 2840

**Clip vs. Timeline Grading** 2841

**Grading Order of Operations** 2842
Node Editor Basics

By default, every clip has one node in the Node Editor that contains the first corrections you make. However, you also have the option of creating multiple nodes, where each node contains one or more corrections that affect the image.

The specific arrangement of nodes you create lets you exert precise control over the order of operations performed by your grade, which provides many advantages. This section covers different ways of creating, editing, and arranging node trees to harness the full power of DaVinci Resolve.

Thumbnail-Optional Nodes

The Node Editor option menu provides a Show Thumbnails option that lets you disable or enable the thumbnails attached to each Corrector node.
How Many Nodes Do I Need to Use?

In this chapter and the ones that follow, you’ll learn many different techniques for combining adjustments and nodes in different ways to achieve highly specific effects. Consequently, new DaVinci Resolve users often wonder, how far do I go? There is no right answer, but suffice it to say that some of the world’s leading colorists achieve stunning results in as few as three or four nodes, while others routinely build carefully organized hierarchies of ten to twenty nodes, or more. The number of nodes you use is often dependent on the quality of media you’ve been given to work with, as well-lit footage usually requires less work than material shot run-and-gun with available light, that typically needs many more adjustments to achieve an acceptable result. Furthermore, the number of nodes you may use can also depend on what kind of program you’re working on, with commercial spots affording the colorist enough time in the schedule to build truly massive grades that adjust every little detail, and narrative features and television shows requiring you to work faster and do more within fewer adjustments in order to stay on track. The real answer? Each grade requires as many nodes as are necessary. No more, no less.

The Node Editor Interface

As you work within the Node Editor, you may find the need to zoom into or out of it to get a better look at the node tree, and to pan around the working area to deal with large collections of nodes.

To expand the size of the Node Editor’s working area:

- Drag the border between the Node Editor and the Viewer to the left or right to make it wider or narrower.
- Right-click anywhere within the Node Editor (except on a node) and choose Toggle Display Mode, which hides the Viewer and moves the Node Editor to the right of the Gallery, enlarging it considerably. Right-click and choose Toggle Display Node again to return to the default layout.
- You can toggle Display mode using the DaVinci control panel by pressing SHIFT UP and the DISPLAY/CURSOR button above the fourth trackball on the Center panel.

To arrange the node tree to fit your current working area:

- Right-click anywhere in the Node Editor (except on a node) and chose Cleanup Node Graph from the contextual menu. This will rearrange your node tree to fit in whatever size working area you have at the time.

To zoom and pan within the Node Editor, do one of the following:

- Use the Node Editor’s zoom slider to shrink or enlarge the nodes in the Node Editor.
- Click the Pan tool (the hand icon) at the upper left-hand corner of the Node Editor, and drag anywhere within the gray area of the Node Editor to pan around.
- Press the H key to toggle between selection and pan modes in the Node Editor.
- Middle-click and drag anywhere within the Node Editor to pan around.
- Right-click and choose Zoom In or Zoom Out.
- Right-click and choose Zoom to Window to fit the node tree to the current size of the node graph.
- Right-click and choose Original Size to return the node graph to the default size.
The Components of a Node Tree

Ambitious grades may require trees of multiple nodes to create the necessary effect. This section covers the mechanics of putting nodes together into the structures that are described in more detail later in this chapter.

Every node you add is a “Corrector” node, which is capable of either primary or secondary correction, depending on whether or not you enable the Qualifier/Window/Matte controls. Even “Serial” and “Parallel” nodes are simply Corrector nodes that are added in series or in parallel to the previous node in the node tree; the names are a consequence of how they’re added.

Each Corrector node has two inputs and two outputs, which lets you separately manage the RGB image-processing channel, and the Key channel that defines areas of isolation for image processing operations, or transparency for compositing. RGB connections are light green, located at the top left and right of each node. Key connections are blue, located at the bottom left and right of each node. Inputs into the node are triangles, and outputs are squares. These inputs and outputs let you control the flow of image and isolation channels coming into and going out of each node in the tree.

Nodes are attached to one another via “connections,” seen as lines that connect one node to another. Image data flows from left to right, starting with the Source input all the way at the left of the Node Editor, through each node in the tree, and ending at the Node Tree output at the right of the Node Editor.
Here’s an explanation of the different components of a basic node tree where all nodes are connected in serial, one after the other, and how they work together:

- **Source Input**: The green source node to the far left is the clip’s image data as processed by the Sizing and Source decode settings, ungraded. The Source input feeds RGB data to the grade, and is connected to the RGB input of the first node in your tree. If necessary, you can connect the Source input to more than one Corrector node, creating multiple simultaneous streams of image processing emerging from the original source state of the image that you can eventually recombine in different ways using the Parallel or Layer Mixer nodes.

- **Nodes**: Each node in the node graph represents a collection of image processing operations that can be enabled or disabled separately from any other node in the graph. By separating operations into multiple nodes, you’re able to precisely control the order of all image processing operations in DaVinci Resolve to create many different corrections and effects. The green RGB inputs and outputs are used to connect these nodes together. Each node’s thumbnail image shows how the clip looks at that particular stage of the grade, giving you a visual indication of what each node is doing, and small badges below each node show you which specific operations are being applied by that node.

- **RGB Inputs and Outputs**: The green inputs and outputs at the upper right and left of each node are used to connect the RGB image that’s output from one node to the RGB input of the next node. For a Corrector node to have an effect, you must connect both its RGB input and its RGB output to neighboring nodes in the tree. Furthermore, every single node in the Node Editor must be connected for a grade to be enabled; having any disconnected node in the node tree disables that grade until it’s fully connected.

- **Key Inputs and Outputs**: The blue inputs and outputs at the bottom right and left of each node are used to route the key channel generated by a node’s Qualifier or Window controls, or imported via a Matte clip that you previously associated with a clip in the Media page. When you connect the key output of one node to the key input of another, you basically copy the first node’s key to the second node. You can also combine the key outputs of multiple nodes in various ways using the Key Mixer node.

- **Node Tree Output**: The RGB output of the last node in a tree must be connected to the green Node Tree output node, which “completes the circuit” of image processing, and passes that correction on to the next stage in the DaVinci Resolve image processing pipeline. If the output is not connected, the node tree is disabled and has no effect on the clip. You can only connect one RGB output at a time to the Node Tree output.

- **Second Source Input (for RED HDRx)**: You can access the alternate highlight exposure of RED HDRx media by exposing this optional second Source input. For more information, see “Mulit-Channel RED HDRx Support” in Chapter 127, “Channel Splitting and Image Compositing.”

- **Second Source Input (from Fusion page)**: You can also create additional sources to route in masks or mattes created in the Fusion page for use as keys in the Color page.

- **Alpha Output**: It’s possible to create regions of transparency for compositing directly in DaVinci Resolve by connecting a key output to an optional Alpha output. For more information, see Chapter 126, “Combining Keys and Using Mattes.”
Node Badges and Labels

Nodes appear with various labels and badges to help you identify what each node is contributing to the overall grade. How long a label and how many badges appear depends on the size of each node, as set by the Node Editor’s Zoom slider.

- **Node number:** Nodes are numbered in the order in which they appear in the node graph, making it possible for you to select specific nodes by number via the DaVinci control panel.
- **Adjustment badges:** As you apply various operations within a node, small badges appear underneath the thumbnail that indicate which palettes have been used to adjust that node. How many badges are visible depends on how far in or out you’re zoomed into the Node Editor, and whether or not there are Color Space or HDR labels already taking some of this room. At larger node sizes, more badges can appear within the width of the node. Each palette in the Color page has a unique badge. If you apply more operations than a node has area to display, a single "downward arrow" badge appears.
- **Animation badge:** Nodes with animated parameters display a keyframe badge.

Labeling Nodes

Nodes can be labeled to identify a particular node’s function in your grade. This can make it easier to revise a grade months later. Node labels are also saved when you save a still, so labels can also make it easier to decipher a saved grade down the road. At each node’s default size in the Node Editor, nodes can appear with up to 12 characters of text, although larger nodes can accommodate more text.

**To label a node:**

1. Right-click a node and choose Change Label.
2. Type the label text you want and press Return.

   The label you entered appears above the node in the Node Editor.

**To edit a node’s label:**

Once a node has a label, you can change the label at any time by double-clicking it.
Selecting Nodes

The node that’s currently selected in the Node Editor is highlighted in orange, and is referred to as the current node. When you adjust any of the parameters or settings in the Color page, you’re adjusting parameters within the current node. You can only select one node at a time.

To select a node, making it the current node, do one of the following:

- Click any node in the node graph.
- Choose Color > Nodes > Previous Node (Option-Shift-Semicolon) or Color > Nodes > Next Node (Option-Shift-Apostrophe). When you do this, the last node loops around to the first one, and vice versa.
- Using the Transport panel of the DaVinci control panel, press the PREV NODE or NEXT NODE buttons. When you do this, the last node loops around to the first one, and vice versa.
- Using the Transport panel of the DaVinci control panel, enter the number of the node you want to select using the keypad, and then press the SELECT NODE button.

The selected node appears highlighted in orange. You also have the ability to select multiple nodes, in preparation for doing things like moving them or creating compound nodes (covered later in this chapter).

To select multiple nodes:

- Command-click each of the nodes you want to simultaneously select.
- With the Node Editor Selection tool chosen (at the upper left-hand corner of the Node Editor) simply drag to select multiple nodes using a bounding box.

When you select multiple nodes, each one appears highlighted in white, with the exception of the current node, which remains orange.

When you select another clip in the Timeline, the default behavior is that the last node that was selected when you worked on that clip is the one that’s selected when you move to that clip again. However, a setting in the option menu of the Node Editor and the Color panel of the User Preferences, called “Switching clips,” lets you change this behavior. For more information on this option, see Chapter 3, “System and User Preferences.”
Disabling Nodes

In the process of creating a node tree, it’s often useful to turn one or more selected nodes off to disable their effect on your grade. It’s also useful to turn the entire node tree off and on in order to see “before and after” views of the current clip. Disabled nodes are not processed during rendering, and they remain disabled when you save that grade along with a still in the Gallery and then apply that grade to another shot.

Disabling Individual Nodes

Disabling a single node is useful for temporarily disabling adjustments that you don’t think you want to use but don’t want to discard (however you should remember that it’s alarmingly easy to inadvertently turn these nodes back on again). It’s also good for giving your client a before and after preview of the last adjustment.

To toggle individual nodes off and on, do one of the following:

- Click the number of any node in the node graph to disable that node by itself.
- Select a single node, and choose Color > Nodes > Enable/Disable Selected Nodes (Command-D).
- On the DaVinci control panel, press the DISABLE CURRENT button (on the T-bar panel).

Disabling Multiple Nodes All At Once

If you select more than one node in the node tree, using any of the methods of turning nodes off and on described above (including Command-D) will toggle Enable/Disable Selected Nodes. Please note that the current node outlined in orange is always considered to be part of the selection.

This makes it easy to do before/after comparisons of any combination of nodes doing complicated adjustments by selecting them, while leaving un-selected nodes doing base adjustments that you want to leave enabled alone.

Disabling All Nodes

In addition to the Bypass All Grades command, disabling all nodes of a grade at once is another easy way of disabling a grade to provide a before and after of the original state of the clip (or the color managed state of the clip if Resolve Color Management (RCM) is enabled). More importantly, it’s a good way to disable all nodes of a grade in preparation for walking your client through each operation in that grade node by node, as you turn each node on in turn while narrating how it’s improving the image.

To turn every node off and on at once, do one of the following:

- Choose Color > Nodes > Enable/Disable All Nodes (Option-D) to toggle all nodes off and on.
- On the DaVinci control panel, press SHIFT-DOWN and then the DISABLE CURRENT button (on the T-bar panel).

IMPORTANT When you turn every node off and then on again, every node is re-enabled, even nodes that had previously been individually disabled.
Turning Grades and/or Fusion Effects Off

The Bypass Color Grades and Fusion Effects button/drop-down commands in the Viewer’s title bar are also available via View > Bypass Color and Fusion menu commands. Turning off Fusion effects in the Color page is an easy way to improve playback performance on low power systems when you just need to make a quick set of grading adjustments. Toggling grades off and on is also a convenient way to quickly get a before and after look at a shot where the before goes all the way back to the source.

If you choose Toggle Bypass or click the Viewer control, you’ll turn off whatever is checked in the optional menu, which lets you choose whether or not you want to bypass both Color and Fusion, or just one or the other.

Resetting Nodes

If you’re dissatisfied with your current operations and want to start over, there are three ways you can reset nodes in the Node Editor. These are available as items in the Color menu, and buttons on the DaVinci control panel’s T-bar panel.

- **Reset Selected Node Grade**: Resets the currently selected node, eliminating all keyframes, to the default parameter settings.
- **Reset Grades and Keep Nodes**: Resets every node in the current node tree, without affecting the node tree’s structure: all nodes remain where they were. However, each node has been reset to the default parameter settings.
- **Reset All Grades and Nodes**: Deletes every node and keyframe, and restores a single node set to the default parameter settings.

You can also reset nodes using the mouse, which can be a quick thing to do if you’re already working in the Node Editor to accomplish other things.

**Methods of resetting nodes with the mouse:**

- **To reset a selected node**: Right-click that node and choose Reset Node Grade from the contextual menu.
- **To reset all grades and nodes**: Right-click anywhere in the background of the Node Editor, and choose Reset All Grades and Nodes from the contextual menu.
Methods of resetting nodes with the keyboard:

- To reset a selected node: Press (Shift-home).
- To reset all grades and nodes: Press (Command-home).
- To reset all grades and keep nodes: Press (Shift-Command-home).

Previewing and Restoring Node Trees

There are two other methods of quickly dealing with unwanted changes you've made to node trees, without needing to use undo.

- **Preview Memory**: Lets you preview the effect of any saved grade on the current clip. To preview, choose Color > Preview Memory (Option-Shift-P), and then right-click any saved still in the Gallery (or Memory) and choose Add Correction. In fact, you can use Add Correction to try out as many stills as you like. If you like any still's effect, then you can leave it be. If you don't like any of the stills you previewed, then choosing Color > Preview Memory again reverts the clip to the original grade.

- **Original Memory**: This command lets you quickly revert a clip's grade to its original state when you first selected that clip. It is accessed by choosing Color > Original Memory (Option-Shift-O). This is useful for getting immediately back to a clip's original grade if you've made a series of changes that you then regret. Selecting another clip in the Timeline and then reselecting the clip you made changes to resets what is considered to be the current grade.

Caching Specific Nodes to Improve Performance

You can flag specific nodes to be cached, along with all nodes appearing upstream in that node tree. By caching nodes using processor-intensive effects, you free up real time capability for the remaining downstream nodes in a grade. Choosing Playback > Render Cache > User only caches nodes that you've flagged for caching.

When you choose Playback > Render Cache > Smart mode, DaVinci Resolve automatically caches any nodes that use Motion Blur, Noise Reduction, or OFX plug-ins, without you needing to do anything.

To flag a node and all corrections made in upstream nodes for caching:

- Right-click any node and choose Node Cache > On from the contextual menu.
Editing Node Trees

There is no limit to the number of nodes you can create and connect to one another, and you can make as many or as few parameter adjustments as you like within each node. The following procedures describe the ways you can add nodes to the node graph as you build each grade’s node tree.

Adding Nodes

The simplest thing you can do to add to the complexity of a node tree is to add additional nodes, in order to add more adjustments to the current grade. You can add nodes so that they’re automatically attached to nodes that are already in the node tree, for immediate adjustment, or you can add unattached nodes to empty areas of the node tree in preparation for assembling a particularly complicated and specific node tree to accomplish a difficult task.

Methods of adding nodes to the tree using a mouse, tablet, or trackpad:

- **To add any kind of node to the node graph using the mouse:** Right-click any node in the node tree, and choose the type of node you want to add from the Add Node submenu of the contextual menu.
- **To add a disconnected node to the node graph:** Right-click anywhere within the node graph’s background, then choose Add Node > Corrector from the contextual menu. Disconnected nodes have no effect on a node tree until they’re connected.

Methods of adding nodes to a currently selected node in the tree using the keyboard or control panel:

- **To add a serial node after the currently selected node:** Press Option-S key, choose Color > Nodes > Add Serial from the menu, or press the ADD SERIAL button on the T-bar panel of the DaVinci Resolve control panel.
- **To append a serial node to the very end of the node tree:** Press Option-K, choose Color > Nodes > Append Node from the menu, or press the APPEND NODE button on the T-bar panel of the DaVinci Resolve control panel.
- **To add a serial node before the currently selected node:** Press Shift-S, or choose Color > Nodes > Add Before Current, or press SHIFT DOWN and then ADD SERIAL on the T-bar panel of the DaVinci Resolve control panel.
- **To add nodes in parallel to the currently selected node:** Press Option-P, choose Color > Nodes > Add Parallel from the menu, or press the ADD PARALLEL button on the T-bar panel of the DaVinci Resolve control panel.
- **To layer nodes with the currently selected node:** Press Option-L, choose Color > Nodes > Add Layer from the menu, or press the ADD LAYER button on the T-bar panel of the DaVinci control panel.
- **To add an outside node to the currently selected node:** Press Option-O, choose Color > Nodes > Add Outside Node from the menu, or press the ADD OUTSIDE button on the T-bar panel of the DaVinci control panel.
Adding Nodes with Windows Turned On

There are also dedicated commands for adding serial nodes with Circular/Linear/Polygon/Curve windows automatically turned on, for convenience.

To add a node to the tree with a Window automatically enabled:

Choose an item from the Nodes menu, or press the button on the T-bar panel of the DaVinci Resolve control panel that corresponds to the following:

- **Node + CPW**: Circular Power window (Option-C)
- **Node + LPW**: Linear Power window (Option-Q)
- **Node + PPW**: Polygonal Power window (Option-G)
- **Node + PCW**: PowerCurve window (Option-B)

Whenever you add a node to a tree, it’s numbered consecutively to come after the next most recent node you’d added, regardless of the order in which it appears in the node tree. For example, if you’ve already added three nodes, and then you decide to add another node in between Nodes 1 and 2, the new node will be Node 4, and the order of the nodes will be 1, 4, 2, and 3.

Deleting Nodes

If there’s a node that you no longer need, you can choose to remove it completely from the node tree to remove its effect permanently.

To delete a node, do one of the following:

- Select a node, then press the Forward-Delete key.
- Right-click a node, and choose Delete Node.
- Using the DaVinci Resolve control panel, select any node, and press the DEL-CURRENT button (on the T-bar panel).

After you’ve deleted a node, the node to the left and right of the node you deleted are automatically connected so that the node tree is unbroken. Also, all the nodes in a tree are renumbered after the deletion of any node, so there’s no discontinuity in node order. For example, if you have three consecutively numbered nodes in a tree and you delete the second one, the node that was formerly number 3 is renumbered to be 2.

Connecting and Disconnecting Nodes

For a node tree to work, every node in the Node Editor must be connected into a working node tree, from the Source input, through each node in the tree, to the Node Tree output. Any disconnected node will result in that clip’s grade being disabled. However, you may find the need to disconnect some parts of a node tree in order to reconnect them in different ways.

To connect two disconnected nodes:

Click and drag a connection from the RGB or key output of one node to the corresponding RGB or key input of another, and when the line highlights, release the mouse button.
To change the connection from one node to another:
Move the pointer over the second half of any connection line between two nodes until it highlights blue, then click and drag it to reconnect it to another input, on that node or another.

To disconnect two nodes, do one of the following:
- Position the pointer over the right-hand side of a node connection so it highlights, and click it to delete it.
- Click a link to select it (selected links turn orange), and then press the Delete or Forward-Delete key.
- Right-click a link and choose Delete Link.

To overwrite a node’s previous connection:
- You can drag a connection to a node input or output that’s already connected, which will overwrite the previous connection with the new one you’re dragging. When you do this, the connection that’s about to be overwritten appears highlighted in orange.
- You can connect any node’s RGB or Key output to as many inputs as you want, but you can only have one connection going to a node’s input. The exception to this is a node with multiple inputs, designed to combine the output of multiple nodes. These include the Parallel, Mixer, and Key Mixer nodes.

Extracting a Node
Sometimes you need to remove a node from its current position in the node tree, such that the nodes to the left and right of it automatically reconnect to one another, saving you from having to reconnect them manually. This is called extracting a node.

To extract a node, do one of the following:
- Select a node, and choose Color > Nodes > Extract Current Node.
- Select a node, and press E.

Keep in mind that disconnected nodes in the node tree suspend grading altogether, so you’ll want to either reconnect that node to another part of the node tree, or delete it; you cannot leave it disconnected in the Node Editor.

Inserting a Node
If there’s a disconnected node in the Node Editor, there’s a simple way you can insert it into the node tree between any two other nodes. This also works for nodes that you’re dragging into a node tree from another source, for example, from the exposed node tree of a still in the Gallery.

To insert a disconnected node between two other nodes:
- Drag a disconnected node, or a node from another node tree, onto the connection between any two other nodes in a node tree; when a plus icon appears over the node you’re dragging, drop it to insert the node.
Rearranging Node Order

The order in which nodes are connected in your tree affects the result of a grade. For example, if you boost the highlights in the first node, and then you try to isolate a portion of the picture in a second node that you now realize has been clipped, you may need to change your order of operations to optimize your corrections.

To swap the contents of two nodes:

Command-drag any node and drop it onto another node to swap the operations within each node. The nodes won’t appear to have moved, but you should be able to tell from the node badges underneath that the operations have been reversed.

To move a node to any other position in the node tree:

1. Double-click any node in the node tree and press E to extract it, removing it from the tree so that it becomes unattached.
2. Drag the now-unattached node to the connection line between any two other nodes in the tree, and when a small plus icon appears, drop it to automatically connect that node at that position in the node tree.

Copying and Pasting All Settings From One Node to Another

The simplest thing you can do is to copy all of a node’s settings and paste them into another node. This makes it easy to duplicate things like windows, qualifier settings, keyframing, or motion tracking that you want to reuse in another node as the basis for another operation. This is also a quick way to manually ripple a change you make in a node to that same node in another clip’s grade.

To copy a node’s settings from one clip to another, do one of the following:

- Option-drag one node onto another. When you drop it, the settings of the node you dragged overwrite those of the node you dropped onto.
- Select a node with settings you want to copy and choose Edit > Copy (Command-C). Then, select a node you want to paste these settings to either in the current grade or in the grade of another clip, or create a new node, and choose Edit > Paste (Command-V) to paste the settings you copied. These pasted node settings overwrite any other settings that node previously used.

NOTE: There are additional methods of copying nodes and individual node settings. For more information, see Chapter 123, “Grade Management.”
Keeping Node Trees Organized

It’s a good idea to keep the arrangement of your nodes in the node graph clean and neat. It’ll make it easier to read your tree if you need to revisit a grade later on, and it will also make it easier for other colorists working on the same project to figure out what you’re doing. The following procedures describe how to rearrange the nodes in your tree, and the node tree working area, to help you keep on top of your grades.

To move nodes within the Node Editor:

- Drag any node to a new position.
- Command-click or drag a bounding box around multiple nodes that you want to move, and drag them all to a new position.

Of course, it’s easy to get carried away. If you’ve been working furiously on a complex grade and you find yourself staring at a riot of disorganized nodes, it’s easy to quickly reorganize your node graph using a pair of commands in the Node Editor contextual menu.

To clean up the node graph, right-click the Node Editor and choose:

- **Cleanup Node Graph:** Moves all nodes in the node graph so they appear in an evenly spaced grid. Connection lines are routed around nodes to minimize clutter.
Using Compound Nodes

Another node structure you can use to keep complex node trees organized is the compound node. You can Command-click to select any number of nodes in the node tree (selected nodes are highlighted white), and then use the “Create Compound Node” command to nest all selected nodes inside of a single node.

The resulting compound node that’s created has as many inputs and outputs as are necessary to accommodate the connection lines that attached the nodes you selected to the rest of the node tree.

You can use compound nodes to organize complicated node trees by nesting sets of nodes that work together to do a specific thing within a single node. You can also turn a set of nodes that you’re using to create a specific effect into a compound node in preparation for saving to the Gallery. Creating a library of effects in this way makes it easy to reuse them via the Append Grade command, without the undue burden of adding lots more nodes to your grade later on.

Methods for creating and working with compound nodes:

- **To create a compound node:** Command-click each node you want to nest inside of a compound node to select them with a white highlight, or drag a bounding box around a group of nodes. Then, right-click one of the selected nodes, and choose Create Compound Node from the contextual menu.

- **To edit a compound node:** Either hold the Command key down while double-clicking the compound node you want to open, or right-click any compound node and choose Show Compound Node from the contextual menu. The contents of that node appear in the Node Editor, taking the place of the overall node tree.
• **To exit a compound node you’re editing:** To return to the top level node tree, double-click the leftmost item in the path control at the bottom of the Node Editor, or click the name of the compound node. You can also right-click in the compound Node Editor and choose “Exit Compound Node” from the contextual menu.

• **To label a compound node:** Right-click a compound node, choose Change Label from the contextual menu, and type a new label for that node. Press the Return key when you’re finished.

• **To decompose a compound node:** Right-click the compound node you want to decompose, and choose “Decompose Compound Node” from the contextual menu. The compound node disappears, replaced by the original nodes within. Please note, if you had applied an adjustment to the compound node itself, that adjustment is lost when you decompose it back into its constituent nodes. If you want to preserve the compound node adjustment itself, you can copy it, then decompose the node, and then create a new node and paste the adjustment you’d copied.

### Adding Inputs and Outputs to Compound Nodes

When you open the contents of a compound node using the Show Compound Node command, you can make whatever adjustments you like to the node tree within, but you also have the option of right-clicking within the Node Editor and choosing Add Source to add an input to the compound node, or Add Output to add an output. Adding more inputs and outputs lets you set up the node to connect to the rest of your node tree in more complicated ways. Disconnected inputs and outputs have no effect on your grade.

Furthermore, you can also use the Add Alpha Source and Add Alpha Output contextual menu commands to add KEY inputs and outputs to a compound node, making it easy to route key or alpha channel data to other connections in the enclosing node tree.

### Nesting Compound Nodes

Compound nodes can also be nested within other compound nodes, if necessary.

### Grading Compound Nodes

After you’ve created a compound node, you can select it to make one or more adjustments using the compound node itself, which effectively adds those adjustments after all other adjustments that take place via the nodes that are inside of the compound node. This gives you the opportunity to “trim” the effect that compound node is having on your grade, or to limit it using a qualifier or window.

To adjust the individual nodes nested within a compound node, you need to first open the compound node. Then, you can select and adjust any node as you ordinarily would.
Identifying Nodes

As you make various adjustments to nodes, small badges appear underneath that indicate what each node is actually doing. Since nodes are capable of holding multiple adjustments, any given node may have multiple badges; how many badges a node can show depends on the zoom level of the Node Editor. Larger nodes will show more badges, whereas smaller nodes will show fewer badges, hiding whichever badges don’t fit.

![Badges underneath each node indicate which adjustments it contains](image)

Another nice organizational feature of the Node Editor is an automatic tooltip that appears whenever you hover the pointer over a particular node, that shows you a concise list of all the operations applied to that particular node.

Putting Nodes into HDR Mode

When using various grading controls in the Color page to grade wide-latitude images for HDR output, you may find it useful to enable the HDR mode of the node you’re working on by right-clicking that node in the Node Editor and choosing HDR Mode from the contextual menu.

![Using a node’s contextual menu to put that node into HDR mode](image)

This setting adapts that node’s controls to work within an expanded HDR range. Practically speaking, this makes it easier to work with wide-latitude signals using controls that operate by letting you make adjustments at different tonal ranges such as Lift/Gamma/Gain, Custom Curves, Soft Clip, and so on.
Clip vs. Timeline Grading

Ordinarily, the Node Editor has two modes. The default Clip mode lets you create individual grades for each clip or group in the Timeline. However, the Timeline grade mode lets you apply a single grade simultaneously to every clip in the Timeline, as seen in the Thumbnail timeline in the following screenshot.

A paragon of sophisticated grading, the author applies a red edge vignette to every clip in the project simultaneously using the Timeline grade.

There are a variety of reasons you might want to do this. For example, if you're working on a commercial spot, you might elect to use Clip grades to do general correcting and scene-to-scene balancing, and then use the Timeline grade to apply a single stylistic grade to the entire spot simultaneously. That way, any changes the client wants made to the style of the grade can be instantly applied to the whole spot.

Another example would be using the Timeline grade to apply corrections meant to address QC issues running throughout a program, desaturating highlights or selectively darkening a specific shade of red wherever it appears.

To switch between Clip and Timeline grading modes:

Choose the mode from the drop-down menu at the top right of the Node Editor.

Selecting Track mode in the Node Editor

Click the dot in the Node Editor toolbar that corresponds to the Clip or Timeline mode.

Two dots show whether you’re in Clip or Timeline mode; these can be clicked to switch.

NOTE: When you reset the Timeline grade using the Color > Reset All Grades and Nodes command, the Output Sizing parameters are reset as well.

Two dots at the top of the Node Editor let you switch between Clip and Timeline modes via a single click. If you’re working on a clip that’s part of a group, four dots will be displayed to allow fast access to the Pre-Clip and Post-Clip Group modes as well. For more information about group grading, see Chapter 123, “Grade Management.”
Timeline Grades and Saved Stills

When you save a Gallery still, the Clip and Timeline grades are both saved. However, when you apply a grade from that still, you only apply either the Clip grade, or the Timeline grade, depending on which mode the Node Editor is in. For more information on saving and applying grades, see Chapter 123, “Grade Management.”

Grading Order of Operations

As you construct grades more carefully in the Color page, it may help you to know what the precise order of operations are in the image processing pipeline of DaVinci Resolve. While you can control the order of operations for node-specific adjustments by being careful about what you do in which nodes, the order of pre-grade, non-node specific, and post-grade operations are all fixed.

The following illustration shows DaVinci Resolve’s order of operations:
This chapter covers the four fundamental node structures you can use to combine Color page adjustments in even more detailed ways. These methods let you control your order of operations and re-combine multiple versions of the graded image in much more specific ways.
Serial, Parallel, and Layer Node Tree Structures

There are several ways you can organize nodes in a tree. Each method lets you control a group of image processing operations in different ways to achieve specific results. This section covers how to use Serial nodes, Parallel nodes, and Layer nodes, as well as how to use LUTs, work with HDR media that lets you combine two different exposures using two different Source inputs, and apply additional project-wide adjustments using the Timeline grade.

Serial Node Structures

The simplest, and most common node structure is a serial cascade of nodes, where a linear series of nodes is connected, one after another.

Serial nodes, where the output of one node feeds an altered image to the next

Much of the time, this method of constructing a tree of multiple operations is all you need to do. It’s a simple and intuitive way of organizing your adjustments, similar in principle to the stacks of layers used in other grading and compositing applications to apply multiple operations to a clip.

Controlling What Feeds a Node’s RGB Input

When you create a grade using serially arranged nodes, each node’s output is used as the next node’s input, so the order in which the nodes are arranged determines the order of image processing operations.

In the following screenshot, the node tree shows a series of three operations that are applied to a log-exposed, low-contrast clip. The first node expands clip contrast and increases saturation. The second node isolates the sky to intensify its color. The third desaturates and warms the image. At right, you can see the result of this node tree.

Node 2 pulls a clean key from the image data fed it by Node 1

If, instead, we reversed the order of Nodes 2 and 3, the result will be a less effective key.
By comparison, Node 3 pulls a less than optimal key from the image data fed it by Node 2

Because the secondary operation is sampling the desaturated image, rather than the source, the HSL Qualifier’s key has less image data to work with, and thus you may get an inferior result.

**Parallel Node Structures**

Another way to organize your corrections is to use a Parallel node structure, which lets you apply two or more overlapping adjustments at a single stage of a node tree. You can use the Parallel node structure for organizational reasons when there is a group of secondary corrections that you want to apply all at once. You can also use this structure for the unique way it blends overlapping image adjustments.

The Parallel Mixer node that makes this possible has multiple RGB inputs and a single RGB output. This lets the Parallel Mixer mix together multiple Corrector nodes, outputting a single image as a result.

When you add a Parallel node to an existing node, DaVinci Resolve automatically adds one Corrector node below the current node, and adds a Parallel Mixer node to its output.

**TIP:** If you want to create a series of Parallel nodes that connect to the output of the currently selected node, create a Serial node before you create your first Parallel node.

If you’re manually connecting another node to a Parallel Mixer node, you must first create an additional input to connect it to.
To create an additional, unconnected input on a Parallel Mixer node:
Right-click a Parallel Mixer node and choose Add One Input.

Ordinarily, the RGB input of every Corrector node that’s connected to a Parallel node is connected to the output of the same node. This results in a stack of nodes that take the same state of the image as their input. This makes it easy to apply multiple secondary operations without worrying about whether or not a change to one will affect the keys of the others.

Further Parallel nodes can be added as you wish with each using a common source

If you add another node in parallel, the Parallel Mixer automatically adds another input. You can have as many nodes in parallel as you need.

The adjustments made by all nodes that are connected to a Parallel Mixer are combined equally, regardless of which nodes are highest. In the following example, a separate overlapping window is applied by each of three nodes in parallel.

As you can see in the image at right, the three tints created by the overlapping windows are all mixed together equally; the colors blend with one another as if they are optically mixed. Most of the time, this is exactly what you want when you’re blending overlapping naturalistic color adjustments.
Converting Parallel Mixers to Layer Mixers

On the other hand, if you need your overlapping color adjustments to have priority over one another, or if you want to combine multiple adjustments using composite modes, then you may want to use the Layer Mixer node instead. If you’ve created a Parallel Mixer structure and you want to convert it to a Layer Mixer, you can.

To change a Parallel Mixer node into a Layer Mixer node:

Right-click a Parallel Mixer node and choose Morph Into Layer Mixer Node.

Layer Mixer Node Structures

The Layer Mixer is structurally quite similar to the layout used by the Parallel Mixer. However, there are two key differences. First, the Layer Mixer node combines multiple adjustments with priority given to the image adjustment in the lowest overlapping node input. Second, you have the option of combining all of the Corrector nodes that are connected to a Layer Mixer using one of several different composite modes, to create a wide variety of visual effects.

Because of their similarities, layering nodes with the Layer Mixer works in much the same way as creating a Parallel node structure.

Layer Mixer Prioritization

In the following example, the same node structure from the Parallel Mixer example is shown, this time with the three overlapping color adjustments mixed together using the Layer Mixer.

Now, instead of the three adjusted color tints being blended, you can see that the blue tint, which is connected to the lowest input of the Layer Mixer, is dominant and covers the overlapping regions of the two other adjustments. Meanwhile, the green tint, which is connected to the middle input of the Layer Mixer, covers the overlapping portion of the orange tint, which is connected to the highest input of the Layer Mixer.

Rearranging which connections are attached to which Layer Mixer inputs changes each node’s priority, and like the Parallel Mixer, you can add more inputs if you need to connect more nodes manually.
The Layer Mixer’s prioritization is most useful when you have an overlapping adjustment that you need to override any other adjustments happening on that stack. In the following example, two nodes are connected to the Layer Mixer node. Node 2 is applying a high-contrast, cool look to the entire clip. Node 3 isolates the skin tone, which is unflattering with the background stylization, and applies a different, more naturalistic adjustment.

Using the layer mixer, grades on Node 3 will have a greater priority over Node 2, so the final grade combines the high contrast from Node 2 with the adjusted skin tone from Node 4.

Because of the Layer Mixer’s prioritization, the adjustment made to the woman’s skin tone completely covers the adjustment made to the node that comes above it, providing the best of both worlds with one simple adjustment.

**TIP:** If you want to “solo” overlapping nodes that are connected to the Layer Mixer to see their individual adjustment, turn on Highlight (Shift-H, or the HILITE button on the Transport panel of the DaVinci control panel). This lets you view just that node’s effect, regardless of what other node adjustments are overlapping.

**Using Composite Modes With the Layer Mixer**

You have the option of combining the adjustments made by all nodes connected to a Layer Mixer node using the same Composite modes that are available when compositing clips in the Timeline. This lets you combine different overlapping image adjustments using compositing math to achieve creative effects or utilitarian fixes.

The following simple example shows two overlapping Corrector nodes connected to a Layer Mixer node that’s set to the Add composite mode. Node 3 has no adjustment, but Node 5 has an extremely high-contrast curve adjustment applied, along with a blur, that effectively isolates the highlights of the image and feathers them out.
Combining two nodes using the Layer Mixer set to Add to create a glowing effect

By adding both treatments together, a hot glow has been created, blowing out the highlights of the image. Many, many other effects are possible using the different composite modes that are available. For more information on composite modes, see Chapter 41, “Compositing and Transforms in the Timeline.”

**Adjusting Layer Node Strength Using Key Output Gain**

Whether you’re combining overlapping corrections, or mixing different adjustments using Composite modes, you’ll run into situations where you want to reduce the influence of one overlapping adjustment relative to the other nodes that are connected to the Layer Mixer node. This can be accomplished using each overlapping node’s Key Output Gain parameter, located in the Key palette.

![Using the Output Gain parameter in the Key palette](image)

Key Output Gain defaults to 1.00, but lowering this value reduces the strength of that node’s contribution to the Layer Mixer. Using the previous example, selecting Node 4 (the high-contrast image used to create the glow), opening the Key palette, and reducing the Key Output Gain parameter to 0.50 reduces the intensity of the Glow effect by half.
You can use Key Output Gain to mix the proportion of any number of overlapping adjustments in order to create the perfect combination for your purposes.

**TIP:** You can also use the Key Output Gain parameter to mix the proportion of adjustments being combined using the Parallel Mixer node.

### Converting Layer Mixers to Parallel Mixers

You can easily convert a Layer Mixer to a Parallel Mixer should you discover that you need to mix your overlapping corrections evenly rather than combine them with priority. Keep in mind that you’ll lose the ability to use Composite modes.

**To change a Layer Mixer node into a Parallel Mixer node:**

- Right-click a Parallel Mixer node and choose Morph Into Parallel Node.
Chapter 126

Combining Keys and Using Mattes

A key is the actual image channel that’s generated by different secondary operations to isolate specific portions of images to work on. This chapter covers different ways you can manipulate and combine keys from multiple nodes, or propagate keys among nodes. It also shows different ways you can use mattes that are imported from other applications, as well as how to use the Key palette to further manipulate keys in different ways.
Introduction to Manipulating and Combining Keys 2854
Outside Nodes 2854
Feeding Keys From One Node to Another 2855
Connecting Key Outputs to RGB Inputs, and Vice Versa 2857

Using Mattes From the Fusion Page 2866
Using the Key Mixer 2868
Adding Two Keys Together 2868
Subtracting One Key from Another 2870
Adding Inputs to Key Mixer Nodes 2872
Using the Key Palette 2873
Using the Key Palette to Affect Corrector Nodes 2873
Using the Key Palette to Adjust Key Mixer Controls 2875
The Many Uses of Key Output Gain 2876
Introduction to Manipulating and Combining Keys

Each node’s key input and key output makes it possible to route key channel data from one node to another so you can apply isolated corrections. Furthermore, the Key Mixer lets you combine a variety of keys from different nodes to create more detailed keys with which to tackle complex operations. This section covers all the ways you can recombine key data, as well as how keys can be used in conjunction with the Alpha output to create regions of transparency in a clip for compositing right within DaVinci Resolve.

Outside Nodes

Whenever you use a Power Window or HSL Qualifier to limit a correction within one node, a special node structure lets you automatically create a second node, called an Outside node, to apply additional adjustments to the inverse of the region you isolated in the previous node. Outside nodes are really just Corrector nodes with the Key Palette’s Key Input Invert control enabled, which makes it easy to apply separate corrections to an isolated subject and to its surroundings.

In the following example, the sky has been isolated using a Power Window, and an Outside node has been added to make an additional correction to everything else within the shot.

To add an Outside node to a node, creating a secondary correction:

1. Select a node that has been limited using a Power Window or HSL Qualifier.
2. Do one of the following:
   - Choose Nodes > Add Outside (Option-O).
   - Right-click a node choose Add Outside Node.

Press the ADD OUTSIDE button on the T-bar panel of the DaVinci control panel. A new node is created immediately after the selected node, with the RGB and key outputs of the first node automatically connected to those of the new node.
When selecting the new node and opening the Key palette, you can see that the Key Input’s Invert control is on by default, which is what inverts the key from the previous node.

The Key Input Invert control is on by default for each node

If, instead of using the Outside node to invert the incoming key, you want to copy the existing key in order to perform another operation to the same isolated region, you can disable the key input’s Invert control.

### Feeding Keys From One Node to Another

One of the most powerful aspects of the Node Editor is the ability to create keys based on a specific part of the node tree, and feed the result into a completely different correction somewhere else in the node tree. This is one of the reasons for the separate key input and output on every Corrector node.

The key that’s created whenever you use the HSL Qualifier, create one or more windows, or use an external matte can be output from one node’s key output and fed to the key input of any other node in a tree. There are many reasons to do this, but the following example shows a common problem you can solve with this technique.

**Using a key from one node to make an adjustment with a different node:**

1. Use Node 1 to apply a basic primary correction, increasing contrast and balancing the color to achieve a pleasing ambient color temperature.

2. Add a Serial node (Node 2), followed by a Layer Mixer node which also adds Node 4 (as seen in the following screenshots). Then, completely desaturate Node 4 and add contrast to make it super-high contrast black and white, desaturate Node 2 just a bit, and right-click the Layer Mixer node to choose the Overlay blend mode with which to combine these two layers.

A group of nodes to create a stylized image

The result is a highly stylized image, but the skin tone on the actor’s face and hands in the resulting image are too monochromatic, and you want to give them some differentiation. Simply adding another node after the Layer Mixer and keying the skin tone may not work well because the low level of saturation will make a key difficult to pull.
3. Add another node after the Layer Mixer (Node 5 in the screenshot), and then right-click in the gray background area of the Node Editor, and choose Add Node > Corrector to create an unattached node, (Node 6).

4. Connect the RGB output of Node 1 to the RGB input of Node 6, and then connect the key output of Node 6 to the key input of Node 5. Now you’re ready to pull a high-quality key from the very first correction in Node 1, skipping all the complication coming afterwards.

5. Use the HSL Qualifier in Node 6 to pull a good strong skin tone key based on the primary image. Given the way the node tree is now set up, that key is fed to Node 5, and will limit whatever adjustments you make there.

6. Now, you can make your adjustment to Node 6’s grade, to lower the contrast, brighten, and increase the saturation of the actor’s skin tone. As a result of this operation, the background remains desaturated and contrasty, while the actor’s skin tone has the brighter quality we need for the shot.
This example could have been handled in a variety of different ways, but the point is that you can add nodes that connect to the state of the image at any part of a node tree, and use them to generate keys to feed to any other node, regardless of what's happening to the picture in between.

**Connecting Key Outputs to RGB Inputs, and Vice Versa**

There's another way you can manipulate a key from one node using another in the Node Editor, and that's to connect the key output from one node to the RGB input of another node. When you do this, you can use any of the controls of the second node to manipulate the key, and you can then use the result by connecting the RGB output of the second node to the key input of a third node.

In the node tree shown above, Node 2 pulls a key, Node 4 manipulates the key, and Node 3 uses the key to make a color adjustment.
Keep in mind that a key is just a grayscale image. Setting up this kind of node structure lets you use any of the second node’s controls, such as the Custom Curves, Noise Reduction or Motion Blur controls, Sharpen, Midtone Contrast, Lift/Gamma/Gain, Contrast, or Log controls, to manipulate the key in ways you couldn’t do using only the Matte Finesse controls.

While this technique may not be necessary for conventional color isolations, it can come in very handy when making tricky isolations with hard to key subjects, or when using one of theQualifier modes to pull a key to create transparency for compositing using the Node Editor’s Alpha output. In this instance, you can connect the RGB output of a node used for key manipulation directly to the Alpha output. In the example, Node 1 pulls a key, and the RGB is connected to Node 3 which is used to color correct the foreground image. The key from Node 1 is connected to the RGB of Node 2, which manipulates the key to clean it up prior to connecting it to the Alpha output block at the bottom right of the Node Editor.

Furthermore, this capability also lets you create keys in other ways besides using the Qualifier palette controls. In the following example, the Contrast and Custom Curve controls in Node 3 create a high-contrast matte of the windows which is blurred. The RGB output of Node 3 is then connected to the KEY input of Node 2, where the resulting key can be used for a variety of adjustments; in this case, to tint the product within the image green. Alternately, this technique could be also be used to create transparency via the Alpha output.

Interconnecting key and RGB inputs and outputs is a powerful capability that lets you create many kinds of workarounds for uncommon situations.
Using External Mattes

The External Matte node has evolved over the years. What was once purely a means for importing matte channels for defining opacity and limiting adjustments has expanded to become a way to import the RGB channels of a media file to be used for overlaying grain, texture, and stylized distress onto an image, and even as a way to use the channels of a clip itself as a matte.

Matte clips can be added to your project in one of two ways:

- You can add mattes using the Media page, either by attaching them to a clip so a particular matte is only available to a particular clip as part of a Clip grade, or you can add timeline mattes that stand alone in the Media Pool, which are then available to any Track grade.
- You can also add a matte to a clip using the Media Pool in the Color page, by dragging a clip from the Media Pool to the Node Editor. When you do so, that clip is turned into an external matte in the current grade, which you can use as a matte for secondary adjustments, or as a compositing layer (in conjunction with the Layer mixer) for mixing textures or images with your grade. That clip is also automatically attached to the Media Pool clip that corresponds to the clip you’re grading, as a clip matte, to help you keep track of which clips are using other clips as mattes.

For more information about adding matte clips in the Media page, see “Adding and Removing External Mattes” in Chapter 11, “Adding and Organizing Media with the Media Pool.”

Whether attached or unattached, mattes operate within a grade using EXT MATTE (external matte) nodes. EXT MATTE nodes have the following outputs:

**EXT MATTE Outputs:** Four blue square key outputs let you output the channels contained within the EXT MATTE node, but which channels are available affects what is output. If the EXT MATTE node’s source clip has RGBA channels, then these are available as Alpha, Red, Green, and Blue key outputs that you can attach to any other node’s key input. On the other hand, if the EXT MATTE node’s source clip only has RGB channels, then the key outputs that are made available are Y (luma), Red, Green, and Blue, and a “Use Lum for Alpha Output” setting in the Node Editor contextual menu lets you use the Y channel as a matte.

An interesting aspect of these four outputs is that each one is dedicated to individual A, R, G, and B color channels. Ordinarily, External Matte clips are written with matte data...
written simultaneously to all three RGB channels. However, you could also render separate pure primary-colored mattes to each color channel (a so-called "disco" matte), so that the Red channel has one matte, the Green channel another, and the Blue channels still another, thereby exporting three separate mattes within a single media file, for convenience. If you add another matte to the Alpha channel, you can even export four mattes within a single file. You can then use each one of these mattes individually by connecting the correct output of the EXT MATTE node. (Note: For backward compatibility, projects from versions of DaVinci Resolve previous to 12.5 continue to output RGBY from the square outputs, not YRGB.)

- **RGB Output**: A square green RGB output lets you connect the RGB image data of a matte clip to any other clip's RGB input. This is especially useful when you're combining a matte clip with the current clip using a Layer Mixer node, to create a textured composite of some kind.

### External Mattes to Limit Adjustments

Going back to the External Matte node’s original use, mattes are typically grayscale media files that represent image opacity, and are meant to be used either as alpha channels for creating opacity within a corresponding RGB clip, or as a matte for limiting effects.

An example of a matte channel would be the key created by a green screen keyer. If you output just the key, that would be an external matte. If you receive an external matte along with an effects clip, you can attach the matte to its corresponding RGB clip in the Media page. Then, you can access that matte via an External Matte node in the Node Editor, so you can use the key it outputs to limit different kinds of corrections you want to apply.

In the following example, the keyed matte of a green screen composite clip is used to apply different corrections to the inside and outside of a keyed composite, in order to make the subject match the background more convincingly.

![A matte attached to clip Makeup_Green.mov, as seen in the Media Pool](image)

**To use a clip matte to limit an adjustment within a Clip grade:**

1. Right-click any node, and choose the attached matte you want to use from the Add Matte submenu of the contextual menu.

   By default, the EXT MATTE node that appears has its first output connected to the key input of the node you want it to limit.

2. Select the node to which the EXT MATTE node is attached, and add an Outside node to make it possible to add adjustments on either side of the matte.
3 If necessary, select Node 1, and use the Key palette controls to modify the incoming key, inverting or blurring it as necessary to create the isolation you need.

**NOTE:** Don’t select the EXT MATTE node, because it exposes different controls in the Key palette for transforming, flipping, looping, and freezing the matte.

At this point, you can add adjustments to the inside and the outside of this composited shot to improve the composite.

(Before/After) An external matte is used to apply separate grades to the foreground and background of a previously composited clip

Ideally, external mattes are exported so that they match the size and duration of the RGB clip they’re supposed to accompany. If they don’t match or if you’re using some other grayscale clip as an external matte to create some sort of effect, then there are parameters in the Key palette that you can use to retime or transform a matte so it works better in your grade.
To slip the sync of a matte relative to the clip it’s attached to:

1. Select the Ext Matte node you want to slip.
2. Open the Key palette, and turn off the Lock Matte checkbox.
3. Raise or lower the Offset parameter until the matte is perfectly aligned with the clip it’s supposed to match.

To transform a matte:

1. Select the Ext Matte you want to transform.
2. Open the Key palette, and turn off the Lock Matte checkbox.
3. Use the Pan, Tilt, Zoom, Rotate, Width, Height, HFlip, or VFlip parameters to adjust the matte so it has the correct geometry.

It’s worth mentioning that you can attach as many external mattes to a single clip in DaVinci Resolve as you like. For example, if a CGI shot has been delivered with a set of isolation mattes for each of three characters in the scene, you can import all three mattes and use them to isolate adjustments that you want to make in the Node Editor.

Extracting External Mattes from OpenEXR Layers

OpenEXR media is capable of containing multiple layers and multiple alpha channels, which can also be accessed from EXT MATTE nodes. As a result, DaVinci Resolve uses a slightly different but related procedure for accessing these mattes.

To extract OpenEXR layers as external matte nodes:

1. Right-click any node, and choose the .exr clip name from the Add Matte submenu of the contextual menu.
   
   By default, the EXT MATTE node that appears has its first output connected to the Connect one of the EXT MATTE node’s triangular key outputs to the key input of a node you want it to limit.

2. Double-click the EXT MATTE node to select it, then right-click it and choose which layer you want to use from the Select Matte submenu.

Right-clicking an OpenEXR file’s EXT MATTE node to choose which layer to use
OpenEXR files with multiple RGBA layers (or passes) embedded within them (RGBA + RGBA + RGBA and so on) or OpenEXR files with multiple alpha channels (RGBA + A + A) expose multiple entries in this submenu. Whichever one you choose is the layer that will be used as a matte by that EXT MATTE node.

Once you’ve extracted an OpenEXR layer, you can use it as you would any other EXT MATTE node described in this section, to limit adjustments (as seen above), or to add texture or transparency (as seen in the following sections).

**Using External Mattes to Add Texture**

You can also use external mattes as creative tools, to add grain and texture. For example, you might use a more abstract animated matte, or a grayscale film scan of dirt and dust, to apply correction for effect.

Once attached to a clip, external mattes can be exposed in the Node Editor, and their key output can be used just like any other key in a node tree.

**To use a clip matte to create texture for a Clip or Timeline grade:**

1. When applying a matte as part of a Clip or Timeline grade, right-click any node and choose the attached or timeline matte you want to use from the Add Matte submenu of the contextual menu. Unattached mattes appear in the Add Matte > Timeline Mattes submenu.

2. Disconnect the EXT MATTE node’s key output connection to the Key input of the node it’s connected to by default.

3. Add a Layer Mixer to the end of the node tree.

4. Disconnect the bottom Corrector node’s RGB input, and then connect it to the EXT MATTE node’s square RGB output.
A node tree set up to feed an EXT MATTE node’s RGB output to the input of a node connected to a Layer Mixer, in order to blend it with the grade using composite modes.

5 Right-click the Layer Mixer node, and choose Overlay from the Composite Mode submenu to blend the Ext Matte node most effectively with the grade.

6 If necessary, you can use the grading controls of the Corrector node to which you’ve attached the EXT MATTE node to change the characteristics of the texture clip, desaturating it for instance. You can also select the EXT MATTE node itself, open the Key palette, and use the Transform, Offset, Loop, or Freeze controls described later to change how the matte appears.

The resulting texture effect, blended with the grade using the Overlay composite mode.

**TIP:** If you want the texture you create to be unaffected by blur or sharpening operations within the grade, be sure to add it to the very end of the node tree.

**Using External Mattes to Create Transparency**

You can also use an EXT MATTE node to create transparency in a clip, for compositing with clips underneath it on the Timeline.

**To use a clip matte to create transparency in a clip:**

1 Right-click any node, and choose the attached matte you want to use from the Add Matte submenu of the contextual menu.

Adding an EXT MATTE node to a Clip grade applies the effect to only that clip, whereas adding an EXT MATTE node to a Track grade applies the effect to the entire Timeline.
2 Right-click any empty area of the Node Editor, and choose Add Alpha Output to reveal the Node Tree output on the right that lets you assign a key to be used to define clip transparency.

3 Connect one of the EXT MATTE node’s triangular key outputs to the Alpha output at the right of the Node Editor.

The node setup for using an external matte to composite two layer

The areas of the matte defined by the key are now rendered transparent.

The final composite created using the external matte node

Key Palette Controls for the External Matte Node

When you select an EXT MATTE node, the Key palette displays different parameters only for mattes. Be aware that you must turn off the Lock Matte checkbox before you can make adjustments to transform the matte.

- **Transform**: Standard Pan, Tilt, Zoom, Rotate, Width, and Height parameters let you transform a matte to fit the image better.
- **Flip Image**: Two buttons let you flip the matte clip horizontally or vertically.
- **Offset**: Adjust this parameter to offset the start point of a matte clip.
• **Freeze:** Turning on this checkbox freezes the matte clip on a single frame. Adjust the Offset parameter to choose which frame to freeze on.

• **Loop:** Turning on this checkbox enables matte clips to loop endlessly, which lets shorter matte clips cover longer durations.

• **Lock Matte:** When turned on, locks the sizing of a matte to whatever changes are made to the Input Sizing of that clip, so the matte transforms to follow the clip.

You can also use external mattes as creative tools. For example, you might use a more abstract animated matte, or a grayscale film scan of dirt and dust, to apply correction for effect.

### Using Mattes From the Fusion Page

If you’re grading a composite that’s been created in the Fusion page, you can feed mattes created in different parts of a Fusion composition to the Color page to use in the grade as well. For example, if you’re grading a composite of a foreground actor who’s green screen keyed against a background layer, you might want to use the matte generated for the key to protect the foreground subject from an operation in your grade that you only want to affect the background. Happily, this is easy to set up.

In the following Fusion composition, two DeltaKeyer nodes (one to create an overall matte, and one to create a solid matte protecting the core) and one BSpline node (to create a garbage matte) work together to create a finely-tuned matte. This matte is used by the Merg1 node to preserve the subject’s hair and composite them in front of a gently blurred (using the LensBlur node) planet, with the final result connected to the MediaOut1 node, which feeds this image to the Edit page and Color page for continued adjustment.
Because the Merge1 node outputs the entire composition as a single image, a second MediaOut node (highlighted) is added to output the matte, just in case the colorist might want to use it later.

**TIP:** In this composition, the foreground and background images are different sizes, so outputting the alpha channel of the DeltaKeyer1 node would result in a matte sized to match the foreground image, but that doesn’t fit the composition, which is cropping the top and bottom of the foreground image based on the frame size of the widescreen background image. To get around this, the foreground and background images are composited a second time using the Merge2 node, which has the Operator parameter set to “In” to output just the foreground image and matte, as resized by the Merge operation. The resulting MediaOut2 node thus outputs a foreground matte that’s properly sized to fit the composition.

On the Color page, the grade in node 1 is applied to the overall final result, which is a single image. After grading, it’s decided that the woman appears a bit warm relative to the cool blue of the planet behind.

![The composition as it appears in the Color page Node Viewer](image)

Right-clicking the background of the Node Editor and choosing Add Source adds a second source at the left of the Node Editor.

![Adding a source to bring in the MediaOut2 node’s matte output from the Fusion page composition](image)

This second source corresponds to the second MediaOut node you added to the Fusion page composition, which outputs the Matte as a key in the Color page, usable just like any other key. If you hover your pointer over each source, a tooltip appears letting you know which output corresponds to which node.
Generally, sources are arranged from top to bottom from the first MediaOut node appearing in a Fusion composition to the last. At this point, you can connect the second Source to the Key input of a second corrector node, using that key to selectively grade just the woman in the foreground (grade exaggerated for effect), without affecting the background. The Viewer is shown with Splitscreen set to Highlight Modes, so you can see the result as well as the key from the Fusion page that’s being used by Node 2.

Using the Key Mixer

The Key Mixer node lets you mix keys output from multiple Corrector nodes, combining them in different ways to create a single key output. This makes it possible to build much more intricate keys than you can with a single qualifier or set of four windows. In particular, the Key Mixer node is the only way to combine multiple keys made using qualifiers and windows, adding, subtracting, or intersecting them to create a highly specific result.

Adding Two Keys Together

In the following example, you’ll learn how to set up a Key Mixer to combine the keys output by two Corrector nodes in a node tree. Then you’ll learn how to change the way the input keys are combined using the Key palette.

To combine two or more keys using the Key Mixer:

1. Right-click anywhere on the gray area of the Node Editor, and choose Add Node > Key Mixer.
2. Create two Corrector nodes, then attach their RGB inputs to the RGB output from an appropriate node in the main part of the tree, and attach their key outputs to the key inputs of the Key Mixer.
3 Next, attach the key output of the Key Mixer node to the key input of the node you want to use to make the correction. Remember, the objective is to use the key that’s output by the Key Mixer to limit the adjustment being made using another node, in this case Node 3.

![Setting up the node tree you’ll need to combine two keys together](image1)

Keep in mind, especially since this is a significant reordering of nodes in the Node Editor, that every node needs to be connected properly for the overall grade to work.

4 Now that the node structure is fully connected, use windows, qualifiers, or both to create keys in each of the nodes that you connected to the Key Mixer. In this example, Node 2 is isolating the main skin tone, and Node 5 is isolating the blue of his jeans and hood.

By default, all keys connected to the Key Mixer are added together, as you can see in the Key Mixer’s thumbnail.

![Combining multiple keys with the Key Mixer](image2)

If you wanted, you can use the controls in the Key palette to change this, in order to isolate the intersection of two keys, or to subtract one key from another. This is covered in the next section.

5 Continuing with the previous setup where both keys are added together by default, selecting Node 3 and dropping the saturation to be very faint stylizes the entire background, while leaving the various hues of the man we’ve isolated alone.
Subtracting One Key from Another

The way multiple keys are combined within the Key Mixer depends on a pair of Key Input buttons you can toggle using the Key palette. In the following example, a partial green tint is washed throughout the midtones of the image using a qualifier, but you want to exclude the man’s skin tone from this operation. Using the Key Mixer, you can subtract one key from another to accomplish this with ease.

To change the Key Input settings for a node connected to a Key Mixer:

1. In this example, Node 2 is isolating part of the midtones of the image, and feeding its key through the Key Mixer to Node 4, which is using it to apply a partial blue tint. However, in preparation for subtracting the skin tone from this operation, Node 3 is isolating the man’s skin tone.
2 To reveal the controls you’ll use to change how the key from Node 3 interacts with the key from Node 2, double-click the Key Mixer node to select it.

3 Open the Key palette; a list of all input links that are connected to the Key Mixer appears at the right.

![The input list of the Key Mixer node](image)

4 Within each list entry is the input name (Input Link 1, Input Link 2, etc.), a Matte control, a Mask control, a gain parameter, and an offset parameter.

- **To subtract Node 3’s key from that of Node 2**: Turn on both the Key Input Matte button and the Key Input Invert button for Input Link 2.

![Turning on Matte and Invert for Input Link 2 to Output Node 3 subtracted from Node 2](image)

- **To subtract Node 2’s key from that of Node 3**: Turn on both the Key Input Matte button and the Key Input Invert button for Input Link 1.

![Turning on Matte and Invert for Input Link 1 to Output Node 2 subtracted from Node 3](image)
• **To limit the output to the intersection of both keys:** Turn on the Key Input Matte button for either Input Link 1 or Input Link 2.

![Key Mixer Interface]

Turning on Matte for Input Link 1 to output the intersection of two mattes

• **To invert the resulting matte you’ve created:** Turn on the Output Link Invert button.

When you’re finished, if you choose to subtract Node 3’s key from that of Node 2, the result should resemble the following screenshot.

![Image of a man with a selective green tint]

The result of subtracting a key of the man’s face from a key of the overall midtones of the image, and using that to add a selective green tint

**Adding Inputs to Key Mixer Nodes**

New Key Mixer nodes have two key inputs by default. If necessary, additional inputs can be added in order to combine even more keys with one another.

**To add inputs to the Key Mixer:**

- Right-click a Key Mixer node, and choose Add One Input.

When combining three or more keys, the interaction of keys using the Key palette controls becomes even more complex, but the rules outlined above still apply.
Using the Key Palette

For example, the Key Input Invert control is always enabled when you add an Outside node, which is why the Outside node applies adjustments to the inverse area of the previous node. If you turn this control off, that node’s key will exactly mirror the original key being fed to it from the previous node.

The controls that are available in the Key palette vary depending on what kind of node you have selected:

- **Corrector Nodes**: Have three sets of parameters. Key Input parameters let you make adjustments to keys being fed through a node’s Key Input connection. The Key Output parameters let you make adjustments to the key data being output by a node’s Key Output connection, and includes the incredibly powerful Offset Gain parameter that governs the strength of that node’s contribution to the overall grade. Finally, the Qualifier parameters let you make adjustments to the internal key created with the HSL Qualifier or Window controls. This functionality is covered more extensively in the next section.

- **Ext Mattes**: Have two sets of parameters. Transform parameters let you make geometric transformations to a matte so it fits the clip it’s being applied to better. An Offset control lets you slip the sync between an external matte and the clip to which it’s applied. This functionality is covered in the section on external mattes.

- **Key Mixer Nodes**: Have two sets of parameters that are dependent on which of the connections attached to a Key Mixer’s key inputs is selected. Input parameters let you adjust how much of a contribution a key makes to the total key mix, and whether the contribution is additive or subtractive.

The Output parameters let you adjust the inversion and strength of the key that’s output by the Key Mixer. This functionality is described more extensively in the Key Mixer section.

Layer Mixer and Parallel Mixer nodes have no adjustable controls in the Key palette.

Using the Key Palette to Affect Corrector Nodes

When you open the Key palette for a selected Corrector node, you can adjust the following parameters:

![Key palette showing controls when a node is selected](Key_palette.png)
Key Input Controls

- **Input invert**: Inverts the key being fed into the key input. Off by default.
- **Input matte**: Lets you switch the key input between Matte and Mask modes. In Matte mode (on by default) the key input combines via intersection with keys generated internally using the Qualifier or Windows palette. In Mask mode, the key input is added to the internal key instead.
- **Gain**: Controls the strength of the key connected to the key input.
- **Offset**: Controls the contrast of the key connected to the key input.
- **Blur Radius**: Blurs the key connected to the key input.
- **Blur H/V Ratio**: Alters the horizontal/vertical ratio of the blur that’s being applied to the key input.

Key Output Controls

- **Qualifier invert**: Inverts the overall key.
- **Gain**: Using the key output, this parameter governs the strength of that node’s contribution to the overall grade. Setting Gain to 0 results in that node having no effect at all, while the default setting of 1.00 applies the full strength of any adjustments made with that node. The maximum setting of 2.00 increases the intensity of any part of the key output that’s less than 100 percent white. You can also use this parameter to keyframe the key output to fade that node’s contribution in or out with one set of keyframes.
- **Offset**: Lets you adjust the contrast of the Output key. This has no effect if the entire key is 100 percent white (a solid key).

Qualifier Controls

- **Qualifier invert**: Inverts the key created by that node’s Qualifier palette.
- **Qualifier matte**: Lets you switch the interaction of the keys generated by the Qualifier and Windows palettes between Matte and Mask modes. In Matte mode (the default), the Qualifier and Windows palettes combine via intersection. In Mask mode, they’re added together instead.
- **Gain**: Lets you raise or lower the strength of the key generated by the Qualifier palette.
- **Offset**: Lets you adjust the contrast of the key generated by the Qualifier palette.
Using the Key Palette to Adjust Key Mixer Controls

When you open the Key palette for a selected Key Mixer node, you can adjust the following controls:

- **Input list**: A list of every input that’s connected to the Key Mixer. Each entry on the list has the following controls:
  - **Input name**: The name of each node connection attached to that key mixer, such as Input Link 1, Input Link 2, and so on.
  - **Input invert**: Inverts the key being fed into this particular input. Off by default.
  - **Input mask**: Lets you switch the key input between Matte and Mask modes. In Matte mode (on) the key input combines via intersection with other inputs connected to the Key mixer. In Mask mode (off by default), the key input is added to the other key inputs connected to the Key mixer.
  - **Gain parameter**: Decreases or increases the intensity of that input matte’s contribution to the resulting output matte.
  - **Offset parameter**: Adjusts the contrast of that input matte’s contribution to the resulting output matte.

- **Output invert**: Inverts the overall result of the various Input Link interactions.

- **Gain**: This parameter increases or reduces the strength of the resulting output key. Setting Gain to 0 results in all inputs being set to black, while the default setting of 1.00 outputs the combined mattes at full strength. The maximum setting of 2.00 increases the intensity of any part of the key output that’s less than 100 percent white, which can have the practical effect of “growing” soft edges. You can also use this parameter to keyframe the key output to fade that node’s contribution in or out with one set of keyframes.

- **Offset**: Lets you adjust the contrast of the Output key.
**The Many Uses of Key Output Gain**

Several of the techniques discussed in here and in "Secondary Qualifiers," can be further customized using the Key Output Gain parameter, which makes it easy to control the strength of a node’s effect on your grade with a single adjustment. In the following example, two simple Serial nodes are applied to a clip, with the first one expanding image contrast, and the second one using a variety of controls to add some extreme warmth to the highlights.

![Image](image.png)

A tint applied only to the highlights of the image

If you decided that you want to reduce the amount of warmth added by the second node without readjusting the controls you used to create the effect, you could open the Key palette and lower the Key Output Gain parameter to fade the effect with a single adjustment.

![Image](image.png)

Four versions of this grade shown using the Versions option of the Split Screen controls, with Output Gain set to 1, 0.75, 0.5, and 0.25 for comparison

This principle also works for controlling the strength of individual nodes that are being combined in parallel, that are combined using the Layer node, or for simply fading out the effect of any node in the node tree you want to “turn down” a bit.
Chapter 127

Channel Splitting and Image Compositing

This chapter begins by showing node structures you can use to isolate, split apart, convert, and recombine the image channels of clip in different ways. This includes ways of using the additional image channels that are provided in some types of media.

The second part of the chapter shows ways that you can do image compositing right in the Color page, with techniques for using external mattes for compositing, and using qualifier keys to do green- and blue-screen compositing against other layers in the Timeline.

Isolating, Splitting, and Converting Color Channels

DaVinci Resolve provides two different methods of making channel-specific adjustments, depending on whether you need to apply an adjustment to just one channel within a single node, or apply separate adjustments to all three channels across several nodes.

Enabling, Disabling, and Converting Node Channels

Within the contextual menu of each node in the Node Editor is a series of four options:

1. Expanded choices for choosing a color space and gamma for image processing within a node, and for disabling channels.

While the ability to change the color space in which a particular node’s operations work from the RGB default has been available for many versions, the list of available color spaces was greatly expanded in DaVinci Resolve 15 (all the previous options such as Lab (CIE), HSL, and YUV are still there). Additionally, you have the option of choosing the gamma that node works with as well, with a similarly long list of options.

Choosing a node-specific color space and gamma does not directly alter the image, as with the Color Space Transform ResolveFX plug-in. Instead, changing a node’s color space and gamma alters what type of image channels the red, green, and blue controls affect, and how the adjustments you make within that node are applied. For example, this lets you make a temperature adjustment with a node’s gamma set to Linear, which in some instances may be mathematically advantageous.

Additionally, three checked Enable Channel 1–3 options let you turn individual channels off or on, limiting which channel that node’s adjustments will actually affect.

In the following example, you’ll see how to use these features to selectively sharpen just the Y’ (luma) of an image without affecting the chroma, which can be a more subtle effect than simply sharpening the entire image.

To use channel disabling and color space conversion to sharpen luma only:

1. Add a node with which to apply the sharpening you want to the current clip.

2. Right-click the new node, and choose YUV from the Color Space submenu of the contextual menu.
Apply sharpening by doing one of the following:

- Using that node’s contextual menu, uncheck Enable Channel 2 and Enable Channel 3, which correspond to the U (Cb) and V (Cr) channels, leaving only Channel 1 (Y) enabled. Then, open the Blur palette, and drag the ganged Radius sliders down to sharpen the Y channel.

- You can also just open the Blur palette, ungang the Radius sliders, and drag the red slider down to sharpen the Y channel, since any control with three gangable sliders will automatically assign those sliders to whichever channels are used by the currently selected Color Space.

As you can see, while the Blur palette ordinarily provides separate R, G, and B controls that can be unganged from one another, the Color Space submenu lets you apply sharpening to the channel definitions of other colorspace, providing many other corrective and creative possibilities with the same controls.

**Supported Color Spaces for Conversion**

The Color space submenu available when you right-click a node in the Node Editor supports four different color spaces that you can set each node to work within. When you choose a color space other than RGB, all channel-specific controls (the Custom curves, Soft curves, RGB Lift/Gamma/Gain sliders, and RGB mixer) operate on the particular channels of that color space, rather than the default YRGB channels. By switching color spaces, you can achieve very different kinds of adjustments by swinging values among mathematically different axes.

YUV converts the image into Y’, Cb, and Cr channels. The Y’ channel governs luminance, while the Cb and Cr channels are color difference channels that work within the broadcast model of color.
HSL converts the image into Hue, Saturation, and Lightness channels. Lightness is identical to Luminance, while Hue and Saturation are exactly as described.

LAB operates on the L, A, and B channels. The L channel governs luminance, while the A and B channels are color difference channels; A adjusts color on an axis from magenta to green, B adjusts color on an axis from yellow to blue.

Splitting Channels with the Splitter/Combiner Nodes

Another method of applying corrections to individual color channels is using the Splitter/Combiner nodes, which break the Red, Green, and Blue channels apart into separate node tree branches, each capable of accepting multiple serial and parallel nodes of image adjustment. There are two ways you can create a Splitter/Combiner node structure.

Methods of adding Splitter/Combiner nodes:

- **To add a premade Splitter/Combiner node structure:** Choose Color > Nodes > Add Splitter/Combiner Nodes (Option-Y). A Splitter and Combiner node appear already connected to three Corrector nodes, one for each color channel.

- **To manually construct a Splitter/Combiner node structure:** Right-click in any empty area of the Node Editor, and choose from the Add Node submenu to create a Splitter node, a Combiner node, and three Corrector nodes, wiring them together as necessary to create the desired effect.

The Splitter node takes an incoming image and provides individual outputs for each color channel (top/red, middle/green, bottom/blue). When you connect each of these outputs to a Corrector node, that color channel automatically connects to all three internal channels of that node, so that the default three nodes in a Splitter/Combiner structure are internally processing red/red/red, green/green/green, blue/blue/blue. The Combiner then pulls the Red, Green, and
Blue channels out of each node connected to its three inputs, and reassembles them into a single RGB image again. Of course, what happens in between the Splitter and Combiner is entirely up to you.

One of the simplest ways of showing the possibilities of this node structure is to combine it with Node Sizing in the Sizing palette. Using Node Sizing, you can correct for misaligned channels in older archived video, or create channel misalignments for creative looks. In the following example, a simple Node Sizing adjustment to a split Blue channel will create an interesting “prism vignette” effect.

**To use Node Sizing on individually split channels:**

1. Choose Nodes > Add Splitter/Combiner Node (or press Option-Y) to add a premade Splitter/Combiner node structure to the Node Editor.

2. Select the middle of the three Corrector nodes appearing in between the Splitter and Combiner nodes (Node 5 in the following screenshot).

3. Open the Sizing palette, choose Node Sizing from the Mode drop-down, and then raise the zoom parameter by a small amount; this example uses 1.014.

As you can see in the screenshot, just the Green channel has been zoomed in on across the entire image. This is only possible using Node Sizing. This is cool, but not quite what you need.

4. Open the Window palette, add a Circular window, turn on its Invert control, and transform it to be a very soft, horizontally aligned vignette. This limits the individual scaling done to the Green channel to just the outer edge of the image, similar to a lens with excessive chromatic aberration.

You could easily keep going, applying varying amounts of zoom with different window shapes to each of the other color channels, and perhaps adding some blur to enhance the effect, but this example should show the creative potential available when using this technique.
Multi-Channel RED HDRx Support

The RED EPIC, SCARLET, DRAGON, and WEAPON cameras are all capable of shooting in an HDR mode that effectively “brackets” two different exposures of each frame. The resulting image data stores two channels of image data: the regular exposure, and a “highlight exposure” that’s underexposed by a user-selectable margin (+3, +4, +5, or +6 f-stops difference).

By default, the Input bar in the node graph feeds the regular exposure to your grade’s node tree. To take advantage of the additional “highlight” exposure, you can add an additional Source input to the node graph that feeds a second stream of image data that you can mix with the regular exposure in different ways.

NOTE: You can also take advantage of the highlight exposure of RED HDRx media by enabling and adjusting the Magic Motion controls in the Camera Raw palette.

To set up a node tree combining the normal and highlight HDR versions:

1. Using the first default node (Node 1), grade the image to see if you even need to use the alternate exposure that’s available. We’ll assume for this example that you do. In this example, the sky of the default exposure is pretty blown out, but there may be detail that can be retrieved using the highlight exposure.

2. Create a Layer Mixer node by choosing Nodes > Add Layer (Option-L), or press the ADD LAYER button of your control panel.

Two nodes are created, a Layer Mixer node that’s added after Node 1, and a third node (Node 3) that’s connected to a second RGB input of the Layer Mixer node in parallel to Node 1.
3 Right-click anywhere within the node graph (except on a node) and choose Add Source from the contextual menu.

A second Source input appears underneath the first, which outputs the highlight exposure of the image as a separate image stream.

4 Delete the connection between the top Source input and Node 3, and then connect the bottom Source input to the RGB input of Node 3.

Immediately, the image in the node thumbnail and Viewer updates to show the darker, underexposed version of the HDR image. This is because, by default, the Layer Mixer is mixing 100% of Node 3 over Node 1.

5 Select Node 3 and use one of the following two procedures to create a useful combination of the two exposures:

To create a mix of the two exposures, open the Key tab, and drag the Key Output Gain slider to lower the contribution of Node 3 to the overall image (you can also do this using the DaVinci control panel by pressing the KEY MODE soft button, and then using the Post Mix Gain rotary control). Using dynamics (keyframing), this is a good way to animate a dissolve from the regular exposure to the highlight exposure if you’re going from a dark environment to a bright environment in the same take and you want to create a smooth transition between both exposures.

TIP: You can also use the Blend Type and Blend Bias parameters in the Camera Raw palette to blend the two exposures without building a dedicated node tree.
To use the highlight exposure to selectively put detail back into the image (for example, to retrieve blown-out windows), use a Power Window, HSL Qualification, or a combination of the two to isolate the region you want to retrieve in Node 3. (Be careful if you’re using HSL Qualification to combine both exposures, as keyed edges can be tricky to blend.)

Isolating a region of the image to replace using the highlight exposure image of a RED HDRx clip

Final node display with isolations

A Note About RED HDRx Media and Performance

Since RED HDRx media records two complete streams of image data, DaVinci Resolve must simultaneously decode two separate tracks whenever you add a second Source input. (If you don’t add the second Source input, only the first stream is decoded.)

Because of this, whether you’re relying on your computer’s CPU or GPU to decode RED media, you’ll get half the performance when using the highlight stream of an HDR clip.

To improve performance, you can enable the Smart Cache by choosing Playback > Render Cache > Smart (or by pressing the CACHE MODE button on the T-bar panel of your DaVinci Resolve control panel repeatedly until you toggle to User mode). This automatically caches all raw source clips to the current codec set in the Render Cache Format parameter of the Master Settings panel of the Project Settings. Alternatively, you can enable the User Cache, and cache all HDRx clips manually by right-clicking them and choosing Render Cache Fusion Output > On (or by pressing the CACHE MODE button of your DaVinci Resolve control panel). DaVinci Resolve renders all cached clips while you’re paused, so the next time you play a cached clip, it will play at full speed.

If you regularly use RED HDRx media, multiple high-end GPU cards are recommended for optimal decoding performance.
Introduction to Compositing
Using the Alpha Output

While DaVinci Resolve can use the alpha channel of imported media for compositing, the Alpha Output in the Node Editor is an optional output that you can turn on to create clip transparency using operations inside DaVinci Resolve to create composites against other clips on lower video tracks. There are many ways of using the Alpha Output, but this section will focus on three examples.

Using a Qualifier Key to Create Transparency

In this first example, the Alpha Output will be used to composite a green screen clip with a background plate.

A green screen clip, ready for compositing

In preparation for this composite, the background plate is on track V1 of the Timeline, and the green screen clip has been superimposed on track V2.

A superimposed green screen clip on track V2 of the Timeline, above a background plate on track V1, ready for compositing.

To create a chroma-key composite in the Color page:

1. Right-click anywhere within the gray area of the Node Editor and choose Add Alpha Output to add the Alpha Output at the right of the node graph.

An Alpha Output appears underneath the Node Tree output at the right of the Node Editor.

The image Node Tree output with Alpha Output below
2. You’ll want to use Node 1 to color correct the image to optimize it for keying. In this example, the foreground plate is log-encoded, so a LUT is added to Node 1 to normalize it.

3. Add a Serial node after Node 1 and connect its key output to the Alpha Output. This is a fast way to build this composite if you’re confident that the corrections you’ve made in Node 1 won’t adversely affect the key (or if you know they’ll improve it by expanding the contrast of a flat-contrast source clip).

Alternately, you could create a second processing branch by adding a disconnected node (Node 2), connecting the Source node to its RGB input, and then connecting its key output to the Alpha Output you just added. Creating a second image processing branch from which to pull your key lets you key directly from the source (assuming the source is fit to key without adjustment), avoiding any problems that grading the first node could introduce to the key.

Node 1 grades the clip, expanding contrast to improve both the image, and its ability to be keyed. Node 2 uses Qualifier controls to pull the key.

4. Use the Qualifier controls of Node 2 to key out the green background, and then turn on the Invert checkbox to create the proper composite. In this example, we’re using the 3D Qualifier mode to pull a high-quality key.

An HSL Qualification to key the green feeding the Alpha Output to create transparency
5 If there’s green spill in the composite (or blue in cases where you’re keying a bluescreen) you can turn on the Despill checkbox to eliminate it.

6 You can also use a Power Window to garbage matte out any elements you don’t want intruding into the shot, using the Tracker palette if necessary to make the window follow the motion of the foreground subject.

7 If necessary, you can add another node to the output of Node 2 to make whatever corrections are necessary to the background plate clip to make the composite blend more seamlessly. For example, with this additional node selected, you could right-click the background clip and choose “Shot Match to This Clip” to use the automatic shot matching in DaVinci Resolve to adjust the foreground to match the background.

With all this set up, you end up with a nice green screen composite that’s visible in both the Color and Edit pages.
Using a Matte to Create Transparency

If you’ve been provided with a separate Matte clip for defining clip transparency, you can use that Matte clip within the node tree of a superimposed clip to create a composite using the Alpha Output.

**To create a composite using an external matte:**

1. To associate an external matte with a clip, open the Media page, select the clip you want to add a matte to in the Media Pool, navigate to the matte file using the Library browser, and then right-click the matte file and choose Add as Matte. For more information on importing mattes, see Chapter 126, “Combining Keys and Using Mattes.”

2. Open the Color page and select the foreground clip in the Thumbnail timeline, then right-click Node 1 in the Node Editor and choose the matte you added from the Add Matte submenu.

   An EXT MATTE node appears underneath Node 1, with the first of its four key outputs connected to Node 1’s key input. (Working with external mattes is covered in more detail in a prior section of this chapter.)

3. Now, right-click anywhere within the node graph (other than on a node) and choose Add Alpha Output from the contextual menu.

   An Alpha output appears underneath the Node Tree output.

4. Drag a connection line from the second key output of the EXT MATTE node to the Alpha output.

You should now see a successful composite, with the external matte creating a region of transparency in the foreground clip through which the background clip shows through.

Before and after the final composite, created by connecting an EXT MATTE node to the Alpha output in the node graph
Use an OFX Plug-in to Create Transparency

If you’ve installed an OFX plug-in capable of keying, you can right-click the node you’ve applied it to and choose Use OFX Alpha to route the key created by the plug-in out the key output of that node. When Use OFX Alpha is enabled, the HSL Qualifier and Window palette output is ignored, the only key that’s output is from the OFX plug-in.

Choosing Use OFX Alpha in the Node Editor

Once Use OFX Alpha is enabled, and you’ve created a key using your OFX plug-in of choice, you can right-click anywhere within the node graph (other than on a node) and choose Add Alpha Output from the contextual menu to make the Alpha output appear, and you can then connect the key output from the node with the OFX plug-in to the Alpha output to use it to create transparency.

Setting up a composite using an OFX plugin

**NOTE:** When Use OFX Alpha is enabled for a node, you cannot use a window to create a garbage matte within that node as you would when keying with the HSL Qualifier. To create a garbage matte with which to exclude unwanted and unkeyable elements from the edges of the picture, you’ll need to combine the key from a window in another node with the key output by the OFX plug-in using a Key Mixer node.
Combining an OFX key with a window using a Key Mixer to add a Garbage matte

Compositing Entirely Within an OFX Plug-In

Certain OFX plug-ins that are capable of combining two image streams to create a composite can be used as of DaVinci Resolve version 11.1 by exposing a “second layer input” on the node to which that plug-in has been applied. This makes it possible to composite the image you’re grading with the RGB output from an EXT MATTE node.

Combining a clip with an EXT MATTE image using the second layer input of a node with an OFX plug-in applied to it

To create a composite using an OFX plug-in:

1. Open the OpenFX Panel, use the Library to find the OFX compositing plug-in that you want to use, and drag it onto the appropriate node to apply it. The above example shows the Boris Effects plug-in “BCC Composite,” which mathematically combines two image streams using one of a long list of blending modes.

2. Right-click the node with the OpenFX plug-in applied to it, and choose Second Layer Input from the contextual menu. A second RGB input should appear on the left of the node, underneath the first.
3 Open the Media page, locate the clip you want to composite in the Library, and import it as an unassigned matte.

4 Open the Color page again, right-click the node with the OpenFX plug-in applied to it, and choose Add Matte > Track Mattes > "name of matte imported in step 3" from the contextual menu.

5 By default, the EXT MATTE node that appears is connected via one of its key outputs. Delete the key connection, and drag a new connection line from the EXT MATTE node’s RGB output to the second RGB input of the node with the OpenFX plug-in.

6 At this point, the node tree is wired up to composite the clip with the EXT MATTE image, and you need only adjust the parameters of the OpenFX plug-in to achieve the result you desire.
Chapter 128

Keyframing in the Color Page

The Color page has a dedicated Keyframe Editor, found at the right of the palette area, that you can use to animate grading changes from one frame to another. Because grading is a fundamentally different task than editing, the Color page Keyframe Editor operates somewhat differently from the Curve Editor in the Edit page.
Introduction to Keyframing

Whether it’s referred to as keyframing, dynamics, or marks, DaVinci Resolve provides an interface for automatically interpolating color adjustment parameters in various ways from one setting to another. For example, if you have a clip with varying exposure settings, you can animate a series of contrast adjustments using Dynamic keyframes to make the changes in exposure less distracting.

![The Keyframe Editor with dynamic keyframes animating the parameters of Node 2](image)

In another example, suppose you’re grading a documentary, and an archival clip that’s edited in the middle of the Timeline actually consists of six different shots from a program in the eighties. If you’re in a hurry, you can insert Static keyframes (marks) at the cut points of each of these shots, creating instant one-frame transitions between different adjustments made to that clip’s grade, which allows you to create unique adjustments for each shot within the clip.

![Round static keyframes added to all parameters, enabling individual adjustment of shots merged together within a single clip](image)

In both cases, you use the Keyframe Editor to create a series of keyframes with which to change parameters from one value to another. In this section, you’ll learn how to work with the Keyframe Editor to set up these kinds of animated changes.
The Keyframe Editor Interface

The Keyframe Editor has all the controls necessary to create and modify keyframes for the currently selected clip. If necessary, you can even make it wider in a single screen layout by clicking its expand button (at the top right of the Keyframe Editor). If you have two computer displays, you can use the Color page’s Dual Screen layout which places the Keyframe Editor on a second screen and uses the entire width of the monitor, for even more room.

The Keyframe Editor consists of the following components:

- **Timeline Ruler**: Mirrors the record timecode of the currently selected clip; dragging within the Timeline Ruler moves the playhead, and a timecode display to the left shows the current frame.

- **Keyframe track header**: Each node in the current grade has a corresponding keyframe track, Sizing has its own keyframe track, and the track header contains controls you can use to manage the keyframing.

  - **Enable/Disable button**: A round white button lets you enable or disable that track’s corresponding node.

  - **Lock button**: Lets you prevent any changes from being made to that track’s corresponding node. Nodes that have been locked show a lock icon. You can also lock or unlock nodes by right-clicking a node in the Node Editor and choosing Lock Node from the contextual menu.
- **Auto-Keyframe button**: Turn this button on to automatically create a Dynamic keyframe every time you adjust any parameter within that node.

- **Track disclosure triangle**: Exposes individually keyframable groups of parameters underneath the main keyframe track.

- **Keyframe tracks**: To the right of the track header, the keyframe tracks are where you create and edit the keyframes that animate parameter changes. A topmost “master keyframe track” shows every keyframe applied on every keyframe track in the Keyframe Editor, even keyframes applied to a keyframing track hidden inside a track with a closed disclosure triangle.

- **Keyframes**: Each keyframe appears as a small diamond for a Dynamic keyframe or as a circle for a Static keyframe. Dynamic keyframes are associated with dissolves while Static keyframes (marks) act instantly. Grades are linked to the preceding keyframe, which may be a default one on the first frame of the master clip. Keyframes can be selected by clicking on them, or moved by dragging them to another position in the keyframe track.

- **FX track**: ResolveFX or OFX plug-ins that have been added to a grade as a standalone node have a separate track for creating animated effects. Every parameter of that track is keyframed via a single consolidated keyframe track. If you apply multiple plug-ins as multiple nodes, each has a separate FX track.

- **Sizing track**: The Pan, Tilt, Zoom, Rotate, and Convergence (in Stereo 3D projects) parameter have an entirely separate track for creating animated pan and scan adjustments.

- **Track selection Dropdown**: A colored bar shows the currently selected scope of keyframing: all tracks at once, just the current correction node, or the Sizing settings, as defined by the Keyframe Timeline mode discussed in the next section.

Ordinarily, the Keyframe Editor takes up the rightmost bottom third of the Color page. However, you can make it wider to have more room to work if you have a scene requiring complex keyframing.

**To expand and collapse the Keyframe Editor:**

Click the Expand/Collapse button at the top right corner of the Keyframe Editor. The Keyframe Editor widens or narrows accordingly.

**To zoom into and out of the keyframe tracks:**

- Use the Zoom slider to zoom into or out of the Keyframe Editor.
- Right-click any keyframe track and choose Maximum Zoom to zoom all the way in.
- Right-click any keyframe track and choose Reset Zoom to fit the entire clip into the available width of the Keyframe Editor.
All/Color/Sizing

Perhaps the most important control for keyframing, the Keyframe Timeline mode, lets you switch the scope of what tracks get keyframed when you use the Start Dynamic or Add Static Keyframe commands, either from the keyboard or via the buttons of your control panel. This command alternates among three modes:

- **All:** The default mode. Adds keyframes to every track in the Keyframe Editor, keyframing every parameter in every node all at once, including the Sizing settings. In this mode, an orange bar appears highlighting the topmost “master keyframe track.”

- **Color:** Only adds keyframes to the node currently selected in the Node Editor. In this mode, a green bar appears highlighting the keyframe track corresponding to the node currently selected.

- **Sizing:** Only adds keyframes to the Sizing track, which is useful when you’re keyframing “pan and scan” style transforms. In this mode, a blue bar appears highlighting the Sizing track.

- **EXT MATTE:** Only appears if there’s an external matte node in the node tree. Lets you keyframe external matte-specific parameters in the Key palette.

Even though All is the default setting, it may be to your advantage to switch to the Color or Sizing keyframing modes to avoid creating a lot of unnecessary keyframes. Even though keyframing everything all at once is a fast way to work, the extra keyframes may slow you down when you later need to make adjustments to nodes that didn’t need to be keyframed in the first place.

To change the keyframing mode, do one of the following:

- Choose an option from the Keyframe Mode drop-down at the top right of the Keyframe Editor.
- Choose an option from the Mark > Keyframe Timeline Mode submenu.
- Press the ALL/COLOR/Sizing button on the Transport panel of the DaVinci control panel repeatedly until you’ve chosen the mode you need.

**TIP:** This control has one other function. Choosing a mode also affects what is copied when you use the various grade management tools in DaVinci Resolve. For example, if you choose Color, then you can copy a clip’s color grade without copying its sizing. If you choose Sizing, then you can copy the sizing without copying the color grade. For more information, see “Copying Grades” in Chapter 123, “Grade Management.”
Keyframing Methods

There are two different types of keyframes used by DaVinci Resolve to create automated changes. Each type of keyframe interpolates parameters differently.

Dynamic Keyframes (Dynamics)

Dynamic keyframes are the most conventional type of keyframe you’ll use, and are the type of keyframe used for creating animated changes from one state to another. For example, if you need a grade to become brighter over time to compensate for a change in lighting conditions, you’ll use Dynamic keyframes.

Nearly every parameter and control in the Color page can be keyframed, but it’s important to understand that the Interface controls do not animate to match whatever dynamically keyframed changes are taking place. Instead, visible Interface controls that correspond to keyframed changes will jump from their initial position at one keyframe to their final position when the playhead reaches the next keyframe.

This can be most confusing with Curves, which can be interpolated using Dynamic keyframes just like any other control or parameter. Just keep in mind that the actual settings are animating, even though the controls are not.

To animate a node using Dynamic keyframes:

1. Move the playhead in the Keyframe Editor’s Timeline ruler to the frame where you want to begin a change.

2. Do one of the following to place a Dynamic keyframe at that frame:
   - Choose Mark > Add Keyframe (Command-`).
   - Press the START DYNAMIC button on either the T-bar or Transport panels of the DaVinci control panel.
   - Turn on the Auto Keyframe button for the track you want to animate in the Keyframe Editor.

   Dynamic keyframes are diamond-shaped.

3. If necessary, adjust your clip at this first position of your animated change. If you’re using Auto Keyframe, then you have to make an adjustment for a keyframe to be created.

4. Now, move the playhead to the frame that is at the second position of the animated change you’re making, and create another Dynamic keyframe if you’re creating keyframes manually, or make another adjustment if Auto Keyframe is on.

5. After you’ve created this second keyframe, make whatever adjustments are necessary to the clip to create the final look you need.

At this point, playing from the first keyframe to the second keyframe should show a smoothly animated change from the first adjustment to the second. When you’re finished, make sure you turn Auto Keyframe off if it was enabled.
**Static Keyframes (Marks)**

Static keyframes, or marks, are keyframes that are used to create abrupt, one frame changes from one state to another. They’re typically used to mark edit points separating one shot from another when multiple shots appear within a single clip. However, Static keyframes are also useful in any situation where you need a sudden change from one setting to another, such as when creating a lightning effect.

To automate a node using Static keyframes:

1. Find the frame at which you want the abrupt change to take place, and place a keyframe at that frame by doing one of the following:
   - Choose Mark > Make Static Keyframe (Command-`).
   - Press the MARK button on either the T-bar or Transport panels of the DaVinci control panel.

   Static keyframes (marks) are round.

2. Move the playhead to any frame before the keyframe to make changes to the entire segment of the clip leading up to the keyframe, or move the playhead to any frame after the keyframe to make changes to the entire segment of the clip appearing after the keyframe. The playhead does not need to be on top of the keyframe, but if it is, you’ll be adjusting the second portion of the clip.

**NOTE:** If you’re using Static keyframes to automate grading changes between multiple shots appearing within a single clip, keep in mind that you can’t add nodes from one keyframe to the next as you would if you had split the clip in the Edit page.

**Mixing and Converting Dynamic and Static Keyframes**

Typically, if you’re creating multiple animated changes within a clip, you’ll want to use all Dynamic keyframes. Similarly, if you’re creating a series of abrupt changes, you’ll use all Static keyframes. However, you can mix Dynamic and Static keyframes together, so long as you keep in mind the following rules:

If you add a Dynamic keyframe to the right of a Static keyframe: There will be no interpolation from the Static keyframe to the Dynamic keyframe. However, if you add a Static keyframe to the right of a Dynamic keyframe, there will be interpolation.
No dynamic interpolation following the static keyframe

If you accidentally create the wrong kind of keyframe, it’s easy to convert it into the type of keyframe you need.

**To change one kind of keyframe into another:**

1. Click the keyframe you want to convert to select it.
2. Right-click the selected keyframe, and choose either Change to Dynamic Keyframe or Change to Static Keyframe.

**Try Creating Keyframed Changes in a Separate Node**

One tip to keep in mind is that you don’t have to create keyframed changes within the same nodes you’re using to create other adjustments. If you want to create some automated changes without altering the nodes you’ve already adjusted, you can simply create a new node in which to make your keyframed changes. That way, if you don’t like the result, or you somehow find yourself hopelessly tangled up in a needlessly complicated set of keyframes, it’s easy to reset either just the keyframes or the entire node without affecting the rest of your grade.

**Keyframed Nodes Have a Badge**

Nodes with keyframed parameters display a keyframe badge in the Node Editor, to make them easy to find. Note that keyframe badges won’t appear when you simply add a keyframe but only once there’s an actual keyframed adjustment being made.
Using Specific Keyframing Tracks

If you’re simply using the Color mode of the All/Color/Sizing command to do keyframing, then you’ll be adding keyframes to every parameter of the currently selected node whenever you apply a single keyframe. However, often that’s overkill in situations where you only need to keyframe a single setting or group of settings.

For example, you may find that you need to keyframe a color adjustment in order to change the color temperature and brightness when the camera pans across a window, but you don’t want to keyframe the Windows palette controls because you want to adjust them independently. This can be done by opening a Corrector track to expose the keyframing tracks within.

Keyframing tracks let you keyframe different sets of similarly functioning parameters separately from one another. For example, there’s one keyframing track for all the color adjustment parameters, and another keyframing track governing the parameters found within the Qualifier palette.

To reveal a node’s keyframing tracks:
Click the disclosure triangle next to the number of the node you’re keyframing.

To keyframe an individual keyframing track manually:
1. Make whatever adjustments you need to the currently selected node, and click its disclosure triangle to reveal its keyframing tracks.
2. Move the playhead in the Keyframe Editor to where you want to add the first keyframe, then right-click within the keyframing track you want to animate, and choose Add Static Keyframe or Add Dynamic Keyframe (this example shows a Dynamic keyframe).
   A keyframe appears at the position of the playhead in that keyframing track.
3. Move the playhead in the Keyframe Editor to where you want to add the next keyframe, then right-click within the keyframing track and again choose either Add Static Keyframe or Add Dynamic Keyframe (this example shows a Dynamic keyframe).
Now, you can make whatever changes you need to the controls governed by the keyframing track you keyframed, in order to create the necessary animated effect.

**TIP:** You can also animate individual keyframing tracks using automatic keyframing, explained in more detail later in this chapter.

**Corrector Keyframing Tracks**

All of the parameters governing the adjustment of color and contrast controls, as well as various effects, Power Windows, and other adjustments are sorted into various sub-tracks within the Corrector track.

- **Linear Win:** Controls parameters corresponding to the Linear window.
- **Circ Win:** Controls parameters corresponding to the Circular window.
- **Polygon Win:** Controls parameters corresponding to the Polygon window.
- **PowerCurve:** Controls parameters corresponding to the PowerCurve window.
- **Gradient Win:** Controls parameters corresponding to the Gradient window.
- **Color Corrector:** Controls all parameters found in the Camera Raw, Color Wheels, Primary Controls, RGB Mixer, and Curves palettes.
- **Qualifier:** Controls all parameters in the Qualifier palette.
- **Defocus:** Controls all parameters in the Blur and Key palettes.
- **NR:** Controls the Spatial and Temporal Noise Reduction and Motion Blur parameters found in the Motion Effects palette.
- **Open FX:** Controls all parameters of whichever OFX plug-in is applied to the current node.
- **Node Format:** Controls all parameters of the node sizing mode of the Sizing palette for the current node.

**ResolveFX Keyframe Tracks**

The Color Page Keyframe Editor supports viewing and editing keyframes for ResolveFX and OpenFX plug-ins in the Color page in one of two ways:

- Plug-ins that have been added to a Corrector node appear within the hierarchical list of keyframe tracks that appear within that node’s top-level keyframe track.

The keyframe track of a ResolveFX plug-in added to a Corrector node
Plug-ins that have been added as standalone nodes appear within a new FX track of the Keyframe Editor. Each plug-in that’s added as a separate node has a separate FX track.

The keyframe track of a ResolveFX plug-in added as a standalone node.

The Sizing Keyframing Tracks

The Sizing keyframing tracks govern sizing transforms and stereoscopic adjustments separately from the color controls.

- **Input Sizing**: Controls the Input Sizing parameters found within the Sizing palette.
- **Convergence**: Controls the Convergence parameter in the Stereo 3D palette.
- **Float Window**: Controls the Left, Right, Top, and Bottom Position/Rotate/Softness Floating Windows parameters.
- **Auto Align**: Controls the Pitch and Yaw parameters in the Stereo 3D palette.

**TIP**: Output Sizing can only be keyframed when you choose Timeline mode in the Node Editor.

The Ext Matte Node’s Freeform Isolation Track

If your node tree has an External Matte, the EXT MATTE node exposes a Freeform Isolation track in the Keyframe Editor. This is useful for time offsets or Sizing repositioning of the Ext Matte image.

Automatic Keyframing

Every track in the Keyframe Editor has an Auto-Keyframing button that can be turned on or off. When auto-keyframing is enabled for a particular track, every change made to a parameter or control associated with that keyframe track automatically generates a keyframe. There are two ways you can use this:

- Used with a keyframing track, auto-keyframing makes it simple to set up animated changes to specific adjustments within a node. This is a lot easier than manually placing keyframes one by one.
- On the other hand, turning on auto-keyframing for the Corrector track correspondingly enables auto-keyframing for every keyframing track belonging to that node. In this case, keyframes will automatically be placed on whatever keyframing track corresponds to the parameters or controls you adjust.
Auto-keyframing selected for Circular window on Node 1

When auto-keyframing is disabled, changes you make alter existing keyframes. How this alteration works depends on the location of the playhead, and the type of keyframes in the Keyframe Editor. For more information, see the next section.

Modifying Keyframes

Once you’ve started adding keyframes to animate changes to a grade, there are a variety of methods available to navigate and edit these keyframes to further customize these effects. This section covers the different ways you can navigate among, alter, and remove keyframes.

Navigating Among Keyframes

For many operations, it’s necessary to move the playhead directly on top of the keyframe you want to modify. While you can always use the transport controls or pointer to move the playhead, there are also commands for jumping to a specific keyframe.

To move the playhead among a series of keyframes, do one of the following:

- Choose Playback > Next > Keyframe (the right bracket key) or Playback > Previous > Keyframe (the left bracket key).
- On the Transport panel of the DaVinci control panel, press SHIFT then STEP REV to move the playhead to the previous keyframe, or press SHIFT then STEP FWD to move the playhead to the next keyframe.

Moving Keyframes

If you need to change the timing of a series of keyframes, you can move the position of any keyframe, along with whatever values that keyframe contains.

To move a single keyframe using the onscreen interface:

- Use the pointer to drag any keyframe to another location.
- Drag keyframes in a top-level Corrector or Sizing track to simultaneously move all other keyframes on the same frame within that corrector.

To move a single keyframe using the DaVinci control panel LIFT MARK button:

1. Move the playhead to the keyframe you want to move. This procedure works for either Dynamic and Static keyframes.
2. Press LIFT MARK on either the T-bar or Transport panels.
3. Move the playhead to the frame you want to move that playhead to.
4. Press MARK on either the T-bar or Transport panels.
To move multiple keyframes at the same time:

1. If necessary, open the keyframe track with the keyframes you want to move.
2. Drag a bounding box around the keyframes you want to move. Selected keyframes appear highlighted in red.
3. Drag any of the selected keyframes to move them to the left or right.

Changing Keyframe Values

Unlike many other applications, DaVinci Resolve lets you alter keyframe values when the playhead isn’t directly on an existing keyframe. How this works depends on the location of the playhead relative to the keyframes that are in the Keyframe Editor, and what kind of keyframes you’re editing.

- If the playhead is to the left or on the first Dynamic keyframe: The Dynamic keyframe at or to the right of the playhead updates with the new adjusted values.
- If the playhead is to the left or on the last Dynamic keyframe: The Dynamic keyframe at or to the left of the playhead updates with the new adjusted values.
- If the playhead is between two Dynamic keyframes: The Dynamic keyframe to the left of the playhead updates with the new adjusted values, but the Dynamic keyframe to the right is unaffected.
- If the playhead is between two Static keyframes (marks): Adjustments made between two Static keyframes always affect the keyframe to the left of the playhead. The entire segment of the clip between that keyframe and the next is affected equally.

Changing Dynamic Attributes

By default, the transition from one Dynamic keyframe to the next is linear. However, if you need to alter the acceleration of value interpolation from one Dynamic keyframe to the next, then you can change that keyframe’s dynamic attributes.

To change a keyframe’s dynamic attributes:

1. Click to select a keyframe in the Keyframe Editor.
2. Right-click the selected keyframe, and choose Change Dynamic Attributes.
3. When the Dynamic Attributes window appears, do one or both of the following:
   - Choose a new outgoing acceleration curve using the Start slider, affecting the interpolation occurring to the right of that keyframe.
   - Choose a new incoming acceleration curve using the End slider, affecting the interpolation occurring to the left of that keyframe.

As you choose different acceleration curves, the display to the right shows the resulting curve graph.
Changing the dissolve profile

4 When you’re happy with the curve, click OK.

By using different Start and End values, you can make animated adjustments “ease in” or “ease out” of a particular keyframe, to create a more gradual or abrupt transition.

TIP: The default dynamic profile start and end of each new keyframe can be set via the Dynamics Profile values in the General Options panel of the Project Settings.

Deleting Keyframes

You have the option to delete individual keyframes, or to delete all the keyframes within a particular grade at once.

To delete individual keyframes, do one of the following:

- Move the playback on top of the keyframe you want to delete, then choose Mark > Delete Keyframe (Option-`). Every keyframe at the position of the playback is deleted.
- Using the DaVinci control panel, press DELETE on either the T-bar or Transport panels. Every keyframe at the position of the playback is deleted.
- Using the pointer, click a keyframe in the Keyframe Editor to select it, then right-click that keyframe and choose Delete Selected Keyframe. Only the selected keyframe is deleted.

To delete every keyframe for the current clip:

Choose Mark > Delete All Keyframes.
Copying Keyframes

It’s possible to copy a set of keyframes from one node to another, either within the current grade, or in another clip entirely. It’s also possible to copy an entire grade with keyframes from one clip to another.

**To copy a set of keyframes from one node to another:**

1. Select a node to copy keyframes from, and choose Edit > Copy (Command-C).
2. Do one of the following:
   - To copy all keyframes, select another node to paste keyframes and other adjustments to, and choose Edit > Paste (Command-V).
   - If you want to just copy only the keyframe information from a specific keyframe track, choose Edit > Paste Attributes (Option-V), then click the “Copy Keyframes and Align Using” checkbox, and select the appropriate parameters to copy.

**TIP:** This procedure also works for tracking data that you want to copy from one node to another, either in the current clip, or another clip altogether.

**To copy an entire grade with keyframes from one clip to another:**

1. Click the thumbnail of the clip you want to copy to in the Thumbnail timeline.
2. Right-click the thumbnail of the clip you want to copy from, and choose Apply Grade from the contextual menu.

**NOTE:** When copying a grade with keyframes from one clip to another, the keyframes will automatically be placed at matching frames that correspond to the source timecode of the originating clip. This makes it easy to copy a grade with keyframes to the same clip elsewhere in the Timeline, but it may not provide the desired results if you’re applying a grade with keyframes from one clip to a completely different one.
Keyframes and Saved Stills

If you save a still from a clip using keyframes within the grade, by default keyframes are not saved. However, the still and grade that are saved reflect whatever parameter values are contained by the next keyframe to the left of the position of the playhead. For example, if a clip has a dynamically keyframed transition from a saturation of 50 to a saturation of 0, and you place the playhead right in the middle of both keyframes when you save a still, the grade and still that are saved have a saturation of 50.

However, if you right-click the background of the Gallery, choose one of the options within the “Apply Grades Using” submenu, and choose the appropriate “Keyframes Aligning...” options, then grades saved within a still are saved with the keyframes, which reference the source timecode, or start frame of the original clips. This means that if you apply a saved grade with keyframes to a clip, the keyframes will automatically be placed at matching frames that correspond to the source timecode or start frame of the original clip. This makes it easy to copy a grade with keyframes to the same clip elsewhere in the Timeline, but it may not provide the desired results if you’re applying a grade with keyframes from one clip to a completely different one.

Adding EDL Marks

Just as clip grades are separate from the timeline grade that can be applied to the entire Timeline, so clip keyframes are separate from timeline keyframes. Keyframes you apply to the timeline grade work exactly the same as clip keyframes. However, there is one extra option you have when keyframing the timeline grade.

If you find yourself wanting to adjust a timeline grade individually to take into account variations from one clip to the next, you can use the Add EDL Marks on Tracks command to add a Static keyframe (mark) to the Keyframe Editor at the position of every edit point in the entire Timeline.

To add EDL marks:

1. Choose Timeline from the Node Editor’s mode drop-down menu.
2. If you want to keyframe a grade, then create whatever grade you need to apply to the entire Timeline. If you want to keyframe Sizing settings, you don’t need to do anything else.
3. Right-click the Corrector track or the Sizing track in the Keyframe Editor, and choose Add EDL Marks on Tracks.

Marks appear at the frame of every edit point in the Timeline. You may want to widen the Keyframe Editor to make it easier to work with all these keyframes.

After you’ve added EDL marks, you can delete them if you decide you don’t want them any more.

To delete EDL marks:

• Right-click the Corrector track in the Keyframe Editor, and choose Delete EDL Marks on Tracks.

If you’ve added your own keyframes in addition to the EDL marks, then the Delete EDL Marks on Tracks command only eliminates the EDL marks. Your custom marks are left alone.
Chapter 129

Copying and Importing Grades Using ColorTrace

ColorTrace is a key feature of DaVinci Resolve, which lets you copy grades quickly and easily from the clips of one timeline to those within another, based on the source timecode of each clip (or using clip names when in Automatic mode). You can even use ColorTrace to copy grades between timelines within the same project, and ColorTrace one stereo timeline to another.

Copying Grades Using ColorTrace

ColorTrace copies whichever version of a clip’s grade was applied in the Source timeline you’re copying from, either local or remote, depending on which grades each clip in the Source timeline is set to use. Furthermore, ColorTrace copies Group Pre-Clip and Group Post-Clip grades, as well as Fusion compositions. These improvements make this an extremely reliable tool for copying grades from one timeline to another in a wide variety of situations.

To use ColorTrace:

1. Open the Edit page and select the Timeline you want to use ColorTrace with from the Media Pool, then open it and choose Timelines > ColorTrace > ColorTrace From Timeline.

2. Using the Project List browser, select the specific Timeline you want to copy grades from.

   You’ll need to click the disclosure triangle to the left of the database, user name, and project that contains that Timeline in order to select it.

---

Chapter – 129 Copying and Importing Grades Using ColorTrace

2912
3 (Optional) If you’re using ColorTrace with a project that has numerous VFX clips in a workflow where all VFX clips have specific reel names that identify them, you can enter these names (with asterisks (*) used as wildcards that indicate text in each reel name that can vary) in the “Effects Shot Definitions” field.

This speeds automatic ColorTrace operations by enabling DaVinci Resolve to use fuzzy string matching when a clip’s reel number qualifies it as a VFX shot so that the best match is displayed first on the list. You can enter multiple VFX reel names with wildcards, one per line, for simultaneous string matching. You can use whatever reel name text makes sense for your workflow, some examples of VFX reel names are as follows:

- *_COMP_*
- VFX*
- EFFECTS*

4 Click Continue.

The ColorTrace window appears with two tabs that let you choose how to work.

5 Choose which mode to work in by clicking the Automatic or Manual tab:

- In Automatic mode, ColorTrace automatically searches for matching clips between the selected Timeline and the current Timeline. Each clip is color coded depending on the correspondence that’s been identified.
- In Manual mode, you copy grades yourself, using the Copy and Paste procedures, or by dragging and dropping using your mouse.

The ColorTrace window is complex; details about the operation of each mode are covered separately in the following sections.

6 When you’re finished using ColorTrace, click Close.

Using ColorTrace in Automatic Mode

In Automatic mode, ColorTrace automatically finds the correspondences between clips in the selected Timeline that you want to copy grades from (the Source timeline), and those in the current Timeline that you want to copy grades to (the Target timeline).

Each clip in the Target Timeline Thumbnail timeline is outlined with a color that indicates its status.

- **Red**: No match was found at all. Generally true for clips in the current Timeline that weren’t used in the Timeline you’re ColorTrace matching to.
- **Blue**: Due to overlapping timecode and reel names, multiple correspondences have been found (similar to a reel conflict), and you must select the correct one for each clip. This often happens with VFX and motion graphics clips that you’ve imported with timecode starting at 00:00:00:00.
- **Green**: A match has been found.
In Automatic mode the correspondence between each clip in the Source timeline and each clip in the Target timeline should be automatically made. However, overlapping timecode and reel names can cause problems. The other controls in the ColorTrace window help you deal with the subset of clips that can't be automatically matched, or are matched in error. These controls are:

- **Matching Source Clips list**: Shows a scrollable collection of thumbnails that might correspond to the selected clip in the Target timeline.
- **Target Timeline**: Shows each clip in the Timeline you want to copy grades to, color coded according to how good a match it is.
- **Clip Info pane**: Displays two columns of properties for the source clip and the target clips that you've selected. These properties include the reel, source timecode, record timecode, clip name, project names, and timeline names of each clip, for easy comparison.
- **Attributes and options checkboxes**: A series of checkboxes lets you specify which clip attributes are copied as part of the ColorTrace operation.
- **Color**: Enables the copying of grades.
  - **Preserve Num Nodes**: When copying grades, lets you prevent the first X nodes of the target clip grades from being overwritten by the first X nodes of the source clip grades.
  - **Sizing**: Enables the copying of Edit sizing attributes.
  - **Input Sizing**: Enables the copying of Input Sizing attributes.
  - **Convergence**: Enables the copying of Convergence for Stereo 3D projects.
  - **Floating Windows**: Enables the copying of Floating Windows for Stereo 3D projects.
  - **Auto Align**: Enables the copying of Auto Align settings for Stereo 3D projects.
  - **All Versions**: Copies all versions, rather than just the current version, from the source to the target clips. The currently selected version of each source clip is always correctly copied.
- **Version Camera Raw Settings**: Enables the copying of versioned Raw settings, rather than just the current Raw setting.
- **Track Marks**: Enables the copying of keyframes.
- **Flags and Markers**: Enables copying of all flags and markers.
- **Hide Matching Clips**: Hides all clips which have been successfully matched, and only show the clips with multiple or no matches. This lets you focus on the subset of problem clips within a potentially long timeline.
- **Ignore Reel Names**: If you believe the reel names are in error, you can turn this checkbox on to ignore them, matching all source and target clips by timecode alone.

- **Copy Grades**: Copies the matched source grades to each green and purple target clip.
- **Copy Grades & Exit**: Once you’ve finished making all the grade matches you can, click this button to copy the matched source grades to each green and purple target clip, and close the ColorTrace window.

Here’s how to use these controls to sort out which source clips to copy from for each blue and red target clip in the Target timeline.

**To manually choose which source grades should be copied to which target clips:**

1. Click any blue clip thumbnail in the Target timeline.

A collection of clips with overlapping timecode and reel names appears. If you want to ignore the reel names because you believe they might be in error, turn on the Ignore Reel Names checkbox.

2. If a comparison of the Source and Target thumbnails doesn’t make the choice obvious, then click any of the clips in the Matching Source Clips timeline to view its metadata for comparison in the source/target columns below.

Source and Target clip metadata for comparison
Once you’ve decided on a clip correspondence, double-click the Matching Source Clip thumbnail you want to copy from. If no clip in the Matching Source Clip pane is a good match, double-click the “Set As New Shot” box.

The Source and Target thumbnails both turn purple, to show that you’ve created a correspondence.

Continue working your way through every thumbnail with Blue and Red Xs until you’ve found matches for every clip in the Timeline for which it’s possible.

When you’re finished, click Copy Grades & Exit.

Using ColorTrace in Manual Mode

Manual mode is ideal for situations where you want to copy grades between programs with clips that have no timecode or reel name correspondence at all. The Manual ColorTrace interface is designed to let you move through two different timelines, either a clip at a time, or in matching multiples of clips, copying grades from the Source timeline to the Target timeline.

For example, if you’re trying to copy grades from a timeline that was conformed from individual media files, to another timeline that was conformed from a flattened master media file, you can use the ColorTrace Manual mode to accomplish this.

The manual interface consists of two sets of controls that correspond to the Source timeline (labeled “Timeline to copy from”), and the Target timeline (labeled “Timeline to paste to”). The general idea is that you move through both sets of timelines one clip at a time, or in matching multiples of clips at a time, and copy grades from the “Copy from” timeline to the “Paste to” timeline.
Manual mode has the following controls:

- **Source timeline**: Shows all clips in the Source timeline you selected; the clips you’re copying grades from. Click any one clip thumbnail to select it, or click a thumbnail, and then Shift-click another thumbnail to select a contiguous range of clips. You cannot select a noncontiguous range of clips.

- **Copy Range controls**: Two fields show the range of clips in the current selection that you’ll be copying from, referred to by their numeric position in the Source timeline. You can change the range numerically by either entering new numbers in the fields, or by using the up/down arrow buttons to alter the value by one. The First button automatically adds all clips from the first one in the Timeline into the current selection. The Last button automatically adds every clip going to the last one in the Timeline to the current selection.

- **Target timeline**: Shows all clips in the Target timeline you selected; the clips you’re pasting grades to. Selecting clips works identically as with the Source timeline.

- **Paste Range controls**: Two fields show the range of clips in the current selection that you’ll be pasting to, referred to by their numeric position in the Source timeline. All controls work identically to the Copy Range controls.

- **Attributes and options checkboxes**: Turn off the checkboxes of any clip characteristics that you don’t want to copy as part of the ColorTrace operation. A more complete description of these options appears in the section on the Automatic ColorTrace mode.

- **Paste button**: Once you’ve selected one or more source clips and a matching number of target clips, clicking Paste copies the grades, PTZR settings, and marks (depending on the corresponding checkboxes).

- **Undo Last**: Lets you undo the most recent paste action.

- **Undo All**: Lets you undo all paste actions in Manual mode.

- **Done**: Finishes the operation and closes the ColorTrace window.

If you’re cherry picking individual grades from one timeline to paste into shots in another, you can copy grades one at a time.
To copy one source grade to one target clip:

Click a thumbnail in the Source timeline (on top) to copy from, then click a thumbnail in the Target timeline (on the bottom), and click Paste.

You can also simultaneously copy the grades of entire scenes of clips from one timeline to another. For example, if you’re copying grades from an originally graded timeline to a re-edited version of the same program, you can copy every grade from a 10-clip scene in the Source timeline to the same 10 clips in the Target timeline which have been pushed back later in the Timeline.

To copy a group of source grades to a group of target clips:

1. Choose a continuous range of source clips by doing one of the following:
   - Click the first clip in the range, and then Shift-click the last clip in the range.
   - Enter the clip number of the first clip in the left “Copy Range” field, and then enter the clip number of the last clip in the right field.
   - Click a clip, and then click First to select every clip from that one to the first clip in the Timeline.
   - Click a clip, and then click Last to select every clip from that one to the last clip in the Timeline.

2. Choose a continuous range of Target clips by using the same procedures as in the previous step, but using the “Paste Range” controls.

   **IMPORTANT** You must select the same number of target clips as you did source clips for the Paste button to become enabled.

3. When you’ve made your selections, click Paste.

   The grade settings from the source clips are pasted to the destination clips, in order. In other words, if you copy from clips 5 through 9 to clips 11 through 15, then grade 5 is copied to shot 11, grade 6 is copied to shot 12, grade 7 is copied to shot 13, and so on.
Importing CDL Data Using ColorTrace

The ColorTrace CDL command lets you import ASC CDL file formats from other applications into DaVinci Resolve. DaVinci Resolve also has the ability to read DRX filenames from CDL files, allowing a CDL to load exported DaVinci Resolve grades.

There are three supported file formats:

- **CMX EDL**: An EDL with comments referring to CCC/CDL XML files, or even Slope, Offset, and Power (SOP) data within the comment area.
- **CCC and CDL XML**: A file format that contains various color correction looks, and even references.

To import CDL data into DaVinci Resolve:

1. If you’re importing CCC/CDL XML correction looks:
   - Open the Gallery page, right-click anywhere within the Stills tab, and choose Import from the contextual menu.
   - When the Import Stills dialog appears, open the CDL/CCC files. When these are finished importing into the Gallery, an ASC logo will appear along with them.

2. Open the Edit page and select the Timeline you want to use ColorTrace with in the Timeline list.

3. Right-click anywhere within the Timeline, and choose ColorTrace from CDL.

4. Select an EDL using the Select EDL dialog, and click Open.

5. Select its corresponding CDL and CCC files using the Select CDL Files dialog. If there are no CDL or CCC files (which is the case if there are inline SOP comments within the EDL), you should click Cancel.

6. Using the ColorTrace With CDL window, copy the source grades from the CMX EDL/CCC & CDL XML files to the Target timeline.
   
   At this point, the ColorTrace window works identically as previously described.

For formatting reference, here are some examples of CMX, CCC, and CDL files.

**Example CMX EDL File**

```
TITLE: Final EDL FCM: NON-DROP FRAME 010 001 V C 01:19:28:16 01:19:28:16 01:00:41:18 01:00:42:18 *ASC_CC_XML test_cc.102 011 001 V C 00:00:00:00 01:19:28:16 01:00:42:18 01:00:43:18 *ASC_SOP (0.9 1.2 0.5)(0.4 -0.5 0.6)(1.0 0.8 1.5)
```
Example CCC File

<ColorCorrectionCollection xmlns="urn:ASC:CDL:v0.5" >
<InputDescription> test corrections for ref_input_image.1920 </InputDescription>
<ViewingDescription> for mathematical analysis only </ViewingDescription>
<ColorCorrection id="test_cc.100"> <SOPNode>
<Description> for ref_output_image.0100 </Description> <Slope> 1.0 1.0 1.0 </Slope> <Offset> 0.0 0.0 0.0 </Offset> <Power> 1.0 1.0 1.0 </Power>
</SOPNode> </ColorCorrection>
<ColorCorrection id="test_cc.101"> <SOPNode>
<Description> for ref_output_image.0101 </Description> <Slope> 1.0 1.5 0.6 </Slope> <Offset> 0.0 -0.1 0.01 </Offset> <Power> 1.0 1.5 0.5 </Power>
</SOPNode> </ColorCorrection>
</ColorCorrectionCollection>

Example CDL File

<ColorDecisionList xmlns="urn:ASC:CDL:v0.5" >
<InputDescription> GeneralProducts M1 std thru GP M1 LUT4 </InputDescription>
<ViewingDescription> GP P1, DCI P3, Pathe color emul </ViewingDescription>
<ColorDecision>
<MediaRef ref="/some/Project/frame%250900-0954%5B.dpx"/>
<ColorCorrection id="cc03340"> <SOPNode> <Description>change +1 red, contrast boost</Description> <Slope>1.2 1.3 1.4</Slope> <Offset>0.3 0.0 0.0</Offset> <Power>1.0 1.0 1.0</Power>
</SOPNode> </ColorCorrection>
</ColorDecision>
</ColorDecisionList>

Using CDL Adjustments

Once you’ve imported a CDL (Color Decision List), then the CDL adjustment for each clip is made available to you via a contextual menu command in the Thumbnail timeline of the Color page.

Calculating CDL Functions

To turn the SOP values into a primary correction, the following math is used by DaVinci Resolve:

Output = (Input * Slope + Offset)^Power

Output refers to the final grade. Input is the value of each pixel within each color channel (on a scale from 0–1). The detent value for Slope is 1. The detent value for Offset is 0. The detent value for Power is 1.
Chapter 130

Using LUTs

Lookup Tables, also known as LUTs, are one of the most ubiquitous means of creating, exchanging, and applying image processing operations there is for purposes of color management, display calibration, look management, and general-purpose processing of image color and contrast. DaVinci Resolve has robust support for LUTs throughout its image processing pipeline.

What is a LUT?

LUTs are simply files, similar to plug-ins but far more focused and with no user interface, that specify image processing operations. These operations are accomplished in a variety of ways. The traditional approach is to use a 1D table or 3D “cube” of pre-calculated values to perform an image color transform. However, newer LUT formats including CLF and DCTL let you use mathematical scripts to process an image.

Whatever type of LUT you use, these files can be loaded into DaVinci Resolve and applied at different points of the image processing pipeline to apply image processing operations for different purposes. There are several well-known uses of LUTs, but the important thing you should take away is that LUTs are simply color transform operations that can be used for many things, and there’s no single use of a LUT that’s more or less important than any other.

Here are some frequent uses for LUTs:

- While optionally superseded by Resolve Color Management (RCM), lookup tables (LUTs) have been frequently used to create a starting point adjustment for media acquired with some logarithmic encoding. DPX log film scans, digital media using the ARRI ALEXA’s Log-C encoding, Sony’s S-Log exposure setting, or RED R3D media that is debayered using the REDFilmLog setting are all examples of media using a logarithmic exposure curve, designed to protect as much detail in the highlights and shadows of a digitally encoded image as possible. While log-encoded media retains a lot of image data, the picture is initially flat and unsuitable for use without grading. The exposure and color must be adjusted to “normalize” the media, making it look closer to the way it’s supposed to, in order to start grading. While you can do this manually, it’s usually faster to use a LUT that’s tailored to your type of media and the exposures you’re using. Alternately, you can also use Resolve Color Management to accomplish this.

- LUTs are commonly used in onset workflows where dailies for different scenes are managed with corresponding LUTs. These LUTs were used to monitor the media as it was being recorded to define a baseline reference for how each scene is meant to look, at least so far as field monitoring is concerned. In more advanced workflows, LUTs are used as a baseline look, defined prior to the shoot and used during the shoot, that then defines the creative starting point for different scenes once grading begins after the shoot.

- LUTs are frequently used as a stylistic component of a grade, or “look” that gives users a quick start when desiring some manner of creative adjustment. Over the years, companies and individuals have created an ecosystem of such looks that are disseminated and sold in various LUT formats supported by DaVinci Resolve.

In all of these instances, LUTs are simply image processing adjustments that are applied to affect the color and contrast of a clip, in much the same way as you’d make adjustments using any of the contrast or color controls in the Color page.
Supported LUTs

DaVinci Resolve uses both 1D and 3D LUTs, and supports LUTs in a variety of formats.

- **.cube**: DaVinci Resolve uses both 1D and 3D LUTs in the .cube format. 3D LUTs are exported as 33x33x33 cubes with 32-bit floating point processing. 65x65x65 cubes created outside of DaVinci Resolve are also compatible but may cause issues with performance. DaVinci Resolve can also read and use Shaper LUTs in the .cube format, but these must also be created outside of DaVinci Resolve. The .cube format used by DaVinci Resolve is no relation to the Iridas/Adobe SpeedGrade .cube format.

- **Panasonic VLUT format**: A LUT format associated with Panasonic VariCam cameras.

- **CLF (common LUT format)**: CLFs use an XML format that is capable of encompassing a limited number of mathematical transforms in addition to traditional lookup-tables to do image processing. Promoted by the academy as the ideal LUT format for use with ACES, LMTs for ACES are recommended to be in the CLF format due to its increased precision and flexibility.

- **DCTL**: DCTL files are actually color transformation scripts that DaVinci Resolve sees and applies just like any other LUT. Unlike other LUTs, which are 1D or 3D lookup tables of values that approximate image transformations using interpolation, DCTL files are actually comprised of computer code that directly transforms images using combinations of math functions that you devise. Additionally, DCTL files run natively on the GPU of your workstation, so they can be fast. For more information on DCTL, see Chapter 174, “Creating DCTL LUTs.”

What’s the Difference Between a LUT and a Shaper LUT?

DaVinci Resolve is capable of importing and using LUTs within its 32-bit floating point image processing pipeline. The .cube format can be used as either a simple 33x33x33 3D LUT, or as a shaper LUT, which is actually a method of using two LUTs, a 1D LUT and a 3D LUT together, that addresses signal processing issues that 3D LUTs alone can’t handle.

For processor efficiency, 3D LUTs are designed with reasonable lower and upper limits for the data they will handle. It’s well known that when a 3D LUT is fed values that are outside of the range that LUT is designed to handle, the out-of-range data will be clipped. Since many LUTs are designed with digital cinema workflows in mind, the practical result is that feeding a video signal with super-white in it to a 3D LUT that’s designed for full-range data (0–1) will clip the super-white part of the signal.

Shaper LUTs handle this issue by first using a 1D LUT to process video signals with out-of-range data, fitting the signal into a range that the 3D LUT won’t clamp. The output of the 3D LUT includes the reverse transformation, to effectively zero out the 1D LUTs transform, while retaining whatever processing the 3D LUT was meant to apply.

Shaper LUTs are also useful for dealing with extremely large data sets, such as OpenEXR files that can theoretically handle an image data range of –infinity to +infinity. Using a Shaper LUT, you can remap the incoming data to fit more precision in the 0–1 range, leaving less important data outside the range.
LUTs and ACES

The academy that promotes the correct use of ACES strongly recommends that LUTs be processed in the ACES color space. For this reason, two project settings let you choose how this will be done:

- **ACEScc AP1 Timeline Space**: This setting works for either the ACEScc or ACEScct Color Science settings depending on what you’ve selected in the Color Science pop-up at the top of the Color Management panel in the Project Settings. This setting lets you use LUTs that were created for ACES workflows that are similar to (but not the same as) LUTs you would create and use in a traditional log-encoded workflow. LUTs designed for working with this setting should have a range of –0.358 to 1.468 so that grading operations that clip an image from 0 to 1 won’t destroy the look being applied. The “ACEScc AP1 Timeline Space” setting is also good for workflows where you want to use conventional LUTs that were designed for Rec. 709 workflows using the ResolveFX “ACES Transform” plug-in, which over a series of three nodes lets you transform the image from ACES to 709, apply a Rec. 709-designed LUT, and then convert the image from 709 back to ACES.

- **ACES AP0 Linear**: This setting requires you to apply an LMT LUT that has been specifically created for ACES image data. Only use this setting if you’re using CLFs that are designed for ACES using a range of –65504 to 65504, as specified by SMPTE 2065.

Adding Lookup Tables of Your Own

The menus in the Color Management panel of the Project settings include a series of factory preset LUTs that were installed with DaVinci Resolve, along with any LUTs that have been generated by DaVinci Resolve, or that you’ve imported into the proper directory for your operating system for your own use.

- **On OS X**: Library/Application Support/Blackmagic Design/DaVinci Resolve/LUT/
- **On Windows**: C:\ProgramData\Blackmagic Design\DaVinci Resolve\Support\LUT
- **On Linux**: /home/resolve/LUT

If you downloaded the non-studio version of DaVinci Resolve from the Apple App Store, LUTs are saved in a different location in order for DaVinci Resolve to remain totally self-contained. In this case, you can click the Open LUT Folder button in the Lookup Tables panel of the Project Settings, to open up a Finder window at the location these LUTs are stored. You can use this window to copy LUTs that you want DaVinci Resolve to have access to, or delete LUTs that you no longer need.

If you add a LUT to one of these directories after DaVinci Resolve has been opened, you can click the Update Lists button to refresh the contents of the pop-up menus.
LUT Controls in the Project Settings

While there’s an entire group of LUT controls in the Color Management panel of the Project Settings, those are designed to apply LUTs, in different parts of the image processing pipeline, to the entire Timeline. This is useful when you want to apply a single color and contrast transformation to the entire program at once, but less so if you want to apply different LUTs on a per clip basis. (For more information on using the Lookup Table settings, see Chapter 3, “System and User Preferences.”)

Applying a LUT to the Source

Another way of applying a LUT to a clip is to apply it directly to the source clip, which you can do to any clip in the Media Pool, or in the Thumbnail Timeline of the Color page. This can be convenient, but keep in mind that source clip LUTs cannot be copied from one timeline to another using ColorTrace, so using source clip LUTs limits your potential workflows. For most workflows, it’s better to apply LUTs directly in the Node Editor so they live in each clip’s grade.

To apply a LUT to one or more selected clips in the Media Pool:
Right-click one of the selected clips, and choose a LUT from the 1D LUT or 3D LUT submenus.

To apply a LUT to one or more selected clips in the Thumbnail Timeline of the Color page:
Right-click one of the selected thumbnails, and choose a LUT from the 1D LUT or 3D LUT submenus.

TIP: If you’re wanting to apply an image transformation to normalize log-encoded source clips, consider using Resolve Color Management (RCM) to do so via clip tagging in the Media Pool instead. It’s an easier process and opens up greater flexibility of workflows. For more information, see Chapter 7, “Data Levels, Color Management, and ACES.”
Using the Color Page LUT Browser

The LUT Browser on the Color page provides a centralized area for browsing and previewing all of the LUTs installed on your workstation. All LUTs appear in the sidebar, by category.

By default, all LUTs appear with a test thumbnail that give a preview of that LUT’s effect, but you can also get a live preview of how the current clip looks with that LUT by hover scrubbing with the pointer over a particular LUT’s thumbnail (this is described in more detail below).

To open the LUT Browser:
Click the LUT Browser button in the UI Toolbar at the top of the Color page.

Methods of working with the LUT Browser:

- **To see the LUTs in any category:** Click on a LUT category to select it in the sidebar, and its LUTs will appear in the browser area.
- **To make a LUT a favorite:** Hover the mouse over a LUT and click the star badge that appears at the upper right-hand corner, or right-click any LUT and choose Add to Favorites. That LUT will then appear when you select the Favorites category in the Node Editor contextual menu for nodes.
- **To search or filter for specific LUTs:** Open a bin that has the LUT you’re looking for, then click the magnifying glass icon to open the search field, and type text that will identify the LUTs you’re looking for.
- **To see LUTs in Column or Thumbnail view:** Click the Column or Thumbnail buttons at the top right of the LUT Browser to choose how to view LUTs in the browser area.
- **To sort LUTs in Thumbnail view:** Click the Thumbnail Sort pop-up menu and choose which criteria you want to sort LUTs by. The options are filename, type, relative path, file path, usage, date modified. There are also options for ascending and descending sort modes.
To sort LUTs in Column view: Click the column header to sort by that column. Click a header repeatedly to toggle between ascending and descending modes.

To update the thumbnail of a LUT with an image from a clip: Choose a clip and frame that you want to use as the new thumbnail for a particular LUT, then right-click that LUT and choose Update Thumbnail With Timeline Frame.

To reset the thumbnail of a LUT to use the standard thumbnail: Right-click a LUT and choose Reset Thumbnail to go back to using the standard test image.

To refresh a LUT category with new LUTs that may have been installed: Select a LUT category, then right-click anywhere within the browser area and choose Refresh to refresh the contents of that category from disk.

Enabling and Disabling the LUT Viewer live preview:

1. Open the LUT Viewer’s option menu and choose Live Preview.

![Live Preview option](image)

The Live Preview option for the LUT browser lets you hover over a LUT to preview it on the current clip in the Viewer.

2. Click a node in the Node Editor you want to preview applying a LUT to. The live preview will display how the current clip will appear with the LUT you select applied to the currently selected node of the current grade, which will affect the result.

3. Move the pointer over the LUT you want to preview.

   The Viewer image updates to show how that clip would look with that LUT applied to the currently selected node.

To apply a LUT from the LUT Browser to a specific node, do one of the following:

- Right-click a LUT and choose Apply LUT to current node.
- Drag a LUT from the LUT Browser and drop it onto the node you want to apply a LUT to. If you drag a LUT onto a node that already has a LUT, the previous LUT will be overwritten by the new one.
Applying a LUT Within a Node

DaVinci Resolve lets you apply LUTs within a grade by connecting a LUT to a particular node in the Node Editor. This gives you the greatest amount of control over where the LUT is applied in your image processing pipeline, and it also gives you the opportunity to apply image adjustments prior to the LUT, and after the LUT, as you require.

To apply a LUT within a node, do one of the following:

- Right-click any node, and choose a LUT from the 1D Input LUT, 1D Output LUT, 3D LUT, DCTL, or CLF (common LUT format) submenus of the LUT submenu. The LUT submenus list whichever LUTs have been installed on your workstation. For more information on installing LUTs, see Chapter 3, “System and User Preferences.”
- Right-click any node, and choose a LUT from the LUT > Favorites submenu.
- Use the LUT Browser to find a LUT you want to use, and then drag and drop that LUT onto the node you want to apply it to.

**TIP:** If you hold down the Option key while scrolling through the submenu of LUTs in a Corrector node’s contextual menu, you’ll get a live update in the Viewer of how each LUT affects the image.

To reveal a selected node’s LUT:
For any node in the Node Editor with a LUT applied to it, you can right-click that node and choose Reveal Selected LUT to automatically open the LUT viewer and select that LUT.

LUTs Are the Last Operation Within a Node

Each node in the Node Editor is capable of performing multiple operations, and these operations occur in a specific order. LUTs that you add to a node impose their transformation as the last operation within that node, after all other Color page adjustments applied by that node.

Practically, this means that you can use a node’s Color and Contrast controls to trim the image data that will be fed into a LUT applied to that same node. For example, if a LUT’s contrast adjustment clips the highlights of the image too much, you can use that node’s Contrast controls to lower the highlights of the image prior to the LUT, restoring detail to the image.

Favorite LUTs Submenu in Node Editor

When you “star” a LUT as a favorite in the LUT Browser, those favorite LUTs appear in a submenu of the contextual menu that appears when you right-click on a node in the Node Editor. This makes it easy to create a short list of your go-to LUTs for various situations, for rapid application right in the Node Editor.
Exporting LUTs

If you find it necessary to exchange image adjustments with other grading applications, compositing applications, or NLEs, often the easiest inter-application solution is to export a LUT. This can be done whether your grade consists of one node or several nodes, so long as they contain only Primaries palette adjustments, Custom Curves palette adjustments, and compatible ResolveFX plug-ins that include Color Space Transform, ACES Transform, and Gamut Mapping. All nodes with compatible functions will be mathematically combined and translated into a LUT.

Keep in mind that any nodes that use Qualifiers, Windows, incompatible filtering operations (such as sharpening or blurring), or incompatible ResolveFX or OpenFX will be completely ignored, as will all other correction operations made within these nodes.

To export a LUT:
1. Right-click a clip thumbnail in the Timeline of the Color page, and choose one of the following commands corresponding to the type of LUT you want to export:
   - Generate 3D LUT (33 Point Cube): A DaVinci-developed LUT format
   - Generate 3D LUT (65 Point Cube): A DaVinci-developed LUT format
   - Generate 3D LUT (Panasonic VLUT): A LUT format associated with Panasonic VariCam cameras
2. Choose a location for the resulting LUT file in the file dialog. The default file path depends on your operating system; saving it here will make it available to DaVinci Resolve for future use.
   - On OS X: Library/Application Support/Blackmagic Design/DaVinci Resolve/LUT/
   - On Windows: C:\ProgramData\Blackmagic Design\DaVinci Resolve\Support\LUT
   - On Linux: /home/resolve/LUT
   If you like, you can create a new folder in which to save your custom LUTs.
3. Enter a name into the Save As field, and click Save. A LUT file is saved.

Once created, you can use an exported LUT from within DaVinci Resolve, applying it to a clip or node directly, or applying it to the entire project using the settings found in the Color Management panel of the Project Settings. You can also copy the LUT to a memory stick to give to someone for monitoring or previewing in an onset workflow, or to someone using another grading application that can read this LUT format.
PART 10
Color Page Effects
Chapter 131

DaVinci Resolve Control Panels

The DaVinci Resolve control panels make it easier to make more adjustments in the same amount of time than using a mouse, pen, or trackpad with the on-screen interface. Additionally, using a DaVinci Resolve control panel to control the Color page provides vastly superior ergonomic comfort to clutching a mouse or pen all day, which is important when you’re potentially grading a thousand shots per day.

This chapter covers details about the three DaVinci Resolve control panels that are available, and how they work with DaVinci Resolve.

About The DaVinci Resolve Control Panels

There are three DaVinci Resolve control panel options available and each are designed to meet modern workflow ergonomics and ease of use so colorists can quickly and accurately construct both simple and complex creative grades with minimal fatigue.

This chapter provides details of the each of the panel functions and should be read in conjunction with the previous grading chapters to get the best from your panel.

The DaVinci Resolve Micro Panel is ideal for edit suites that need a professional grading panel for occasional grades or quick adjustments to shots. You will also find it on set where its small size, portability, and low power needs are ideal for those on the move.

![DaVinci Resolve Micro Panel]

For many facilities the DaVinci Resolve Mini Panel is an elegant, compact yet powerful full featured grading panel. The direct selection palette keys, soft knobs, and menus offer considerably more flexibility than the Micro panel and a better grading experience as a result.

![DaVinci Resolve Mini Panel]

For the ultimate grading panel to make an impact on your clients and give you the speed for long and complex grading sessions the DaVinci Resolve Advanced control panels features dozens of keys and menu driven soft knobs so grading operations are just a keystroke or two away. With high resolution liquid crystal displays (LCD) and backlit hard keys to accommodate a darkened grading environment. The color and intensity of the keys and the LCD panel brightness are user programmable, so each colorist can set up his/her personal panel configuration.
DaVinci Resolve Advanced control panels

DaVinci Resolve Micro Panel

The Micro control panel features a row of direct control knobs at the top of the panel, three trackballs with rings for color grading, and to the right, transport and commonly used keys to speed up your grading session. Above the trackballs are reset buttons and also mode selection buttons for Log, Offset, and the Viewer selector. When selecting the Viewer mode, the full display will switch to the Cinema Viewer which is ideal for playback and review of clips. The Log and Offset selections are described below.

Trackballs

The three trackballs, from left to right, are in the traditional DaVinci format of Lift, Gamma, and Gain when DaVinci Resolve is set for Primary grading. This is the default mode for the panels but you can quickly toggle to Log mode using the LOG key just above the center trackball. When in Log grading, the trackballs control the Lowlights, Midtones, and Highlights.

You can also select the OFFSET button whether in PRIMARY or LOG modes. This is a toggle operation and when selected the left hand side ring surrounding the trackball controls the color temperature of the image, the center trackball ring the color tint, and the right hand side trackball controls the image offset balance and master exposure with the ring.

By rotating the trackball the colorist can alter the balance between the red, green, and blue levels of the image. Using the vectorscope as a rough guide, moving the trackball towards the three-thirty clock position adds more blue while reducing the red and green.

The control ring surrounding these trackballs provides a master amplitude control of the associated trackball.
Above the three trackballs are three buttons for resetting the grade:

- **RGB**: This key only resets the RGB balance to default detent.
- **All**: Select All to reset both RGB and level.
- **Level**: Select the Level key to reset the level while maintaining RGB differential.

![Log, Offset, Viewer, and Trackball reset buttons](image)

**Control Knobs**

The top of the panel features 12 high resolution endless turn optical encoder control knobs with detent resets. These are spaced in groups of three for fast operation in dark suites. From left to right the knobs control:

- **Y Lift**: This knob is for adjusting the contrast of the image in the darker areas. The midtone and to a lesser amount the brighter areas of an image will also change.
- **Y Gamma**: Use the gamma knob for primarily mid tone contrast changes with some influence on the darker and brighter sections.
- **Y Gain**: The Y Gain control influences the brighter parts of the image at a greater extent to the mid and darker portions.
- **Contrast**: This one parameter lets you increase or reduce the distance between the darkest and lightest values of an image, raising or lowering image contrast. The effect is similar to using the Lift and Gain master controls to make simultaneous opposing adjustments.
- **Contrast Pivot**: Changes the center of tonality about which dark and bright parts of the image are stretched or narrowed during a contrast adjustment.
- **Midtone Detail**: When this parameter is raised, the contrast of regions of the image with high edge detail is raised to increase the perception of image sharpness, sometimes referred to as definition. When lowered to a negative value, regions of the image with low amounts of detail are softened while areas of high detail are left alone.
- **Color Boost**: Lets you naturalistically raise the saturation of regions of low saturation, sometimes referred to as a vibrance operation. Can be used also to lower the saturation of regions of low saturation.
- **Shadow**: Lets you selectively lighten or darken shadow detail. Raising this value retrieves shadow detail recorded below 0 percent, while leaving the midtones alone. 0 is unity.
• **Highlight:** Makes it easy to selectively retrieve blown-out highlight detail in high dynamic range media by lowering this parameter, and achieves a smooth blend between the retrieved highlights and the unadjusted midtones for a naturalistic result.

• **Saturation:** Increases or decreases overall image saturation. At higher values, colors appear more intense, while at lower values, color intensity diminishes until, at 0, all color is gone, leaving you with a grayscale image.

• **Hue Rotation:** Rotates all hues of the image around the full perimeter of the color wheel. The default setting of 50 shows the original distribution of hues.

• **Luminance Mix:** Lets you control the balance between YRGB contrast adjustments you’ve made using the Master Wheels or ganged Custom curves, and Y-only adjustments to contrast made using the Y channel Lift/Gamma/Gain controls of the Primaries palette or the unganged Luma curve.

Additional detail can be found in the Color page basics chapter and each of these operations can be seen on the Primary palette of the user interface.

**Control Buttons**

On the right hand side of the trackballs there are three groups of control buttons.

**The top group includes:**

- **Grab Still:** At any time when you are grading, selecting the Grab Still key automatically grabs a full resolution frame from the Timeline and attach the node graph metadata for later display and use.

- **Undo:** Undo is one of the favorite keys of colorists. Try any grade, and if you don’t like it, simply undo. There are multiple steps of undo available within the page.

- **Redo:** Sometimes you hit undo once too many times. Redo will put back into effect the last item you undid. As with undo, there are multiple levels of redo.

- **Play Still:** Using Play Still, DaVinci Resolve will automatically display a wipe on the Viewer between the current scene and the current still. You can use your mouse on the viewer to move the wipe position. Selecting Play Still a second time will toggle this mode off.

- **Prev Mem:** Each clip, by default, has a memory of its grade, sizing, and so on, which is saved in reference to the source timecode. If you are grading a clip and move from it to another clip, the grade is saved automatically in a memory for that clip. If you come back to the clip and make a change to the grade, then decide you don’t like the change, select Prev Mem to return to the previous grade status you found when selecting the clip.

- **Reset:** This key resets the grade of the current node. Holding down this key deletes all nodes in the clip except for the first node and resets the grades to default and clears the keyframes.

- **Loop:** You may wish to repeat a review of a grade of a clip, or a selection of clips on the Timeline; this Loop toggle key selects or deselects the Loop operation.

- **Bypass:** This toggle selects the node graph bypass mode.

- **Disable:** This toggle enables or disables the current node.
The middle group of buttons include:

- **Prev Node:** Within the Node Editor on the Color page you are likely to have a number of nodes. These are numbered based on the order that you added them. DaVinci Resolve node graphs are completely user configurable, so you can add nodes anywhere and in any order you like. Thus, the Previous Node key selects the node one lower in numerical order.

- **Next Node:** Similar to the Previous Node key, this selects the node adjacent to the current node, in this case the next higher numerical position.

- **Prev Frame:** To step the viewer one frame in reverse along the Timeline. Press and hold the Prev Frame button to go to the first frame of the clip.

- **Next Frame:** A single frame step forward for each key press. Press and hold the Next Frame button to go to the last frame of the clip.

- **Prev Clip:** Selects the first frame of the previous clip.

- **Next Clip:** Selects the first frame of the next clip.

The bottom group includes the **Timeline Transport buttons for reverse play, stop, and play.**

- **Left Arrow:** Select this key to play the clip/Timeline in reverse. Press the left arrow key multiple times to play in reverse at a faster speed.

- **Stop:** You guessed it. This stops the playback.

- **Right Arrow:** The forward key plays the clip/timeline forward. Press the right arrow key multiple times to play forward at a faster speed.
DaVinci Resolve Mini Panel

The Mini control panel has an identical feature set and controls as the Micro panel for the lower trackball deck. In addition the panel has an upper sloped desk with dual high resolution LCD displays with four soft knobs and keys that are menu driven. There are also two banks of control buttons, on the left hand side for palette selection and on the right hand side for commonly used operations.

Please refer to the Micro panel details above for the lower deck features.

Palette Selection Buttons

On the left hand side of the top deck you will find 15 palette selection buttons. To quickly select the main palette toolsets in DaVinci Resolve simply select the appropriate button and the menus on the LCD screens will update to the correct display.

- **Home**: This key is used for the initial setup of the panel and also selects the top-most menu. Additional palettes in DaVinci Resolve without their own direct access button will be available here in future releases.
- **Left Arrow**: A number of menus have multiple pages as indicated by the small dots in the center of the LCD displays. The left arrow moves the menu display left.
- **Right Arrow**: The right arrow moves the menu display right.
- **Raw**: This palette contains groups of parameters that correspond to every camera raw media format that’s supported by DaVinci Resolve.
- **Primary**: The first grade for every clip will be likely be a primary. This is where you balance the clip and correct for offsets in the black and white balance. Selecting Primary switches DaVinci Resolve from other grading modes and automatically selects the Primary menus for the LCD displays.
- **Motion**: The Motion Effects palette (only available in the Studio version) contains two sets of controls for applying optical-flow-calculated effects to clips in your program. These include enhanced Spatial and Temporal noise reduction, and motion-estimated artificial motion blur.
- **Curves**: The Curves palette has six modes that provide different curve-based methods of manipulating the color and contrast of an image. Each curve lets you adjust a customizable region of the image based either on image tonality (zones of lightness or darkness), hue (specific colors), or saturation (intensity of color).
• **Qualifier:** When you select and isolate a particular color, and change that color, you are making a secondary correction. The qualifier key updates the menus to provide all the Secondary controls, including the 3D, HSL, RGB, or Luma key, with which to isolate the correction you need.

• **Window:** Power Windows are another way of making secondary correction, being essentially shapes you can use to isolate regions of the image. Different controls let you use oval, rectangular, polygonal, or custom curved shapes. Because you can isolate regions of the image by drawing, Power Windows produce exceptionally clean results, with edges that can be precisely positioned and feathered to achieve a variety of effects.

• **Tracker:** The Tracker palette has three modes, available from the Palette menu. In Window mode, the tracking controls let you match the motion of a window to that of a moving feature in the frame. In Stabilizer mode, the same underlying technology is used to smooth or stabilize the motion within the entire frame, while in FX mode a point tracker can be used to animate ResolveFX or OFX plug-ins with positioning controls.

• **Blur:** With the Blur palette controls you can apply an exceptionally high-quality Gaussian blur, or another equally high-quality sharpening operation to your image.

• **Keyer:** Each color correction node’s key input and key output makes it possible to route key channel data from one node to another so you can apply isolated corrections. These key levels are controlled in the Keyer palette.

• **Sizing:** DaVinci Resolve has a powerful toolset for making geometric transforms, using advanced algorithms for optical-quality sizing operations and they are found in this palette.

• **Fx:** Control of the Resolve FX plug-ins from this palette will be available here in future releases.

• **User:** User configured menus will be available here in future releases.

**Quick Selection Buttons**

On the right hand side of the top deck you will find 15 quick selection buttons. These are for very commonly used selections that a colorist might use many times for each clip.

![Quick selection buttons](image)

• **Serial:** The most common node to use on the node graph is a Serial node. A Serial node is a full-featured color correction processor offering primaries, secondaries, windows, tracking, image stabilization, sharpening and blur, matte blur, and so on. Serial nodes are added one after the other in a cascade mode, similar to adding one layer of correction on top of the last. All grades in a preceding node(s) will impact the source image and therefore the grades in following nodes.
• **Parallel**: Unlike adding a Serial node, adding a Parallel node first actually adds two nodes. One behaves like a Serial node with full color correction capabilities. The second is a Parallel Mixer node. This mixer accepts the image from the original Serial node and from the new Serial node and the output is a mix of these two. If the current node is one of the Serial nodes immediately preceding the Parallel Mixer node and you select Add Parallel again, another input to the mixer will be created as will another preceding Serial node. In each case, the input to these Serial nodes will be common, effectively making them in parallel to each other. The key advantage is that the source image is available to many nodes, whereas in a straight Serial node graph, each time you restrict a color in a node the following nodes have little ability or limited range to use that color.

• **Layer**: The Layer node is similar to the Parallel node in that it accepts the image inputs from more than one node. The key difference to a Parallel node is that the mixing of the inputs in a Layer node is prioritized towards the latest additions to the input list. For example, select Add Layer and DaVinci Resolve will add a node in parallel to the current node and link the output of the current and the newly made Parallel node to the two inputs of the Layer Mixer node. The previous current node will have the lowest priority in the mix, and the newly made Parallel node the highest priority. Add one more Layer node, a third input node will be created with a higher mix priority than the first two nodes.

• **Node + Linear**: Adds a Serial node after the current node on the node graph and simultaneously adds a Linear Power Window, thus reducing the number of keystrokes.

• **Node + Circle**: Adds a node after the current node on the node graph and simultaneously adds a Circular Power Window.

• **Append**: Often when navigating around the Node Editor and making correction trims, the colorist decides he/she needs an additional node for more correction. Using the Append Node key will always add a Serial node to the very end of the node graph, regardless of which node in the graph is the current node.

• **Copy**: Used to copy a selected nodes grade to another node.

• **Paste**: Use this key to complete the copy/paste of node grade.

• **Full Viewer**: The Full Viewer display shows an enlarged Viewer and this includes transport controls at the bottom, timecodes and the selections for Reference Still modes, split screens, and Highlight modes.

• **Prev Still**: If you have a still selected, the Previous Still key selects the one preceding.

• **Next Still**: The next still is selected if this key is used.

• **Highlight**: When in the Qualifier menus making secondary qualifiers, it’s common to select the Highlight key to show a high contrast separation of the qualified color and all other parts of the image. Toggle this key to turn off.

• **Prev KF**: This key steps backward one keyframe on the Clip/Track Timeline display.

• **Next KF**: For keyframe steps forward on the Clip/Track Timeline display.

• **Ref**: This toggle key changes the reference wipe mode between Gallery, Timeline, and Offline sources.
DaVinci Resolve Advanced Control Panel

There are three panels in the Advanced control panel set. The center Trackball panel is where the majority of controls and feedback for the colorist are found and it includes a slide-out keyboard.

On either side of the Trackball panel are two interchangeable panels, the position of which is determined by operator preference. The T-bar panel, shown above on the left, has a T-bar Mix/Wipe control and a number of menu and function keys. The Transport panel, shown above on the right, has the Timeline Transport controls and a Jog/Shuttle control as well as a numerical keypad and associated function keys.

All panels have soft keys and variable control knobs within the LCD panel, which provide an accurate visual reference to the control without the risk of parallax errors.

A key feature of the panel design is real-time feedback, provided to the colorist via the full color LCD panels where you can see, at a glance, the relative settings of the controls and a highlight of the last control touched. For example, if a control is out of its default reset, the panels show this with a selectable color highlight.

Menus, Soft Keys, and Soft Knob Controls

The soft menu structure is designed to offer simultaneous control over multiple functions and a fast, logical, and efficient way to move between the menus. These soft menus, the soft keys, and the operation of these in conjunction with the variable knobs are covered in the preceding chapters of this manual as their state changes depending on the operation being performed.

You will find the LCD on each of the panels has a two-line title description of the menu’s main function and there are two lines of text above each pot or switch describing the control. The T-bar and Transport panels also have a “More” key to the bottom right of the LCD which will select a second layer of menus.

The T-bar and Transport panels have quite independent controls compared to the Trackball panel. For example, the T-bar panel’s default menu is for Windows adjustment while the default menu for the Transport panel is Sizing. This allows users to control windows or sizing at any time, regardless of the Trackball panel mode and eliminates the need to change the work surface to adjust window position or input sizing.

While the menus change with the UI, the hard keys, trackballs, T-bar, and shuttle control remain relatively constant, so the majority of this chapter describes groups and individual key functions.

At the end of this chapter are details on copying forward, scrolling, and rippling changes using the Advanced control panel.

Shift Key Convention

Before describing the hard key operation, it is important to understand two keys on the left and right panels. These keys, Shift Up and Shift Down, provide access to potentially two more functions on each of the next key selected.

For example, on the T-bar panel, next to the Shift Up key is the Base Mem key. The term “Base Mem” is a legacy DaVinci colorist description to revert to the default memory, so there is no grade or sizing on that node. (There is an exception discussed later in this chapter.)
If you select Shift Up and then Base Mem, the All operation is to Base Mem All or reset the current color correction of every node in the node graph for the current clip, leaving the nodes in place. To “Reset” the selected node graph or “Reset Grades and Nodes,” first select Shift Down, then Base Mem.

To permit a fast and single-handed operation, this function does not require you to hold the Shift Up or Shift Down key while selecting the second key; just select them sequentially, first the Shift key, then the function.

**Trackball Panel**

The center panel has the traditional four trackballs, each with a surrounding control ring and no end stop in either direction. Three variable knob controls are on each side of the panel, three keys above the trackballs, three below the leftmost and rightmost trackballs. On the LCD panel, there are three LCD displays, each with eight knob controls and four keys. The LCD screens are menu driven and thus the knobs, soft keys, and the display itself depends on the application’s current operation. The center panel also offers a slide-out keyboard for naming files, stills, and nodes, as well as for a number of other operations.

The three trackballs, from left to right, are in the traditional DaVinci format of Lift, Gamma, and Gain when DaVinci Resolve is set for Primary grading; when in Log grading they are Lowlights, Midtones, and Highlights.

By rotating the trackball the colorist can alter the balance between the red, green, and blue levels of the image. Using the vectorscope as a rough guide, moving the trackball towards the three-thirty clock position adds more blue while reducing the red and green.

The control ring surrounding these trackballs provides a master amplitude control of the associated trackball.

**Above the three leftmost trackballs you will see three buttons for resetting the grade:**

- **RGB:** This key only resets the RGB balance to default detent.
- **All:** Select All to reset both RGB and level.
- **Level:** Select the Level key to reset the level while maintaining RGB differential.

The rightmost (fourth) trackball has a number of modes. It operates similar to a mouse for moving the onscreen cursors, Color curve control point position, and Power Windows position, and can also act as a primary grade Offset control.
Under the leftmost and rightmost trackballs there are three unmarked buttons.

On the left hand side of the panel, the right-most of the three unlabelled buttons below the
trackball toggles the right hand side (fourth) trackball in and out of offset adjust mode.

The keys under the right-hand side trackball provide left, center, and right mouse buttons.

Above the rightmost trackball, the three keys have two modes.

When used in conjunction with the Shift Down button, the three buttons above the trackball
function as resets, as per the buttons above the other trackballs.

- **Shift Down Adjust Window:** Only resets the RGB balance to default detent.
- **Shift Down Modes:** To reset both RGB and level.
- **Shift Down Cursor:** To reset the level while maintaining RGB differential.

**In their normal operation they select:**

- **Adjust Window:** Selection turns on the Viewer Shape cursors for the current node and
  allows the trackball to position the current window.
- **Modes:** This key allows access to a number of menus and acts as an on/off toggle.
- **Display (Shift Up Cursor):** This shift function changes the cursor views on the main
  monitor. The user can select the cursor display, including: Windows, Off, On the UI but
  not the main SDI monitor, or displayed on both.
- **Cursor:** The Cursor is used for the color picker when in Curves and Vector/Secondary
  modes. This key also controls the Window display.

On the left side of the panel are three luminance knobs. From top to bottom they are Luminance
Gain, Gamma, and Lift.

On the right side there are three more controls, from top to bottom: Saturation, Hue (has the
effect of hue rotation), and Luminance Mix.

**T-bar Panel**

The T-bar panel, typically located on the left for a right-handed colorist, has an LCD display with
four variable controls and nine soft keys. The lower section of the panel houses the T-bar and
six groups of hard keys. Each group and their keys are described below.

**Mode Control Group**

The Mode Control group provides navigation to a number of the GUI pages and a few
commonly used functions.

- **Config:** This key opens the Project Setting window where you will set up
  DaVinci Resolve for each project. Select again to close the window without saving.
- **Browse:** Select Browse to call the Media page where you can review files on attached
  storage and review the Media Pool.
- **VSR (Shift Down Browse):** This selection is reserved for future use.
- **Conform:** Selects the Lightbox display on the Color page.
- **Shift Up Conform:** Toggles the display of the Lightbox on the SDI output.
- **Deck (Shift Up Revival):** The Deck key selects the Capture mode for importing a batch
  list from an EDL.
- **Revival:** This key opens the Revival Dirt and Dust-busting window.
• **Scene (Shift Down Revival):** To select the Scene Cut Detection window, select the Shift Down key followed by the Revival key.

• **Current ~ Viewer:** This key toggles between the Color page and the Enhanced Viewer page.

• **Object Track Mode:** This key selects the Tracking menus.

• **Clip/Track/Unmix:** This is a toggle key between the Clip/Timeline modes of the node graph and the Unmix mode.

• **User (Shift Up Cache Mode):** This marks a clip for render cache of the clip output.

• **Cache:** This key is a toggle function to turn the render cache on or off.

• **Editor:** Selects the Edit page where you can edit the Timeline, import AAF, EDL or XMLs and apply speed changes, Composite and Dissolve/Wipe effects, and so on.

• **Proxy On/Off:** This key toggles the proxy mode on and off.

• **Auto Color:** This is a popular key. Using this key, DaVinci Resolve will automatically make a basic primary color correction to balance the blacks and whites of your image.

• **Page Up (Shift Up Gallery):** In larger projects you may have a number of gallery albums holding stills. This key changes the Gallery page to the next higher album on the list.

• **Gallery:** Used to select the Gallery UI page where you can manage, import, and export your stills.

• **Page Down (Shift Down Gallery):** The inverse of the Shift Up Gallery function, this selects the Gallery album one lower than the current.

• **A/C Mode:** This toggle key displays the clips in the Timeline in the order of the EDL (the record order, often referred to as C Mode), or the ascending order of the source clip timecode, called A Mode.

• **Handles Mode:** This selection exposes the handles of the selected clip to allow tracking and grading outside the I/O selections of the current edit.

**Timeline Management Group**

When grading clips, colorists often try different looks. This group of keys offers a quick way to navigate through these versions and to split and join clips on the Timeline.

• **Split (Shift Up Undo):** This key splits the clip at the position of the cursor on the Timeline.

• **Undo:** Undo is one of the favorite keys of colorists. Try any grade, and if you don’t like it, simply undo. There are multiple steps of undo available within the page.

• **Join (Shift Up Redo):** The reverse of split. Place the Timeline cursor at the junction of two clips that have sequential timecode and select Join to make just one clip.

• **Redo:** Sometimes you hit undo once too many times. Redo will put back into effect the last item you undid. As with undo, there are multiple levels of redo.

• **Restore Point:** This selection is reserved for future use.

• **Save:** Remember this key; it’s your friend. Save often, and also consider the auto save options found in the User Preferences.

• **Add Version:** When you make a grade on any clip, DaVinci Resolve stores the parameters for that clip. If you want to try different grades, don’t lose your good grades, just use the Add Version feature. This key makes a second, third, or higher version of the grade for that clip.
• **Default Version:** If you have multiple versions of grades for a clip, this key is used to select the Default version, regardless of which version is currently displayed.

• **Previous Version:** This selects the grade one version lower in order. For example, if you are on version three, select Previous Version to get to version two. Once the Default version is reached, selecting Previous Version again will select the highest version.

• **Next Version:** Use this key to select the next higher version of the grade. Once the top version is reached, selecting Next Version again will select the lower version.

### Keyframing Group

On the bottom right of the Color page is the Keyframe timeline for the current clip. The Keyframing group of keys is used in association with the Keyframe timeline and controls the selection of marks for the start and end of dynamic transitions of the grade.

• **Start Dynamic:** Use Start Dynamic to select the first keyframe in a transition. The transition may be a grade change, resizing, the addition of a matte, or any number of 100 variables, all of which are associated with the node graph and the Clip or Track timeline.

• **Ripple Value:** If you have a grade or effect, or just an adjustment, and you would like to ripple this effect over another effect or over a large number of other clips, use Ripple Value.

• **Delete:** This key deletes the selected keyframe.

• **Lift Mark:** If you place a keyframe in the wrong spot, put your cursor on the keyframe and use Lift Mark to remove it.

• **Trim:** This key is used with the numerical keypad to trim a keyframe’s position.

• **Mark:** Like the Start Dynamic key, Mark is a major key. It places a Static keyframe on the Keyframe timeline.

• **Scene (Shift Down Mark):** This selection opens the Scene Cut Detector.

### Memory Access Group

DaVinci Resolve has a number of hot keys, called Mem, where you can store a grade for quick reference. In fact, every time you make a grade for a clip, a memory of the grade is kept. While you could save a still for each clip, having thousands of stills to scroll through would take time, so there are 26 quick and easy memory locations to store a grade, called A–Z Mem.

Every clip has its own metadata for the grade that is stored by DaVinci Resolve as a memory. There are a number of keys available to select or revert to these stored metadata memories, or to clear the metadata to revert to a base grade or no grade state.

• **All (Shift Up Base Mem):** This is used to reset the current color correction of every node in the node graph for the current clip, leaving the nodes in place.

• **Base Mem:** Used to reset the grade of the current node.

• **Reset (Shift Down Base Mem):** Used to reset the grades of the current clip.

Please note that there is an exception to the rule to clear the Base Mem. It is possible, in fact very helpful sometimes, to have a clip preset that is not cleared when you select Base Mem. For example, when a film is over scanned and the frame edges are shown as well as the image. Instead of making an input resize adjustment for every clip to remove the framing, a preset resize can be made and stored, with a label, and this preset is not deleted when using Base Mem.
• **Preview Mem:** To preview one of the Memory grades on any clip, select the clip on the Timeline, select Preview Mem and then the Memory letter. This key is a toggle so if you do not like the grade on the memory for that clip, select Preview Mem again and the grade will revert to the original.

• **Original Mem:** Each clip by default has a memory of its grade and sizing, etc. If you are grading a clip and move from it to another clip, the grade for the first clip is saved automatically in a memory for that clip. If you come back to that clip and make a change to the grade, then decide you don’t like the change, select Original Mem to return to the grade status you found originally.

• **Scroll:** When you select Scroll you can navigate up and down the Timeline to find and select a clip and its grade to recall to the current clip.

• **View (Shift Up Current):** The Color page has two display modes. The normal mode includes the viewer, stills, and node graph on the top of the page. Selecting View toggles to the alternate page with a wide Node Graph view and stills but no viewer. Select View again to toggle back to the normal mode.

• **Crnt:** Select Current before selecting a Mem key (A, B, C to Z) and the current grade on the active Timeline clip will be stored in the memory selected.

• **Shift Up:** The Shift Up key permits the operator to select the upper secondary function of keys on the control panel. This operation does not require you to hold the Shift Up key, just select it prior to the second key.

• **Shift Down:** The Shift Down key permits the operator to select the lower secondary function of keys on the control panel. This operation does not require you to hold the Shift Down key, just select it prior to the second key.

• **Macro:** This key displays the Split Screen controls on the T-bar panel LCD display.

• **Memory Keys:** The A, B, C to Z keys, selected directly or with the appropriate Shift Up or Shift Down preselection will recall the grade stored in this memory and will apply it automatically to the clip that is active on the Timeline.

**Menu Navigation and Node Control Group**

DaVinci Resolve is a nodal-based color enhancement system. Grades are not stored in layers, but in nodes. In operation they can appear to be in layers if you select the Serial nodes, but greater grading flexibility is available by using the Parallel and Layer nodes.

This group also gives you quick access to the main menus to control primaries, secondaries (known here as Vectors), image sizing, and windows. It also offers a quick way to add and manage nodes.
• **Primary**: The first grade for every clip will be likely be a primary. This is where you balance the clip and correct for offsets in the black and white balance. Selecting Primary switches DaVinci Resolve from other grading modes and automatically selects the Primary and Custom Curve menus for the LCD displays.

• **Vectors**: When you select and isolate a particular color, and change that color, you are making a secondary correction. The Vectors key updates the menus to provide all the Secondary controls, including the hue selection and control.

• **Sizing**: The input and output image resizing engines are controlled using the menus selected by Sizing.

• **Windows**: The Windows key opens the menus for Circular, Linear, Polygon, PowerCurve, and Gradient windows that can be used as a matte or mask for primary and secondary grades.

• **Outside Node**: Selecting the Outside Node key adds another node after the current node and automatically link both image and key paths. If the original node has a grade within the matte shape the new Outside node would control the grade in the inverse (i.e., outside the matte).

• **Add Matte**: Selecting this key displays the Matte node on the node graph for the selected node and the default matte selected.

• **Disable Current**: This key is a toggle key and it disables or enables the grade on the current node.

• **Delete Current**: To delete the current node. Remember to use undo if you had the wrong node selected.

• **Bypass (Shift Up Disable Current)**: This toggle selects the bypass mode.

• **Enable/Disable All (Shift Down Disable Current)**: This toggle enables or disables all nodes.

• **Node + CPW**: Adding a Serial node is a one button selection, Add Serial, but to also add a window requires a number of extra key selections. The Node + CPW key adds a node after the current node on the node graph and simultaneously adds a Circular Power Window, thus reducing the number of keystrokes.

• **Node + LPW**: As above, adds a Serial node after the current node with a Linear Power Window.

• **Node + PPW**: A Polygon Power Window is also selected when adding a Serial node.

• **Node + PCW**: This key, like the others above, adds a Serial node after the current node, but also sets up the PowerCurve Window to permit the marking of freeform shape points and Bezier spline curves on the viewer to construct a freeform window.

• **Add Serial**: The most common node to use on the node graph is a Serial node. A Serial node is a full-featured color correction processor offering primaries, secondaries, windows, tracking, image stabilization, sharpening and blur, matte blur, and so on. Serial nodes are added one after the other in a cascade mode, similar to adding one layer of correction on top of the last. All grades in a preceding node(s) will impact the source image and therefore the grades in following nodes.

• **Shift Down Add Serial (Add Serial Before)**: This adds a serial node before the current node.

• **Add Parallel**: Unlike adding a Serial node, adding a Parallel node first actually adds two nodes. One behaves like a Serial node with full color correction capabilities. The second is a Parallel Mixer node. This mixer accepts the image from the original Serial node and from the new Serial node and the output is a mix of these two. If the current node is one of the Serial nodes immediately preceding the Parallel Mixer node and
you select Add Parallel again, another input to the mixer will be created as will another preceding Serial node. In each case, the input to these Serial nodes will be common, effectively making them in parallel to each other. The key advantage is that the source image is available to many nodes, whereas in a straight Serial node graph, each time you restrict a color in a node the following nodes have little ability or limited range to use that color.

**Add Layer:** The Layer node is similar to the Parallel node in that it accepts the image inputs from more than one node. The key difference to a Parallel node is that the mixing of the inputs in a Layer node is prioritized towards the latest additions to the input list. For example, select Add Layer and DaVinci Resolve will add a node in parallel to the current node and link the output of the current and the newly made Parallel node to the two inputs of the Layer Mixer node. The previous current node will have the lowest priority in the mix, and the newly made Parallel node the highest priority. Add one more Layer node, and a third input node will be created with a higher mix priority than the first two nodes.

**Append Node:** Often when navigating around the Node Editor and making correction trims, the colorist decides he/she needs an additional node for more correction. Using the Append Node key will always add a Serial node to the very end of the node graph, regardless of which node in the graph is the current node.

**Reference Configuration Group**

This area of the T-bar panel includes six keys and the fader T-bar. It is primarily used for control of stills display with and without reference wipes. The fader bar controls the mix or wipe position when the appropriate mode is active.

- **Key:** This key adds and Alpha output on the node graph.
- **Circle:** This key is not yet implemented.
- **Wipe:** The Wipe key selects a wipe for reference comparison with the current image.
- **H/V:** This key toggles the wipe between horizontal and vertical.
- **Box:** This key is not yet implemented.
- **Mix:** Select this key to mix in preference to wipe.
- **Still:** The Still key permits comparison of the current clip with the selected still.
- **Memory:** Use this key to compare the current clip with a memory.
- **Highlight:** When in the Qualifier (Vector) menus making secondary qualifiers, it’s common to select the Highlight key to show a high contrast separation of the qualified color and all other parts of the image. Toggle this key to turn off. Highlight is used so often it’s also on the T-bar panel and, when in Vectors mode, on the Trackball panel.
- **Mode (ShiftDownHighlight):** Used to toggle the Highlight mode from gray to high contrast.
- **Timeline:** Select the Timeline key when you want to compare the current to the Timeline image.
- **Offline:** Select the Offline key when you want to compare the current to the Offline image.
- **Reference On/Off:** This toggle key will turn the reference view on or off. When on, you can see the current clip in comparison to a reference.
Transport Panel

The Transport panel, typically located on the right for a right-handed colorist, has an LCD display with four variable controls and nine soft keys. The lower section of the panel houses the Jog/Shuttle knob and six groups of hard keys. Each group and their keys are described below.

Reference Configuration Group

Located at the top left-hand side of the Transport panel are the Deck and Still selection keys. These are all related to controlling the tape deck and to grabbing and selecting stills. There is also an Undo and Redo key, a Shift Up and a Save key.

- **Split (Shift Up In):** DaVinci Resolve associates grading information based on source timecode so it’s important to have each source clip identified as a different clip from the others. The Split key will split one clip into two on the frame selected. Each can therefore have its own grade. This is a quick, accurate, and easy way to split a long image sequence into multiple clips.

- **In:** When marking an In point you can use the UI, a keyboard shortcut, or this key.

- **Join (Shift Up Out):** Join is the reverse of the Split key. If you have clips with contiguous timecode, place the playhead on the first frame of a clip and select Join to merge the preceding clip.

- **Out:** The Out key is used to select an Out point on the Timeline or deck.

- **Duration:** To define a duration, first select the time using the numerical keypad (the colon separates the hours, minutes, seconds, and frames), and then select Duration.

- **Gang:** This key is not implemented.

- **Undo:** The colorist’s friend. DaVinci Resolve has virtually unlimited undo steps available within the page you are working in.

- **Redo:** If you want to redo a step, use redo. Ideal when used with undo to compare two grades quickly.

- **Source (L):** This key is not implemented.

- **Place (Shift Up A ( R )):** This key is not implemented.

- **A ( R ):** This key is not implemented.

- **F:** This key is not implemented.

- **Place (Shift Up B):** This key is not implemented.

- **B:** This key is not implemented.

- **G:** This key is not implemented.

- **Place (Shift Up C):** This key is not implemented.

- **C:** This key is not implemented.

- **H:** This key is not implemented.

- **D:** This key is not implemented.

- **I:** This key is not implemented.

- **E:** This key is not implemented.

- **J:** This key is not implemented.

- **Shift Up:** Use the Shift Up key as a pre-selector for the keys with an upper option. Select the keys sequentially and do not hold the Shift Up key while selecting the second key.
• **Preroll**: The Preroll key is used in conjunction with the numerical keypad to select a preroll time for tape operations.

• **Cue**: Selecting Cue will force the transport to the preroll position.

• **Previous Still**: If you have a still selected, the Previous Still key selects the one preceding.

• **Next Still**: The next still is selected if this key is used.

• **Play Still**: Using Play Still, DaVinci Resolve will automatically display a wipe on the Viewer between the current scene and the current still. You can use the fader T-bar to move the wipe position and in the Reference Wipe menus change the reference image as required by moving or resizing. Selecting Play Still a second time will toggle this mode off.

• **Save**: The most important key on the panel. Besides using the auto-save feature, you can and should consistently save your project with this key. It only takes a few seconds and can save you hours.

• **Grab Still**: At any time when you are grading, selecting the Grab Still key will automatically grab a full resolution frame from the Timeline and attach the node graph metadata for later display and use.

**Transport Control Keys Group**

Most colorists will use the Transport Control keys every minute of every grade, so they are located for quick and easy access. While not technically within this key group, the Jog/Shuttle knob is directly above these keys.

• **Jog**: Rotate the Jog control to step forward or backward a few frames at a time.

• **Shuttle**: On the outside of the Jog rotary control is the Shuttle knob. This knob has a detent at the null position and is turned clockwise or counter clockwise to shuttle the Transport/Timeline forward or reverse at the rate selected by the rotation of the Shuttle knob.

• **Loop**: You may wish to repeat a review of a grade of a clip, or a selection of clips on the Timeline; this Loop toggle key selects or deselects the Loop operation.

• **Render**: Once you have finished your grade, the Render key selects the Deliver page used for configuring the render parameters for your project and starting the render.

• **Rec**: (Shift Down Render) This key is not yet implemented.

• **Previous Node**: Within the Node Editor on the Color page you are likely to have a number of nodes. These are numbered based on the order that you added them. DaVinci Resolve node graphs are completely user configurable, so you can add nodes anywhere and in any order you like. Thus, the Previous Node key selects the node one lower in numerical order.

• **Next Node**: Similar to the Previous Node key, this selects the node adjacent to the current node, in this case the next higher numerical position.

• **Highlight**: When in the Qualifier palette making secondary qualifiers, it’s common to select the Highlight key to show a high contrast separation of the qualified color and all other parts of the image. Toggle this key to turn on or off. Highlight is used so often it’s also on the T-bar panel.

• **Mode**: (Shift Down Highlight) Used to toggle the Highlight mode from gray to high contrast.

• **Shift Down**: This is the preselection key for functions indicated on the lower portion of the second keys legend.

• **First Frame**: Selects the first frame of the current clip.
- **Last Frame**: Selects the last frame of the current clip.
- **Step Reverse**: To step the viewer one frame in reverse along the Timeline.
- **Step Reverse Keyframe**: (Shift Down Step Reverse) This key steps backward one keyframe on the Clip/Track Timeline display.
- **Step Forward**: A single frame step forward for each key press.
- **Step Forward Keyframe**: (Shift Down Step Forward) For keyframe steps forward on the Clip/Track Timeline display.
- **Previous Scene**: Selects the first frame of the previous scene.
- **Next Scene**: Selects the first frame of the next scene.
- **Rewind**: Places the Transport, or Timeline, in rewind.
- **Reverse**: Select this key to play the Clip/Timeline in reverse.
- **Stop**: You guessed it. This stops the current transport operation.
- **Forward**: The Forward key will play the Clip/Timeline forward.
- **Fast Forward**: The inverse of the Rewind key; fast forward shuttles along the Timeline/Transport.

**Memory Access Keys Group**

For fast and direct access to A to Z Memories, or Mems, use this section of the Transport panel. This is an extremely powerful feature. With any clip selected on the Timeline, with a single key press, for example “A,” the grading parameters stored in memory A, including the node structure, sizing, and so on are automatically applied to the current clip.

- **O (Shift Up A)**: Selects memory O.
- **A**: Selects memory A.
- **I (Shift Down A)**: Selects Memory I.
- **R (Shift Up B)**: Selects memory R.
- **B**: Selects memory B.
- **J (Shift Down B)**: Selects Memory J (and so forth).
- **All (Shift Up Base Mem)**: This function returns all grades for all nodes on the clip to the default grade/settings and clears dynamic keyframes.
- **Base Mem**: The Base Mem key clears the current node of all its grades and keyframes. Again, with the preset exception noted above.
- **Reset (Shift Down Base Mem Crnt)**: This key deletes all nodes in the clip except for the first node and resets the grades to default and clears the keyframes.
- **Preview Mem**: To preview one of the memory grades on any clip, select the clip on the Timeline, select Preview Memory and then the memory. This key is a toggle, so if you do not like the grade on the memory for that clip, select Preview Mem again and the clip’s grade reverts to the original.
- **Original Mem**: Each clip, by default, has a memory of its grade, sizing, and so on. which is saved in reference to the source timecode. If you are grading a clip and move from it to another clip, the grade is saved automatically in a memory for that clip. If you come back to the clip and make a change to the grade, then decide you don’t like the change, select Original Mem to return to the previous grade status you found when selecting the clip.
- **Scroll**: The Scroll key selects a soft menu on the Trackball panel so clips or frames can be scrolled via the rotary control in the soft menu.
Numerical Entry Key Group

On the center right-hand side of the Transport panel is the Numerical Entry key group. Here you will find numbers 0 to 9 and associated keys for entering timecode and clip numbers. You will notice the numbers you type are displayed in a scratchpad area at the bottom of the Keyframe palette.

- **Current**: To store a new grade in any memory, first select the Current key and then the memory of your choice.
- **All Color PTZR**: This key is a toggle that selects the parameters that will be copied when updating a grade. Generally, all aspects of the grade are copied, including the pan, tilt, zoom, and rotation sizing transforms, but on occasion you may wish to copy only the grade and not the sizing parameters. In this case, use the All/Color/PTZR to select the mode you need. You can see the Keyframe Timeline toggle between the master or the node selected and the input PTZR parameters.
- **Select Node**: Use this key in conjunction with the numerical keys to select any node on the current node graph. First, select the node number, and then Select Node. The current node changes to the selected node.
- **Backspace**: The Backspace key moves you one item left in the numerical scratch pad display. This permits correction of your numerical entries.
- **0 to 9**: You guessed it. These are the numbers!
- **>, (Comma)**: The comma is used just before the frame count if you wish to indicate a drop frame timecode.
- **: (Colon)**: When typing in timecode, the convention is to type the hours followed by a colon, then the minutes, a colon, the seconds, a colon, and finally the frames. DaVinci Resolve does not need to have leading numbers entered where they offer no value and the default value is 0, so to type one hour, three minutes, zero seconds, and sixteen frames, you do not need to type 01:03:00:16. Simply type 1:3::16 and then press Enter. This speeds timecode entry.
- **Clear**: Clears the scratchpad number.
- **- (Minus)**: Select the Minus key prior to the number to reduce the number.
- **+ (Plus)**: Select the Plus key prior to a number to increase the number.
- **Take/Enter**: Select the Take/Enter key to accept or enter any input.

Keyframing Group

The Keyframe keys are on the bottom right-hand side of the Transport panel. The functions are replicated on the T-bar panel. On the bottom right of the Color page is the Keyframe timeline for the current clip in the Timeline. The Keyframe group of keys is used in association with the Keyframe timeline and controls the selection of keyframes for the start and end of dynamic transitions of the grade.

- **Start Dynamic**: This key is used to select the first point in a transition, a Dynamic keyframe. The transition may be a grade change, a sizing or reposition, or the addition of a matte or any number of 100 variables, all of which are associated with the Node Editor and the Clip or Track Keyframe timeline.
- **Ripple Value**: If you have a grade or effect, or just an adjustment and you would like to ripple this effect over another effect or a large number of other clips, use Ripple Value.
- **Delete**: This key deletes the keyframe.
- **Lift Mark**: If you place a keyframe in the wrong spot, put your cursor on the keyframe and use Lift Mark to remove it.
- **Trim**: This key is used with the numerical keypad to trim a keyframe position.
• **Mark:** Like the Start Dynamic key, Mark is a major key. It places a Static keyframe on the Clip timeline.

• **Scene (Shift Down Mark):** This selection is reserved for future use.

## Copying Grades Using the Advanced Control Panel

There are a number of methods of copying grades that are exclusive to the Advanced control panel.

### Copy Forward Keys

The simplest way of copying grades using the control panel is to use the comma and colon keys on the keypad of the Transport panel to copy grades from one or two clips behind the currently selected clip. This is a great way to copy grades in scenes with a shot-reverse-shot structure, where you’re cutting between two angles of coverage, each of which uses the same grade.

- **To copy a grade from one clip back:** Press Comma (,).
- **To copy a grade from two clips back:** Press Colon (:).

### Scroll

Scroll mode lets you quickly preview the effects of many different grades applied to clips in the Timeline on the currently selected clip, with the option to either accept or reject the previewed grade to which you’ve “scrolled.” This can be useful for checking to see if any of the previous grades you’ve created in a scene will work for the currently selected clip.

**To use Scroll mode:**

1. Move the playhead to the clip to which you potentially want to copy a new grade. You can use the PREV SCENE and NEXT SCENE buttons to move quickly.

2. Do one of the following to enter Scroll mode:
   - Press SCROLL on the Transport panel.
   - Press MODES, above the fourth trackball on the Center panel, then press the SCROLL MODE soft key.

3. Now, do one of the following to preview different grades from other clips:
   - Press the PREVIOUS SCENE and NEXT SCENE soft keys to move from clip to clip in the Timeline, previewing each grade to the current clip.
   - Turn the SCROLL SCENES knob to scroll smoothly along multiple clips in the Timeline.
   - Turn the SCROLL FRAMES knob to scroll along different frames of any clip, previewing the effects of keyframed grades at different points in time.
   - Press the TOGGLE DECK KEYS soft key to use the transport controls on the Transport panel to play through the Timeline, previewing grades as you go.
   - Press a number on the keypad of the Transport panel, and then the SCENE NUMBER soft key, to jump to a clip and preview its grade.
   - As you scroll from clip to clip, a red outline indicates the clip with the grade being previewed, and an orange outline indicates the current clip to which you’re previewing each scrolled grade.
When you're finished, do one of the following to either accept or reject a scrolled grade:

- Press EXIT AS WAS if none of the grades you scrolled through was suitable. This exits Scroll mode and leaves the clip as it was previously.
- Press EXIT AS IS if you've found a grade that works for the current clip. This exits Scroll mode and copies the scrolled grade.

When you press the TOGGLE DECK KEYS soft key in Scroll mode, each of the Transport Control buttons on the Transport panel functions as a means of previewing the grades of other clips in the Timeline.

- **STEP FWD**: Move to the next clip and preview its grade.
- **STEP REV**: Move to the previous clip and preview its grade.
- **FWD**: Plays (scrolls) forward at 1 scene per second, previewing each new grade as it appears.
- **REV**: Plays (scrolls) the clips in reverse at 1 scene per second, previewing each new grade as it appears.
- **FFWD**: Shuttles (scrolls) forward through the Timeline at 4 scenes per second, previewing each new grade as it appears.
- **RWD**: Shuttles (scrolls) reverse through the Timeline at 4 scenes per second, previewing each new grade as it appears.

## Rippling Changes Using the Advanced Control Panel

DaVinci Resolve has a mechanism for rippling specific changes made to one clip to a range of other clips in the Timeline. This is only possible using the controls of the DaVinci Resolve Advanced control panel.

The general idea of the ripple function is that you select a clip, make a change, and then ripple that change to a range of other clips. This rippled change can be applied to the same node in each clip, or the change can be added as an appended node within each rippled clip.

The Ripple mode that's used when you press the RIPPLE VALUE button can be changed in the Color panel of the User Preferences. There are four options.

- **Exact values changed**: Changes made to the current clip are rippled to the specified clips using the exact parameters that were changed. For example, if Lift in the current clip is changed to 0.75 of its range, each clip you ripple will have a Master Gain setting of 0.75. Only parameters you adjust are rippled.
- **Percent value changed**: Changes made to the current clip are rippled to the specified clips by the percentage of change you made to the altered parameters. For example, if the current clip has a Lift level of 1.00 and is changed to 0.90 units, then the Lift setting of each clip you ripple will have a relative reduction of 10% relative to its previous value.
- **Unit value changed**: Changes made to the current clip are rippled to the specified clips by the same delta of change, using whichever units make sense for the affected parameter. For example, if the current clip had a Lift of 0.80 and you increased it to 0.90, each rippled scene’s master gain level increases by 0.10.
- **All values are copied**: The current clip’s grade is rippled to the specified clips in its entirety. No comparison is made with the original clip’s parameters, and all memory parameters are rippled.
The following procedure describes in detail how you can use the control panel to ripple a change to a range of other clips. While this procedure may appear complicated, it’s just that there are several options. Once you learn the sequence of commands, this process is actually quite fast.

**To ripple a change using the Ripple Mode soft key commands:**

1. (Optional) Press MODES, then press RIPPLE MODES. Four commands appear mapped to the middle soft keys of the Center panel, which can be used later to execute different types of ripple operations.
2. Move the playhead to the clip you want to adjust.
3. Adjust the current clip that you want to ripple to other clips in the Timeline.
4. Define the range of clips you want to ripple to using the number pad on the Transport panel. The following combinations will work:
   - An absolute range of clips is defined by entering two clip numbers separated by a comma. For example, if you want to ripple the current change to clips 10 through 15, you’d press “10, 15”
   - To specify every clip from the beginning of the Timeline, use the Minus (–) key. For example, to specify a range of clips from the beginning to clip 20, you’d press “–, 20”
   - To specify every clip to the end of the Timeline, use the Plus (+) key. For example, to specify a range of clips from the clip 50 to the end, you’d press “50, +”
   - To specify every clip in the whole Timeline, press “–, +”
5. (Optional) You can control whether the rippled change is applied as a new node, or an existing node, in every rippled clip:
   - If you want to apply the rippled change as a new node that’s appended to the end of every rippled clip’s grade, press SHIFT DOWN.
   - Otherwise, the rippled change will be applied to the same node in every rippled clip that you made your adjustment to in the current clip. In other words, if you made a change to Node 2, it would be rippled to Node 2 of all the clips you specified. If one of the rippled clips doesn’t have the same number of nodes, you may get an error.
6. To execute the ripple, do one of the following:
   - Press RIPPLE VALUE on the Transport panel to ripple a change using the currently selected Ripple Mode in the Color panel of the User Preferences.
   - Press one of the Center panel soft keys corresponding to the ripple function you want to perform. There are four soft keys:
     - **Static Ripple:** Changes made to the current clip are rippled to the specified clips using the exact parameters that were changed. For example, if Lift in the current clip is changed to 0.75 of its range, each clip you ripple will have a Master Gain setting of 0.75. Only parameters you adjust are rippled. Identical to the “Exact values changed” ripple setting.
     - **Relative Ripple:** Changes made to the current clip are rippled to the specified clips by the percentage of change you made to the altered parameters. For example, if the current clip has a Lift level of 1.00 and is changed to 0.90 units, then the Lift setting of each clip you ripple will have a relative reduction of 10% relative to its previous value. Identical to the “Percent value changed” ripple setting.
• **Absolute Ripple:** Changes made to the current clip are rippled to the specified clips by the same delta of change, using whichever units make sense for the affected parameter. For example, if the current clip had a Lift of 0.80 and you increased it to 0.90, each rippled scene’s master gain level increases by 0.10. Identical to the “Unit value changed” ripple setting.

• **Forced Ripple:** The current clip’s grade is rippled to the specified clips in its entirety, overwriting all previous nodes and parameters in the rippled clips.

The adjustment you made in step 4 is applied to the designated range of clips.

Admittedly, that was a long and detailed procedure, but the actual button sequences are straightforward once you put them together. Here are some examples of button sequences that ripple an adjustment you’ve just made in different ways:

- “10, 15” then SHIFT DOWN then RIPPLE VALUE: Copies the change you’ve made to the current clip, and applies it as a new node that’s appended to the end of clips ten through fifteen.
- **MODES then RIPPLE MODES then “34, 45” then FORCED RIPPLE:** Copies the entire grade of the current clip, using it to overwrite the grade of clips 34 through 45.

- **MODES then RIPPLE MODES then “–, +” then SHIFT DOWN then RELATIVE RIPPLE:** Copies the change you’ve made to the current clip as a relative percentage, and applies it as a new node appended to the end of every single clip in the entire Timeline.

**WARNING** Once you ripple a change in this manner, there is no going back. Since undo is a per-clip operation, there is no global undo for changes made to the entire Timeline. Proceed with caution.
Chapter 132

Using OpenFX and ResolveFX

This chapter covers the use of ResolveFX and OpenFX plug-ins, that allow you to use the built-in filters that come with DaVinci Resolve, as well as third-party filters from a variety of companies, to create complex effects and adjustments that aren't possible using the ordinary palette tools in the Color page.

ResolveFX

ResolveFX are the built-in plug-ins that come with DaVinci Resolve. These plug-ins span the gamut from blurs and complex color adjustments to stylized image treatments and lighting effects to sharpen and repair operations that are too complex to accomplish using the palette controls of the Color page.

Most ResolveFX plug-ins have been optimized for real-time playback, making it possible to apply complex effects such as Lens Flares, Light Rays, Film Grain, or Warping, and make adjustments while getting immediate, high-quality feedback, and enabling you to play each variation of your effect as you work without the need to wait for rendering or caching to happen first. Of course, if you’re working with extremely high-resolution or raw source media, if your workstation is particularly old, or if you’re applying many ResolveFX all at once, your performance may slow, necessitating the use of either the Smart Cache or User Cache.

OpenFX

OpenFX (OFX) is an open plug-in standard intended to enable easier development of cross-platform visual effects plug-ins for a variety of applications. Popular plug-in packages include BorisFX Sapphire and Continuum Complete, Red Giant Universe, and NewBlue TotalFX, all of which are ubiquitous tools for feature and broadcast work. The available OpenFX plug-in packages are also growing every year as this format becomes more widely adopted among developers.

With OpenFX support, you can use plug-ins to do many stylized operations that would be difficult or impossible to do using the other tools in DaVinci Resolve. Everything from lens flares, optical blurs and prism effects, lens warp correction, film and video grain and damage effects, dead-pixel corrections, and more can be accomplished with the right plug-in collection.
The installation and licensing of OpenFX plug-ins is handled by a vendor’s own installer. Once installed, OpenFX plug-ins appear within the Library of the Open FX panel, which can be opened by clicking the FX button at the top right of the Color page or Edit page Interface toolbar.

**Where are OFX Installed?**

According to the standard governing how OFX work, all OFX plug-ins on a particular workstation are installed into a standardized location to foster plug-in compatibility with multiple applications. These locations are:

- **On macOS:** `/Library/OFX/Plugins`
- **On Windows:** `C:/Program Files/Common Files/OFX/Plugins`
- **On Linux:** `/usr/OFX/Plugins`

**OpenFX Plug-Ins Can Be Processor Intensive**

Because they create such a wide variety of effects, some third-party OpenFX plug-ins can be extremely processor intensive, all the more if you add multiple plug-ins to a single grade. If you find your playback performance dropping because of a particularly expensive effects operation, you can use the Smart Cache to automatically cache nodes and clips that have OpenFX plug-ins applied to them. Once fully cached, you can play these clips back in real time, at least until you change that clip’s grade again. For more information on caching and on improving performance in DaVinci Resolve overall, see Chapter 6, “Improving Performance, Proxies, and the Render Cache.”
Browsing the OpenFX Library

All of these built-in plug-ins appear within categories at the top of the OpenFX Library.

When you click the FX button, the Open FX panel opens out of the right side of the Node Editor to show the Library, resizing the Viewer, Gallery, and Node Editor to make room. The OpenFX Library is organized hierarchically. Each vendor’s plug-ins appear under a header with the name of that plug-in collection, and possibly organized into categories, separated by headers with Open or Close buttons that appear when you hover the pointer over them, which let you show or hide the contents so that you can make the hierarchy as compact or spread out as you like.

**To open and close OpenFX categories, do one of the following:**

- Move the pointer over the header you want to open or close, and click the Close or Open button that appears.
- To open or close all headers at once, Option-click the Open or Close button that appears.

Since many OpenFX plug-in collections are quite large, an optional Search field can be opened at the top of the Library that lets you quickly find plug-ins by name or partial name.

**To search for an OpenFX filter by name:**

1. Click the magnifying glass button at the upper right-hand corner of the OpenFX panel.
2. Type your search string into the Search field that appears. A few letters should be enough to isolate only those plug-ins that have that character string within their name.
OpenFX Library Favorites

You can click on the far right of any ResolveFX or OFX filter to flag it with a star as a favorite filter. When you do so, choosing Favorites from the Effects Library option menu filters out all clips that are not favorites, letting you see only effects you most commonly use. To “de-favorite” any effect, click its star to turn it off.

Stars indicate a flagged favorite effect

OFX Random Frame Access

Previous to DaVinci Resolve 12.5, third-party OpenFX plug-ins could only access a limited range of media at a time, which stopped certain types of plug-ins from being able to do the multi-frame temporal analyses of clips they required to function. DaVinci Resolve Studio 12.5 and later enables third-party OpenFX multi-frame random access, so a wider variety of plug-ins and effects will work in DaVinci Resolve. This feature is not available in the non-studio version of DaVinci Resolve.
Using ResolveFX and OpenFX in the Color Page

This section provides an overview of procedures that describe how you can work with OpenFX plug-ins within the Color page.

Methods of working with OpenFX:

- To add an OpenFX plug-in to a node: Drag a plug-in from the OpenFX Library onto a node. If you drag a plug-in onto a node that already has a plug-in, the previous plug-in will be overwritten.

- To remove an OpenFX plug-in from a node: Right-click a node showing the FX badge, and choose Remove OFX Plug-in from the contextual menu.

- To add an OpenFX plug-in as a separate node: Drag a plug-in from the OpenFX Library onto a connection line in the Node Editor. A new node is created and labeled with the name of the OpenFX plug-in.

- To edit the parameters of an OpenFX plug-in: Select any node with an FX badge, and open the Open FX Panel to show the Settings list. You can switch to the Library by clicking the Library button.

- To sample a color parameter within an OpenFX plug-in: Some OFX plug-ins have a color swatch parameter, which exposes an eyedropper button in the Settings. Clicking the eyedropper turns the pointer into an eyedropper you can use to sample the contents of the Viewer.

- To use OpenFX onscreen controls in the Viewer: Select any node with an FX badge, and the onscreen controls, if there are any, should appear in the Viewer. If not, make sure the Viewer mode drop-down is set to FX.

Applying ResolveFX and OpenFX Plug-Ins

Once you’ve found an OpenFX plug-in you want to use in the Library, there are two ways of applying it within the Node Editor of the Color page. Which method you use depends on how you want to use that plug-in.

Adding a Plug-In to a Corrector Node

If you want to combine an OpenFX plug-in with a grade within a single node, simply drag and drop it onto a new corrector node to apply that plug-in’s effect to that node. Nodes with an OpenFX plug-in applied have an FX badge in the bottom left-hand corner.

A node with an OpenFX plug-in applied
You can only apply one OpenFX plug-in to a node at a time, but by using multiple nodes you can add as many OpenFX plug-ins to your grade as you need.

When added to a corrector node, OpenFX are applied after Motion Blur and Noise Reduction, but before anything else. This means you can use Motion Blur and Noise Reduction to pre-process the image before it's handed off to the OpenFX plug-in. This also means that all other adjustments you make within that node are applied to the OpenFX plug-in's output.

However, the principal advantage of adding plug-ins to corrector nodes is that you can use secondary operations such as a window, a qualifier, or a key to limit that plug-in's effect, much as you would limit any other kind of adjustment you'd make with a corrector node.

Adding a Plug-In as a Stand-Alone OFX Node

If you want to add an OpenFX plug-in to your grade as a stand-alone effect, you can simply drag any plug-in from the OpenFX Library onto a connection line of your grade, and an OpenFX node will be created.

The advantage of this is that it's fast to apply plug-ins in this way, and this can be an easier way for you to add plug-ins that are more complicated, such as those having multiple inputs for creating compositing effects.

For example, the Lens Blur plug-in lets you connect a black and white image that's been added to the node tree as an external matte to a Lens Blur node's second RGB input to use to create custom bokeh effects when you set the Shape Type drop-down to External Input.
ResolveFX and OpenFX Settings

When you select a node with a ResolveFX or OpenFX plug-in applied to it, the Open FX panel switches to the Settings, which show you every single parameter associated with that plug-in, ready for customization.

Adjust any of the standard controls to manipulate that plug-in’s effect on the image.

Editing Effects Using the Full Screen Viewer

Because the OpenFX panel can often be too short to present the full controls of more complicated filters, it remains visible when you switch to the Full Screen Viewer mode in the Color page. Jump into this mode by choosing Workspace > Viewer Mode > Full Screen Viewer (Shift-F).

This control layout makes it considerably easier to do detailed work while viewing a larger image and having all of your effects visible in a taller panel off to the side.
ResolveFX and OpenFX
Onscreen Controls

In the Edit page, Fusion page, and Color page, ResolveFX and OpenFX display on-screen controls that you can use to visually edit an effect. In the Edit and Color pages, selecting an OpenFX plug-in node or a plug-in in the Inspector that has onscreen controls automatically changes the Viewer’s mode to OpenFX Overlay mode, with the available controls ready to use. Different plug-ins expose different custom controls, letting you control the effect or manipulate the image, depending on that plug-in’s function.

If for whatever reason you switch the Viewer to another onscreen control mode (for example, showing the Window or Image Wipe controls), you can always switch back to the OpenFX controls by choosing the OpenFX Overlay mode from the onscreen control drop-down menu underneath the Viewer.

Keyframing ResolveFX and OFX in the Inspector

ResolveFX and OpenFX can be keyframed in the Edit, Fusion, and Color pages. However, they can only be keyframed in the Edit and Color pages using the keyframing controls found in the Inspector (at the time of this writing). Happily, most simple keyframing tasks can be performed using three buttons that appear to the right of any parameter that’s capable of being keyframed. It takes two keyframes at minimum to create an animated effect.

TIP: You can also open and close the Node Editor while in Full Screen Viewer mode, if you need to switch nodes while doing effects work.

TIP: You may find that as you work you want to temporarily hide or show the onscreen controls in the Viewer so you can get an uncluttered look at the image you’re adjusting. You can quickly toggle any set of onscreen controls off and on without selecting Off in the menu by pressing Shift-` (tilde).
The three keyframe controls that appear in the Inspector, from left to right: Previous keyframe, Create/Delete keyframe, Next keyframe

Methods of keyframing parameters in the Inspector:

- **To add a keyframe:** Select a clip, open the Inspector, then move the Timeline playhead to the frame where you want to place a keyframe, and click the Keyframe button next to the parameter of the Inspector you want to animate. Once you’ve added at least one keyframe to a parameter, all other adjustments you make to parameters in the Inspector, or using the onscreen Transform/Crop controls in the Timeline Viewer, add new keyframes automatically if the playhead is at another frame.

- **To move the playhead to the next or previous keyframe:** Click the small left- or right-hand arrow to either side of a parameter’s keyframe control, or press Right-Bracket ( ] ) or Left-Bracket ( [ ), to jump the playhead to the next or previous keyframe.

- **To edit an existing keyframe of a parameter:** Move the playhead to be on top of the keyframe you want to edit, and then change that parameter, either in the Inspector, or using the onscreen controls of the Timeline Viewer.

Methods of changing keyframe interpolation in the Inspector:

- **To change a keyframe to Static:** (Color page only) Static keyframes create abrupt one-frame changes at the keyframe to which they’re applied, which is good for creating sudden effects. Move the playhead to a frame with a keyframe using the next/previous keyframe controls, then right-click the orange keyframe button and choose “Change to Static Keyframe.” The keyframe control changes to a round button to show that keyframe is now Static.

- **To change a keyframe to Dynamic:** Move the playhead to a frame with a keyframe using the next/previous keyframe controls, then right-click the orange keyframe button and choose “Change to Dynamic Keyframe.” The keyframe control changes to a diamond button to show that keyframe is now Dynamic.

Methods of deleting keyframes and disabling keyframed effects:

- **To delete a single keyframe:** Open the Inspector, move the Timeline playhead to a frame with a keyframe, and click the orange Keyframe button in the Inspector to delete it.

- **To delete all keyframes for one parameter:** Click the reset button to the right of a parameter’s keyframe control in the Inspector.

- **To delete all keyframes in a group of parameters in the Inspector:** Click the reset button to the right of a parameter group’s title bar in the Inspector.

- **To disable or enable a single parameter’s keyframed effect:** In the Timeline, click the toggle control at the left of a parameter’s keyframe track. A white dot means it’s enabled, while no dot means it’s grayed-out and disabled.

- **To disable or enable a group of parameters in the Inspector:** Click the toggle control at the left of a parameter group’s title bar in the Inspector. Orange means that group is enabled. Gray is disabled.
Motion Tracking ResolveFX and Compatible OFX Plug-Ins

When using ResolveFX in the Color page, ResolveFX that have position parameters, including Dent, Lens Flare, Light Rays (when “From a Location” is selected), Mirrors, Radial Blur, Ripples, Vortex, and Zoom Blur can all be motion tracked to follow the position of a moving subject in the frame using the point-based tracking in the FX mode of the Tracker palette.

To match move ResolveFX to a feature using the FX tracker:

1. Create a new node, and drag the ResolveFX filter you want to apply onto that node to apply the effect. In this example, we’re adding a Lens Flare effect, that has the position parameters necessary to be match moved to follow the motion of the shot, and we’re choosing the MIR-I 2.8/37 preset, which looks like a sun.

![Applying a Lens Flare to the shot](image)

2. If necessary, use the onscreen controls in the Viewer or the X Position and Y Position sliders to move the ResolveFX effect to where you want it.

![Moving the Lens Flare using the onscreen controls](image)

3. Next, open the Tracker Palette and choose FX from the mode drop-down.

![Opening the FX tracker mode of the Tracker palette](image)

4. Click the Add Tracker Point button, at the bottom left-hand side of the Tracker palette, to add tracker crosshairs to the center of the Viewer.
Adding a point tracker

5 Drag the crosshairs to a high-contrast detail (such as a small object or corner), and click the Track Forward button. In this example, there's a rock out at sea that will make a good plane of motion for tracking a far-away sun. There is no inner or outer box to position or resize while you do this; you just need to drag the crosshairs to center on the feature you want to track.

Positioning the point tracker on a feature you want to track

6 Now, click the Track Forward button, and DaVinci Resolve will track the feature. The ResolveFX applied to that node will simultaneously move to follow the track, and when the tracking is done, you’re finished.

A successful track

7 After you’ve finished tracking, you can freely reposition the ResolveFX to offset it from the track.

For more information about single-point tracking, see the “Point Tracker Workflows” section of Chapter 121, “Motion Tracking Windows.”
Chapter 133

Sizing and Image Stabilization

DaVinci Resolve has a powerful toolset for making geometric transforms, using advanced algorithms for optical-quality sizing operations. This section covers the nuts and bolts of resolution independence in DaVinci Resolve, and how to use the Sizing palette. This chapter also covers how to use the Stabilizer mode of the Tracker palette to subdue unwanted camera wiggle.
The Five Color Page Sizing Modes

The Sizing Palette on the Color page can be put into one of five modes, each of which accomplishes a different task.

- **Edit Sizing**: These controls mirror those found in the Inspector of the Edit page.
- **Input Sizing**: These controls let you make sizing adjustments to individual clips that affect their overall geometry (pan, tilt, zoom, and rotation). These controls are useful for doing clip-by-clip pan and scan adjustments.
- **Output Sizing**: These controls are nearly identical, except that they affect every clip in the entire timeline, all at once. Output sizing is useful for making a formatting adjustment to an entire timeline, such as changing an HD timeline to an SD timeline with simple adjustments to crop and pan the resulting framing.
- **Node Sizing**: Lets you add targeted sizing adjustments at any point within the node tree. Like Input Sizing, Node Sizing is specific to a particular clip. Unlike Input Sizing, Node Sizing is affected by operations that split color channels (such as the splitter/combiner nodes) and limit the image (such as qualifiers and windows). You can also add as many node sizing adjustments to a clip’s grade as you need.
- **Reference Sizing**: A set of sizing controls that lets you reposition the still when a wipe comparison is being made. Using these controls, you can move the still image to better compare it to the clip you’re wiping it against. The Reference Sizing controls only work when you have a wipe enabled.

Sizing Order of Processing on the Color Page

Input Sizing adjustments are applied before all image processing that takes place in the node graph, including Node Sizing, while Output Sizing adjustments are applied after image processing in the node graph.

Sizing Controls

Input, Node, and Output Sizing share many of the same controls. When the Sizing palette is set to Input Sizing mode, the controls transform each clip individually. If you’re simply pushing in on one or two clips, or making individual pan and scan adjustments to account for a change in format, these are the controls you want to use.
• **Pan:** Moves the clip along the horizontal, X axis. Positive values move the clip right, negative values move the clip left.

• **Tilt:** Moves the clip along the vertical, Y axis. Positive values move the clip up, negative values move the clip down.

• **Zoom:** Adjusts the overall dimensions of the clip. The range is from 0.250 (1/4x size) to 4.000 (4x size). Normal size is 1.000.

• **Rotate:** Positive values rotate the clip clockwise. Negative values rotate the clip counter-clockwise.

• **Width:** Stretches the image wider or narrower. The range is from 0.250 (1/4x width) to 4.000 (4x width). Normal width is 1.000.

• **Height:** Stretches the image taller or shorter. The range is from 0.250 (1/4x height) to 4.000 (4x height). Normal height is 1.000.

• **Pitch:** Rotates the image toward or away from the camera along an axis running through the center of the image, from left to right. Positive values push the top of the image away and bring the bottom of the image forward. Negative values bring the top of the image forward and push the bottom of the image away. Higher values stretch the image more extremely.

• **Yaw:** Rotates the image toward or away from the camera along an axis running through the center of the image from top to bottom. Positive values bring the left of the image forward and push the right of the image away. Negative values push the left of the image away and push the right of the image forward. Higher values stretch the image more extremely.

• **Key Lock:** (Node Sizing only) Lets you choose how regions of the image that are isolated by one or more windows will be transformed. There are two options:
  - **Off:** While off, the transform controls will move the windowed region to another area of the frame, effectively duplicating the windowed area.
  - **On:** While on, the transform controls will move other areas of the frame into the windowed regions, effectively covering up the windowed area with another portion of the picture.

• **Flip Image:** Two buttons let you flip the image in different dimensions.
  - **Flip Horizontal control:** Reverses the image along the X axis, left to right.
  - **Flip Vertical control:** Reverses the clip along the Y axis, turning it upside down.

• **Lens Correction:** (Edit Sizing only) Two controls let you correct for lens distortion in the image, or add lens distortion of your own (only available in the Studio version).
  - **Analyze:** Automatically analyzes the frame in the Timeline at the position of the playhead for edges that are being distorted by wide angle lens. Clicking the Analyze button modifies the effect of the Distortion slider so that it gives a more accurate result, but it doesn’t perform a correction.
  - **Distortion:** Dragging this slider to the right applies a warp to the image that lets you straighten the bent areas of the picture that can be caused by wide angle lenses. It’s not necessary to click the Analyze button prior to using this slider, but using the Analyze button can improve the accuracy of the result.
Blanking Controls

Output Sizing mode also has a set of Blanking controls that you can use to add custom blanking to a clip or project. For example, you can use these controls to add nonstandard letterboxing or pillarboxing to an image. Along with all other Output Sizing adjustments, blanking is added last in the image processing pipeline, so it’s not affected by any of the color or contrast adjustments you make.

- **Top**: Adjusts the top letterbox.
- **Right**: Adjusts the right pillarbox.
- **Bottom**: Adjusts the bottom letterbox.
- **Left**: Adjusts the left pillarbox.
- **Smooth**: A checkbox that lets you turn on edge anti-aliasing for source blanking. Overrides the Anti-alias Edges drop-down menu found in the Image Scaling panel of the Project Settings.

**NOTE**: It might be necessary to turn anti-aliasing off if you notice black blurring at the edges of blanking being applied to an image.

Blanking presets are also available by choosing from the Timeline > Output Blanking submenu. Choosing one of these options automatically sets the Blanking parameters of the Sizing palette’s Output Sizing mode. The following presets are available:

- **1.33**: SD or 4:3
- **1.66**: European theatrical
- **1.77**: HD or 16:9
- **1.85**: Theatrical flat aspect ratio
- **2.00**: Univisium. Aspect ratio designed to accommodate both theatrical wide-screen and HD delivery.
- **2.35**: Original anamorphic (scope) theatrical wide-screen
- **2.39**: Current 35mm anamorphic (scope) theatrical wide-screen
- **2.40**: Current 35mm anamorphic (scope) theatrical wide-screen (rounded up for Blu-Ray)
- **Reset**: Restores the clip to its original aspect ratio.

Anti-aliasing at the edges of blanking is handled by an Anti-Alias Edges setting in the Image Scaling panel of the Project Settings. For more information, see Chapter 3, "System and User Preferences.”

Resetting the Sizing Palette

You can reset every control within the Sizing palette at any time by clicking the reset button in the upper right-hand corner of the palette.
Input and Output Sizing Presets

If there are Input or Output Sizing settings that you find yourself using repeatedly, you can save them as presets for easy recall. For example, if there’s a group of input settings that you use to resize a clip of a particular format to match the current project, you can save it as a preset that you can use whenever:

- **Preset drop-down menu:** Provides access to all the currently saved presets in the current database.
- **Delete Preset:** To delete a preset, select it from the drop-down menu, click the trash can button, then click OK.
- **Save As New Preset:** To add a preset, make whatever settings adjustments you need, then click the plus button. When the Format Preset dialog appears, enter a name, check that the settings are correct, then click Save in the Format Preset window.
- **Update Preset:** To change a preset, load the preset you want to change, make whatever changes you need, then click Update in the Format Preset window.

The Input and Output Sizing modes save different presets. Each of these sets of presets is available from the “Override input scaling” and “Override output scaling” drop-down menus in the Image Scaling project setting menu.

Sizing Controls with the DaVinci Control Panel

There are two sets of DaVinci control panel mappings for the sizing controls. The most obvious controls can be seen permanently mapped to the knobs and soft keys of the Transport panel. This makes these controls easy to access for projects where you’re panning and scanning nearly every shot of a film-scanned program.

**To adjust PTZR settings:**

1. Press the OUTPUT or INPUT soft key to switch between Output Sizing and Input Sizing modes.
2. Use the PAN, TILT, ZOOM, and ROTATE knobs of the Transport panel, and the H FLIP and V FLIP soft keys.

**To adjust Input and Output Blanking:**

1. Press the INPUT BLANKING or OUTPUT BLANKING soft key on the Transport panel.
2. Use the knobs labeled LEFT, RIGHT, TOP, and BOTTOM to make a blanking adjustment.
3. Press SIZING when you’re finished.

Another set of DaVinci control panel mappings appears when you press the SIZING button of the T-bar panel. In this case, the Center panel knobs and soft keys update to a page showing the following:

- **Ref Wipe Sizing Adjustments:** These controls, on the middle screen of the Center panel, let you reposition a still from the Gallery that’s being displayed in a split screen. This can make it easier to compare features that would otherwise be obscured by the still’s position on screen.
• **Input Sizing Adjustments:** The Input Sizing controls are displayed on the right screen of the Center panel. These are similar to the mappings on the Transport panel, but the Center panel’s second row of knobs also exposes PITCH, YAW, H SIZE, and V SIZE controls, and there’s an additional MODIFY PAR button that lets you change the pixel aspect ratio of a clip.

• **Output Sizing Adjustments:** If you press the OUTPUT soft key on the Center panel, the knobs and soft keys change to show the Output Sizing controls. Press BLANKING to expose all the preset aspect ratios on the Transport panel, along with the USER which allows you to expose user definable presets.

**To save and recall user definable blanking aspect ratios:**

1. Press SIZING on the T-bar panel.
2. Press the OUTPUT soft key on the Center panel.
3. Press the OUTPUT BLANKING soft key on the Transport panel, and then enter the blanking aspect ratio as a number (e.g., 2.4) using the number pad on the Transport panel to set your customized blanking.
4. Press the BLANKING soft key on the Center panel.
5. To apply the new ratio, press the BLANKING soft key on the Center panel, then press USER on the Transport panel, and press one of the USER 1–5 soft keys.

**TIP:** With the Input Sizing Adjustments controls exposed on the Center panel, you can set the Transport panel to display the Output Sizing controls, for simultaneous presentation of every sizing control that’s available.

**Using Node Sizing for Channel and Paint Effects**

Using Node Sizing, you can apply individual sizing adjustments on a per-node basis. All Node Sizing adjustments within a grade are cumulative, and any keyframing done to Node Sizing parameters is stored in that node’s Node Format keyframe track in the Keyframe Editor. Two good examples of Node Sizing include realigning color channels individually in conjunction with the Splitter/Combiner nodes, or duplicating windowed regions of an image by moving them around the frame.

**Example 1**

**Using node sizing on individual color channels:**

1. Choose Color > Nodes > Add Splitter/Combiner Node to add this node structure to the current grade.
2. Select one of the three Corrector nodes connected between the Splitter and Combiner nodes that corresponds to the color channel you want to transform.
Adding the Splitter/Combiner nodes to use Node Sizing on individual color channels

3 Open the Sizing palette, choose Node Sizing from the mode drop-down, and use the Sizing parameters to transform that channel as necessary. For example, if you have an old video clip with misaligned color components, you could pan a misaligned channel to the left or right to try and improve its alignment.

Before and after panning the green channel

Example 2

Using Node Sizing to duplicate a windowed area of an image to cover a blemish:

1 Create a new node.

2 Open the Window palette, create a Circular window, and then shrink and reposition it to surround a feature you want to remove.

3 Open the Tracking palette, and track the window to follow the feature to be removed.

4 After the track is complete, now move the window to an adjacent area of clean detail that’s right next to the feature you want to remove. This is the area of the image you’re going to duplicate and cover the unwanted feature with.

5 Now, open the Sizing palette, choose Node Sizing from the mode drop-down, check Key Lock, and use the Sizing parameters to move a duplicate of the windowed area to cover up the unwanted feature.
When you’re done, playing through the clip should show that the duplicated area of the image is still tracking the feature you want to remove.

**Image Stabilization in the Tracker Palette**

The Image Stabilization mode of the Tracker palette lets you smooth out or even steady unwanted camera motion within a clip. The analysis is performed in such a way as to preserve the motion of individual subjects within the frame, as well as the overall direction of desirable camera motion, while correcting for unsteadiness.

**Using the Stabilizer**

DaVinci Resolve uses an advanced stabilizer that’s capable of both warping and translation to minimize unwanted shaking in a clip replaces the classic stabilization tools that were available previously (these tools are still available should you need specific capabilities of the older toolset, and are covered in a later section). With a single click of the Stabilize button, the currently selected clip is analyzed and automatically stabilized using a combination of warping and image translations.

**Stabilizer Parameters and Controls**

The default settings yield good results for most situations, but there are ways you can customize stabilization in situations where unique issues arise.
A drop-down menu provides three different options that determine how the selected clip is analyzed and transformed during stabilization. You must choose an option first, before clicking the Stabilize button, because the option you choose changes how the image analysis is performed. If you choose another option, you must click the Stabilize button again to reanalyze the clip.

- **Perspective**: Enables perspective, pan, tilt, zoom, and rotation analysis and stabilization.
- **Similarity**: Enables pan, tilt, zoom, and rotation analysis and stabilization, for instances where perspective analysis results in unwanted motion artifacts.
- **Translation**: Enables pan and tilt analysis and stabilization only, for instances where only X and Y stabilization gives you acceptable results.

The other controls let you customize how aggressively the selected clip is stabilized.

- **Bypass Stabilization**: This checkbox lets you turn stabilization off and on to be able to compare the stabilized and unstabilized image.
- **Cropping Ratio**: This value limits how hard the stabilizer tries to stabilize, by dictating how much blanking or zooming you’re willing to accept in exchange for eliminating unwanted motion. A value of 1.0 results in no stabilization being applied. Progressively lower values enable more aggressive stabilization. Changing this value requires you to click the Stabilize button again to re-analyze the clip.
- **Smooth**: Lets you apply mathematical smoothing to the analyzed data used to stabilize the clip, allowing camera motion in the shot while eliminating unwanted jittering. Lower values perform less smoothing, allowing more of the character of the original camera motion to show through, while higher values smooth the shot more aggressively. Changing this value requires you to click the Stabilize button again to reanalyze the clip.
- **Strength**: This value is a multiplier that lets you choose how tightly you want to use the stabilization track to eliminate motion from a shot using the current analysis. With a value of 1.00, stabilization is maximized. Since some clips might look more natural with looser stabilization, choosing a number lower than 100 lets a percentage of the original camera motion show through. Zero (0) disables stabilization altogether. As an additional tip, you can invert the stabilization by choosing –1.00 when pasting a stabilization analysis from another clip to perform a match move based on the overall motion of the scene, and you can use a negative value either lower or higher than –1.00 to under or overcompensate when inverting the stabilization, simulating the effects of parallax where foreground and background planes move together but at different speeds.
- **Camera Lock**: Turning on this checkbox disables Cropping Ratio and Smooth, and enables the stabilizer to focus on eliminating all camera motion from the shot in an effort to create a locked shot.
- **Zoom**: When this checkbox is turned on, the image is resized by a large enough percentage to eliminate the blanking (black edges) that is the result of warping and transforming the image to eliminate unwanted camera motion. The lower a value Cropping Ratio is set to, the more DaVinci Resolve will need to zoom into the image to eliminate these blanked edges. If you turn this off, the image is not zoomed at all, and whatever blanking intrudes into the image is output along with the image, on the assumption that you’ll have dedicated compositing artists deal with eliminating this blanking by filling in the missing image data in a more sophisticated manner. You may also leave this checkbox turned off if you’re planning on animating the Input Sizing Zoom parameter to dynamically zoom into and out of a shot being stabilized to eliminate blanking only where it occurs, using only as much zooming as is necessary for each region of the shot.
Using the Classic Stabilizer

The "classic" image stabilizer controls available in DaVinci Resolve version 12.5 and earlier are still available, simply select "Classic Stabilizer" from the option menu of the Tracker palette. Classic image stabilization in DaVinci Resolve consists of three steps. First, you analyze the clip. Second, you choose the Stabilization settings you want to use. Third, you click Stabilize to calculate the result.

When analyzing the clip, you can choose to use either the default Cloud Tracker, which automatically finds as many trackable points as possible throughout the image and calculates stabilization based on all of them, or you can use the Point Tracker, which lets you manually place one or more individual crosshairs on image features that you select. For more information on using the Point Tracker for window tracking, see Chapter 121, “Motion Tracking Windows.”

The Classic Stabilizer mode of the Tracker palette

As with object tracking, you can choose which aspects of motion to stabilize, but this must be done before you do the initial image analysis.

Analyze Controls

The Analyze controls automatically scan through the entire clip, identifying trackable features that can be used to stabilize the shot.

A series of four checkboxes let you turn on and off which axes you’d like to stabilize. These checkboxes must be selected before you perform an analysis in order to restrict the data that’s generated.

- **Pan**: Enables horizontal stabilization.
- **Tilt**: Enables vertical stabilization.
- **Zoom**: Enables stabilization of size.
- **Rotate**: Enables stabilization of orientation.

**NOTE**: Once stabilization has been done, disabling these checkboxes does nothing to alter the result. To make changes, you need to enable or disable the necessary checkboxes first, and then reanalyze the clip.
The five direction buttons let you perform the stabilization analysis.

- **Track One Frame Reverse**: Initiates tracking from the current frame backward by a duration of one frame.
- **Track Reverse**: Initiates tracking from the current frame backward, ending at the first frame of the clip.
- **Pause**: Stops tracking (if you’re fast enough to click this button before tracking is finished).
- **Track Forward**: Initiates tracking from the current frame forward, ending at the last frame of the clip.
- **Track One Frame Forward**: Initiates tracking from the current frame forward by a duration of one frame.

**Interactive Mode Controls**

The Interactive controls let you make manual changes to the automatically generated tracking point cloud that DaVinci Resolve creates, so you can try different ways of obtaining better stabilization results in challenging situations.

- **Interactive Mode checkbox**: Turns the Interactive stabilization mode on and off. When you enter Interactive mode, you can manually alter the point cloud that DaVinci Resolve uses to stabilize the image. You’ll then make your analysis while in Interactive mode. When you exit Interactive mode, your manual changes to the point cloud are eliminated, and DaVinci Resolve again uses automatically placed point clouds to do all stabilization.
- **Insert**: Lets you add tracking points to whatever analyzable features exist within a bounding box that you’ve drawn in the Viewer. Inserted stabilization points are automatically placed.
- **Set Point**: Lets you use the cursor (using the DaVinci Resolve control panel), to manually place individual tracking points, one by one, with which to track a feature. If there is no trackable pixel group at the coordinates where you placed the cursor, a tracking point will be placed at the nearest trackable pixel group. You must place at least two tracking points at different pixel groups to track rotation, and at least three to track zoom.
- **Delete**: Eliminates all stabilization points within a bounding box that you’ve drawn in the Viewer.

The procedures for using Interactive mode for stabilization are the same as for tracking. For more information, see Chapter 121, “Motion Tracking Windows.”

**Stabilization Parameters and Controls**

There are five controls in the Stabilization group:

- **Strong**: Lets you choose how tightly you want to use the stabilization track to eliminate motion from a shot. With a value of 100, stabilization is maximized in an effort to “lock” the shot in place and eliminate all camera motion. This value is a multiplier. Since some clips might look more natural with looser stabilization, choosing a number lower than
100 lets a percentage of the original camera motion show through. Zero (0) disables stabilization altogether. Additionally, you can invert the stabilization by choosing –100, as described in the section on performing a match move below, and you can use a negative value either lower or higher than –100 to under or overcompensate when inverting the stabilization, simulating the effects of parallax where foreground and background planes move together but at different speeds.

- **Smooth**: Lets you apply mathematical smoothing to the analyzed data used to stabilize the clip, and is meant to be used when the Strong parameter is less than 100, allowing camera motion in the shot while eliminating unwanted wiggling. Lower values perform less smoothing, allowing more of the character of the original camera motion to show through, while higher values smooth the shot more aggressively.

- **Zoom**: When this checkbox is turned on, the image is resized by a large enough percentage to eliminate the blanking (black edges) that is the result of repositioning the image to eliminate unwanted camera motion. The higher a value Smooth Frames is set to, the more DaVinci Resolve will need to zoom into an image to eliminate these blanked edges. If you turn this off, the image is not zoomed at all, and whatever blanking intrudes into the image is output along with the image, on the assumption that you’ll have dedicated compositing artists deal with eliminating this blanking by filling in the missing image data in a more sophisticated manner. You may also leave this checkbox turned off if you’re planning on animating the Input Sizing Zoom parameter to dynamically zoom into and out of a shot being stabilized to eliminate blanking only where it occurs, using only as much zooming as is necessary for each region of the shot.

- **Tracker Type**: A drop-down menu below the Tracker graph lets you choose whether to use the Cloud Tracker or the Point Tracker. The default Cloud Tracker automatically finds as many trackable points as possible throughout the image and calculates stabilization based on all of them. This is fast, but can result in problems if there are too many prominent subjects in the frame with different vectors of motion. The Point Tracker, by contrast, lets you manually place one or more individual crosshairs on image features that you select. This involves more steps, but has the advantage of letting you choose exactly which features exhibit the motion you’re trying to stabilize. For more information on using the Point Tracker for window tracking, see Chapter 121, “Motion Tracking Windows.”

- **Stabilize**: After you’ve tracked the clip and adjusted the previous two controls, you need to click Stabilize to calculate the resulting effect of the Strong, Smooth, and Zoom controls on your clip. Whenever you make changes to the Strong, Smooth, or Zoom parameters, you need to click Stabilize to recalculate the resulting effect on your clip.

**Classic Stabilization With the Cloud Tracker**

Classic Image stabilization in DaVinci Resolve is easy, but you need to follow a specific series of steps for it to be successful.

**To stabilize an image:**

1. Open the Tracker palette, and choose Stabilizer from the Palette mode drop-down menu. Select Classic Stabilizer in the option menu. Make sure the Tracker Type drop-down menu at the bottom right of the Tracker palette is set to Cloud Tracker.

2. Turn off any of the Analyze checkboxes (Pan, Tilt, Zoom, Rotate, Perspective 3D) that correspond to transform axes you don’t want to smooth.

3. Click the Track Forward button to track the clip forward (or Track Reverse if you’d rather start from the end of the clip and work backward).
Multiple tracking points are automatically placed to analyze the motion of the image for stabilization.

This analyzes the clip, but no stabilization is yet applied.

4 Adjust the Strong parameter to reflect what kind of stabilization you want. If you want to eliminate all possible motion from the shot, leave Strong set to 100. If you want to use stabilization to smooth out the shot but leave some motion in the frame, reduce the strong parameter to be less than 100 but greater than 0. This parameter is a multiplier, so higher numbers reflect a higher percentage of smoothing being applied to the clip’s range of motion, and lower numbers reflect a lower percentage of smoothing being applied to the original range of motion.

5 If you’ve set the Strong parameter to a value less than 100 to calm the motion in the shot, rather than lock the shot completely, you can also adjust the Smooth parameter to mathematically smooth what motion remains in the shot. This lets you even out any “wobbling” that you don’t want, while retaining the camera motion that you do want. The Strong and Smooth parameters work together, so experiment with different values in each parameter to get the result you need.

6 Choose how you want the edges of the stabilized clip to be handled using the Zoom checkbox:
   - If you want DaVinci Resolve to zoom into the image as much as is necessary to prevent blanking (black edges) from intruding into the frame (the result of repositioning the image to steady camera motion), then turn on the Viewer Zoom checkbox.
   - If you want to leave the scale of the image alone, allowing blanking (black edges) to intrude into the frame so that you either (a) have an effects artist deal with filling in these holes later, or (b) manually animate the Input Sizing Zoom parameter to eliminate blanking in a dynamic way, then turn off the Viewer Zoom checkbox.

7 With all of these controls adjusted, click Stabilize. The clip is immediately transformed to apply the amount of stabilization you selected via the Smooth Frames slider.

8 Play the clip and examine the stabilization effect. If you need to make any changes, choose new Strong and Smooth Frames values, then click Stabilize. Any time you change any of the Stabilization parameters, you need to click Stabilize to recalculate the resulting transform to your clip.
Classic Stabilizing Using the Point Tracker

For clips in which there are too many moving subjects for the Cloud Tracker to get a solid lock, you need to track a very specific feature in order to successfully stabilize the image. In these cases, it’s often faster to use the Point Tracker for stabilization.

To stabilize an image using the Point Tracker:

1. Open the Tracker palette, and choose Stabilizer from the Palette mode drop-down menu. Select Classic Stabilizer from the option menu.

2. Choose Point Tracker from the Tracker Type drop-down menu at the bottom right of the Tracker palette. This changes the available controls under the tracker graph.

3. Click the Add Tracker Point button to add a crosshairs to the Viewer, and drag it to a high-contrast, angular feature you want to track that’s indicative of the overall motion of the clip.

4. Click the Track Forward button to track the clip forward (or Track Reverse if you’d rather start from the end of the clip and work backward).

This analyzes the feature you chose to track with the crosshairs, but no stabilization is yet applied.

5. Adjust the Strong parameter to reflect what kind of stabilization you want. If you want to eliminate all possible motion from the shot, leave Strong set to 100. If you want to use stabilization to smooth out the shot but leave some motion in the frame, reduce the strong parameter to be less than 100 but greater than 0. This parameter is a multiplier, so higher numbers reflect a higher percentage of smoothing being applied to the clip’s range of motion, and lower numbers reflect a lower percentage of smoothing being applied to the original range of motion.

6. If you’ve set the Strong parameter to a value less than 100 to calm the motion in the shot, rather than lock the shot completely, you can also adjust the Smooth parameter to mathematically smooth what motion remains in the shot. This lets you even out any “wobbling” that you don’t want, while retaining the camera motion that you do want. The Strong and Smooth parameters work together, so experiment with different values in each parameter to get the result you need.
Choose how you want the edges of the stabilized clip to be handled using the Zoom checkbox:

- If you want DaVinci Resolve to zoom into the image as much as is necessary to prevent blanking (black edges) from intruding into the frame (the result of repositioning the image to steady camera motion), then turn on the Viewer Zoom checkbox.

- If you want to leave the scale of the image alone, allowing blanking (black edges) to intrude into the frame so that you either (a) have an effects artist deal with filling in these holes later, or (b) manually animate the Input Sizing Zoom parameter to eliminate blanking in a dynamic way, then turn off the Viewer Zoom checkbox.

With all of these controls adjusted, click Stabilize. The clip is immediately transformed to apply the amount of stabilization you selected via the Smooth Frames slider.

Play the clip and examine the stabilization effect. If you need to make any changes, choose new Strong and Smooth Frames values, then click Stabilize. Any time you change any of the Stabilization parameters, you need to click Stabilize to recalculate the resulting transform to your clip.

### Using Stabilization to Create a Match Move

In some circumstances, such as when you’re using the HSL Qualifier to create transparency for a composite (using the Alpha Output described later in this chapter), you may find you need to apply the motion from a foreground clip to the background clip so that the two clips appear to be moving as one. This is referred to as doing a “match move,” and is a necessary step when creating a composite for purposes of doing a sky replacement, for example. This can be done in a simple way using the Stabilizer mode of the Tracker palette.

**To match the motion of a background clip to a foreground clip:**

1. First, in the Edit page, edit a foreground clip onto track V2, and a background clip with a more interesting sky onto track V1.

2. With that done, open the Color page and follow the instructions in the section titled “Using a Qualifier Key to Create Transparency” in Chapter 127, “Channel Splitting and Image Compositing,” to key the sky, and use that key to create a region of transparency in the foreground clip that lets the background sky clip in track V1 show through.

Creating transparency to replace the sky in a superimposed clip with a sky image edited into a lower video track

In this example, the plain blue sky is being keyed so that it can be replaced with a more interesting photo of a dramatically cloudy sky.
Before (top) and after setting up a sky replacement by connecting an HSL qualifier of the blue in the sky to the Alpha Output to create transparency.

This procedure works equally well with still images or movie clips. Also, depending on the range of motion you’re going to be matching, you’ll probably need to use a background image that’s somewhat larger than the region you’re keying, to make sure you have full coverage as the layer moves to match the foreground motion. If necessary, you can zoom into the image using the Zoom parameter in the Transform section of the Edit page Inspector.

3 In this example, the foreground clip happens to have a camera pan, which gives the composite away as the sky doesn’t move along with it. To move the compound clip of the sky image to match this pan, open the Tracker pallet.

4 Choose its Stabilizer mode, and then click the Analyze Forward button to analyze the motion of the entire clip. Then, click the Tracker palette’s Option menu, and choose Copy Track Data.

5 Select the clip that you want to match (in this case the sky image), then open the Tracker Palette’s Option menu and choose Paste Track Data.

6 Now, for this to work correctly, you need to set the Strong parameter to –100, and click the Stabilize button. Setting a negative value inverts the tracking data you copied in step 3, which enables it to become a match move. If you’re feeling extra tricky, you can set the Strong parameter to a little less than –100, say –94, which introduces a disparity of foreground and background motion that simulates parallax.

At this point, playing through the clip should result in a nicely matched correspondence between the movement of the foreground and background layers.
Tracking and Stabilizing with the DaVinci Control Panel

All of the tracking commands are available via the DaVinci Resolve control panel.

**To open and close tracking controls:**
- Press OBJECT TRACK MODE at the top of the T-bar panel.
- All of the tracking controls appear on the soft keys of the Center and T-bar panels.

**To do simple tracking:**
- Use the TRACK FWD, TRACK REV, and STOP TRACK soft buttons on the left side of the Center panel.
- Press SHOW TRACK if you want to see the resulting motion path.

**To turn tracking on and off for Pan, Tilt, Zoom, and Rotate:**

1. Press the P/T/Z/R ENABLE soft key. The middle four soft keys of the Center panel change to display PAN ON/OFF, TILT ON/OFF, ZOOM ON/OFF, and ROTATE ON/OFF.
2. Use these buttons to toggle any of these checkboxes on or off, then press BACK to go back to the other tracking controls.

**To interpolate between two separately tracked ranges of frames:**

1. Use the transport controls to move the playhead to the first frame you want to place a mark, and press MARK. A Viewer Mark appears on the tracking bar, identifying either the beginning or the end of the gap in that clip’s motion tracking data.
2. If necessary, use the transport controls to move the playhead to the second frame where you want to place a mark, and press MARK. A second Viewer Mark appears in the tracking bar, identifying both the beginning and end of the gap in that clip’s motion tracking data.
3. To perform the interpolation, do one of the following:
   - If you marked both the first and last tracked frames that surround a gap in tracking data, press the INTRPLT BETWEEN soft key.
   - If you marked the last tracked frame in the first half of the clip, then use the transport controls to move the playhead to the first tracked frame of the second half of the clip and press the INTRPLT REV soft key.
If you marked the first tracked frame in the second half of the clip, then use the transport controls to move the playhead to the last tracked frame of the first half of the clip and press the INTRPLT FWD soft key.

**To move the playhead to different “cue” frames:**
Press the CUE START, CUE LOWER, CUE UPPER, or CUE END soft keys on the T-bar panel.

**To use Interactive mode:**
1. Press the INTERACTIVE soft key at the left of the Center panel.
   Additional button controls appear on the soft keys of the Transport panel, including INSERT (POINTS), DELETE (POINTS), CLEAR (POINTS), and SET POINT.
2. Do one of the following:
   - To eliminate all tracking points, press the CLEAR soft key.
   - To add a single tracking point, press CURSOR (above the fourth trackball), use the fourth trackball to position the onscreen cursor over the feature you’d like to add a tracking point to, and then press the SET POINT soft key.
   - To eliminate a range of tracking points in order to prevent the tracking of an undesirable feature, use the mouse to draw a bounding box around the tracking points you want to remove, and press the DELETE soft key.
   - To add a range of tracking points to a specific feature, use the mouse to draw a bounding box around the feature you want to track, and press the INSERT soft key.
3. Use the TRACK FWD, TRACK REV, and STOP TRACK soft buttons on the left side of the Center panel to perform the necessary tracking.
4. Press the INTERACTIVE soft key again to leave Interactive mode.
Chapter 134

The Motion Effects and Blur Palettes

This chapter covers the Noise Reduction and Motion Blur effects found in the Motion Effects palette. It also goes into detail about the Blur, Sharpen, and Mist features of the Blur palette.
## Contents

**Motion Effects Palette** 2992

**The Blur Palette** 2998
- Blur 2999
- Sharpen 3000
- Mist 3001
Motion Effects Palette

The Motion Effects palette (only available in the Studio version) contains two sets of controls for applying optical-flow-calculated effects to clips in your program. These include enhanced Spatial and Temporal noise reduction, and motion-estimated artificial motion blur.

Noise Reduction Controls

Two sets of parameters let you apply GPU-accelerated Temporal and/or Spatial noise reduction that’s designed to let you subdue noise in problematic clips, in close to real time on workstations with appropriate processing power. Both methods of noise reduction can be used separately or together, in varying amounts depending on the needs of the particular material you’re working on. Furthermore, each set of controls is highly customizable, allowing for varying amounts of noise reduction to the chroma and luma of an image, as well as numerous options for how to apply this noise reduction.

Temporal NR Controls

The Temporal NR controls analyze images across multiple frames in order to isolate noise from detail. Motion estimation settings let you exclude moving subjects from this operation in order to prevent unwanted motion artifacts.

- **Number of Frames**: The number of frames you want DaVinci Resolve to average in order to separate detail from the noise. You can choose between 0 and 5 frames. 0 applies no frame averaging, higher values apply more frame averaging, at the expense of being significantly more computationally intensive the higher a value you use. Also, a higher frame setting will yield a better analysis, but may yield unwanted artifacts if there are fast-moving images in the frame. A value of 1 may yield better results for fast-moving images. If you need to use higher frame values but you see artifacts, you can also try adjusting the Motion Threshold to fix the issue.

- **Motion Est. Type**: Picks the method DaVinci Resolve uses to detect motion in the image. The default, Faster, is less processor intensive, but less accurate. Choosing Better can effectively exclude motion more accurately, but is more processor intensive. None lets you disable motion estimation altogether, with the result being the application of Temporal NR to the entire image.

- **Motion Range**: Three settings, Small, Medium, and Large, let you set the speed of motion that Motion Estimation should expect to exclude. A Small setting assumes slow-moving subjects with little or no motion blur, allowing Temporal NR to affect more
of the image at a given Motion Threshold setting. A Large setting assumes fast motion with blur occupying a larger area of the image, which excludes more of the image from Temporal NR at the same Motion Threshold setting. Choose the setting that gives you the best compromise between a reduction in noise and the introduction of motion artifacts when adjusting the Motion Threshold parameter.

- **Luma Threshold:** Lets you determine how much or how little Temporal NR to apply to the luma component of the image. The range is 0–100, where 0 applies no noise reduction at all, and 100 is the maximum amount. Too high a setting may eliminate fine detail from the image.

- **Chroma Threshold:** Lets you determine how much or how little Temporal NR to apply to the chroma component of the image. The range is 0–100, where 0 applies no noise reduction at all, and 100 is the maximum amount. Too high a setting may eliminate fine color detail from the image, although you may find you can raise the Chroma Threshold higher than the Luma Threshold with less noticeable artifacting.

- **Luma/Chroma Threshold ganging:** Ordinarily, the Luma and Chroma Threshold parameters are ganged together so that adjusting one adjusts both. However, you can ungang these parameters in order to adjust different amounts of noise reduction to each component of the image, depending on where the noise happens to be worst.

- **Motion Threshold:** Defines the threshold separating which moving pixels are in motion (above this threshold) versus which moving pixels are static (below this threshold). Using Motion Estimation, Temporal Noise Reduction is not applied to regions of the image that fall above this threshold, in order to prevent motion artifacts by not applying frame-averaging to parts of the image that are in motion. Lower values omit more of the image from Temporal NR by considering more subtle movements. Higher values apply Temporal NR to more of the image by requiring faster motion for exclusion. You can choose between 0 and 100, where 0 applies Temporal NR to no pixels, and 100 applies Temporal NR to all pixels. The default value is 50, which is a suitable compromise for many clips. Be aware that if you set too high a Motion Threshold, you may see artifacts in moving parts of the image.

- **NR Blend:** Lets you dissolve between the image as it’s being affected by the Temporal NR parameters (at 0.0) and the image with no noise reduction at all (100.0). This parameter lets you easily split the difference when using aggressive temporal noise reduction.

**Spatial NR Controls**

The Spatial NR controls let you smooth out regions of high-frequency noise throughout the image, while attempting to avoid softening by preserving detail. It’s effective for reducing noise that Temporal NR can’t.

- **Mode:** The Mode drop-down lets you switch Spatial NR between three different algorithms. All three modes of operation use exactly the same controls, so you can switch between modes using the same settings to compare your results.
  - **Faster:** Uses a computationally lightweight method of noise reduction that’s good at lower settings, but may produce artifacts when applied at higher values.
  - **Better:** Switches the Spatial NR controls to use a higher quality algorithm that produces greatly superior results to Faster, at the expense of being more processor intensive to render, as well as not allowing you to decouple the Luma and Chroma Threshold sliders for individual adjustments to each color component.
  - **Enhanced:** Does a significantly better job of preserving image sharpness and detail when raising the Spatial Threshold sliders to eliminate noise. This improvement is particularly apparent when the Spatial Threshold sliders are raised to high values.
what constitutes “high” varies with the image you’re working on. At lower values, the improvement may be more subtle when compared to the “Better” mode, which is less processor intensive than the computationally expensive “Enhanced” setting. Additionally, “Enhanced” lets you decouple the Luma and Chroma threshold sliders so you can add different amounts of noise reduction to each color component, as the image requires.

- **Radius:** Options include Large, Medium, and Small. A smaller radius offers greater real time performance, and can provide good quality when using low Luma and Chroma Threshold values. However, you may see more aliasing in regions of detail when using low NR Threshold values.

  Setting Radius to be progressively larger results in higher quality within areas of greater visual detail at high Luma and Chroma Threshold values, at the expense of slower performance. An NR Radius of Medium should provide suitable quality for most images when using medium NR Threshold settings. As with many operations, there’s an adjustable tradeoff between quality and speed.

- **Luma Threshold:** Lets you determine how much or how little noise reduction to apply to the luma component of the image. The range is 0–100, where 0 applies no noise reduction at all, and 100 is the maximum amount. Too high a setting may eliminate fine detail from the image.

- **Chroma Threshold:** Lets you determine how much or how little noise reduction to apply to the chroma component of the image by smoothing out regions of high-frequency noise while attempting to preserve the sharpness of significant edge details. The range is 0–100, where 0 applies no noise reduction at all, and 100 is the maximum amount. Too high a setting may eliminate fine color detail from the image, although you may find you can raise the Chroma Threshold higher than the Luma Threshold with less noticeable artifacting.

- **Luma/Chroma Threshold ganging:** Ordinarily, the Luma and Chroma Threshold parameters are ganged together so that adjusting one adjusts both. However, you can ungang these parameters in order to adjust different amounts of noise reduction to each component of the image. For example, if an image softens too much at a certain level of noise reduction, but you find there’s more color speckling than there is luma noise, you can lower the Luma Threshold to preserve detail while raising the Chroma Threshold to eliminate color noise.

- **NR Blend:** Lets you dissolve between the image as it’s being affected by the Spatial NR parameters (at 0.0) and the image with no noise reduction at all (100.0). This parameter lets you easily split the difference when using aggressive spatial noise reduction.

### Using Noise Reduction
The following procedure suggests a method of using the Noise Reduction (NR) parameters to achieve a controlled result.

#### Applying noise reduction to an image:

1. Enable Temporal NR by choosing 1 to 5 frames from the Number of Frames drop-down menu. Keep in mind that more frames dramatically increase the render time of this effect, while it may or may not significantly improve the result, depending on your material.

2. Choose options from the Motion Est. Type and Motion Range drop-down menus corresponding to how much motion is in the image. If there’s a lot of motion, you may need to choose Better and Large. If there’s not very much motion, lesser settings may suffice.
With Luma and Chroma Threshold linked, slowly raise either parameter until you just start to see a reduction in noise within the nonmoving areas of the image, then make smaller adjustments to determine the maximum amount of Temporal NR you can add without creating motion artifacts, or overly softening image detail you want to preserve.

If there’s obviously more chroma than luma noise in the image, you can disable Luma/Chroma linking at a satisfactory level of luma noise reduction, and then raise the Chroma Threshold to apply more aggressive Temporal NR to address color speckling in the picture.

If you’re not satisfied with the tradeoff between the maximum possible threshold of noise reduction and the prevention of motion artifacts, you may want to adjust the Motion Threshold setting, lowering it to omit more of the motion from the noise reduction operation, or raising it to include more motion. If you’re still not satisfied, you can also try better Motion Est. Type and Motion Range settings.

Enable Spatial NR by raising either the Luma or Chroma Threshold parameters, which are linked by default, until you strike a suitable balance between the reduction of noise, and an unwanted increase in image softness.

It’s recommended to choose the Enhanced option from the Spatial NR mode drop-down, as it will yield the best possible results. However, this can be processor-intensive, so if you need better real-time performance, you can switch the mode to Faster and compare results.
If there’s obviously more chroma than luma noise in the image, you can disable Luma/Chroma linking at a satisfactory level of luma noise reduction, and then raise the Chroma Threshold to apply more aggressive Spatial NR to address color speckling in the picture.

(Top) Before and (Bottom) after noise reduction improves the “look”

If you’ve had to use a high Spatial NR Luma or Chroma Threshold setting to reduce noise visibly, and areas of detail look a bit chunky or aliased, you can choose a larger setting from the Radius drop-down menu to enable a more detailed analysis of the scene.

This will result in higher visual quality, but larger NR Radius settings are more processor intensive, and may reduce real time performance if you don’t have adequate GPU resources available to your system.

If you’ve found suitable noise reduction settings, but the result is too aggressive and makes the image appear too processed, you can try raising the Spatial NR and/or Temporal NR Blend parameters to fade between the noise reduction added by each set of controls, and the image as it was before you added noise reduction.

Try Applying Temporal NR First, then Applying Spatial NR

Because Temporal NR analyzes multiple frames for its noise isolation, it tends to be better at preserving detail accurately in regions of the image where there’s little motion. If you try applying Temporal NR first and get a successful result, even if only in part of the image, you may reduce how much Spatial NR you have to apply, thus improving the overall quality of your final result.

Keep in mind that while Temporal NR does a great job in unmoving parts of an image but is less effective when dealing with subjects in motion, Spatial NR is able to reduce noise everywhere in the frame falling below its threshold, even when there’s motion. Ultimately, a combination of the two is almost always going to be a winning combination.
Spatial NR Radius, How Large Should You Go?

Larger NR Radius settings can dramatically improve the quality of high-detail regions in shots where you’re using aggressive Spatial noise reduction, but it’s not necessary to always jump to the large Radius setting, which provides the highest precision. In many cases, when evaluating an image that you’re applying noise reduction to, you may not actually be able to perceive the additional quality, and you’ll waste processing time on an unnecessary level of correction.

It’s a good idea to make sure that you’re evaluating the full-frame image on a large enough display to see the noise you’re working on within the viewing context of the intended audience. Zooming really far into a clip while applying noise reduction may encourage you to use higher quality settings than are necessary, because an excessively enlarged detail of an image lets you see subtle changes that you wouldn’t notice at actual size.

Limiting Noise Reduction in Useful Ways

As with any other correction in the Color page, noise reduction can be limited using HSL Qualification or Power Windows. This means you can focus your efforts on reducing noise in the most problematic areas of an image (for example, in shadows and background regions), while sparing elements that you don’t want to affect (such as faces or better-lit areas of the image).

Furthermore, you can use Spatial NR in lieu of Blur operations to perform a subtler form of complexion smoothing, using the HSL qualifier or a window to isolate an actor’s skin tone for targeted noise reduction.

Controlling the Order of Operations for Noise Reduction

You can apply noise reduction at any point in your image processing tree using a dedicated node. If you have an image with noise that you think might be enhanced by whatever corrections you need to make (increasing the contrast of underexposed clips often increases whatever noise is within an image), there are two approaches to noise reduction:

- **Apply noise reduction at the beginning of a node tree:** This lets you pre-emptively eliminate any noise before it becomes a problem as a result of whatever adjustments you’re planning to make. The result can be smoother, but you may also notice that the edge detail within the image is a bit softer.

- **Apply noise reduction at the end of a node tree:** The alternative is to make your adjustments first, and then apply noise reduction in a separate node afterwards. In this case, you may find that the noise reduced regions of the image aren’t quite as smooth, however the edge detail within the image may be visibly sharper as a result.

- **Apply noise reduction to only one color channel of an image:** Using the Splitter/Combiner nodes, you can also apply noise reduction to only one color component of an image. If you’re grading a video clip with a noisy Blue channel, this can be a way to focus noise reduction where it’s needed. Isolating a single color channel for noise reduction is also possible using the Channels selection when right-clicking a node. By selecting the specific channel numbers in this node corresponding to your color space (RGB, YUV, LAB, etc.), you can limit the noise reduction operation to the appropriate channels only.

Neither result is universally better or worse than the other. Which is preferable depends on the image you’re working on, and the type of result you’re looking for (you might prefer some shots to be a bit softer, while you’d like other shots to be a bit sharper). The real point is that the node-based image processing of DaVinci Resolve lets you choose which technique works best for you.
NOTE: If you apply noise reduction and make color adjustments within the same node, noise reduction is processed first, followed by color adjustments.

Using Noise Reduction Controls with the DaVinci Control Panel

All three Noise Reduction controls are available via knobs on the PRIMARIES, NOISE REDUCTION control group on the Center panel.

To open the Noise Reduction controls on the DaVinci control panel:
Press the PRIMARIES or MAIN soft key on the Center panel, whichever is visible (depending on which control group is currently displayed).

Motion Blur

Motion Blur settings use optical-flow based motion estimation to add artificial motion blur to clips that have none. This can be useful in cases where a program was shot using a fast shutter speed, and you later decide that the resulting video has too much strobing. By analyzing the motion within a clip, the Motion Blur settings can selectively apply blurring to the image based on the speed and direction of each moving element within the scene.

Three parameters let you set how much motion blur to add, and at what quality:

- **Motion Est. Type**: A setting of Better provides more accurate pixel mapping at the expense of being more processor intensive. Faster provides a more approximate result, but is less processor intensive.

- **Motion Range**: Determines what speed of motion to consider when defining regions being blurred.

- **Motion Blur**: Raise this parameter to add more motion blur to the image, lower it to add less. The range is 0–100, where 0 applies no motion blur, and 100 applies maximum motion blur.

The Blur Palette

The Blur palette has three different modes of operation—blur, sharpen, and mist. While the functionality of the Blur and Sharpen modes somewhat overlap, each mode provides dedicated controls that the other ones lack.

As with virtually everything else in the Color page, the operations performed in the Blur palette can be limited as a secondary operation using HSL Qualifiers, Windows, or Imported mattes, which makes it easy to apply these effects to specific portions of the image.

Many of the controls in the Blur palette consist of three ganged sliders, one for red, one for green, and one for blue.
By default, these ganged sliders move together as one, resulting in each color channel of the image being equally affected. A small white button to the left of each control’s name lets you ungang these sliders, in order to apply degrees of adjustment to individual color channels.

**Blur**

The default mode, Blur lets you apply an exceptionally high-quality Gaussian blur, or another equally high-quality sharpening operation to your image. This mode of operation has the simplest controls.

Two sets of linked parameters let you adjust the extent and directionality of blur or sharpening. Which is applied depends on the direction in which you adjust the Radius control.

![Blur Radius controls are ganged by default, but can be ungangned](image)

- **Radius**: This is the primary control for adding blur or sharpening. The default value of 0.50 results in no effect being applied to the image. Raising the radius slider increases blur, while lowering the radius increases sharpness, with a minimum value of 0.00 providing maximum sharpness.

  **TIP**: If you raise the Radius slider all the way to 1.00 and the image isn’t blurred enough, add another node and use it to add another blur operation. You can also use the scroll wheel on your mouse while hovering over one of the bars to increase the radius.

- **H/V Ratio**: Lets you add directionality to the current operation. At the default value of 0.50, the image is affected in both the horizontal and vertical directions equally. Raising H/V Ratio makes the effect increasingly directional along the horizontal axis, while lowering makes the effect increasingly directional along the vertical axis.

**To adjust the Blur controls using the DaVinci control panel:**

1. Press the VECTORS button on the T-bar panel, or the VECTORS soft key on the Trackball’s main page.
2. Use the BLUR AMOUNT and H/V RATIO knobs to add either blur or sharpening.
3. When you’re finished, press the PRIMARIES soft key to return to the Center panel’s main page.
Sharpen

While the Blur controls also let you apply sharpening simply by lowering, rather than raising, the Radius sliders, the actual Sharpen mode provides additional controls specifically for tailoring sharpening operations.

![Sharpen with Coring Softness and Level](image)

- **Radius**: This is the primary control for adding blur or sharpening. The default value of 0.50 results in no effect being applied to the image. Raising the radius slider increases blur, to a maximum value of 1.00. Lowering the radius increases sharpness, with a minimum value of 0.00 providing maximum sharpness.

- **H/V Ratio**: Lets you add directionality to the current operation. At the default value of 0.50, the image is affected in both the horizontal and vertical directions equally. Raising H/V Ratio makes the effect increasingly directional along the horizontal axis, while lowering makes the effect increasingly directional along the vertical axis.

- **Scaling**: Multiplies the amount of scaling being applied by the Radius control for sharpening operations. The scaling parameter has no effect if Radius is set to 0.50 or above for blur effects.

The Coring Softness and Level parameters work together to let you limit sharpening to only the most detailed areas of the picture that would most benefit from it, based on a threshold of image detail that you define using the Level and Softness parameters.

- **Level**: The first slider you should use. Raising this value sets the threshold at which image detail is omitted from the sharpening operation. The default setting of 0 sets the threshold low enough to sharpen the entire image. Raising Level gradually omits low-detail areas of the image, which results in sharpening being restricted to well-defined outlines.

- **Coring Softness**: After you’ve set the Level slider to an appropriate amount, raising Coring Softness blends the border between parts of the image that are sharpened and parts of the image that are left alone.

**To adjust the Sharpening controls using the DaVinci control panel:**

1. Press the VECTORS button on the T-bar panel, or the VECTORS soft key on the Center panel’s main page.

2. On the Center panel, press the IMAGE MODE soft key repeatedly to cycle to the RESOLVE IMAGE SHARPENING controls.

3. Use the SHARP AMOUNT, SCALING, LEVELS, and SOFTNESS knobs to create the desired sharpening effect.

4. When you’re finished, press the PRIMARIES soft key to return to the Center panel’s main page.
Mist

The Mist mode lets you combine blur and sharpen operations in such a way as to create effects similar to those achieved via “Vaseline on the lens” or Pro-Mist optical filters.

Unlike the Blur or Sharpen modes, where the Radius sliders provide immediate access to the desired effect, the Mist mode requires you to lower the Radius and Mix sliders together to get a desirable result. By varying the amounts of Radius and Mix, you can create many variations on the mist effect.

- **Radius:** When creating a Mist effect, you first need to lower Radius to sharpen the image. This operation then combines with a lowering of the Mix parameter to provide the combination of detail and blurring that results in a mist effect.
- **H/V Ratio:** Lets you add directionality to the current operation. At the default value of 0.50, the image is affected in both the horizontal and vertical directions equally. Raising H/V Ratio makes the effect increasingly directional along the horizontal axis, while lowering makes the effect increasingly directional along the vertical axis.
- **Scaling:** Multiplies the amount of scaling being applied by the Radius control, and lets you intensify a mist effect beyond the Radius slider’s ordinary range. The scaling parameter has no effect if Radius is set to 0.50 or above for blur effects.
- **Mix:** After you sharpen the image using the Radius slider, decreasing the Mix parameter adds a superimposed blur that mixes with the high-detail areas of the picture to create the mist effect.

**To adjust the Mist controls using the DaVinci control panel:**

1. Press the VECTORS button on the T-bar panel, or the VECTORS soft key on the Center panel’s main page.
2. On the Center panel, press the IMAGE MODE soft key repeatedly to cycle to the RESOLVE MIST EFFECT controls.
3. Use the RADIUS, H/V RATIO, SCALING, and MIX knobs to create the desired mist effect.
4. When you’re finished, press the PRIMARIES soft key to return to the Center panel’s main page.
This chapter shows how you can use the legacy Dust Removal feature that’s built into the Color page. There’s also a pair of ResolveFX plug-ins: “Automatic Dirt Removal” and “Dust Buster,” found in the Revival category of the ResolveFX plug-ins. For more information on those, see Chapter 143, “ResolveFX Revival.”

Introduction to Dust Removal 3004
Dirt and ROI Settings Parameters 3004
Algorithms for Dirt and Dust Removal 3005
Introduction to Dust Removal

The interactive Dirt and Dust Removal tool provides an interface for dustbusting right from within DaVinci Resolve. This is a raster-based effect, and results in a duplicate set of “dustbusted” media being created within a hidden subdirectory.

If, at any point, you’re unsatisfied with the adjustment you’ve made, you need only use the undo command to return the clip you’re working on to its prior state.

**IMPORTANT** The Dirt and Dust Removal tool only works with DPX image sequences. Media in a raw, ProRes, or DNxHD format must first be converted to a DPX image sequence before it can be operated on with this tool.

To use the Dirt and Dust Removal tool:
Click the Onscreen Control drop-down menu at the bottom left of the Viewer, and choose Dust Removal.

To open the Dirt and Dust Removal tool setup options:
Right-click the Dirt and Dust Removal icon showing in the Onscreen Control drop-down to open the setup window.

Dirt and ROI Settings Parameters

In the Dirt and ROI Settings window, there are a number of parameters that you can use to optimize this tool for the particular problem you’re trying to solve.

- **Algorithm**: The Algorithm drop-down menu lets you select the method of filtration to use when painting out dirt or dust. Different options provide different methods for replacing the problem pixels with image data copied from other frames in time, or from other regions of the current frame. You’ll want to choose an option that works best for the type of camera and subject motion happening within the clip you need to clean. For more information on the advantages of each algorithm, see the next section.
- **Aggression**: Increase or decrease the Aggression and Blend sliders depending on the degree of correction you want to apply.
• **Blend:** Sets the % of the original image to be feathered at the edges of the repair.

• **Optimize:** Turning this option on provides better-looking results, at the expense of increased processing time.

• **ROI Mode:** Determines whether a correction is applied with a single click, or via a paint stroke. There are three options.

• **Click and Clean:** Applies a correction with one click, and is fast to use on small dust spots.

• **Draw and Clean:** Lets you “paint” over a larger dirty area with the mouse or a pen, with the correction being applied at the conclusion of your paint stroke.

• **CNC Size:** Defines the width of the “brush” that’s used to paint out dirt and dust.

### Algorithms for Dirt and Dust Removal

There are six algorithms you can choose from that determine how the pixels you paint over are automatically replaced.

- **Auto-temporal –/+ 1:** When an ROI is drawn, the previous frame, the next frame and the current frame will all be used for analysis. The best of these 3 will be automatically selected and used for removing the dirt in the current frame.

- **Auto-temporal –/+ 2:** This is the same as the above, but the frames used instead are the current frame, previous-to-previous frame (i.e., 2 frames back), and next-to-next frame (i.e., 2 frames forward). Therefore, if the ROI is drawn on frame 100, frame 98, frame 100, and frame 102 will be used for analysis. The best of these 3 will be used for removing the dirt in the current frame. The advantage of this selection is that it will avoid the appearance of frozen grain, which may be possible in case of dirt against a stationary background.

- **Temporal –/+ 1:** If the ROI is drawn by dragging the mouse from left to right, the next frame will be used for motion-compensated dirt removal. If the ROI is drawn by dragging the mouse from right to left, the previous frame will be used.

- **Temporal –/+ 2:** If the ROI is drawn by dragging the mouse from left to right, the next-to-next frame will be used for motion-compensated dirt removal. If the ROI is drawn by dragging the mouse from right to left, the previous-to-previous frame will be used.

- **Spatial:** In case of fast or blurred motion, using the previous or next frames may give unsatisfactory results. In this case, the same frame itself can be used for removing the dirt. This will use surrounding information in the current frame to remove the dirt.

- **Median:** The Median filter performs a blending of the pixels, smoothing out the region. Use this when other options do not replace the image, or when there is no support information in which to reconstruct the original. Using small boxes will produce better results.
Chapter 136

Data Burn

This chapter covers how to use the Data Burn window that’s available in the Edit, Color, Fairlight and Deliver pages of DaVinci Resolve. Data Burn-Ins allow you to superimpose crucial metadata information directly onto the picture itself, making it easier to visually track and troubleshoot your edit in progress.
Contents

Data Burn 3008
Project vs. Clip Mode 3009
Setting Up Burned-In Metadata 3009
Saving and Loading Burn-In Presets 3009
Data Burn Metadata 3010
Custom Output Options 3011
Gang Rendered Text Styles 3012
Prefix Render Text 3012
Data Burn

The Data Burn window lets you display select metadata as a timeline-wide “window burn” that’s superimposed over the image in the Viewer. This window burn is written into files that you render in the Deliver page, and it’s also output to video, for viewing on your external display, or for outputting to tape.

The Data Burn window is available by choosing Workspace > Data Burn-In.

Traditionally, window burns are useful as a reference when creating offline media that you need to keep track of later. However, the Data Burn window is extremely flexible. For example, it’s also useful for watermarking review files that you don’t want to be distributed accidentally with either custom text or graphics with alpha channels, for adding graphical logos or “bugs” to programs in preparation for broadcast (again, optionally using graphics with alpha channels), for superimposing custom reference guidelines of some sort over the images being monitored, or even just for temporarily displaying timecode or clip names to refer to on your monitor while editing, mixing, or reviewing graded dailies with a client.
Project vs. Clip Mode

Two buttons at the top of the Data Burn window let you choose whether you want to edit one set of burned-in metadata that will be displayed for the entire duration of the Timeline, or edit burned-in metadata on a clip-by-clip basis. You can combine the two, having timeline-wide window burn settings and separate clip-specific window burn settings for a handful of clips in that timeline at the same time.

When rendering in the Delivery page, window burns are applied both when rendering timelines as individual source clips and when rendering as one single clip.

Setting Up Burned-In Metadata

Setting up different clip and project metadata to output as a window burn is easy.

To set up a window burn:

1. Choose Workspace > Data Burn-In.
2. Click Project or Clip at the top of the Data Burn-In window.
3. Turn on the checkboxes of whatever items of metadata you want to display in the “Add to Video Output” column. More information about the available items appears later in this chapter.

   The first item of metadata is centered near the bottom of the frame, above Action Safe. Each additional item of metadata you turn on for display is added above whichever items are already displayed, regardless of their position in the “Add to Video Output” list.

4. Click any currently enabled item of metadata from the list to highlight it in black, and edit that item’s Custom Output parameters at the right. More information about the available parameters appears later in this chapter.

To reset the current window burn setup:

Click the Reset button next to the Option drop-down menu to reset the current mode of the Data Burn window.

Saving and Loading Burn-In Presets

If there are common sets of metadata that you regularly use and switch among, you can save each set up as a preset for future use.

To save a burn-in preset:

1. Click the Option menu and choose Save As New Preset.
2. Type a name into the Burn In Preset dialog that appears, and click OK. That preset is added to the list of saved presets in the Option menu.
To delete a burn-in preset:
1. Choose a preset from the Option menu.
2. Click the Option menu, and choose Delete.
3. A dialogue box appears asking you to confirm the deletion.

To modify a burn-in preset:
1. Choose a preset from the Option menu.
2. Edit it however you like.
3. Click the Option menu, and choose Update.

Data Burn Metadata

The leftmost column in the Data Burn window contains a list of all the options that you can add to the video output as a window burn. Each option has a checkbox that lets you turn it on or off. You can also select in the Option drop-down if you would like the item name rendered as a prefix to the burn-in data.

**NOTE:** If two clips overlap in the Timeline, the metadata that matches the currently visible clip in the Viewer is what will be displayed in the window burn.

- **Record Timecode:** The timecode relative to the Timeline, as set in the Conform Options section of the General Options panel of the Project Settings.
- **Record Frame Number:** The number of frames from the first frame of the Timeline.
- **Source Timecode:** Each clip’s individual timecode.
- **Record TC & Frame Num:** Both metadata options combined in one line.
- **Source TC & Frame Num:** Both metadata options combined in one line.
- **Source & Record TC:** Both metadata options combined in one line.
- **Feet + Frames 35mm:** Displays a Feet + Frames conversion of the program’s record timecode, calculated for 35mm film.
- **Feet + Frames 16mm:** Displays a Feet + Frames conversion of the program’s record timecode, calculated for 16mm film.
- **Audio Timecode:** The timecode of audio that’s been synced to a clip.
- **Keycode:** Also referred to as edge-code, the identification codes running along the edge of film stocks that provide an absolute reference for which digital frames correspond to which film frames.
- **Source File Name:** The full file path, including file name, of the media file that’s linked to the current clip.
- **Record File Name:** The file name as defined in the Render Settings list of the Deliver page.
- **Source Clip Name:** The file name of the media file that’s linked to the current clip, without the file path.
- **Custom Text1**: A line of text that you type into the Text field of the Custom Output parameters. You can use any characters you like. When editing any of the three custom text fields that are available, you can use “metadata variables” that you can add as graphical tags that let you display clip metadata. For example, you could add the corresponding metadata variable tags %scene_%shot_%take and the custom text would display “12_A_3” if “scene 12,” “shot A,” “take 3” were its metadata. For more information on the use of variables, as well as a list of all variables that are available in DaVinci Resolve, see Chapter 173, “Using Variables and Keywords.”

- **Custom Text2**: A second line of text that you can customize.

- **Custom Text3**: A third line of text that you can customize.

- **Logo**: Lets you superimpose a graphic over the image in a customizable location. Compatible graphics formats include PNG, TGA, TIF, BMP, and JPG. Alpha channels are supported for transparency in logos.

- **Logo2**: Lets you superimpose a second graphic.

- **Logo3**: Lets you superimpose a third graphic.

- **Reel Name**: The currently defined reel number for the current clip.

- **Shot**: Shot metadata, if it’s been written to the file by a camera, or entered into the Metadata Editor on the Media page.

- **Scene**: Scene metadata, if it’s been written to the file by a camera, or entered into the Metadata Editor on the Media page.

- **Take**: Take metadata, if it’s been written to the file by a camera, or entered into the Metadata Editor on the Media page.

- **Angle**: Angle metadata, if it’s been written to the file by a camera, or entered into the Metadata Editor on the Media page.

- **Day**: Day metadata, if it’s been written to the file by a camera, or entered into the Metadata Editor on the Media page.

- **Date**: Date metadata, if it’s been written to the file by a camera, or entered into the Metadata Editor on the Media page.

- **Circled Take**: Corresponds to Good Take metadata, if it’s been written to the file by a camera, or entered into the Metadata Editor on the Media page.

- **Camera**: Corresponds to the Camera metadata, if it’s been written to the file by a camera, or entered into the Metadata Editor on the Media page.

- **Roll/Card**: Corresponds to the Roll/Card metadata, if it’s been written to the file by a camera, or entered into the Metadata Editor on the Media page.

---

### Custom Output Options

The parameters in the Custom Output panel let you modify the look, position, and in some cases content, of the selected metadata item. Pan and Tilt are individually customizable for each metadata item.

- **First x frames**: Turning on this checkbox lets you specify a number of frames during which the current item of metadata will be displayed before dissolving away over one second. When enabled, the current item of metadata will cut onscreen with the beginning of each new clip, remain onscreen for the duration specified, and then dissolve away.
• **Last x frames:** Turning on this checkbox lets you specify a number of frames before the end of each clip during which the current item of metadata will appear onscreen after fading up over one second, before cutting away with the end of the clip.

• **Font:** Defaults to Courier, but you can choose any font that’s installed on your system.

• **Size:** Defaults to 48, but you can choose standard increments from 6 to 72.

• **Alignment:** Defaults to Center. The only other option is Left.

• **Color:** Defaults to white, but you can choose from a range of predefined colors in this drop-down menu.

• **Background:** Defaults to black, although the apparent color is influenced by the Opacity setting. For a more garish look, you can choose from a range of predefined colors in this drop-down menu.

• **X-Y Position:** Lets you change the horizontal and vertical orientation of the current item of metadata. The default horizontal value is the center of the frame, relative to the current project’s frame size. The first item of metadata is centered vertically near the bottom of the frame, above Action Safe. Each subsequent item of metadata you turn on is automatically placed above the previous item of metadata, regardless of its order in the “Add to Video Output” list.

• **Opacity:** Defaults to 1.0. Lets you define the transparency of the burned-in metadata’s background color.

• **Text:** (only if one of the Custom Text options is checked) A text field that lets you enter custom text to display as one of three possible custom text items.

• **Logo:** (only if one of the Logo options is checked) A field that displays the file path of any currently selected graphic that you’re displaying as one of the three possible Logo graphics. Compatible graphics formats include PNG, TGA, TIF, BMP, and JPG. Alpha channels are supported for transparency in logos.

• **Import File button:** (only if one of the Logo options is checked) Lets you choose a graphics file to use as a logo.

**Gang Rendered Text Styles**

You have the option of independently styling each item of metadata, depending on whether the Gang Render Text Styles option is checked in the Data Burn window’s Option menu. When turned on, all text metadata share the same font, size, color, background, justification, and opacity. When turned off, each item of metadata can have individual settings.

**Prefix Render Text**

Another option in the Data Burn window’s Option menu lets you turn the prefixes, or headers, on or off for all metadata that’s enabled to be burned in.
PART 11
ResolveFX
This section provides detailed explanations for each ResolveFX filter that’s available on the Cut, Edit, Fusion, and Color pages.

For more information on how to apply and adjust ResolveFX on the Cut page, see Chapter 22, “Video and Audio Effects in the Cut Page.”

For more information on how to apply and adjust ResolveFX on the Edit page, see Chapter 39, “Editing, Adding, and Copying Effects and Filters.”

For more information on how to apply and adjust ResolveFX on the Fusion page, see Chapter 75, “Using OpenFX and ResolveFX.”

For more information on how to apply and adjust ResolveFX on the Color page, see Chapter 132, “Using OpenFX and ResolveFX.”
Contents

Catalogue of ResolveFX Filters

3016
Catalogue of ResolveFX Filters

DaVinci Resolve comes with a set of ResolveFX filters, many of which have been optimized for real time playback. These are located within their own category in the Effects Library of the Edit page and in the OpenFX browser of the Color page. These effects (or filters) work just like any other OpenFX plug-in.

ResolveFX come in two types. Some are CPU-based, while most are GPU-accelerated, depending on which type of processing is faster for a particular effect. Each ResolveFX filter’s icon shows you which it is.

Icons show which ResolveFX filters are GPU-accelerated, versus those that are optimized for CPU processing.

In addition to the different parameters built into each filter, every single ResolveFX filter has a Blend parameter that mixes that filter’s effect against the original image. Each filter’s Blend parameter appears at the bottom of that filter’s settings.

The Blend slider found in the parameters of every ResolveFX filter.
Chapter 138

ResolveFX Blur

The plug-ins in this category offer a wider variety of different blur methods than those found in the Blur palette.

Box Blur

A variable quality blur that ranges from very low quality to very soft.

- **Horizontal and Vertical Strength**: These sliders let you adjust the width and height of blur.
- **Gang**: This checkbox lets you adjust these parameters together or separately.
- **Number of Iterations**: Controls how smooth the resulting blur is, with 0 being the lowest and most “boxy” level of quality and 1 being the highest and smoothest level of quality. At low iteration values, box blurs can appear somewhat similar to lens blurs.
- **Border Type**: Lets you choose how the edges of the image are affected by this blur, options include Black, Replicate, Reflect, and Wrap Around.

Directional Blur

A blur that’s constrained to a single angle.

- **Blur Strength**: How much blur you want.
- **Blur Angle**: The direction of blur.
- **Border Type**: Lets you choose how the edges of the image are affected by this blur, options include Black, Replicate, Reflect, and Wrap Around.

Gaussian Blur

What the name says.

- **Horizontal and Vertical Strength**: Two sliders let you adjust the Horizontal and Vertical Strength independently.
- **Gang**: This checkbox lets you keep the Horizontal and Vertical Strength values ganged together.
- **Border Type**: Lets you choose how the edges of the image are affected by this blur; options include Black, Replicate, Reflect, and Wrap Around.
**Lens Blur (Studio Version Only)**

A high-quality simulation of optical lens blurring. Adjustable parameters let you achieve different kinds of “bokeh” effects, which are similar to those produced by different combinations of aperture design and lens spherical aberration corrections that affect the “circle of confusion” that creates visible shapes in areas of the picture with pinpoint highlights.

**Shape**

The Shape group lets you choose what shape of aperture to simulate and affects the shape of the bokeh in this effect.

- **Shape Type**: Lets you choose what type of apertures you want to use.
  - **Real Apertures**: Lets you choose a realistic option from the Aperture Shape pop-up menu below, with which to influence the shape of the bokeh effect. Aperture Shape options include Triangle, Square, Pentagon, Hexagon, Heptagon, or Octagon shaped aperture.
  - **Creative**: Lets you choose a more fanciful option from the Aperture Shape pop-up menu below, with which to influence the shape of the bokeh effect. These options simulate the kind of bokeh you could realistically achieve by placing a blackout filter with a custom shaped hole in the center in front of a lens. Aperture Shape options include Heart, Star, Starfish, Starburst, Petals, Lip, Eye, Droplet, and Leaf.
  - **External Input**: Uses any arbitrary graphic with a (preferably small) white shape against a black background to influence the shape of the bokeh effect. This shape must be a graphic or matte clip that’s added to the Node Editor and can be connected in one of two ways. If the plug-in is dragged onto an ordinary corrector node, then you must use the Add OFX Input command to expose an RGB input with which to connect the image. If you’ve added the plug-in as a self-contained OFX node (named “Lens Blur”), then you can attach the image to the second RGB input of the Lens Blur node.

- **Aperture Shape**: Provides different options for aperture shapes that influence the shape of this plug-in’s simulated bokeh blur effect.
- **Preview Shape**: This checkbox lets you see the actual shape you’ve selected to use.
### Speed
The Speed Options group lets you adjust the quality/speed tradeoff of this plug-in.

- **Quality**: Three options, Full, Half (Faster), and Quarter (Fast), let you choose a suitable tradeoff between image quality and plug-in performance.
- **Horizontal and Vertical Crop**: Crops the shape image being used to influence the bokeh to a smaller size, in the event the large size of the graphic is slowing things down and you can crop out extra black from the edges. You won’t notice a change to the result until you start cropping into the white part of the shape.

### Controls
The parameters available from the Controls group change depending on the Shape Type you’ve selected.

- **Blur Size/Scale**: Adjusts the overall amount of blur. At higher values, the shape of bokeh can be more clearly seen.
- **Blade Curvature**: (Only available with Real and Creative Apertures) Lets you round off the edges of the Aperture Shape you selected.
- **Rotation**: Lets you adjust the angle the shape appears at.
- **Anamorphism**: Lets you adjust the aspect ratio of this effect in order to match the lens blur created by anamorphic lenses.
- **Chroma Shift**: Lets you simulate chromatic aberration within the blur effect.
- **Highlights**: Lets you adjust how the highlights of the image affect the blur, dilating or eroding the image more or less depending on how high Smooth Strength is.
- **Apodization**: (Only available with Real and Creative Apertures) A slider that lets you adjust the simulated “Airy disk” pattern in the defocused effect being generated. Dragging the slider to the left toward negative values accentuate concentric rings around the bokeh pattern that simulate the effects of optical diffraction and add a pattern to the result, while dragging this slider to the right introduces positive values that gradually filter the edges of the simulated bokeh pattern, resulting in a progressively smoother result.
- **Catadioptric**: (Only available with Real and Creative Apertures) A slider that lets you simulate the effect of a shaped mirror element in a Catadioptric telescope to “improve” focus within the defocused bokeh effect this plug-in produces. At higher and higher values, the underlying image becomes progressively less blurry, while still being distorted by the bokeh shape being used which results in soft image overlays, creating a very different kind of simulated optical defocusing effect.
Mosaic Blur

A simple, pixelated blur suitable for hiding the face of anonymous witnesses.

- **Pixel Frequency:** Lets you adjust the size of each pixel, thus determining the density and resolution of the resulting grid of pixels.
- **Smooth Strength:** Lets you blur the edges of adjacent pixels.
- **Border Type:** Lets you choose how the edges of the image are affected by this blur; options include Black, Replicate, Reflect, and Wrap Around.

Radial Blur

A blur effect that simulates the motion blur that would occur were the image spinning around its center point.

- **Smooth Strength:** Adjusts how much blurring is applied.
- **X and Y Position:** Lets you move the center of the blur.
- **Border Type:** Lets you choose how the edges of the image are affected by this blur; options include Black, Replicate, Reflect, and Wrap Around.

Zoom Blur

A blur effect that simulates the motion blur that would occur were a camera moving toward the image.

- **Smooth Strength:** Adjusts how much blurring is applied.
- **X and Y Position:** Lets you move the center of the blur.
- **Border Type:** Lets you choose how the edges of the image are affected by this blur; options include Black, Replicate, Reflect, and Wrap Around.
Chapter 139

ResolveFX Color

These plug-ins provide color processing methods that aren't available in any of the Color Page palettes of the Color page, and include several color management tools that can be applied outside of Resolve Color Management (RCM).

ACES Transform

Lets you perform the kind of color transforms that the ACES Input Device Transform and ACES Output Device Transform parameters of the Color Management panel do, without the need to have ACEScc or ACEScct enabled.

- **ACES Version:** When you’ve chosen one of the ACES color science options, this pop-up becomes available to let you choose which version of ACES you want to use. As of DaVinci Resolve 15, you can choose from ACES 1.0.3 or ACES 1.1 (the latest version).
- **Input Transform:** This pop-up menu lets you choose which IDT (Input Device Transform) to use to process the image. It presents the same options that are available in the Color Management panel of the Project Settings.
- **Output Transform:** This pop-up menu lets you choose an ODT (Output Device Transform) with which to transform the image data for monitoring on your calibrated display and when exporting a timeline in the Deliver page. It presents the same options that are available in the Color Management panel of the Project Settings.

For more information about the options available in these parameters, see Chapter 7, “Data Levels, Color Management, and ACES.”

**NOTE:** This plug-in does ACES transforms correctly using the transforms specified by the Academy, whereas the Color Transform plug-in does transforms to the ACES color space colorimetrically, which is not actually correct for ACES workflows.

Chromatic Adaptation

A Color category plug-in that lets you precisely transform an image that has been lit or processed assuming one specific color temperature to another user-selectable color temperature. This transformation alters the appearance of all colors in the image as perceived by the human vision system in the same way that a new illuminant would, whether that illuminant is a light in the environment being recorded or the color temperature of a display on which the image is shown. This plug-in is useful for performing specific color temperature transformations as part of color management workflows or for setting up precise color temperature adjustments as part of a creative grade.

You control this transformation by using pop-up menus to define the Illuminant Type of the source (typically the color temperature the camera was set to), and that of the target that you want to transform the image to. For both sets of controls, you can choose a Standard Illuminant from a list, a Color Temperature via a slider, or CIE 1931 xy coordinate values. This plug-in also takes into account the current color space and gamma of the clip, which default to the current Timeline Color Space.

This image transform is extremely precise because the image is first transformed from the Timeline Color Space to XYZ, and then it’s transformed to match the LMS (long, medium, short) color space that models the cone response of the human eye to colors lit by different illuminants.
The Method pop-up menu provides a variety of different transform methods to choose from, defaulting to CAT02. Each option in the Method pop-up menu uses different measurement datasets to create individual CAT matrixes to guide this transformation. As a result, each method prioritizes different levels of accuracy for different sets of colors. For example:

- CAT02 has a non-linear component that compensates for the tendency of extremely saturated blues to go purple, a typical weakness of other methods. It usually gives the best result for the widest variety of measured data sets and works best for emissive sources (displays) and dim viewing environments.
- Bradford Linear is also a commonly used method, albeit one in which extremely saturated blues will go purple during the transform. It works well for both emissive sources in dim environments and for reflective sources (theater screens) and dark environments.
- Von Kries is one of the oldest methods in common use, although it’s also one in which extremely saturated blues will go purple during the transform. This, as well as all other methods, are available if you need to match work done in another image processing application.

**NOTE:** Be aware that all methods listed will match neutral colors perfectly; the only differences lie in how different ranges of saturated color are transformed.

### Color Compressor (Studio Version Only)

This filter lets you compress a range of colors toward a single target color. It works best when applied to similarly colored regions that have been isolated with a secondary qualifier or window. For example, if you’re adjusting an irregularly lit product such as a soda can or a dress that must have a very specific hue, you can isolate that item and use this filter to push the range of Hue, Saturation, and Luminance closer to the ideal color that’s identified using the color picker.

(Before/After) Using the Even plug-in to compress original range of hues of the jacket into a narrow “target” range within a secondary operation
• **Target Color:** A color control with an eyedropper button that you choose or sample a single set of Hue/Saturation/Luminance values you want to push all other colors toward.

• **Compress Hue, Compress Saturation, and Compress Luminance:** These sliders let you individually compress the range of colors you’re adjusting in the image to more and more closely match the image. At 0, no compression is applied, at 0.500 the original range of colors in the image have been adjusted to be halfway between their original values and the values of the Target Color, and at 1.000 the original range of colors has been set to be identical to the Target Color.

---

**Color Space Transform**

Lets you perform the kind of color transforms that LUTs do, but instead of using lookup tables, this plug-in uses the same math used by Resolve Color Management (RCM) in order to do extremely clean color transforms without clipping.

**Color Space Transform**

Exposes four pop-up menus that let you set an Input Colorspace, Input Gamma, Output Colorspace, and Output Gamma, in order to do controlled transforms from the Input settings to the Output settings, right within a grade. Resolve Color Management does not have to be enabled for you to use this filter.

**Gamut Mapping**

The Color Space Transform plug-in provides Gamut Mapping controls to accommodate workflows where you need to transform one color space into another that has a dramatically larger or smaller gamut. These controls are similar to those found in the Color Management panel of the Project Settings.

Tone Mapping Method lets you enable tone mapping to accommodate workflows where you need to transform one color space into another with a dramatically larger or smaller dynamic range by automating an expansion or contraction of image contrast in such a way as to give a pleasing result with no clipping. There are three options, None, Simple, and Luminance Mapping.

• Choosing None results in no tone mapping at all.

• Choosing “Simple” uses a simple curve to perform this transformation, compressing or expanding the highlights and/or shadows of the timeline dynamic range to better fit the output dynamic range. Note that the “Simple” option maps between approximately 5500 nits and 100 nits, so if you’re mapping from an HDR source with more than 5500 nits to an SDR destination there may still be some clipping of the highlights above 5500 nits.

• Choosing “Luminance Mapping” lets you use a customized curve operation to remap the gamma of the image and enables the Max. Input Luminance, Max. Output Luminance, and Avg. Input Luminance sliders.

  – The Max. Input (nits) checkbox and slider lets you set the reference maximum Luminance value (in nits) that you want to remap to the value set by the Max. Output (nits) checkbox and slider, which governs the maximum luminance level of the Output color space (in nits). Using these two sliders together, you can set which value from the Input Gamma is mapped to which value of the Output Gamma.
The Adaptation slider is designed to compensate for large differences in the viewer’s state of visual adaptation when viewing a bright image on an HDR display versus seeing that same image on an SDR display. For most “average” images this setting works best set between 0–10. However, when you’re converting very bright images (for example, a snow scene at noon), then using a higher value will yield more image detail within the highlights.

- Choosing “Clip” hard clips all out-of-bounds values.

Gamut Mapping Method accommodates workflows where you need to transform one color space into another with a dramatically larger or smaller gamut by helping to automate an expansion or contraction of image saturation in such a way as to give a pleasing and naturalistic result with no clipping.

- Choosing None results in no Gamut mapping at all.
- Choosing Saturation Mapping from this menu enables saturation mapping to fit the range of saturation values from the Input Color Space and Gamma into the Output Color Space and Gamma. It enables the Saturation Knee and Saturation Max. controls.
  - The Saturation Knee slider sets the image level at which saturation mapping begins. Below this level, no remapping is applied. All saturation values from this level on up are remapped according to the Saturation Max. slider. A value of 1.0 is maximum saturation in the currently selected output color space.
  - The Saturation Max slider sets the new maximum level to which you want to either raise or lower all saturation values that are above the Saturation Knee setting. A value of 1.0 is maximum saturation in the currently selected output color space.
- Choosing “Clip” hard clips all out-of-gamut values.

**NOTE:** While this plug-in has ACES settings, it does transforms to the ACES color space colorimetrically, which is not actually correct for ACES workflows. For actual ACES workflows, use the ACES Transform plug-in, which uses transforms specified by the Academy.

### Color Stabilizer (Studio Version Only)

Designed to deal with clips that have inconsistencies in exposure and color, caused by manual changes to a lens’ aperture setting or by a camera’s auto exposure settings causing unwanted changes to color and brightness in the middle of a shot. The Color Stabilizer plug-in analyzes a frame of the clip that represents the desired exposure and color, and automatically adjusts every other frame of the current clip to match the analyzed levels.

**IMPORTANT** The Color Stabilizer gives you the best results with clips that don’t have clipped highlights. When used in the Color page, it’s recommended to grade the image to bring all the highlights you want somewhere at or under a value of 1023, and then apply the Color Stabilizer to a node after this adjustment.
There are two ways of using the Color Stabilizer:

- **The easiest way is to choose Entire Frame from the Region For Analysis pop-up menu.** Then, move the playhead in the Viewer to the frame that represents the contrast and color you want the entire clip to have, and click the Analyze This Frame. Now, if you play through the clip, changes in contrast and color should be gone. This method works best for clips where the inconsistency you’re trying to eliminate is fairly uniform, affecting the entire picture.

- **Another way is to choose Overlay Rectangle from the Region For Analysis pop-up menu.** This causes an onscreen rectangle to appear that you can resize and position over a specific region you want to sample for the duration of the clip. If the selected feature you’re analyzing is moving, then you can use the FX Tracker to track the subject so the selection box follows it (this is important for a consistent result). Once this is set up, move the playhead in the Viewer to the frame that represents the contrast and color you want the entire clip to have, and click the Analyze This Frame. Now, if you play through the clip, changes in contrast and color should be gone. This method works best for clips where there are parts of the picture that are supposed to have a change in brightness or color, such as when something moves into the frame, or a reflected highlight comes and goes because of the lighting scheme, at the same time as an otherwise undesirable change in contrast or color. You can use the selection box to specifically analyze the part of the frame that has the unwanted exposure change, while ignoring the desirable exposure change.

Depending on what option you choose from the Region for Analysis pop-up menu, different additional options appear.

### Analysis Region

If you choose “Entire Frame” from the Region For Analysis pop-up, these controls don’t appear. A set of Source X/Y Position and Source Width/Height parameters let you transform the selection box that defines which part of the image is being analyzed.

### Channels to Stabilize

Once you’ve analyzed the frame that represents the best contrast and color for that clip, the Channels to Stabilize controls let you choose how you want to handle making the correction. The What to Stabilize pop-up menu lets you choose between stabilizing White Balance and Brightness, or R, G, B Channels Separately.

- **If you choose White Balance and Brightness**, two checkboxes let you choose whether or not you want to include Stabilize White Balance and Stabilize Brightness independently from one another.

- **If you choose R, G, B channels separately**, three checkboxes appear letting for Stabilize Red, Green, and Blue Channel, so you can pick which particular channels you want to correct.

The “Stabilize Levels How” pop-up lets you choose how to make the correction, with options to Match Levels and Contrast, Lift to Consistent Level, Gain to Consistent Level, each of which uses a subtly different method to make the necessary correction, so if one method doesn’t work for the particular problem your clip is exhibiting, you can try the other methods to try and get a better result.
Captured Analysis Values

Once you’ve analyzed the frame, another set of parameters appear showing the captured analysis values upon which the automated correction is based, so that you can make manual adjustments if necessary to improve the result. The parameters that are shown depend on the option you chose from the What to Stabilize pop-up menu.

- If you chose White Balance and Brightness, then you’ll have a Normalized White Balance color control, and Low Level and High Level sliders.
- If you chose R, G, B Channels Separately, then you’ll have Red, Green, and Blue High and Low Level sliders.

Contrast Pop (Studio Version Only)

A more extreme and selective version of the Midtone Detail control found in the Color Wheels palette, designed to add either sharp high-contrast looks, or soft low-contrast looks to a selective portion of the tonal range of the image.

- **Detail Amount:** Lets you choose how much of this effect to apply. At 0, no effect is applied. At positive values progressively sharper contrast is added, while at negative values progressively softer low-contrast is applied.
- **Detail size:** Lets you choose which structures of the image are affected by this localized contrast adjustment, from smaller to larger.
- **Low and High Threshold:** These values let you define what range of image tonality is affected by this filter, allowing you to omit either shadows or highlights from this operation.
- **Softness:** Lets you soften the transition between the affected and unaffected areas of the image.

DCTL

Lets you apply a DCTL wherever you can apply ResolveFX plug-ins. For more information on DCTLS and where they’re installed, see Chapter 174, “Creating DCTL LUTs.”

- **DCTL List:** A pop-up that lets you choose from the available DCTLS installed on your workstation.
- **Reload DCTL:** A button that lets you refresh the DCTL list pop-up if you’ve installed new DCTLS while DaVinci Resolve is running.

Dehaze (Studio Version Only)

Designed to let you make fast, selective adjustments to color and contrast to reduce the visible effects of smog, airlight, and haze in an image. This filter automatically generates a simulated depth matte which is used to apply more of this corrective color adjustment to faraway parts of the image that would be more affected by haze effects and less color adjustment to closeup parts of the image. However, the simulated depth mask is not going to be perfect, so additional controls exist to let you make adjustments to it to achieve a better result.
• **Dehaze Strength**: This slider applies a simultaneous color and contrast adjustment. Raising Dehaze Strength subtly increases contrast (especially in the shadows) while rebalancing color toward the complement of the currently selected Haze Color and selectively intensifying saturation. Lowering Dehaze Strength decreases contrast and rebalances color toward the selected Haze Color itself while selectively lowering saturation.

• **Haze Color**: A color control with an eyedropper button that you choose or sample the color of smog, airlight, or haze in an image that you want to minimize.

• **Display Depth**: Lets you view the simulated depth matte that’s being generated. It’s useful to turn this on before adjusting the Shadow and Highlight controls below.

• **Shadow**: This slider raises or lowers darkest parts of the simulated depth mask that defines the parts of the image that are supposedly farthest away.

• **Highlight**: This slider lets you raise or lower the lightest parts of the simulated depth mask that defines the parts of the image that are supposedly closest to us.

**Gamut Limiter**

Let’s you limit the gamut to a specified standard. Useful in situations where the delivery color space is a large gamut such as Rec.2020, but the QC specification requires limiting to a smaller gamut such as P3, in order to limit the amount of saturation allowable in the final output. This is a limiting operation, so out of bounds values are hard clipped. This plug-in can be used regardless of whether or not Resolve Color Management is enabled. Because it’s a limiter, it should probably be one of the last operations in any node tree to prevent useful image data from being clipped.

• **Current Gamut**: Choose the timeline gamut currently being used by the image.

• **Current Gamma**: Choose the timeline gamma currently being used by the image.

• **Limit Gamma to**: Choose the gamut you want to restrict the image to here.

These menus present the same options as the Resolve Color Management menus in the Color Management panel. For more information about the options available in these parameters, see Chapter 7, “Data Levels, Color Management, and ACES.”

**Gamut Mapping (Studio Version Only)**

The Color Space Transform plug-in provides Gamut Mapping controls to accommodate workflows where you need to transform one color space into another that has a dramatically larger or smaller gamut. These controls are identical to those found in the Color Space Transform plug-in’s Gamut Mapping group and are similar to those found in the Color Management panel of the Project Settings.

• **Gamma**: A pop-up menu lets you specify what type of gamma the clip is supposed to have, so set this to whatever matches that image (this may match the timeline color space, but it depends on how you’re working).
• **Tone Mapping Method:** Lets you enable tone mapping, to accommodate workflows where you need to transform one color space into another with a dramatically larger or smaller dynamic range by automating an expansion or contraction of image contrast in such a way as to give a pleasing result with no clipping. There are three options, None, Simple, and Luminance Mapping.

  - Choosing “Simple” uses a simple curve to perform this transformation, compressing or expanding the highlights and/or shadows of the timeline dynamic range to better fit the output dynamic range. Note that the “Simple” option maps between approximately 5500 nits and 100 nits, so if you’re mapping from an HDR source with more than 5500 nits to an SDR destination there may still be some clipping of the highlights above 5500 nits.

  - Choosing “Luminance Mapping” lets you use a customized curve operation to remap the gamma of the image and enables the Max. Input Luminance, Max. Output Luminance, and Avg. Input Luminance sliders.

    **The Max.** Input Luminance slider lets you set the reference maximum Luminance value (in nits) that you want to remap to the value set by the Max. Output Luminance slider, which governs the maximum luminance level of the Output color space (in nits). Using these two sliders together, you can set which value from the Input Gamma is mapped to which value of the Output Gamma.

    **The Avg.** Input Luminance slider is designed to compensate for large differences in the viewer’s state of visual adaptation when viewing a bright image on an HDR display versus seeing that same image on an SDR display. For most “average” images this setting works best set between 0–10. However, when you’re converting very bright images (for example, a snow scene at noon), then using a higher value will yield more image detail within the highlights.

• **Gamut Mapping Method:** Accommodates workflows where you need to transform one color space into another with a dramatically larger or smaller gamut by helping to automate an expansion or contraction of image saturation in such a way as to give a pleasing and naturalistic result with no clipping. Choosing Saturation Mapping lets you remap the saturation values of the image. It enables the Saturation Knee and Saturation Max. controls.

  - The Saturation Knee slider sets the image level at which saturation mapping begins. Below this level, no remapping is applied. All saturation values from this level on up are remapped according to the Saturation Max. slider. A value of 1.0 is maximum saturation in the currently selected output color space.

  - The Saturation Max slider sets the new maximum level to which you want to either raise or lower all saturation values that are above the Saturation Knee setting. A value of 1.0 is maximum saturation in the currently selected output color space.

---

**Invert Color**

A Color category plug-in that lets you invert any color channel, including the alpha channel. This little plug-in has 101 uses in advanced workflows, especially when you need to invert Alpha or Key channels to do something specific. This is not a “film negative” plug-in; this is a simple inversion.
These plug-ins generate imagery that can be used within grades and composites in different ways.

**Color Generator**

Generates a single color using a color picker control. Useful in conjunction with a layer node’s ability to mix a color with an image using different composite modes.

- **Color picker**: You can click the color picker and use the resulting color controls to choose a color to be generated.
- **Eyedropper**: You can also click the eyedropper to sample a color from the image in the Viewer; the eyedropper always samples the image from the input of the current node, regardless of how the current image looks.

**Color Palette (Studio Version Only)**

More of an analysis tool than a creative effect, this plug-in offers four Display modes from the pop-up menu at top: Color Palette, Shadow Region, Midtone Region, and Highlight Region.

- **Display Mode**: A pop-up that provides four different options.
  - **Color Palette**: By default this displays the eight most dominant colors in the image as rectangular swatches along the bottom, and the eight most dominant colors in each of the three main zones of image tonality (shadow, midtone, highlight) are displayed as smaller rectangular patches just above. This lets you see, at a glance, the color palette of any given shot, and this can be output for intrepid art directors who find it useful.
  - **Shadow Region, Midtone Region, or Highlight Region**: Displays a visual preview of which parts of the image fall into which regions (as currently defined by the Shadow and Highlight Threshold sliders). These previews are displayed with the current tonal region appearing saturated and all other parts of the image appearing black.

- **Number of Colors**: Defines the number of isolated colors. This can be set to display anywhere from 8 to 24 patches.
- **Shadow and Highlight Threshold**: The definition of where shadows, midtones, and highlights end and begin is controlled by the Shadow and Highlight Threshold sliders.
Grid

As the name implies, this plug-in generates a grid with two sets of properties.

General

These controls let you adjust the overall density and orientation of the grid.

- **Row Cells and Column Cells**: These sliders let you choose how many cells to divide the grid into, both vertically and horizontally.
- **Pan, Tilt, Zoom, Rotate, Width, Height, ShearX, ShearY, Pitch, and Yaw**: These controls let you transform the grid to serve whatever purpose is necessary.

Line Properties

These controls let you control the properties of the grid lines themselves.

- **Line Color**: This color picker control and accompanying eyedropper let you choose a color with which to draw the grid.
- **Individual Hor. Line Width and Ver. Line Width**: These sliders let you adjust the thickness of all horizontal or all vertical lines.
- **Major Line Spacing**: This slider lets you set every nth line to be thicker, while the Major Line Width control lets you choose how thick to make these major lines.
Chapter 141

ResolveFX Light

The plug-ins in this category all replicate different optical and lighting effects. While most have been designed to quickly give you realistic results, all can be pushed harder to provide many artistic effects.

Aperture Diffraction

Found in the ResolveFX Light category, Aperture Diffraction models the starburst effect usually seen when shooting bright lights with small apertures, the physical cause of which is light-diffraction on the aperture blades of a lens. This plug-in simulates this, with the result being automatically applied to scene highlights that you can isolate and refine, with customizable virtual apertures.

Small regions of brightness exhibit a star pattern glow, as seen in the following image.

(Left) Original image, (Right) Applying Aperture Diffraction

Large regions of brightness exhibit a more even glow with shaping and texture that look like a natural optical effect. It can be used to create a different type of glow effect with a more realistic look in some situations than the Glow plug-in, though it’s more processor intensive. In other situations, this plug-in opens up many different stylistic possibilities for glowing effects.

(Lefr) Original image, (Right) Applying Aperture Diffraction

Output

These controls let you choose what image is output by this plug-in.

- **Select Output:** Lets you preview the image with different stages of the Aperture Diffraction effect applied, viewing the Isolated Source (to help when adjusting the Isolation controls), Preview Aperture (to help when adjusting the Aperture controls), Preview Diffraction Pattern (showing you the resulting diffraction pattern based on the aperture control settings), Diffraction Patterns Alone (showing you the glow effect that will be applied to the image by itself), and the Final Composite.

- **Quality:** Lets you choose a quality setting to trade off between quality and speed. Choices are Full, Half (Faster), Quarter (Fast).
Isolation Controls

The Isolation controls let you choose which highlights in the scene generate visible glow and patterns. The effect of these controls can be directly monitored by setting Select Output to Isolated Source.

- **Color Mode**: A pop-up menu that lets you either choose to keep the colors of the different highlight regions that generate glow, or treat them all as grayscale brightness only (color controls later can change the effect). Grayscale is faster to process, but Color can result in some brilliant effects.
- **Brightness**: Sets the threshold at which highlights are isolated.
- **Gamma**: Lets you shape the isolated highlights.
- **Smooth**: Lets you blur details in the highlights that you don’t want to be pronounced.
- **Color Filter**: Lets you choose a particular color of highlight to isolate (an eyedropper lets you select a value from the Viewer).
- **Operation**: Lets you adjust the resulting Isolation matte (options include Shrink, Grow, Opening, Closing) with a slider to define how much.

Aperture Controls

The Aperture controls let you define the shape and texture of the resulting glow this plug-in creates.

- **Iris Shape**: Lets you choose a shape that determines how many arms the star pattern will have. Options are Triangle, Square, Pentagon, Hexagon, Heptagon, and Octagon.
- **Aperture Size**: Lets you alter the resulting diffraction pattern alternating between more of a star shape at higher values and a stippled wave pattern at lower values.
- **Result Gamma**: Lets you adjust how pronounced will be the glow that appears between the arms of the star patterns that appear.
- **Result Scale**: Lets you alternate between pronounced star patterns at high values and more diffuse glows at low values.
- **Blade Curvature and Rotation**: Let you alter the softness and orientation of the arms of each star.
- **Chroma Shift**: Lets you introduce some RGB “bleed” into the glow.

Compositing Controls

These controls let you adjust how to composite the glow effect against the original image.

- **Normalize Brightness**: This checkbox scales the brightness of the glow to a naturalistic range for the image. Also, when Normalize Brightness is enabled, the Aperture Diffraction effect will keep to a consistent overall brightness as the scene changes.
- **Brightness**: Lets you adjust the intensity of the glow effect.
- **Colorize**: Lets you tint the glow effect using a Color control that appears when Colorize is raised above 0.
**Glow**

A sophisticated, soft glow effect that’s highly customizable with only a few key parameters.

- **Select Output**: Lets you preview the image with different stages of the glow effect applied, viewing the Shiny Regions, the isolated Glow Alone, or the Glowing Image.
- **Shine Threshold**: Defines the luminance level at which glow is triggered to appear on the image.
- **Spread**: Defines how far out shine extends from areas of the picture that trigger it.
- **H/V Ratio**: Lets you adjust the proportion of horizontal to vertical spread, allowing you to create “streaky” shine that extends farther in a particular dimension.
- **Relative Spread Red/Green/Blue**: Lets you adjust the spread within each color channel by a different amount, simulating a kind of chromatic aberration in the glow.
- **Brightness**: Adjusts the intensity of the glow effect.
- **Colorize**: A color picker and eyedropper let you choose a color with which to tint the glow.
- **Glow framing**: Lets you choose what happens when shine hits the edge of the frame, whether it’s amplified by “Reflect in Camera” or whether it’s moderated by a “Vignette” effect.
- **Composite Type**: Lets you choose a composite mode to use to blend the glow effect with the image. Defaults to Screen, which is good for gentle glows. Add lets you create hotter, more intense glows, while other composite modes let you create other varied effects.
- **Opacity**: Lets you adjust the transparency of the glow effect and is a fast way of “easing off” of a glow that you otherwise like, but that’s too intense for the shot at hand.

**Lens Flare (Studio Version Only)**

Simulates different kinds of lens flares resulting from the interplay of light through an aperture of selectable shape bouncing within layered optical elements in a lens. Lens Flares are completely computer-generated, so they’re always created at your project resolution, whether it’s 1080 or 8K. Four groups of controls give you a lot of ways to customize the presets to create your own effect:

**Lens Flare Preset**

You can choose a type of flare from the Lens Flare Preset pop-up. If you manipulate the controls to create your own effect, this pop-up switches to Custom.

**Select Output**

The Select Output pop-up lets you switch among the following viewing options:

- **Final Image**: (Default) Shows the lens flare composited against the current clip.
- **Flare Elements Alone**: Shows the isolated flare, making it easier to adjust.
- **Source Mask and Magnified Source Mask**: Let you see the mask created by the Light Source Masking controls below, which is used to limit the lens flare that’s created.
Light Source Masking

Three additional controls at the top let you create a quick and dirty luma key to create a mask that you can use for occluding the lens flare effect behind foreground elements in the scene. For example, if you’re using lens flare to simulate the sun in the sky, these controls let you mask trees in the foreground so that the lens flare appears to be behind the trees, as the sun would be.

- **Enable Light Source Masking**: This checkbox enables the Mask Threshold and Virtual Light Source Size sliders. You can then choose either Source Mask or Magnified Source Mask to see the mask that’s created by raising the Mask Threshold slider.
- **Mask Threshold**: Raising this slider pulls a fast Luma Key that masks off darker foreground elements (such as trees against the horizon) and limits the flare to areas of the picture where the light source of the flaring can "shine through" (In this example, shining between the trees on the horizon.).
- **Virtual Light Source Size**: This slider determines how quickly the center of a flare will disappear behind the luma-keyed mask you’ve created; higher values (simulating bigger light sources) cause a flare to disappear more slowly when passing "behind" a feature of the image that’s being keyed via the Mask Threshold slider.

Position

Position parameters let you adjust the X and Y Position of the simulated light source that’s causing the flare. There are three ways you can adjust the flare position.

- You can Adjust the X and Y Position sliders.
- You can turn on the OpenFX Overlay in the Viewer and drag the on-screen control.
- You can motion track elements within the scene using the FX mode of the Tracker palette.

Global Corrections

The Global Corrections group have parameters that let you quickly adjust the overall quality of the flare effect.

- **Global Scaling**: Lets you make every element of the flare effect larger or smaller at once.
- **Anamorphism**: Lets you stretch all flare elements horizontally to simulate an anamorphic lens’ stretching effect.
- **Lens Center X and Y position**: Lets you offset the center of the simulated lens that’s causing the flaring, about which the various elements of the flare pivot.
- **Global Defocus**: Lets you blur the overall flaring effect being created to soften the effect.
- **Global Brightness**: Lets you raise and lower the overall level of flaring being produced.
- **Global Saturation**: Lets you adjust the overall color intensity of the flaring.
- **Colorise Result**: Lets you choose how much to tint the flare, if at all. At a value of 0 (the default), no colorization is applied at all.
- **Colorization Color**: Lets you choose a color to use to colorize the flare via the Colorize Result slider above. You can use either a color control or eyedropper to sample color from the source RGB image of the current node.
**Aperture**

The Aperture parameters let you define the aperture of the simulated camera apparatus through which the flare is being generated. The shape defined by these parameters affects the look of the “starburst element” of each flare, as well as the look of any aperture-shaped “ghost elements” you’re turning on.

- **Aperture Blades:** Defines how many blades make up the aperture. You can choose from 3 to 16 (defaults to 6).
- **Angle:** Sets the angle of the resulting Aperture shape (defaults to 0.183).

**Elements**

The Elements pop-up is a deceptively simple set of controls that let you expose the customization controls of each of the layers and elements that combine to create the simulated lens flare. Up to ten levels of elements can contribute to a lens flare effect. Each element and ghost shape has a different set of parameters unique to that type of element. Available elements in this pop-up menu include:

- **Full-Screen Glare:** A simulated overall flaring that covers the entire frame at its most intense. This glare increases as the flare nears the center of the screen and decreases as the flare moves toward the edges of the frame. Recommended for extremely big flaring effects. Parameters include:
  - **Glare Brightness:** A slider; set this to 0 to eliminate glare.
  - **Glare Color:** A color picker and eyedropper combination that lets you tint the glare.

- **Flare Spot:** Simulates the central light source that’s triggering the flare. Parameters include Flare Size (set this to 0 to eliminate the flare spot), Flare Irregularity (which lets you create a more organic-looking, off-balance flare), Flare Softness, and Flare Color.

- **Starburst:** Rays of light stretching out from the center of the flare. Parameters include Starburst Size (set this to 0 to eliminate the starburst), Starburst Softness, Starburst Split Angle (which splits each streak of the starburst into a wider feathered pattern), Starburst Split Balance (which lets you adjust the brightness between each half of split streaks), and Starburst Color.

- **Ghost elements:** Seven available layers of Ghost Elements can be enabled and set to different optional shapes for each lens element you want to simulate. Each of the Ghost element layers can use one of five types of shapes, including:
  - **None:** Turns that particular ghost element off.
  - **Aperture Shape:** A polygonal shape defined by the number of blades in the aperture you’ve selected.
  - **Anamorphic Streak:** A wide horizontal artifact typical of anamorphic lenses.
  - **Disc Shape:** A round ring artifact.
  - **Bubble Shape:** An oval with haze within.
  - **Corona Rays:** A ring of streaks stretching outward.
Ghost elements share many parameters in common, although specific elements have unique parameters. These parameters are as follows:

- **Color:** A color picker and eyedropper combination that lets you colorize that specific element.

- **Position:** A slider lets you set that element’s position along the optical path that’s defined by the angle from the (Flare) Position X and Y to the Lens Center X and Y parameters. A value of 0 centers that element on the Lens Position, while larger values push that element farther and farther away from the Lens Position.

- **Size:** Sets the size of that flaring element, or in the case of the Anamorphic Streak, the width.

- **Height:** (Anamorphic Streak only) Sets the vertical thickness of the streak.

- **Center Brightness:** (Aperture, Disk, and Anamorphic Streak only) Defines the brightness in the middle of that element, filling it to appear as a solid element. Set this closer to 0 if you want the element to appear hollow.

- **Edge Brightness:** (All but Anamorphic Streak) Defines the brightness of the edge of that element. Raising this value while lowering the Center Brightness lets you create outlined element effects.

- **Softness:** Lets you blur that element.

- **Bristle Density:** (Corona Only) Lets you alter the number and arrangement of the optical bristles that appear. At lower values, fewer bristles appear, at higher values, more bristles appear. As you change the value of this parameter, the placement of bristles shifts, allowing you to change distribution as well as density with a single control.

- **Bristle Scale:** (Corona only) Lets you alter the thickness of the bristles that appear. Smaller values result in thicker bristles, higher values result in smaller bristles more tightly packed together.

- **Ringing:** (All types but Bubble) Simulates a pattern of diffraction artifacts. Higher values increase the number of rings or streaks comprising the element.

- **Chromatic shift:** Simulates chromatic aberration effects.

- **Eclipse Position:** Simulates where the outer (away from the center) or inner (toward the center) side of a Ghost Element doesn’t exist because the light is occluded by the edge of a lens element or some part of the tube housing. Practically, this defines which side of the Ghost Element is affected by the other Eclipse parameters of size, softness, and chromatic shift. Adjusting this results in semi-circular ghost shapes of different kinds. At 0, there is no eclipse. At positive values, the eclipse starts from within the frame and pushes out; at negative values, the eclipse starts from the outside of the frame and pushes in.

- **Eclipse Size:** Defines the size of the eclipse region for that flare element. At higher values, more and more of the flare element is eclipsed.

- **Eclipse Softness:** Defines the softness at the transition from the eclipsed and non-eclipsed regions.

- **Eclipse Chromatic shift:** Lets you create a chromatic aberration effect at the boundary of the eclipsed region. At 0, there is no chromatic shift. At increasingly positive values, there’s a shift toward blue. Toward negative values, there’s a shift toward red.

- **Repeat:** Lets you use this element to spawn many duplicates defined by the following two parameters.

- **Repeat Position Seed and Repeat Size Seed:** At different values, these parameters let you pseudo-randomly redistribute the placement of repeated elements.
**Lens Reflections**

Found in the ResolveFX Light category, Lens Reflections simulates intense highlights reflecting off the various optical elements within a lens to create flaring and scattering effects based on the shape and motion of highlights you isolate in the scene. It’s an effective simulation that works best when there are light sources or specular reflections in the scene such as the sun, car headlights, light fixtures, fire and flame, or other lighting elements that are plausibly bright enough to cause such flaring.

Also, this plug-in really shines when these light sources move, as each layer of simulated reflections moves according to that element's position within the virtual lens being simulated, creating organic motion that you don’t have to keyframe. Without intense highlights, the results of this filter will be somewhat abstract.

![Original image](image1.png) ![Applying Lens Reflections](image2.png)

**Output**

The Output controls let you preview the image with different stages of the Lens Reflections effect applied.

- **Select Output**: Lets you choose to view the Isolated Source (to help when adjusting the Isolation controls), Reflections Alone (showing you the flaring effect that will be applied to the image by itself), or the Final Composite (the complete effect).
- **Quality**: This pop-up lets you choose how to render the effect. Options are Full, Half (Faster), and Quarter (Fast). The tradeoff is between quality and speed.

**Isolation Controls**

The Isolation controls let you choose which highlights in the scene will generate lens reflections. The effect of these controls can be directly monitored by setting Select Output to Isolated Source. It’s highly recommended to customize the Isolation controls for the image at hand when using this plug-in, as even more so than other plug-ins, the particular highlights used will have a huge impact on the resulting effect.

- **Color Mode**: A pop-up menu that lets you either choose to keep the colors of the different highlight regions that generate lens reflections, or treat them all as grayscale brightness only (color controls later can change the effect). Grayscale is faster to process, but Color can result in some brilliant effects.
- **Brightness**: Sets the threshold at which highlights are isolated.
- **Gamma**: Lets you shape the isolated highlights.
- **Smooth**: Lets you blur details in the highlights that you don’t want to be pronounced.
• **Color Filter**: Lets you choose a particular color of highlight to isolate (an eyedropper lets you select a value from the Viewer).

• **Operation**: A pop-up lets you adjust the resulting Isolation matte (options include Shrink, Grow, Opening, Closing), and a slider lets you define how much.

### Global Controls

The Global controls let you quickly and easily adjust the overall quality of the Lens Reflections effect using a centralized group of parameters.

• **Global Brightness**: Lets you raise and lower the level of all reflections. Lowering brightness is a good way to make a large lens reflection effect more subtle, although images with small lens reflection effects may benefit from being a little brighter.

• **Global Blur**: Lets you defocus all reflections. This is another good way of making lens reflection effects of all kinds more subtle.

• **Anamorphism**: Lets you deform the reflection elements to simulate an anamorphic lens' stretching effect.

• **Global Colorize**: Lets you adjust the color intensity of the reflections, either intensifying the color of all reflections or desaturating it.

### Presets

A Presets pop-up provides a number of different settings to get you started. Selecting a preset populates the Reflecting Elements parameters below, at which point you can customize the effect to work best with the image at hand. It’s highly recommended to customize these effects to suit the type of highlights in your image, in order to get the best results.

### Reflecting Elements

There are four groups of Reflecting elements, each with identical controls. This lets you create interactions combining up to four sets of reflections. The controls found within each group are as follows.

• **Brightness**: Lets you adjust the intensity of that reflection.

• **Position in Optical Path**: Lets you shift the reflection according to an element’s position in the lens. Practically, this means that positive values will enlarge an inverted reflection based on the highlights, while reducing values toward 0 will shrink the reflection, and pushing this into negative values will invert the reflection and pull it into the opposite direction as it begins to enlarge again. A value of –1 positions the reflection right over the highlight that creates it.

• **Defocus type**: Lets you choose what kind of blur to use, choices include Box blur, Triangular blur, Lens blur (the most processor intensive), and Gaussian blur (the default).

• **Defocus**: Lets you choose how much to blur that element.

• **Stretch**: Lets you give the flare an anamorphic widescreen look.

• **Stretch Falloff**: Lets you taper the edges for a less uniform stretching effect.

• **Lens Coating**: A pop-up lets you choose common colors such as purple, green, and yellow that correspond to different anti-reflective lens coatings, as well as a selection of other vibrant colors. Defaults to none. When you choose any other option, a color control and eyedropper let you manually choose a color or pick one from the image. A Colorize slider lets you vary how much to tint the reflection by the selected color, although setting Colorize to 0 lets the flare take its color from the source highlights of the image, which can sometimes give you the most interesting look.
Light Rays

A “rays of light” effect that simulates volumetric lighting emerging from light sources defined by a threshold you define. The effect mimics what are sometimes called “god rays” in the sky, or other highly directional glow effects.

Main Controls

The Main controls include:

- **Select Output**: Lets you preview the image with different stages of the Lightray effect applied, viewing the Final Image, Lightrays Alone, and Source Regions.
- **Source of Rays**: Lets you choose the emitter of the rays, using Bright Regions or Edges.
- **Source Threshold**: A slider that lets you choose the limit at which light areas of the image emit rays.

Position

Position parameters let you define the direction rays take.

- **Ray Directions**: A pop-up menu that lets you choose either “From A Location,” which exposes controls to let you choose an X or Y position to define a point of origin that defines the angle of the light beams, or “At an Angle,” which exposes controls to let you choose an overall orientation for the rays.

Appearance

Appearance parameters let you customize the ray effect.

- **Ray Dropoff**: A pop-up with four options.
  - **Default (soft)**: Produces soft, indistinct rays of light that appear to fade away as they stream out.
  - **Keep Shape of Source**: The edge of the light rays are defined by the shape that emitted them.
  - **CCD Bloom Harsh**: Severely raises the brightness of the part of the image that’s emitting rays as Length is raised, resulting in harsh glow or bloom in the image.
  - **CCD Bloom Soft**: Gently raises the brightness of the part of the image that’s emitting rays as Length is raised, resulting in a very gentle lightning of the image.

- **Length**: Lets you make the rays longer or shorter.
- **Soften**: Lets you blur the rays being emitted.
- **Brightness**: Lets you adjust how bright the rays are.
- **Color**: A color picker and eyedropper let you define a color with which to tint the rays.
Chapter 142

ResolveFX Refine

These plug-ins let you make different kinds of targeted improvements.
Contents

**Alpha Matte Shrink and Grow** *(Studio Version Only)* 3050

**Beauty** *(Studio Version Only)* 3050
- Operating Mode 3051

- Forehead Retouching 3058
- Cheek Retouching 3058
- Chin Retouching 3058
Alpha Matte Shrink and Grow
(Studio Version Only)

This filter lets you refine the edges of alpha and key mattes in a variety of ways, shrinking and growing the edges, and opening and closing holes that appear within a matte. In the Color page, this filter can be applied to Qualifier or Window keys that have been routed to the RGB input of a corrector node, for adjustment and refinement, before connecting the result to the key input of a subsequent node for use isolating an adjustment.

![Image of Alpha Matte Shrink and Grow filter application]

- **Operation**: A pop-up menu lets you choose how you want to modify the alpha channel/key. You can choose Shrink or Grow to dilate or erode the edges of the matte with great accuracy. Or, you can choose Opening or Closing to plug or expand holes within the key to clean up a ragged matte.
- **Operator Shape**: A pop-up menu lets you choose how corners and angles in the edges of the key are handled when you grow or shrink it. Circle is the default, and results in even expansion around the surface of the key that eventually averages all angles into a circular shape if you use extreme Radius settings. Square averages all angles into a more rectangular shape if you use extreme Radius settings. Diamond averages all angles into a diamond shape if you use extreme Radius settings.
- **Operator Radius**: A slider adjusts how much to Shrink, Grow, Open, or Close the key.
- **Repeat Operation**: A slider alters the effect of the Operator Radius setting to create more extreme adjustments.

Beauty (Studio Version Only)

Beauty is a plug-in that lets you control texture. In Advanced mode, you can selectively smooth image detail that falls above a particular threshold (using the Smoothing Threshold slider), while preserving detail falling below a particular threshold (using the Texture Threshold slider). In this way, you can smooth larger textures you don’t want, while either preserving or exaggerating smaller textures that you do want.

In the case of faces and skin, this plug-in provides another method of smoothing larger, unwanted blemishes, while preserving desirable edge detail and underlying structures such as pores, so you can improve the complexion of subjects on shoots where hair and makeup was not available, without over-softening realistic skin details and creating an overly fake plastic look.
Please note that this plug-in is not only for skin detail, and it’s not only for softening. Once you isolate the fine detail you want to preserve in a subject, you also have the option of exaggerating it to create highly textured results. This plug-in is effective for any subject with textures that need refinement.

**TIP:** This plug-in is best used within a qualification that isolates the particular feature you’re trying to smooth. The default settings apply a moderate amount of smoothing and fine detail recovery that’s appropriate for faces in closeup but will not be universally appropriate for all situations, so some fine-tuning will always be necessary. For naturalistic results, this plug-in produces the best results when used in moderation.

**Operating Mode**

The Beauty plug-in has two operational modes, including an Automatic mode with simpler operation when your objective is to create a maximally smooth or textured result while still preserving important details, and an Advanced mode that provides additional controls that let you preserve fine detail that you want, while smoothing coarse details that you don’t want.

**Auto Controls**

Automatic mode reveals easy-to-use controls for smoothing or coarsening detail.

- **Amount:** Lets you choose how much smoothing or coarsening to apply.
- **Scale:** Lets you reduce or increase the amount of smoothing or coarsening that’s accomplished with the range of the Amount slider.
Advanced Controls

Advanced controls reveal the full power of the Beauty plug-in, with preview modes to examine different aspects of this plug-in’s behavior, while specifically adjusting the level of smoothing or coarsening you want, the amount of texture to preserve, and which additional features of the subject you want to recover from this operation to fine tune the result.

- **Show Split View:** Turns on a split-screen view that displays a grid of four images (in clockwise order from upper left): the smoothed or coarsened image, the Texture Recovery mask, the Feature Recovery mask, and the final result. The Split View works best with the Full Screen Viewer enabled (press Shift-F) while the Inspector is shown at right, so each quadrant is large while you make your adjustments.

Smoothing

These parameters let you adjust how much smoothing to apply to the image.

- **Smoothing Threshold:** Raising this value increasingly smooths textures above the Texture Threshold (below). Using this control and leaving Diffuse Lighting at 0 preserves the contrast of the lighting on the feature you’re smoothing.

- **Diffuse Lighting:** Another method of softening texture, but in such a way that the lighting of the subject also appears to become more and more diffuse (Similar to setting Midtone Detail to negative values).

- **Preview Smoothed:** Lets you view the image with only smoothing applied by the Smoothing Threshold and Diffuse Lighting sliders, with no texture recovery.

Texture Recovery

These parameters let you adjust how much texture to put back into the smoothed result.

- **Texture Threshold:** Lets you set the threshold at which detail is reintroduced to the image. Texture Threshold must always be equal to or lower than Smoothing Threshold, so lowering Smoothing Threshold may also result in lowering Texture Threshold.

- **Add Texture:** Lets you exaggerate recovered texture (at values higher than 1), or minimize recovered texture (at values less than one).

- **Preview Texture:** Lets you view the isolated texture mask that’s being recovered by the Texture Gain and Texture Threshold sliders, so you can fine tune what you want to preserve.

Feature Recovery

These parameters let you recover edge detail.

- **Recovery Amount:** Lets you set the threshold at which detail is reintroduced to the image. Texture Threshold must always be equal to or lower than Smoothing Threshold, so lowering Smoothing Threshold may also result in lowering Texture Threshold.

- **Preview Recovery Area:** Lets you view the mask that’s being generated by the Recovery Amount slider, so you can fine tune what you want to preserve. Preserved detail is white, discarded detail is black.
Face Refinement (Studio Version Only)

Face Refinement is an incredibly sophisticated yet easy-to-use filter that lets you quickly make very targeted adjustments to people’s complexions. When you apply this filter, imaging techniques are used to automatically detect a face, which is automatically tracked so long as it’s somewhat turned toward the camera.

If multiple faces are present in the frame at the position of the playhead, then clicking the Analyze button once results in boxes being drawn over each detectable face. Click any of these boxes to choose which face you want to refine, and that box will be highlighted to indicate which face you’ll be refining.

When multiple faces are detected, you can click a box to choose which one to work on.

If only one face is present, clicking the Analyze button automatically analyzes that face; no boxes appear and this step is not necessary.

After you’ve selected which face to track (if necessary), you need only click the Analyze button at the top of the Face Refinement controls to “auto-magically” track the face through the trackable range of motion that this plug-in is capable of, and an outline of the face’s major features appears to let you follow its progress.

The Face Refinement filter automatically detecting a performer’s face.

Once the face has been tracked, you’re ready to work. This plug-in divides the tracked face into different zones for common operations colorists often perform to quickly eliminate blemishes, adjust the hue and saturation of complexions in regionally appropriate ways, modify lighting, sharpen desirable detail, and refine makeup. Because all adjustments are fit to the proportions of the face that’s been detected and tracked, all you need to do is make the adjustments you need and DaVinci Resolve takes care of the rest.
Main Controls
The top two controls let you initiate the Face Refinement process.

- **Analyze**: This button initiates the process of using the facial detection of the Face Refinement plug-in to detect the face you want to make adjustments for, and track its motion throughout the range of the clip. You only need to do this once, and the data will be stored.

- **Show overlay**: To impress your clients and see how well Face Detection is tracking the face you’re working on, you can turn on this checkbox, which turns on the wireframe tracking that shows you which facial details are being detected.

Skin Mask
These controls let you adjust the skin mask this plug-in automatically generates in order to limit the effect to only the face of the person you’re targeting.

- **Use mask**: This checkbox enables DaVinci Resolve to sample the dominant skin tone values within the face to create a complexion-focused key to isolate the skin tones of the image. However, since it’s still possible to have blonde hair, wood panelling, or other skin-colored features in the frame that inadvertently get included in this key.

- **Use face mask**: Turning on this checkbox places a circular garbage mask that follows the face to eliminate these accidental inclusions.

- **Face mask size and Face mask softness**: These sliders let you adjust the face mask to better fit the face you’re working on, if necessary.

- **Refine mask**: This slider lets you adjust the face mask to smooth or eliminate gaps in the key.

- **Show mask**: This checkbox makes the face mask being generated visible, which can be helpful to see while you’re tuning it.

- **Show overlay**: To impress your clients and see how well Face Detection is tracking the face you’re working on, you can turn on this checkbox, which turns on the wireframe tracking that shows you which facial details are being detected.

Limiting the key with the face mask
Texture

The Texture controls have three Operating Modes that let you choose the method you want to use to control skin texture. Beauty Automatic and Beauty Advanced provide the texture controls available in the Beauty plug-in, while Smoothing provides the previously available texture adjustment controls.

Beauty Automatic Controls

Automatic mode reveals easy-to-use controls for smoothing or coarsening detail.

- **Amount:** Lets you choose how much smoothing or coarsening to apply.
- **Scale:** Lets you reduce or increase the amount of smoothing or coarsening that’s accomplished with the range of the Amount slider.

Smoothing Controls

- **Smoothing:** This slider removes detail from the areas isolated by the Skin Mask controls, smoothing the complexion. Its operation depends on the settings of the Detail Size and Detail sliders below. You may find you can increase Smoothing more dramatically as you increase Detail using the Detail Size and Detail sliders described below.
- **Detail Size and Detail:** Once you’ve used the Smoothing slider, you can then use these sliders to selectively put subtle skin details back into the image; Detail Size determines the maximum size of details you want to put back into the face, and Detail is a sharpening operation that lets you adjust how visible these small details are. By combining smoothing and subtle preservation of small details, you can get a much more naturalistic result than were you to simply leave the entire face unnaturally smooth.

(Top) The original image, (Bottom Left) Only smoothing complexion, (Bottom Right) Using Detail Size and Detail to put natural texture back into the smoothed result (results exaggerated for print)
Beauty Advanced
These controls are identical to the Advanced controls of the Beauty plug-in, covered previously in this chapter.

Color Grading
These controls let you make color adjustments to the overall face.

- **Contrast**: This slider lets you lighten the face in a natural way by keeping the shadows dark even while you brighten the face, making it easy to bring actors out of the background.
- **Midtone**: Lets you add a more luminous quality to the skin tone.
- **Color boost**: Specifically boosts saturation in the lowest saturated parts of the face.
- **Tint**: Provides a limited range of naturalistic hues emphasizing orange through red (but extending to green and magenta) with which to tweak complexion.
- **Desaturate shadow**: This slider lets you selectively desaturate the darkest shadows on the face to keep things looking natural, or to desaturate more aggressively in order to stylize the face in a different way. Also useful when using the other adjustments of this plug-in makes the shadows too colorful. Moving this slider into negative values will add saturation.
- **Shine Removal**: This slider is an inverse contrast adjustment designed to ameliorate sweat and shine on a person’s face, although moving this slider into negative values will also accentuate shine.

Eye Retouching
These controls target just the eyes and surrounding area of the face.

- **Sharpening**: This slider lets you selectively add sharpening just to the eyes and eyelashes, which lets you instantly add focus to any performer.
- **Brightening**: This slider lets you whiten the eyeballs.
- **Eye Light**: This slider lets you brighten the region of the face around the eyes that’s often thrown into shadow by the subject’s forehead in situations with imprudent lighting.
- **Eyebag Removal**: This slider uses a variety of techniques to smooth, color-adjust, and brighten the area under the eyes most susceptible to eye bags with tired talent.
Lip Retouching

These controls target just the lips and surrounding area of the mouth.

- **Hue**: This slider lets you adjust the color of a subject’s lips or lipstick.
- **Saturation**: This slider lets you adjust the intensity of lip color.
- **Upper Lip Smooth**: Lets you smooth out fine age lines that can appear above lips.

Blush Retouching

The parameters in this group let you modify the hue of the blush region of a subject’s cheek, letting you correct an unwise makeup choice, or push a subject’s blush color around to add makeup that wasn’t there.

- **Hue**: This slider lets you adjust the hue of the cheeks.
- **Saturation**: This slider then lets you intensify or remove blush color.
- **Size**: This slider lets you adjust the size of the blush area of the cheeks.

About Forehead, Cheek, and Chin Retouching

The next three groups of controls borrow a technique from portrait painters, who’ve long taken advantage of the “traffic light” approach to rendering skin hues, that observes that foreheads are often a bit yellow, the middle of the face is usually a bit red, and chins can be a bit green. A combination of unequal sun exposure, capillary distribution, and follicle growth account for this, but the bottom line is that faces are seldom a single unified hue. This means that there may be a region of the face that would benefit from individual adjustment (cheeks that have gotten too much sun, for example). But it also means that when you allow a bit of hue variation into your face grade, you can achieve a more naturalistic result.

TIP: For a variety of reasons, people are extremely sensitive to the hues of skin tone, so tiny variations that can be difficult to identify nevertheless have a significant impact on the resulting visuals. Unless you’re aiming to create a special effect, these controls are meant to be used sparingly.
Forehead Retouching
As the name implies, adjusts color and texture on the forehead.

- **Hue and Saturation**: These sliders let you adjust forehead color.
- **Smooth**: This slider lets you apply a specific smoothing operation to the forehead to ameliorate wrinkles and worry-lines.

Cheek Retouching
Simple color adjustment controls affecting the entire cheek area, and not just the blush area.

- **Hue and Saturation**: These sliders let you adjust the color of the cheek, eye, and nose area.

Chin Retouching
Simple color adjustment controls over the chin of the face.

- **Hue and Saturation**: These sliders let you adjust the color of the chin, running up alongside the sides of the face (the beard area).
Chapter 143

ResolveFX Revival

This category consists of plug-ins that let you fix common technical, damage, and quality problems that bedevil programs being finished, remastered, or restored.

Automatic Dirt Removal
(Studio Version Only)

The Automatic Dirt Removal plug-in uses optical flow technology to target and repair temporally unstable bits of dust, dirt, hair, tape hits, and other unwanted artifacts that last for one or two frames and then disappear. All repairs are made while maintaining structurally consistent detail in the underlying frame, resulting in a high quality restoration of the image. Fortunately, despite its sophistication, this is a relatively easy plug-in to use; just drop the plug-in on a shot, adjust the parameters for the best results, and watch it go.

![Original image](image1.png) ![Using Automatic Dirt Removal](image2.png)

**NOTE:** This plug-in is less successful with vertical scratches that remain in the same position for multiple frames and is completely ineffective for dirt on the lens that remains for the entire shot.

**Main Controls**

The primary controls used to adjust how much dirt is removed from the image.

- **Motion Estimation Type:** Lets you choose from among None, Faster, Normal, and Better. This tunes the tradeoff between performance and quality.
- **Neighbor Frames:** Lets you choose how many frames to compare when detecting dirt. Choosing more frames of comparison takes longer to process, but usually results in finding more dirt and artifacts.
- **Repair Strength:** This slider lets you choose how aggressively to repair dirt and artifacts that are found. Lower settings may let small bits through that may or may not be actual dirt, while higher settings eliminate everything that’s found.
- **Dirt Size Threshold:** This slider lets you tune how large a detected bit of dirt must be to be removed. Raising this parameter lets you omit things like film grain from the operation but may allow smaller bits of dirt through.
- **Show Repair Mask:** This checkbox lets you see the dirt and artifacts that are detected by themselves, so you can see the effectiveness of the results as you fine tune this filter.
Fine Controls

These controls let you fine tune the effect in an effort to perfect the tradeoff between removing dirt successfully and preserving true image detail.

- **Motion Threshold**: This slider lets you choose the threshold at which pixels in motion are considered to be dirt and artifacts. At lower values more dirt may escape correction, but you’ll experience fewer motion artifacts. At higher values, more dirt will be eliminated, but you may experience more motion artifacts in footage with camera or subject motion.

- **Edge Ignore**: This slider lets you exclude hard edges in the picture from being affected by dirt or artifacts that are removed. Higher values omit more edges from being affected.

Chromatic Aberration

(Studio Version Only)

A Revival category plug-in that lets you manually correct the slight color fringing that results from chromatic aberration in a lens. "Estimated Red/Blue Fringes" checkboxes display an “alignment guide” that visually isolates each of two types of fringing against gray.

This makes it easy to make manual adjustments to correct the problem, using the Scale and Edge controls to individually adjust Red/Cyan and Blue/Yellow fringing.

Advanced Options provide additional parameters for problem shots. Center X and Y parameters let you offset the center of the lens if you’re dealing with a reframed and re-rendered shot. Balance parameters can help exaggerate hard-to-see fringing to make it easier to correct, and the Fringe Magnification parameter enlarges the fringe indicators that are displayed when you turn on either of the Estimated Fringes checkboxes.
Dead Pixel Fixer (Studio Version Only)

If you have clips that were shot on a camera with one or more “dead” or “stuck” pixels in the sensor, you may have black or white spots that are fixed in place in the image. This filter is designed to let you place crosshairs on each dead or stuck pixel, identifying them so you can use different methods of fixing the problem.

To fix dead or stuck pixels, apply the Dead Pixel Fixer filter, make sure the OFX onscreen controls are enabled in the viewer, and then click on each pixel you need to fix with the mouse to place crosshairs on it. You can click anywhere on the image to place as many crosshairs as you like, there’s no limit. You can also Option-click to delete crosshairs you no longer need. To move any crosshairs, simply drag it to another location.

When you place multiple crosshairs, you can click to select whichever crosshairs you want to adjust the controls for. Each crosshairs can have different control settings, or you can select multiple crosshairs by Command-clicking all the ones you want to adjust.

Remover-Patch Properties
These controls let you adjust the operation of selected crosshairs you’ve placed in the Viewer.

- **Fill-in Method:** This pop-up menu provides two methods of fixing problem pixels: “Blend from surround” and “Clone from Elsewhere.” Blend from surround is the default, which automatically blends surrounding pixels to eliminate the problem. Clone from Elsewhere exposes a second sample control that you can drag onto an adjacent part of the picture to clone pixels to fix the problem.
- **Remover size:** This slider lets you change the size of the region you’re fixing.
- **Soften:** Lets you switch between a hard (value of 0) or soft (value of 3) edge.
- **Points:** A parameter without any controls, save for keyframing, lets you animate the selected remover patch by keyframing it.

Control Visibility
The Control Visibility pop-up menu lets you choose whether the source and target onscreen controls are visible as you work. Show (the default) leaves all onscreen controls visible all the time. Auto Hide hides all onscreen controls whenever you’re dragging one, letting you see the image as you adjust it without having these controls in the way. Hide makes all onscreen controls invisible, so you can see a clean version of the image with the effect, however you can still edit the effect if you remember where the controls are.
Deband (Studio Version Only)

Low bit-depth media that has areas with shallow gradients of color, such as a sky or a wall, often exhibit color banding, seen as visible stripes, because there aren’t enough color values to smoothly represent the gradation from light blue to darker blue in the sky.

This filter is designed to isolate the edges of color banding and minimize them by dithering pixels from either side to soften the transition. This filter works best when applied to regions of the image that have been isolated with a secondary qualifier or window, otherwise you risk all edges within your image being dithered and thus softened (although this can be an interesting stylistic effect).

Deband Parameters

Deband controls include:

- **Edge Threshold**: Adjusts how well-defined an edge needs to be in order to be affected by this filter; lowering this excludes fainter edges, while raising this includes them.
- **Radius**: Lowers or raises the intensity of dithering in areas that will be affected.
- **Post Refine**: Narrows (by lowering) or widens (by raising) the areas affected by dithering.
- **Display Edge**: A checkbox that shows you a black and white high-contrast preview of which edges are being detected for dithering, which can help you fine-tune your results.
**Deflicker (Studio Version Only)**

Introduced in DaVinci Resolve 15, this plug-in replaces the previous Timelapse Deflicker filter, and solves a far broader variety of problems in a much more automatic way. The new Deflicker plug-in handles such diverse issues as flickering exposure in timelapse clips, flickering fluorescent lighting, flickering in archival film sources, and in certain subtle cases even the “rolling bars” found on video screens shot with cameras having mismatched shutter speeds. Two key aspects to this filter are that it only targets rapid, temporally unstable variations in lightness, and that it’s able to target only the areas of an image where flickering appears, leaving all other parts of the image untouched. As a result, this plug-in can often repair problems once considered “unfixable.”

(Left) Original image with flicker, (Right) Result setting Deflicker to Fluoro Light, (clip courtesy Redline Films)

### Main Parameters

By default, the top section of this plug-in exposes a single control, which in many cases may be all you need.

- **Deflicker Setting pop-up menu**: The top two options, Timelapse and Fluoro Light, are presets that effectively eliminate two different categories of flickering artifacts. If neither of these presets is quite as effective as you’d hoped, a third option, Advanced Controls, opens up the Isolate Flicker controls at the heart of this plug-in to let you tailor it further to your needs.

### Isolate Flicker

Hidden by default, these controls only appear when you set Deflicker Setting to Advanced Controls, and let you choose how to detect motion in the scene so that flickering may be correctly addressed relative to the motion of subjects and items within the frame where it appears.

- **Mo.Est. Type**: Picks the method DaVinci Resolve uses to analyze the image to detect motion. Despite the names of the available options, which options will work best is highly scene dependent. The default, Faster, is less processor intensive, but less accurate, however this can be an advantage and actually do a better job with high detail images that would confuse the Better option. Choosing Better is more accurate, but more processor intensive, and Better will try harder to match fine details which can sometimes cause problems. None lets you disable motion analysis altogether, which can work well (and will be considerably faster) in situations where there’s no motion in the scene at all. The default is Better.
- **Frames Either Side**: Specifies the number of frames to analyze to determine what’s in motion. Higher values are not always better; the best setting is, again, scene dependent. The default is 3.
• **Motion Range:** Three settings, Small, Medium, and Large, let you choose the speed of the motion in the frame that should be detected.

• **Gang Luma Chroma:** Lets you choose whether to gang the Luma and Chroma Threshold sliders or not.

• **Luma Threshold:** Determines the threshold above which changes in luma will not be considered flicker. The range is 0–100, 0 deflickers nothing, 100 applies deflickering to everything. The default is 100.

• **Chroma Threshold:** Determines the threshold above which changes in chroma will not be considered flicker. The range is 0–100, 0 deflickers nothing, 100 applies deflickering to everything. The default is 100.

• **Motion Threshold:** Defines the threshold above which motion will not be considered flicker.

### Speed Optimization Options
Closed by default, opening this control group reveals two controls:

- **Reduced-Detail Motion checkbox:** On by default, reduces the amount of detail that’s analyzed to detect flicker. In many cases, this setting makes no visible difference but increases processing speed. Disable this setting if your clip has fine detail that is being smoothed too aggressively.

- **Limit Analysis Area checkbox:** Turning this on reveals controls over a sample box that you can use to limit deflickering to a specific region of the image. This option is useful when (a) only one part of the image is flickering, so focusing on just that area speeds the operation considerably, or (b) part of the image is being smoothed too much by deflickering that’s fixing another part of the image very well.

### Restore Original Detail After Deflicker
Closed by default, opening this control group reveals two controls:

- **Detail to Restore slider:** Lets you quickly isolate grain, fine detail, and sharp edges that should not be affected by the deflicker operation, preserving those fine details exactly.

- **Show Detail Restored checkbox:** Turning this checkbox on lets you see the edges that are detected and used by the Detail to Restore slider, to help you tune this operation.

### Output
The Output pop-up menu lets you choose what Deflicker outputs, with options to help you troubleshoot problem clips. Here are the available options:

- **Deflickered Result:** The final, repaired result. This is the default setting.

- **Detected Flicker:** This option shows you a mask that highlights the parts of the image that are being detected as having flickering, to help you evaluate whether the correct parts of the image are being targeted. This mask can be very subtle, however.

- **Magnified Flicker:** This options shows you an exaggerated version of the Detected Flicker mask, to make it easier to see what the Deflicker plug-in is doing.
**Dust Buster (Studio Version Only)**

This plug-in is also designed to eliminate dust, dirt, and other imperfections and artifacts from clips, but it does so only with user guidance, for clips where the Automatic Dirt Removal plug-in yields unsatisfactory results. This guidance consists of moving through the clip frame-by-frame and drawing boxes around imperfections you want to eliminate. Once you’ve drawn a box, the offending imperfection is auto-magically eliminated in the most seamless way possible. This works well for dirt and dust, but it also works for really big stains and blotches, as seen below.

![Drawing a box around dirt in the original image, Result in the Dust Buster plug-in](image)

This plug-in works similarly to, but supersedes the legacy Dust Removal feature, which only worked on select image sequence formats and wrote new media files on disk. The Dust Buster plug-in works on any format of movie clip and works non-destructively, storing all image repairs within the plug-in without creating new media. Best of all, this plug-in is able to do its magic with only three controls.

- **Mode:** Selects how imperfections within the bounding box you draw are fixed. By default, Auto just takes care of things without you needing to think about this. However, if you’re not satisfied with the result, you can undo and choose a different method from this pop-up method. Here are all the options that are available to you.
  - **Auto:** The default method. Once you’ve drawn a bounding box, the two frames prior to and the two frames after the current clip will be analyzed and compared to the current image. The best of these 5 frames will be drawn upon to remove the imperfection in the current frame. Images two frames away are prioritized since that will avoid the appearance of frozen grain, but only if they’re suitable.
  - **Prev/Next Frame:** If you draw a bounding box from left to right, the next frame will be drawn upon to remove the imperfection. If you draw a bounding box from right to left, the previous frame will be used.
  - **Prev–1/Next+1 Frame:** If you draw a bounding box from left to right, the image two frames forward will be drawn upon to remove the imperfection. If you draw a bounding box from right to left, the image two frames back will be used.
  - **Spatial Fill:** In cases where the other two modes yield unsatisfactory results, such as when the underlying image has fast or blurred motion, this mode uses surrounding information in the current frame to remove the imperfection.

- **Show Patches:** Off by default. Turning this checkbox on lets you see every bounding box you’ve drawn to eliminate imperfections. While the patches are shown, you can Shift-click to select individual patches, group select patches by Command-dragging a bounding box, and delete unwanted patches individually by Option-clicking them.

- **Reset Frame:** Resets all of the bounding boxes drawn on the current frame, so you can start over.
Object Removal (Studio Version Only)

A Revival category plug-in that’s best used in the Color page, Object Removal uses the DaVinci Neural Engine to attempt to remove an object in the frame as automatically as possible. This plug-in works best when removing a moving object that passes over a temporally stable background, or dirt on the lens of a shot where the camera is in motion. Smaller objects get better results than larger objects, but your results really depend on the footage. Here’s a simple procedure that shows how to do this.

To remove a moving object from a clip:

1. In this example, a drone is flying through a long shot that's being simultaneously recorded. We’ll remove the drone using a window to identify the feature to be removed using the Object Removal plug-in.

2. Use the Window palette to draw a window around the object that needs to be removed. You’ll get the best results using windows or masks that hug the feature being removed fairly closely.

3. Track or keyframe the window to move with the feature you’re removing. Again, you’ll get better results the closer your window hugs the object being removed, and it’s good to have some softness at the edge of this window.

4. Drag and drop the Object Removal plug-in onto the node in which you’ve just isolated the feature to be removed.
5 Right-click the node in the Node Editor and choose “Use OFX Alpha” to enable the Object Removal plug-in to use whatever key has been created within that node to do its work.

6 Click the Scene Analysis button, and wait for the analysis to finish. If the object you’re removing is moving but the camera is locked, you can turn on the “Assume No Motion” checkbox to improve your results in this case.

If your footage is ideal for object removal, the object will disappear once analysis is complete, replaced by a seamless background derived from detail found on neighboring frames.

The result after object removal analysis is complete

The Object Removal plug-in is highly footage dependent, and you won’t always get this good a result this easily. Problems with the result are shown via gray, either gray fringing or solid gray filling the replacement window. Gray shows you where the current settings are failing to find background content with which to fill in the patch you’re removing. If this happens, there are two things you can try.

- If you notice while playing through the analyzed result that the object removal mask has gray fringing on some frames, you can try adjusting the “Search Range” slider, which is the distance, in frames, from the current frame that the Object Removal plug-in is searching for replacement image detail. For example, if the Search Range is 20, it searches +/-20 frames from the current location, or 40 frames total. The allowance of 10 frames means we look at every 4th frame. You will generally get the best results for the smallest range that gives an acceptable result.

- If you’re noticing that the object removal mask is filled entirely with gray on some frames, this means that background fill couldn’t be easily generated for those frames. In this case, you can try clicking the “Build Clean Plate” button, which takes a “best guess” approach to generating a background with which to fill the frame and integrates this with frames that could be successfully filled in.

- If the patch is successfully filled, but the result isn’t blending well with the background, you can try changing the Blend mode. The default is Linear, which is a simple cloning operation, but you can also choose Adaptive Blend, which can provide better results except in certain situations where the edges of the replacement patch have a different color or brightness than the background.
Patch Replacer (Studio Version Only)

The Patch Replacer is a quick fix when you need to “paint out” an unwanted feature from the image. For those of you who’ve been using windows and Node Sizing to do small digital paint jobs, this plug-in offers more options and a streamlined workflow.

On adding the plug-in, an onscreen control consisting of two oval patches appears, with an arrow connecting them indicating which patch is being copied into the other. The oval to the left is the “source” patch, used to sample part of the image, and the oval to the right is the “target” patch, used to cover up the unwanted feature using pixels from the source patch.

To use the Patch Replacer, simply drag the target patch over the feature you want to obscure, resize it to fit using the corner controls (the source patch is automatically resized to match), and then drag the source patch to an area of the image that can convincingly be used to fill the target patch.

The source and target patches can be motion tracked using the FX tracker, so this tool is effective even if the subject or camera is moving.

Main Controls

The Fill-in Method pop-up menu is arguably the most important, as it defines what method to use to fill the destination patch with whatever is in the source patch. The rest of the primary controls work differently depending on which Fill-in method you choose.

- **Clone**: Simply copies the source patch into the target patch. When Clone is selected, the Replacement Detail slider (which defaults to 1) lets you fade out the source patch, while Region Shape lets you choose a different kind of shape to use, and Blur Shape Edges lets you feather the edge of this operation, to more convincingly blend the source with the target area.

- **Adaptive Blend**: A much more sophisticated method of obscuring the target area using pixels from the source patch, and in many cases will yield better results more quickly than cloning. The source patch is copied into the target patch in such a way as to combine the source detail with the lighting found inside of the target area, creating in most instances a fast, seamless match. The Keep Original Detail checkbox, when turned on, merges detail from the source and target patches to create a composite, rather than a fill. The Blur Shape Edges slider works a bit differently with Adaptive Blend selected, but the idea is the same, feathering the effect from the outside in to obscure instances where there’s a noticeable border around the target area.

- **Fast Mask**: Eliminates the source patch, doing instead a quick neighboring pixel blend that works well with small patches but can betray a grid pattern on larger patches. Region Shape and Blur Shape Edges are both adjustable.
Patch Positions

Source X and Y, Target X and Y, and Target Width and Height are provided as explicit controls both for numeric adjustment, should that be necessary, and also to allow for keyframing in case you need to change the position and/or size of the source and fill patches over time.

Keep in mind that the source and target patches can be motion tracked using the FX tracker, although two checkboxes, Source Follows Track and Target Follows Track, let you disable FX tracker match moving when necessary.

Onscreen Controls

The Control Visibility pop-up menu lets you choose whether the source and target onscreen controls are visible as you work. Show (the default) leaves all onscreen controls visible all the time. Auto Hide hides all onscreen controls whenever you’re dragging one, letting you see the image as you adjust it without having these controls in the way. Hide makes all onscreen controls invisible, so you can see a clean version of the image with the effect, however you can still edit the effect if you remember where the controls are.
These plug-ins offer a newer and more detailed method of sharpening specific details in images than the sharpen operation found in the Blur palette. Three different plug-ins offer different ways of using the same fundamental algorithm to perform different tasks.

Adjust Small Skin Texture Granularity 3076
**Sharpen (Studio Version Only)**

The Sharpen filter functions by separating the image into four levels of detail, the underlying structure, the fine scale details, the medium scale details, and the large scale details, each of which encompasses differently sized structures that comprise the overall image. In this way, the Sharpen filter lets you apply different amounts of sharpening to each of the fine, medium, and large structures of the image, giving you enormous control over how these different structures of image detail are affected.

**Main Controls**

Controls the overall sharpening effect.

- **Sharpen Amount:** The primary global control that lets you add sharpening to the image. To refine the result, use the controls in Detail Levels to choose how much sharpness to apply to each size of structure this plug-in can operate upon. 1.800 is the default value. 0 is no sharpening, 5.000 is maximum sharpening.

**Detail Levels**

Lets you customize the sharpen effect in a variety of highly specific ways.

- **Fine Detail Size:** This slider adjusts the threshold of what is considered to be a fine detail, although this also alters which image structures are affected by the Medium and Large Details sliders as well. Lowering this slider omits larger structures of the image from sharpening. The default is 0.050.

- **Fine Detail:** At its default setting, the Fine Details slider governs the sharpness of extremely fine detail such as skin pores and strands of hair, or small speckles on textured surfaces. Lower settings apply less sharpening to these structures, while higher settings apply more sharpening.

- **Medium Details:** This slider governs the sharpness of coarser detail such as freckles, wrinkles, clusters of hair, and surface details with greater edge definition. Lower settings apply less sharpening to these structures, while higher settings apply more sharpening.

- **Large Details:** This slider governs the sharpness of the largest details in the image, such as eyelids, the shadows at the edges of lips and noses, and the edges where hair meets the face, and the most contrasty edge details throughout the image. Lower settings apply less sharpening to these structures, while higher settings apply more sharpening.

**Chroma**

A special purpose control that you want to handle with care.

- **Sharpen Chroma:** Selectively sharpens the chroma of the image while leaving the luma (Y) alone.
Sharpen Edges (Studio Version Only)

A variation of the Sharpen filter that’s streamlined for detecting edges to create a key used to limit sharpening to the selected edge details of an image. This is a good filter to use when attempting to make mildly soft-focus clips less objectionable.

Main Controls

Controls the overall sharpening effect accomplished with this plug-in.

- **Sharpen Amount**: The primary global control for adding sharpening to the edges detected by this filter.
- **Sharpen Radius**: Controls the granularity of the detail that’s added using Sharpen Amount.

Edge Detection Controls

These controls let you customize the sharpen effect in very specific ways.

- **Display Edges**: This checkbox lets you see a grayscale preview of the edges that are being detected for sharpening while you use the other controls in this group. If you turn this checkbox on, you can see precisely the effect that the four other controls in this section have on the key that determines which parts of the image are sharpened.
- **Pre Denoise**: Smooths the matte to remove individual pixels of noise. Reducing Pre Denoise lets you minimize edges from the key that you don’t want to sharpen and soften edges that are jagged because of excessive noise. Raising Pre Denoise adds more edges to the sharpening operation and strengthens the edges that are already there.
- **Edge Detect Threshold**: Lets you adjust how strong edge detail needs to be in order to be included in the key. Reducing this parameter includes more edges in the operation, while raising it excludes edges from the operation.
- **Edge Mask Strength**: Lets you increase the intensity of the edges in the key. Reducing Edge Mask Strength diminishes the edges and reduces the intensity of sharpening in those areas. Raising Edge Mask Strength intensifies the edges and adds more of the image within the region of each detected edge to the sharpening operation.
- **Edge Blur**: Lets you control the softness of the edges in the key. Reducing Edge Blur sharpens the key and narrows the edges that are affected by sharpening. Increasing Edge Blur softens the key and potentially includes a wider area of image detail in the sharpening operation.
Soften and Sharpen (Studio Version Only)

A variation of the Sharpen filter that’s streamlined for letting you both smooth some details and add sharpness to other details of the image based on the size of the structures. It can be used with any image for which you want to smooth some features while sharpening others, but this is an operation that’s often used for minimizing unwanted blemishes, wrinkles, or scarring when used within a window or qualifier that’s isolating the skin.

The advantage of using Soften and Sharpen is that you can use the Small Texture slider to leave a bit of natural skin detail intact, such as pores and other small naturalistic details, while you use the Medium and Large Texture controls to smooth out unwanted details in whatever proportion gives you a naturalistic result.

**Tip:** The best way to achieve a more natural result is to leave Small Texture at 0 or just above, while reducing Medium Texture just enough to minimize whatever details merit minimizing and reducing Large Texture by somewhat less to minimize larger blemishes, while leaving overall face detail intact. This is the logic behind the default values of Small 0.000, Medium –0.800, and Large –0.300.

Main Controls

Each of the Small, Medium, and Large Texture sliders can be moved into both negative and positive values. A value of 0 means no change is made to the corresponding details of the image. Negative values remove the corresponding details from the image, eventually leaving only the underlying smooth structure of the image at –1.000. Positive values add sharpness to the corresponding details of the image, to a maximum value of 1.000.

- **Small Texture:** Affects extremely fine detail such as skin pores and strands of hair.
- **Medium Texture:** Impacts coarser detail such as freckles, wrinkles, and clusters of hair.
- **Large Texture:** Affects the largest details in the image such as eyelids, eyebrows, the edges of lips and noses, and the edges where hair meets the face.

**Tip:** What’s identifiable as a small, medium, or large structure depends in large part on how the subject of the shot is framed. These structures differ depending on whether you’re grading a subject in a long shot (where they appear small) versus a subject in closeup (where they appear large).

Adjust Small Skin Texture Granularity

This control lets you adjust the distinction between the Small and Medium/Large texture controls in the previous group of controls.

- **Small Texture Size:** Defines the threshold that differentiates Small Textures from Medium and Large Textures, to help you fine-tune the Small Texture that you want to preserve. Raising this value includes more of the image as small details, while lowering this value excludes more of the image from small details.
The plug-ins found in this category all enable different ways of creating artistic modifications to the image.

**Abstraction** *(Studio Version Only)*

A deceptively powerful filter that lets you create a wide range of cartoon-like renders by simplifying an image into adjustable pools of similar color with optional outlines.

**Main Controls**

These controls create the foundation of this effect.

- **Pre Blur:** Simplifies the image by blurring unwanted details prior to this filter taking effect.

- **Abstraction Strength and Iterate Abstraction:** These parameters work together to then smooth the image, creating pools of simplified color within the details of the image.
  - **Abstraction Strength:** Must be higher than 0 for the Iteration No. parameter to have an effect. Higher Abstraction Strength simplifies image detail even more by averaging adjacent regions of color together.
  - **Iterate Abstraction:** Reduces the amount of small detail in the image even further by “widening” adjacent areas of similar color to blend together as one.

**Quantization Controls**

These controls simplify the pools of color even more aggressively by quantizing the bit depth used to stylize the image. The result is an even sharper flattening of each region of color.

- **Quantization:** A checkbox turns this function on.
- **Steps:** Raising this parameter lets you subdivide each region of color into a greater number of separate regions.
- **Softness:** Lets you blur the border between each level of color.

**Draw Edge Controls**

Adds an edge to the regions of color created by this effect.

- **Draw Edge:** Enables edge drawing.
- **Edge Strength:** Raising this value results in thicker and better-defined edges.
- **Edge Detection Threshold:** Raising this value restricts edges to only the boldest edge details in the picture.
Blanking Fill

This plug-in is specifically designed to quickly fill black frame blanking with a stylized image derived from the clip itself, to make blanking less intrusive for viewers in documentaries and news segments. In the following example, the Blanking Fill plug-in is used to add image to the left and right of “pillarboxed” standard definition 4:3 video that appears within a High Definition or Ultra High Definition 16:9 aspect ratio.

(Left) Original standard definition image, (Right) Image with default Blanking Fill applied

A variety of controls let you easily customize this effect to suit your own purposes.

Source

These controls let you transform the clip in different ways, which also affects how that clip is used to fill the blanking area.

- **Zoom**: Zooms the clip while keeping it within the native domain of definition. Good for quickly cropping unwanted pixels around the edges so they’re hidden and aren’t used for blanking fill.
- **Gang Left/Right Sliders**: On by default, locks both sliders together so moving one moves the other by a mirrored amount.
- **Crop Left and Right**: Crops both the left and right edges of the image and increases the area at the sides with blanking fill.
- **Gang Top/Bottom Sliders**: On by default, locks both sliders together so moving one moves the other by a mirrored amount.
- **Crop Top and Bottom**: Crops both the top and bottom edges of the image and increases the vertical area with blanking fill.

Fill Extent

These controls let you choose how the current duplicate of the image is stretched to fill the blanking area.

- **Zoom Mode**: There are three options:
  - **Stretch to Timeline**: Automatically warps the image to stretch it to fit the full frame. Keeps features in the blanking fill area level with where they appear in the original image.
  - **Zoom to Timeline**: Automatically zooms into the image to fit the full frame. Results in the clip looking “inset” from the blanking fill image.
  - **Manual**: Reveals Expand and Aspect sliders that let you manually choose how much to zoom and stretch the image to fit the blanking fill area.
- **Warp Top Layer:** lets you use onscreen controls to choose a section of the edge of an image to stretch out to fill blanking in the frame. In this mode, there are two sets of onscreen controls you can use to customize the result:

  A set of outer handles let you choose how far out to warp the edges of the image to fill whatever blanking there is. These default to the project frame size.

  A set of inner handles lets you choose how much of the image you want to stretch out. These default to the current title safe boundary. If you customize these, choosing too narrow an edge results in a more extreme warping and stretching effect, while choosing a wider edge to stretch looks more natural, but affects more of the frame.

- **Expand:** (Only appears when Zoom Mode is set to Manual) Zooms the image.
- **Aspect:** (Only appears when Zoom Mode is set to Manual) Stretches the image.

(Figure) The original 4:3 image edited into a 16:9 timeline with black pillar boxing to the left and right as a result. (Right) The image with Blanking Fill set to Warp Top Layer, stretching the left and right edges to fill the blanking area

### Fill Appearance

These controls let you change the look of the image being used to fill the blanking area.

- **Blend Edges:** Lets you feather the edges where the original image meets the blanking fill area.
- **Blur Background:** Lets you choose how much or how little to blur the image that fills the blanking fill area.
- **Fade Amount:** Lets you fade or tint the blanking fill area. At 0, there’s no fade applied. At 1.000, the blanking area is filled with a solid color defined by the Fade Color control.
- **Fade Color:** A color picker/eyedropper combination that lets you choose a color with which to fade, tint, or fill the blanking fill area.

### Drop Shadow

Lets you add a simple drop shadow to any clip, using that clip’s native or generated alpha channel to create the shape of the shadow.

- **Shadow Strength:** Lets you choose how solid the drop shadow appears.
- **Drop Angle:** Lets you choose the angle the drop shadow appears at. At 0 the drop shadow is centered.
- **Drop Distance:** Offsets the drop shadow farther in the direction of the Drop Angle
- **Blur:** Softens the drop shadow.
- **Color:** Tints the drop shadow.
Edge Detect

An edge detection effect with options for customizing which edges create outlines.

- **Mode**: Lets you choose between RGB and Grayscale edges. RGB is the default.
- **Edge color**: (only enabled if Mode is set to Grayscale) Lets you colorize the edge outlines that are generated.
- **Threshold**: Determines the lightness level that’s used for edge creation.
- **Smooth**: Lets you soften these edges.
- **Brightness**: Lets you adjust edge intensity.
- **Denoise Type**: Can be switched between Soften and Sharpen, to preprocess the image.
- **Denoise Strength**: Raise this slider to emphasize dominant outlines and de-emphasize weak ones.
- **Edge Mask Overlay**: This checkbox lets you superimpose the edges created with this filter over the RGB image via a multiply operation.

Emboss

An emboss effect with several options to create different kinds of outline and emboss effects.

- **Emboss Style**: This pop-up lets you choose from among Relief, Emboss Over, Sobel, and Laplacian types of embossing.
- **Power**: Lets you adjust how pronounced the emboss effect is.
- **Angle**: Lets you choose the apparent angle at which the emboss effect is rendered.

Channels

Three checkboxes let you choose to use the Red, Green, and Blue channels to create this effect.

JPEG Damage

Simulates the kinds of minor or major artifacts you get when doing JPEG compression; useful for simulating compression damage.

- **Quality**: Lets you lower the bit depth of the image.
- **Resolution**: Lets you increase the size of macroblocking artifacts that appear.
- **Block Aspect Ratio**: Lets you adjust the macroblocks to be more square or rectangular.
- **Frequency Scale**: Sharpens the effect.
- **Scale Component**: Lets you base this effect on All Frequencies, the X-Frequency, or the Y-Frequency.
Mirrors

An effect that lets you reflect part of the image in any direction you like. At its simplest, this can create a split mirror effect like that found at the end of Prince’s “When Doves Cry.” At its most complicated, multiple reflections can be set up, to create whirling Kaleidoscope patterns in the image.

Main Controls

These controls let you choose what kind of effect this plug-in has.

- **Mirror Placement:** Lets you choose different types of mirror effects including Individual (a simple reflection), Rosette, and Kaleidoscope.
- **Reflect at Borders:** Lets you add another reflection of the image whenever the angle and position of your reflection would result in offscreen black coming into the frame.

Individual Controls

When Mirror Placement is set to Individual, a series of six sets of Mirror parameters lets you add multiple mirrored edges in different combinations; by default only one is on, but you can turn more edges on to create more complicated mirror effects. Each group of Mirror parameters has the following parameters:

- **Enable Mirror:** Turns that mirror reflection on.
- **X and Y Position:** Positions the center of the mirror split reflection.
- **Angle:** Lets you adjust the angle of the seam along which a reflection will run.
- **Flip:** Flips which side of the image is reflected.

Rosette Controls

When Mirror Placement is set to Rosette, a single set of parameters creates a variety of circular patterns.

- **X and Y Position:** Positions the center of the circular rosette reflection.
- **Angle:** Lets you adjust the orientation of the rosette pattern about its center.
- **Wedge Width:** Lets you adjust the thickness of the wedges around the outside of the rosette pattern, and by extension how many wedges there will be. Thicker wedges results in fewer reflections around the rosette pattern and thinner wedges result in more reflections around the rosette pattern.

Kaleidoscope Controls

When Mirror Placement is set to Kaleidoscope, a single set of parameters lets you create a variety of kaleidoscopic images:

- **X and Y Position:** Positions the center of the mirror split reflection.
- **Center Size:** Lets you shrink or expand the cells comprising the kaleidoscopic image.
- **Angle:** Lets you adjust the angle of the seam along which a reflection will run.
- **Number of Sides:** Three sides produce a triangular pattern, while four sides produce a rectalinear pattern aligned with the currently selected angle.
Pencil Sketch in DaVinci
(Studio Version Only)

A plug-in with highly customizable controls for making an image look like it was drawn.

- **Sketch Stroke Controls**: Parameters to control the thickness of outlines, the threshold at which they appear around objects in the frame, and their length.
- **Sketch Tone Controls**: Parameters to control how many levels of tonality are in the rendered result, and contrast controls to influence how much of the image falls into shadows, mid-tones, and highlights.
- **Sketch Texture Controls**: Parameters to apply a customizable stippled texture over the image, with a checkbox to auto animate it.

(Left) The original image, (Right) The image with Pencil Sketch applied

---

Prism Blur

Simulates flat chromatic aberration and a vignetted lens.

- **Blur Strength**: Lets you blur the primary image.
- **X and Y Position**: Let you change the center of the effect within the frame about which chromatic aberration is created.
- **Aberration Distance**: Adjusts how far the aberration effect appears from the source image.
- **Aberration Strength**: Intensifies the zoom blur used to create the chromatic aberration effect to intensify it.
- **Vignette Size**: Lets you add edge vignetting to the image; setting this to 0 removes the vignette, while 1 is the maximum size of a vignette using this filter.
- **Vignette Sharpness**: Lets you adjust the feathering of the vignette effect; lowering this value softens the edge, while raising this value sharpens, but never fully eliminates the softness from this edge. The Vignette effect is designed to fall off in a way that simulates how a lens would exhibit vignetting.
Scanlines

Simulates television scanlines, or any effect where you want alternating lines to darken the image. A variety of parameters makes this an extremely flexible effect that can be applied in numerous ways.

Appearance

Let you customize the type of scanline effect you want.

- **Line Frequency**: Lets you choose how many or few lines are superimposed on the image; fewer lines automatically space themselves to be thicker as they’re uniformly distributed across the image.
- **Line Sharpness**: Lets you blur the border between each line, softening the effect.
- **Line Angle**: Lets you rotate the lines to appear at any angle; the default is 0 which results in horizontal lines.
- **Line Width**: Lets you increase or decrease the width of the blanking lines that obscure the image (which default to black but are tinted by the Color 2 parameter), thus increasing or decreasing the amount of image showing through.
- **Line Shift**: Lets you offset the lines being overlaid on the image. Animating Line Shift lets you create a rolling scanlines effect.

Color

Lets you tint and shift channels of the alternating scanlines created by this filter. Exaggerated, this can create numerous other stylistic effects.

- **Color 1 and Color 2**: Color picker and eyedropper controls that let you tint each alternating set of lines (eyedroppers let you sample a color from the RGB image being input into the current node).
- **Shift Red, Green, and Blue**: Lets you offset individual channels.
- **Scanlines Only**: Lets you see just the scanlines in isolation while you adjust them.

Composite

Lets you choose how to composite the scanlines effect against the original image.

- **Scanlines Only**: Lets you output an image consisting only of the scanlines pattern you’ve created. Good for creating different kinds of patterned textures and mattes.
- **Composite Type**: Lets you choose which composite mode is used to blend the scanline effect into the

Stop Motion

This plug-in is used to replicate the stuttering motion effect found in stop motion animations. Traditional stop motion animation exposes each frame of the shot individually, while the subject is manually moved in tiny increments between frames. An extremely labor intensive process, often individual frames were repeated in a shot to speed up the production which resulted in a staccato motion cadence.
The controls for the Stop Motion ResolveFX

The Main controls are:

- **Frame Repeat**: Selects how many frames (from 1-10) to duplicate in the shot. A larger number makes a more staggered cadence.
- **Blend**: Lets you adjust the amount of blending of the clips original frame rate, with the repeating frames you’ve selected above. 0 is none, and 1.00 is the full frame rate of the clip.

**Stylize (Studio Version Only)**

A plug-in that lets you apply one of a variety of painterly styles to an image based on analyses of different paintings, in such a way as to provide a temporally stable result for moving images as the style strokes will appear to be applied to individual objects in the scene that move and flow in a consistent way. There are two controls:

- **Styles**: A pop-up menu lets you choose an artistic style to apply to the image.
- **Style Scale**: This slider lets you adjust how large or small the applied art strokes should be applied.

(Left) The original image, (Right) The image with Style Transfer applied and set to Dance with a Style Scale of 4

**TIP**: This plug-in is more flexible than you think, if you apply Style Transfer in a layered way against the original image. You can do this using a duplicate layer in the Edit page, or using two nodes representing the Style Transfer effect and original image connected with a Merge node in the Fusion page or a Layer node in the Color page. Once that’s set up, simply combine the Style Transfer output with the original image using composite modes and opacity adjustments for more sophisticated blending. In particular, using the Luminosity composite mode lets you combine the texture from the Style Transfer while retaining the color of the original image, or using the Saturation composite mode lets you combine the color from the Style Transfer while retaining the texture of the original clip.
Tilt-Shift Blur

Simulates depth-of-field effects using a progressive blur that’s applied with a generated Z-depth map. The default settings create a "miniaturization" illusion, where the image appears to be tiny due to the top and bottom depth-of-field settings used.

Main Controls

These controls select and control the overall effect.

- **Blur Type:** You can choose between Fast Blur and Lens Blur (Lens Blur is the default).
- **Blur Strength:** A slider lets you adjust the amount of blur you add.

Lens Iris

The Lens Iris controls are only available when Blur Type is set to Lens Blur. This is a simplified set of controls from those of the Lens Blur filter.

- **Iris Shape:** Lets you choose what type of apertures you want to use, with which to influence the shape of the bokeh effect. Aperture Shape options include Triangle, Square, Pentagon, Hexagon, Heptagon, or Octagon shaped aperture.
- **Blade Curvature:** (Only available with Real and Creative Apertures) Lets you round off the edges of the Aperture Shape you selected.
- **Rotation:** Lets you adjust the angle the shape appears at.
- **Anamorphism:** Lets you adjust the aspect ratio of this effect in order to match the lens blur created by anamorphic lenses.
- **Highlights:** Lets you adjust how the highlights of the image affect the blur, dilating or eroding the image more or less depending on how high Smooth Strength is.

Depth of Field

Additional Depth of Field settings let you adjust the depth map being used to create the depth-of-field effect.

- **Depth Map Preview:** This checkbox lets you see the grayscale depth map directly while making these adjustments. The white area will be blurred, while the black area will be unaffected.
- **Center X, Center Y, and Angle:** These parameters let you transform the depth map.
- **In Focus Range:** Lets you expand or contract the black center of the depth map that defines the blurred region.
- **Near Blur Range and Far Blur Range:** Two parameters let you individually adjust the falloff of the white bottom and top of the depth map.
Vignette

A plug-in with two modes for creating vignette effects of different kinds.

- **Basic mode** gives you Size, Anamorphism, and Softness controls for quickly creating a traditional lens vignetting effect to darken the edges of the frame. A Color control lets you tint the vignette.
- **Advanced mode** adds Border Shape, Rotation, Center, Transparency, and Composite Type controls for customizing this vignetting effect even more specifically.

Watercolor *(Studio Version Only)*

A variation on the Abstraction filter, this filter reduces images into simplified washes of softly blended colors, in a very painterly fashion.

- **Channels:** This pop-up menu lets you choose whether to use Luminance or RGB to derive the smoothed color from.
- **Show Gradient:** This checkbox lets you see the boundaries that define each area of smooth color, based on the value you choose from the Smoothness slider below.
- **Smoothness:** Adjusts the amount of detail in the final result. Low smoothness values result in more detail in the smoothed result, while higher values result in larger pools of lower detail yet smoother color.
These plug-ins are designed to add texture to images, to replicate both naturalistic and other effects.

Analog Damage (Studio Version Only)

A Texture category plug-in that simulates different kinds of signal degradation resulting from analog transmission and recording, Analog Damage can be used to create “old TV” or “junky videotape” effects of various kinds. A Preset pop-up menu lets you choose from a variety of different looks, while a Custom option lets you create your own.

(Left) The original image. (Right) The image with Analog Damage applied

It has the following categories of parameters:

- **Telecine Source**: Options for lens vignetting and automated shutter weave to the left and right.
- **Broadcast Signal**: Options for customizable noise, detail loss, signal ghosting, and chroma misalignment.
- **Color Dials**: Television-signal specific color adjustment controls.
- **Scan**: Controls to simulate problems with television scanning. H- and V-Shift let you “roll” the television signal, while V-Hold interacts with the V-Hold Latch parameter to make it easy to use simple key framing to trigger animated vertical rolls that “bounce” in a realistic way for broadcast. Overscan and vertical scale interact with Vertical Blanking to produce distortions that seamlessly loop to duplicated images at the top and bottom of the frame.
- **Scan lines**: Simulate customizable television scan lines that are capable of simulating moire and color artifacts.
- **TV Construction**: Controls to simulate issues with CRT phosphor brightness, tint, and defocus, and the ability to add a customizable curved border and warped screen curvature.
- **VHS**: Lets you add a customizable “Restless Foot” to simulate recorded tape artifacts.

**TIP:** Using the Analog Damage plug-in on the Fusion page makes it possible connect Modifiers to add automatic animation (such as Perturb) to different parameters in order to quickly and easily create automated video damage effects.
Film Damage

Found in the ResolveFX Texture category. After you’ve used the new ResolveFX Revival plug-ins to fix damage in archival footage, you can turn around and use the Film Damage plug-in to make brand new digital clips look worn, dirty, and scratched instead. When used in conjunction with the Film Grain and Flicker Addition plug-ins, you can convincingly recreate the feel of poorly kept vintage archival footage.

(Left) Original image, (Right) Result with Film Damage

Blur and Shift Controls

The three parameters at the top let you alter the foundation of the image to begin creating the look of an older film.

- **Film Blur**: Adds just a bit of targeted defocusing to knock the digital sharpness out of the image.
- **Temp Shift**: Defaults to warming the image just a bit to simulate the warmer bulb of a film projector, although you can use it to cool or warm the image in varying amounts.
- **Tint Shift**: Defaults to yellowing the image to simulate damage to the film dyes, but you could move the slider in the other direction to add a bit of magenta, simulating a different kind of dye failure.

Add Vignetting

These parameters simulate lens vignetting darkening the edges of the image.

- **Focal Factor**: Adjusts how far the vignetting extends into the image.
- **Geometry Factor**: Affects how dark the vignetting is and how pronounced the edges are.
- **Tilt Amount**: Affects how balanced the vignetting at the top of the image is versus the bottom of the image.
- **Tilt Angle**: Affects how balanced the vignetting left of the image is versus the right, but only when Tilt Amount is set to something other than 0.
Add Dirt
These parameters let you simulate dirt particles (not dust) that have adhered to the film. These are larger specks, although there’s several ways you can customize these.

- **Dirt Color:** This control lets you choose what color you want the dirt particles to be (black simulates dirt on a print, while white simulates dirt on a negative).
- **Changing Dirt:** This checkbox lets you alternate between simulating temporally unstable dirt on the film (checkbox on) and dirt on the lens that doesn’t move (checkbox off).
- **Dirt Density:** Lets you choose more or less dirt particles appearing over time. Dirt Size lets you choose the average size of dirt particles to appear.
- **Dirt Blur:** Lets you defocus the dirt, so it’s not so sharp.
- **Dirt Seed:** Changes the random distribution of dirt when you change this value, but for any given value, the results for any given set of control adjustments remain consistent.

Add Scratch
Five sets of Add Scratch parameters let you add up to five scratches to the image, simulating something scratching the emulsion while the film played.

- **Scratch Color:** Lets you choose the color you want the scratch to be (scratches can be a variety of colors depending on the depth of the scratch, type of film, and method of printing).
- **Scratch Position:** Lets you adjust the scratch’s horizontal position on the image.
- **Scratch Width and Scratch Strength:** Let you adjust the scratch’s severity.
- **Scratch Blur:** Lets you defocus the scratch.
- **Moving Scratch:** This checkbox lets you choose whether the scratch is jittering around or not.
- **Moving amplitude:** Determines how far it moves. Moving Speed determines how fast it moves.
- **Moving Randomness:** Determines how it meanders about.
- **Flickering Speed:** Determines how much the scratch flickers lighter and darker in severity.
**Film Grain (Studio Version Only)**

Composites a procedurally generated layer of simulated “film grain” over the image. Individual simulated grains with falloff are generated to match the resolution of the project.

**Main Controls**

These controls let you quickly choose and apply a film grain effect.

- **Film Grain Presets:** This pop-up lets you quickly choose from among different 8mm, 16mm, and 35mm film grain effects.
- **Composite Type:** Lets you choose a composite mode with which to combine the image with the grain simulated by this plug-in.
- **Opacity:** Lets you fade the Film Grain effect against the original image.
- **Grain Only:** This checkbox lets you see just the grain layer that you’re creating, so you can evaluate its look prior to it being composited into the image.

**Grain Params**

The Grain Params group lets you adjust the quality of the grain.

- **Texture:** Larger values create more separation between the grains generated by this plug-in, while smaller values bunch them up closer together to create denser grain patterns.
- **Grain Size:** Larger values zoom into the individual simulated grains generated by this plug-in, while smaller values zoom out.
- **Grain Strength:** Adjusts the contrast of the simulated grain layer. Higher values produce more contrast, lower values less.
- **Offset:** Lightens or darkens the entire simulated grain layer. The practical effect is that lower values emphasize lighter grains, while higher values emphasize darker grains.
- **Symmetry:** An asymmetrical contrast adjustment. Lower values darken the lighter grains, while higher values brighten the darker grains.
- **Softness:** Lets you blur the grain layer to create even softer transitions from one grain to another.
- **Saturation:** Lets you make the grain more or less colorful. At a value of 0, grain is monochrome.

**Advanced Controls**

In the Advanced Controls, the Shadow, Midtone, and Highlight Gain controls let you adjust the amount of grain that’s composited into each of these tonal regions of the image.
Chapter 147

ResolveFX
Transform

The plug-ins in this category allow different types of animated and non-animated transforms than are possible in the Sizing palette or Clip Transform controls of the Inspector.

Camera Shake (Studio Version Only)

This effect replicates random camera motion for Horizontal and Vertical position, Rotation, and Zoom. A variety of parameters are provided to let you customize the quality of motion, from slow meandering drift to abrupt, jagged jerks and pops.

Main Controls

The primary controls governing how much camera shake is added.

- **Motion Scale and Speed Scale**: These sliders let you adjust the overall amplitude and speed of camera shake that’s introduced to the image.
- **Motion Blur**: Lets you add simulated motion blur to the image being shaken, which can add a more realistic look to the motion. Motion blur is more visible on fast-moving motion, as DaVinci Resolve is simulating the effect of a motion picture camera’s shutter speed on exposed subjects in motion.

Shake Levels

These controls let you adjust the intensity of camera shake.

- **Pan Amplitude**: Lets you set how much horizontal motion you want.
- **Tilt Amplitude**: This slider lets you choose how much vertical motion you want. These sliders are completely independent of one another.
- **Rotation Amplitude**: Lets you introduce rotational motion to the camera shake, as well.
- **PTR Speed**: This slider lets you choose how fast the Pan, Tilt, and Rotation camera shake is.
- **Zoom Amplitude**: This slider lets you add zooming to the camera motion being created.
- **Zoom Speed**: This slider lets you choose how fast this random zooming should occur.
- **Zoom Type**: This pop-up menu lets you choose how to add zooming; you can choose Outward Only, Inward Only, or Outward and Inward. If you choose Inward Only, you don’t have to worry about blanking appearing around the edges of the frame.

Shake Quality

These controls let you customize the type of shaking you want.

- **Motion Method**: This pop-up menu lets you choose from different ways of generating the motion this plug-in introduces. You can choose from SINE, Rectified SINE, Rectified SINE (Invert), and Square Wave (good for popping or flickering motion).
- **Phase**: This slider lets you set the starting point of the camera shake you’re creating, based on the Motion Method and Amplitude settings you’ve chosen.
- **Randomness Scale**: This slider lets you introduce irregularity to the Horizontal, Vertical, and Rotational motion of the camera shake. The greater this value, the more irregularity will be introduced.
- **Randomness Speed**: This slider lets you choose between smoothly erratic motion (at lower values) or more jagged motion (at higher values).
- **Pause Length**: This slider lets you adjust the frequency of intermittent pauses that break up the random motion added by this filter.
• **Pause Interval:** This slider lets you adjust the duration of intermittent pauses that break up the random motion added by this filter.

• **Pause Randomness:** This lets you add a degree of randomness to the intervals that happen.

• **Random Seed:** This slider lets you alter the value that sets what random values are being produced. Identical values result in identical randomness.

**Blanking Handling**

These controls let you determine what to do when camera shake causes blanking past the edge of the image.

• **Border Type:** This pop-up menu lets you choose how you want to fill the empty spaces at the edge that appear if the camera shake you create pushes the image out of the current frame size of your project. Four options let you choose to Replicate, Reflect, or Wrap-Around the image to fill the gap.

• **Zoom to Crop:** This slider lets you zoom in on the image to crop out unwanted blanking being introduced by the Camera Shake effect.

**Flicker Addition**

Why remove flicker with the ResolveFX Flicker Removal plug-in when you can add it instead? Found in the ResolveFX Transform category, the Flicker Addition plug-in adds rapidly animated exposure changes to make the image appear to flicker, creating animated effects that would be difficult to keyframe manually. When applied to an image in different ways, this plug-in can be used to simulate torchlight, firelight, light fixtures with old ballasts or frayed wiring, or any temporally unstable light source. For example, you could key only the highlights of a night-time image, and use Flicker Addition to affect those isolated highlights.

Two groups of controls let you control the quality of this flickering.

**Main Controls**

These controls let you choose how to apply the flicker, and its overall speed and intensity.

• **Flicker Type:** This pop-up menu lets you apply the flicker as a Lift, Gamma, Gain, or Vignette adjustment.

• **Range slider:** This lets you set how widely the flickering will vary.

• **Speed:** This lets you adjust how quickly the flickering is animated.

• **Smoothness:** This slider lets you adjust the temporal quality of the flickering, whether it changes abruptly from one value to another (at lower settings) or whether it makes more continuous transitions from one value to another (at higher settings).

• **Flicker R, G, B Channels:** Three checkboxes let you choose which color channels are affected by this flickering.
**Flicker Quality**

These controls let you adjust the details of how the flickering animates.

- **Randomness Scale**: This slider lets you introduce irregularity to the Horizontal, Vertical, and Rotational motion of the camera shake. The greater this value, the more irregularity will be introduced.
- **Pause Length**: This slider lets you adjust the frequency of intermittent pauses that break up the random motion added by this filter.
- **Pause Interval**: This slider lets you adjust the duration of intermittent pauses that break up the random motion added by this filter.
- **Pause Randomness**: This lets you add a degree of randomness to the intervals that happen.
- **Random Seed**: This slider lets you alter the value that sets what random values are being produced. Identical values result in identical randomness.

**Match Move (Studio Version Only)**

**TIP**: Match move workflows are now much more effectively accomplished in the Fusion page using the tools and methods found there.

The Match Move filter is a patch-based tracker that follows a pattern region defined by a tracker control. You can place as many trackers as you like by applying this filter to a node and clicking on a feature you want to track in the Viewer. Ideal features for tracking are high contrast details that have sharp angles that are clearly defined.

Each tracker control consists of (a) a center point that indicates where the tracked motion path will be centered, (b) an inner box that identifies the patch of image you’re tracking (that can be resized), (c) an outer box that defines the search region for the track (that can also be resized), and (d) a patch window that shows you a zoomed in closeup of the patch you’re tracking. Patch windows can be resized, and the other tracking controls hidden or shown, using controls in the Display Options section of the Match Move controls.

If you’ve accidentally placed a tracker control somewhere you don’t want one, you can either drag anywhere within the inner box to move it to another location, or you can Option-click it to delete that tracker.
Once placed, you can choose how much image detail is considered for analysis by resizing that tracker control. To resize a tracker, move the pointer over the edge of the inner box, and drag to shrink or enlarge it.

This plug-in will automatically derive as much motion data as the number of trackers you’ve placed allows:

- One tracker tracks horizontal and vertical position (pan and tilt).
- Two or more trackers also track rotation.
- Four or more trackers also track perspective.
- If you place six or more trackers, then the Match Move filter is capable of automatically choosing the best tracker data from the overall collection to give you the most accurate track that’s possible.

A Match Move Workflow

The following example shows the simplest complete workflow for importing a foreground clip to composite with a match move to follow a background clip that’s already in the timeline. This workflow is suitable for such operations as placing a graphic as a sign on a side of a building, or into the display of a phone.

To match move:

1. Open the Media Pool in the Edit page, right-click a clip you want to match move to a clip in the Timeline, and choose “Add as Matte For Color Page Clip” to add it to the Color page Node Editor of the currently selected clip as a Timeline Matte. This is currently the only way you can match move and composite a foreground clip against a background clip in the Color page.

2. Open the Color page, make sure the background clip you want to match move to is selected, then open the OpenFX library and drag the Match Move plug-in directly onto the connection from the last node in the tree to the Output, to add it as a stand-alone FX node.

3. Right-click any corrector node in the node tree (Node 01 in this example) and choose the clip you added in step 1 in the Add Matte > Timeline Mattes submenu of the contextual menu to expose that clip as an Ext. Matte node. Delete the connection between the new Ext. Matte node and the node it’s connected to, and then reconnect its RGB output to the second input of the FX node.
4 Select the FX node, make sure the OpenFX onscreen controls are enabled, choose whether you want to start at the first or last frames of the clip to begin the tracking process, and then click within the Viewer to place tracker controls on the surface of the image you’re going to attach the foreground image to. If you want to do a perspective track, place at least four tracker patches in areas you know won’t be occluded by other things in the frame. Choose features that are high contrast and angular for the best results, and try to make sure the features you track won’t go offscreen or be occluded by other features within the frame. As you place tracking controls, their patch window will be tinted the color of the channel that DaVinci Resolve automatically determines will provide the best tracking result.

5 (Optional) If necessary, you can delete trackers you don’t want by Option-clicking them.

6 Now that your tracker controls are all set up, you’re ready to begin the tracking analysis. If the playhead is at the beginning of the clip, click Track Forward, otherwise click Track Backward. DaVinci Resolve will automatically analyze all tracker controls within the clip until the last frame of the clip is reached.
7 (Optional) If anything occludes a patch that’s being tracked, or if the tracked feature starts going off the edge of the frame, that tracker control may veer off course and will eventually turn off. If this happens, there’s a way to continue the track that’s surprisingly easy:

a Click the Track Forward or Track Backward button again to stop the analysis.

b Move the playhead back to the last good frame of tracking data, then click the inner box of each tracker control that went wrong to make sure they’re turned on (you know it’s on if the patch window is displayed), and then click “Clear tracking forward” or “Clear tracking backward” as necessary to delete the incorrect tracking data. When you’re done, click the inner box of each tracker that went wrong to turn it back off again, so it doesn’t continue trying to track incorrectly (you know it’s off if the patch window is hidden).

c Now, place additional trackers on different features of the same surface to replace the trackers that you had to turn off.

d Click “Track forward” again to continue the track, and DaVinci Resolve will automatically use those additional features to continue the analysis.

e When the analysis is complete, turn the trackers you disabled back on again. All trackers that are turned on contribute data to the match move, for whichever ranges of frames they contain valid tracking data.

8 When DaVinci Resolve finishes its analysis, move the playhead back to the first frame of the track, and choose Positioning from the “Show controls for” pop-up menu. This takes you to the next stage in the Match Moving process.
A grid appears, covering the Viewer. This is the positioning canvas, and it lets you corner-pin the area in which the foreground image you connected in step 3 will be composited and tracked. You can corner-pin and resize it by dragging it by the corners, and you can move it by dragging the center.

Once you've positioned the grid, scrub back and forth to verify that it tracks correctly and looks right once it's in motion.

Choose Compositing from the “Show controls for” pop-up menu to expose the compositing controls.

Set the Output pop-up menu to “Composite” to output the final match-moving composite. If necessary, you can use the Composite Type and Plate Cropping controls to choose how the foreground image is blended with the background and whether you need to crop unwanted parts of the image from the edges.

At this point, you've finished the match move.

Main Controls

The “Show controls for” pop-up menu lets you choose one of four pages of controls that take you through the match moving workflow. The Output pop-up menu lets you choose what you want to output, with choices for Disabled, Positioning Reference, and Composite.
Tracking Controls

The Tracking Controls govern the first stage of the match moving process, and this page of controls provides everything you need for setting up, executing, and refining multi-patch motion tracks.

The Tracking Controls group

The primary controls used to initiate tracking. These consist of the tracking buttons that let you execute tracks either automatically using the outer Track Forward or Track Backward buttons, or manually using the inner Track Next or Track Previous buttons. The middle button lets you pause tracking.

The Next Track End and Previous Track End let you jump to previous and subsequent tracked sections of frames; in cases where there may be gaps in your tracking data, these controls let you jump to different segments of contiguous tracking data.

Two checkboxes let you choose whether you want to track and analyze Zoom and/or Rotation. These must be set before you begin tracking.

The Manage Tracking Patches group

The two buttons at the top let you choose which tracking patches are enabled to contribute to the overall match moving result, or disabled. Activate None and Deactivate All let you turn all patches on or off at once.

Clear Past and Clear Future let you clear bad tracking data forward or back in time from the playhead’s current position, for enabled tracker controls. Delete Tracking lets you delete the tracking data at the current frame only for enabled tracker controls.

Refresh Tracks updates a tracker control’s patch when the feature it’s tracking changes shape, color, or lighting enough to interrupt the track. Select one or more trackers and click Place New Patch in Track to update the tracked feature at that frame.
The Display Options group
This group lets you turn the visibility of different onscreen controls off and on. Checkboxes let you Show Trackers, Show Center (the red tracking center point), Show Paths (the tracked motion paths), and Show Active Patches. A slider lets you adjust the size of each patch window.

Show Comp Result lets you see the composited foreground layer against the background layer.

Positioning
The Positioning controls govern the second stage of the match moving process. They provide everything you need to transform the foreground image to fit against the background by moving, corner-pinning, and resizing.

Canvas Options
The Canvas Controls pop-up menu lets you switch between corner-pin controls, where dragging the four corners lets you corner-pin, dragging the center lets you reposition, and dragging the top, bottom, and sides lets you resize vertically or horizontally.

A Reset Corners button lets you reset the grid to full screen, if you need to scrap what you’re doing and try again.

The Display Options group
This group lets you turn the visibility of different onscreen controls off and on. Checkboxes let you Show Trackers, Show Center (the red tracking center point), and Show Paths (the tracked motion paths).

Show Comp Result lets you see the composited foreground layer against the background layer.

Compositing
The Compositing controls govern the third stage of the match moving process, to use when fitting the foreground image against the background image to make a seamless composite. Note, if you need to color correct the foreground image to match the background, you’ll need to add a corrector node between the Ext. Matte that’s routing in the foreground image into the Color page and the FX node that’s doing the compositing.
The controls that are exposed when Main Controls is set to Compositing

**Rendering Options**
The Composite Type pop-up menu lets you choose whether the composite that’s being output is an overlay of the Ext. Matte over the background, or the background Plate only.

**Plate Cropping**
Four sliders let you crop the Left, Right, Top, and Bottom of the image, if necessary.

**Global Blend**
The Blend slider, present in every ResolveFX plug-in in DaVinci Resolve, lets you adjust the opacity of the effect, effectively controlling the opacity of the foreground layer.

**Stabilizing**
The Stabilizing controls actually have nothing to do with match moving, but instead allow you to use the motion tracking accomplished with the Tracking Controls to stabilize the image. An Edge Behavior pop-up menu lets you choose how to handle blanking around the edges as a result of the background image being transformed to keep the subject of the frame in place.
Chapter 148

ResolveFX Warp

The filters in this category let you warp the image in different ways, creating procedural or custom distortion effects, some of which can be automatically animated. The Warper plug-in is a point-based free-form Warp tool.
Contents

Dent 3109
Lens Distortion 3109
Ripples 3110
Main Controls 3110
Ripple Controls 3110
Vortex 3111
Warper (Studio Version Only) 3111
Effect Options 3112
Onscreen Controls 3113
Waviness 3114
**Dent**

A warp effect that creates different types of circular bowing and folding effects.

- **DentType**: This lets you choose from six different types of “dent” warping effects. The options are Type 1, Type 2, Type 3, Sine, Cosine, and Black Hole.
- **X and Y**: Position sliders let you offset the center of the warp.
- **Size**: This lets you adjust the diameter of the warp.
- **Strength**: This lets you adjust the extent and direction of the warp, lowering this below zero “pulls” the image into the center of the effect, while raising this above zero “pushes” the image outward to buckle according to the DentType you’ve chosen.
- **Edge Behavior**: This eliminates any blanking caused by negative distortion by filling black areas in one of several user-defined ways; options include Black (do nothing and leave the blanking), Reflect, Wrap-Around, and Replicate.

**Lens Distortion**

Lets you add convex or concave lens distortion to an image, to make it warp by bulging outward or bulging inward, similar to a poorly made lens. This filter could also be used in a corrective manner, to compensate for images exhibiting barrel distortion. Additionally, the amount of distortion applied to each color channel can be varied, in order to create the effect of chromatic aberration using the curvature of the distortion you’re adding for a more accurate effect.

- **Red, Green, and Blue Distortion**: These sliders are ordinarily locked together by the Gang checkbox. When adjusted as ganged, moving these sliders to the left (negative values) increases “fisheye” distortion, while moving these sliders to the right (positive values) creates an inverted “fisheye” effect that bows the image inward rather than outward. Turning Gang off lets you set the Red, Green, and Blue Distortion sliders to different values, introducing more accurately simulated chromatic aberration to the image.
- **Fine Adjustment**: This checkbox results in the distortion sliders operating within a much smaller range, enabling more precise adjustments.
- **Edge Behavior**: The options available in this pop-up eliminate blanking caused by negative distortion by filling black areas in one of several user-defined ways; options include Black (do nothing and leave the blanking), Reflect, Wrap-Around, and Replicate.
- **X and Y Position**: These sliders let you change the center of the distortion effect.

**TIP**: To resize a clip with an extreme distortion effect that introduces blanking around the edges of the frame, you’ll need to use the Zoom control found in the Node Sizing mode of the Sizing palette. Edit and Input sizing will only zoom the image within the border created by blanking.
Ripples

A warp effect that creates different types of ripples.

Main Controls

These controls govern the type of ripple and the quality of optional ripple shine that you want.

- **Ripple Shape**: Lets you choose from Circular, Square, Horizontal, Vertical, Exponential, Star, and Radial ripples.
- **Wave Shape**: Lets you choose from Sinusoidal, Triangular, Fresnel In, Fresnel Out, and Natural waves.

A set of Shine parameters lets you overlay a simulated shine on top of these ripples.

- **Shine**: A checkbox lets you turn this shine on and off.
- **Shine Direction**: Lets you add a light shine to the peaks of the ripples. Works best at low shine strength.
- **Vertical Shine Height**: Lets you adjust the thickness of the highlights running along the ripples.
- **Shine Size**: Lets you adjust the length of the highlights running along the ripples.
- **Shine Strength**: Lets you adjust the overall appearance of the shine.
- **Animate**: This checkbox, if checked, reveals a Speed slider that lets you set how quickly the ripple effect auto-animates the phase of the currently configured ripple effect, without the need to use keyframes.

Ripple Controls

A separate set of Ripple parameters lets you enable up to five overlapping ripples.

- **X and Y Position**: Lets you change the center position of each set of ripples.
- **Amplitude**: Lets you adjust the “height” of each ripple caused by this effect.
- **Frequency**: Lets you choose how many ripples are being created.
- **Decay**: Lets you adjust the falloff of the ripple effect, where ripples gradually diminish as they reach the point of decay.
- **Phase**: Lets you adjust the phase of the ripple effect relative to the center origination point. If you want to animate a ripple simply, you can also choose to keyframe the Phase parameter to create the same effect created by the Animate checkbox above.
Vortex

Vortex begins as an S shaped warp effect, but you can adjust the parameters to create many types of warping effects.

- **X and Y position:** Two sliders let you offset the center of the warp.
- **Size:** Adjusts the diameter of the warp.
- **Angle:** Adjusts the direction and intensity of the warp effect; setting Angle below 0 twists the image to the left, while raising Angle over 0 twists the image to the right.
- **Power:** Rotates the area that’s affected to create a harder border between what is warped and what isn’t.
- **Swirl:** Intensifies the effect, twisting the image into an even tighter swirling effect.

Warper (Studio Version Only)

The Warper is a free-form image warper that uses points, rather than a mesh or splines, to push and stretch features in an image as if they were on a sheet of rubber. While the Warper has a lot of options and settings, getting started is really easy.

To warp a feature of the image, just click on it to add a warp point, and drag to push that part of the image in the direction you want it to go. By default, warp points influence the entire image, which is pinned down at the corners. This system makes it simple to warp large regions of the image, such as when you want to warp an edge of the image to get rid of a boom dip. Warp points are gray unless they’re selected, in which case they’re white.

To “pin down” parts of the image you don’t want to warp, Shift-click to place limiter points (which are red, pink if they’re selected). By combining warp points with limiter points, you can quickly create extremely specific warp effects to squish and stretch features in an image in any way you want.

As you work, you can Option-click any unwanted warp or limiter point to delete it. To start from scratch, you can click the Warper plug-in’s master reset control in the OpenFX Inspector.
Additionally, you can use the FX mode of the Tracker palette to motion track the feature you’re warping. Then, by setting the Tracking pop-up menu to FXTracker, every warp and limiter point you’ve placed will move along with the feature you’re tracking, meaning you can create warp effects that move along with someone’s face, with a car driving on the road, or with something in a shot with camera motion.

Additionally, starting in version 16, warp and limiter points can be keyframed via the Warp Scale and Warp Point Positions parameters.

**Effect Options**

These controls affect how warp points that you add will affect the image.

- **Warp Limits**: A pop-up menu lets you choose how to treat the edges of the image when you’re warping it. There are three modes:
  - Corners (the default) lock the four corners of the image in place, but allow the sides to bulge in or out as you warp and allowing blanking to creep in.
  - Edges locks the full width and height of all four edges in place as you warp, preventing blanking. Distance locks parts of the image that are n pixels away, but the default setting is very permissive.
  - Manual allows the entire image to be warped without locking any part of it, allowing for extreme warps all along an entire edge of the image, but requiring you to place at least one limiter point prior to adding a warp point.

- **Warp Sharpness**: A pop-up menu lets you choose one of three methods of interpolating how the image bends around a Warp point: Sharp, Rubber-Sheet (the default), and Rounded. Sharp produces the “most pointy” warps, while Rounded produces the most gently curved warps. Rubber-Sheet strikes a balance between the two extremes.
• **Edge Behavior:** A pop-up menu eliminates any blanking caused by warping that affects the edge of the image by filling black areas in one of several user-defined ways; options include Black (do nothing and leave the blanking), Reflect, Wrap-Around, and Replicate.

• **Quality:** A pop-up menu lets you choose from among three methods of calculating the warping effect you’re creating: Faster, Default, and Better. Each choice is an obvious trade-off between image smoothness and performance.

• **Warp Scale:** This slider lets you scale the overall warp effect you’re creating. Setting this to 0.000 reduces the warp effect to nothing, while raising it to the maximum value of 2.000 doubles the warp effect. Warp Scale can be keyframed to animate the warping effect.

**Onscreen Controls**

The second set of controls lets you customize which of the Warper’s onscreen controls appear, with different options that make it easier to see certain things in various situations.

• **Render a reference grid:** This checkbox superimposes a reference grid over the image to make it easier to see what kind of warping you’re applying.

• **Show Warp Boundaries:** This pop-up menu has three choices for letting you see which areas of the image will be locked off by limiter points you place in the image.
  - None hides this information and is the default setting.
  - As Border shows a red line at the boundary where warping becomes locked off.
  - As Mask dims the area that’s protected from warping by limiter points.

• **Control Visibility:** This pop-up menu lets you choose whether the warp and limiter points you create are visible as you work. Show (the default) leaves all control points visible all the time. Auto Hide hides all control points whenever you’re dragging one, letting you see the image as you adjust it without having control points in the way. Hide makes all control points invisible. You can add new control points, but you can’t see existing control points to edit them.
• **Show:** This pop-up menu lets you choose how to represent warp points, and there are two options.
  - Warp Points (the default) simply shows warp points as gray dots.
  - Warp Vectors display pairs of controls connected by a line; a round dot shows the anchor, or the part of the image the warped portion of the image came from, and an arrow shows the destination, where you've warped that part of the image to. Seeing the anchor and destination of each warp operation can sometimes be useful when you're doing something complex.

![Warp points](image1.jpg)

![Warp vectors](image2.jpg)

• **Scale Controls:** This slider lets you shrink or grow the control points or warp vector handles to the most convenient size for the task at hand.

• **Warp Point Positions:** A parameter without any controls, save for key framing controls, that lets you keyframe the position of warp and limiter points. All points are keyframes within a single parameter and keyframe track, visible in the timeline of the Edit page, or the Keyframe Editor of the Fusion and Color pages.

## Waviness

• **Waviness Type:** Lets you choose Vertical or Horizontal waviness.

• **Scale:** Lets you choose the size of the waves.

• **Strength:** Lets you adjust the amplitude.

• **Phase:** Lets you “move” the wave and is a good parameter to keyframe if you’re animating this effect manually.

• **Animate:** A checkbox that reveals a Speed slider that lets you set how quickly the Waviness effect auto-animates without the need to use keyframes.
PART 12
Fairlight
This chapter covers the basic user interface controls found on the Fairlight page, where they are and what they do, in order to give you an overall orientation of how to work with this integrated audio environment.

The Fairlight Page User Interface

In single monitor mode, the Fairlight page is an optimized look at the audio tracks of your project, with an expanded mixer and custom monitoring controls that make it easy to evaluate and adjust the levels of your program in order to create a smooth and harmonious mix.

The Interface Toolbar

At the very top of the Fairlight page is a toolbar with buttons that let you show and hide different parts of the user interface. These buttons are as follows, from left to right:

- **Media Pool**: Shows and hides the Media Pool, from which you can edit audio clips into the Fairlight page Timeline.
- **Effects Library**: Opens the Audio FX panel of the Effects Library, from which you can apply VST and other audio effects to clips in the Timeline.
- **Index**: Shows and hides the Index and its Tracks and Markers panels. The Tracks panel lets you manage the tracks of the Timeline, showing and hiding which ones you want to work with. The Markers panel lets you see every marker in the Timeline, along with associated data, so that it’s easy to browse through your markers all at once to quickly find the information you need.
- **Mixer**: Shows and hides the Mixer, to the right of the Timeline, that lets you adjust various effects and levels associated with each track of the Timeline in order to create a harmonious mix.
- **Monitoring**: Shows and hides the Monitoring audio meters and viewer at the top of the Fairlight page.
- **Inspector**: Show and hides the Inspector, from which you can edit different clip attributes.
- **Metadata**: Shows and hides the clip metadata inspector.
Showing Which Panel Has Focus

Whenever you click somewhere on the DaVinci Resolve interface using the pointer, or use a keyboard shortcut to “select” a particular panel (such as in the Edit page), you give that panel of the user interface “focus.” A panel with focus will capture specific keyboard shortcuts to do something within that panel, as opposed to doing something elsewhere in the interface. A highlight appears at the top edge to show you which panel has focus so that you can keep track of which part of the current page is taking precedence, and you can switch focus as necessary to do what you need to do.

The Audio Timeline

The heart of the Fairlight page, the Audio Timeline presents the audio channels and tracks of the currently selected Timeline differently than the Edit page does, in a one-channel-per-track format that’s optimized for audio mixing and sweetening. The Audio page Timeline cannot be closed.
Controls in the Audio Timeline

The Audio Timeline has the following controls.

- **Timecode fields and Range buttons:** Four timecode fields show the current timecode value corresponding to the position of the playhead (at the very top), the Range In point, the Range Out point, and the Range duration. Clicking the Range In and Range Out buttons (to the left of the timecode fields) set these points and their corresponding timecode value.

![Timecode fields and Range buttons in the Fairlight page](image)

- **Transport controls:** The bar defining the top of the Timeline contains the Fairlight page’s audio-specific transport controls, which differ from those found on the Media, Edit, Color, and Deliver pages due to its inclusion of recording capabilities. These include Fast Reverse, Fast Forward, Play Forward, Stop, Record, and Loop.

![Fairlight page transport controls](image)

- **Automation toolbar:** Clicking this button opens a secondary toolbar with all the controls you need to configure the recording of mixer automation.

![Fairlight page automation toolbar](image)

- **Monitoring controls:** At the far right of the transport controls, a set of three monitoring controls let you quickly control the output volume of your mix. An audio Enable/Disable button lets you mute audio playback, while a slider lets you change the volume, and a DIM button lets you temporarily duck the monitored volume being output in order to have a quick chat with your client about sports or the state of the world while keeping half an ear on the mix. Dim and Mute commands are also available from the Fairlight menu.

![The monitoring controls](image)

- **Timeline Ruler:** The Timeline Ruler shows the program’s timecode. The playhead indicates the current frame and sample where you’re working in the Timeline, and the playhead has a handle that appears within the Timeline Ruler. Dragging within the Timeline Ruler moves the playhead. When you add markers to the Timeline, these markers appear within the Timeline Ruler, as well.

- **Playhead:** Shows the current frame and sample of playback, and provides a visual representation of where you are while playing, shuttling, and jogging through the Timeline. Also used as a reference point for editing operations. The largest timecode display at the upper left-hand display shows the position of the playhead.
• **Audio tracks:** The Fairlight page of DaVinci Resolve supports multiple audio tracks, and each audio track may contain multiple lanes with which to accommodate the audio channels that are contained within multi-channel audio clips using track mappings such as stereo, 5.1, 7.1, or Adaptive (1–24 channels). All audio clips that have been edited into the Timeline appear within each track, with the recorded channels within each clip occupying as many lanes as that clip has available. At the left of each track is a header area that contains a number of controls.

![Image of Fairlight timeline](image)

The Fairlight timeline is divided into tracks and lanes; track A1 has a single lane for the mono audio within it, and track A2 has two lanes to accommodate stereo audio.

• **Track header:** The track header contains different controls for selecting, locking/unlocking, and soloing/muting tracks. Each track header also lists how many clips appear on that track. The track header contains the following five controls, from left to right:

  1. **Track color:** Each track can be color-coded with one of 16 different colors. These color codes correspond to the Edit page Mixer, and to the Fairlight page Mixer and Audio Meters. You can choose a new color for any track by right-clicking the track header and choosing from the Change Track Color submenu. You can set multiple tracks to the same color by Command-clicking in the track header of multiple tracks to select them, and then right-clicking one of the selected track headers and choosing from the Change Track Color submenu.

  2. **Track number:** Indicates the number of each track.

  3. **Track name:** Each track has a name that defaults to the track number, such as Track 1, Track 2. However, you can click any track’s name and edit it to be whatever you like. For example, you can rename each track with the type of audio you’re editing onto it, such as Production, Ambience, SFX, or Music. These track names are also used to identify each track’s channel in the Mixer, in the middle of each channel strip (each channel strip’s track number is simultaneously displayed at the top).

  4. **Audio channel type indicator:** Audio tracks also show which channel configuration that track uses, listing the number of channels for mono, stereo, 5.1, 7.1, and adaptive.

  5. **Fader value:** A field displays the current fader setting at the position of the playhead, in dB.

  6. **Lock Track button:** Light gray when turned on, dark gray when turned off. When a track is locked, clips can’t be replaced, moved, or otherwise edited, although clips on locked tracks can be graded.
– **Arm button:** This button arms recording onto that track.

– **Solo button:** Disables all other tracks but the current one, enabling you to quickly hear a single track in isolation. This affects rendering, so if one or more tracks are soloed, the muted tracks won’t be output or rendered.

– **Mute button:** Temporarily disables audio on that track so it’s neither monitored nor output. This affects rendering, so if one or more tracks are muted, they won’t be output or rendered.

– **Audio meters:** Each track has audio meters in the track header that let you see levels during playback.

• **Toolbar editing tools:** The toolbar contains both modal and command buttons to let you work on your projects. More detail on these appears in the following section.

• **Vertical and horizontal scroll bars:** If your project is longer than the current width of the Timeline, or the number of audio tracks is taller than the current height of the Timeline, these scroll bars let you drag to navigate around your program. When you scroll horizontally, you also move the playhead. You may also scroll vertically using the scroll wheel (or other scroll control) of your mouse or other pointing device. You may scroll horizontally by holding the Command key down while using your scroll control.

• **Individual Timeline track resizing:** Any track in the Timeline can be individually resized by right-clicking anywhere within that track’s header control area and choosing a track height from the Lock Track Height To submenu of the contextual menu. You can choose a fixed size including Micro, Mini, Medium, Large, and Extra Large. When you choose a fixed track height, vertical zooming no longer affects that track until you change that track’s Lock Track Height to option back to None.

**Zooming Audio Waveform Height**

You can zoom into or out of the audio waveforms shown in each clip of one or more tracks, to make them taller or shorter, or you can reset them to unity. This doesn’t change the audio levels of clips in affected tracks, it just lets you make the audio waveforms easier to see.

**To zoom audio waveform height using your scroll wheel:**

Hold down Command-Option, and roll the scroll wheel or control up or down to resize all waveforms in all tracks.
You can also use commands that are accessed by right-clicking any track on the Timeline and choosing a command from the Track Waveform Zoom submenu of the contextual menu. You can also select multiple tracks and resize their waveforms all at once. There are three sets of commands:

- Reset Zoom All/Selected Tracks
- Zoom In All/Selected Tracks
- Zoom Out All/Selected Tracks

**Track Layering**

Audio layering is a special audio editing mode that lets you superimpose multiple audio clips in the same track, with audio clips edited into the top layers muting overlapping sections of audio clips appearing on lower layers. With audio layering enabled, superimposed audio clips are treated similarly to superimposed video clips that have opacity set to 100%, with clips on top obscuring (or muting) clips underneath.

Audio layering is incredibly useful for any situation where you're combining segments of multiple takes together to create a single voiceover, audio vocal track, or dramatic performance, as you can choose which segments to use via their superimposed position in the stack of clips appearing in that track, while at the same time you're preserving the other takes underneath in case you might want them later.

**TIP:** Track layering can be enabled for audio tracks on the Edit page as well.

**Switching Among Multiple Timelines**

Timelines can be organized like any other clip in the Media Pool. To open or switch among timelines, use the following procedures.

**To switch timelines, do one of the following:**

- In the Edit page Media Pool, double-click a timeline.
- In the Edit page Timeline Viewer, choose a timeline from the Timelines drop-down menu at the top of the viewer.
- In the Color page, choose a timeline from the Timelines drop-down menu at the top of the viewer.
- In the Fairlight page, choose a timeline from the Timelines drop-down menu to the left of the transport controls.
**Toolbar**

The Toolbar has buttons that let you choose modes of functionality and other buttons that let you execute commands such as placing markers and flags.

![Buttons in the Fairlight Page toolbar](image)

- **Normal Edit mode:** The default mode in which you can move and resize clips in the Timeline, roll edits, and do other basic editing tasks. While this mode can be used with the pointer, it’s designed for letting you make automatic selections of clips at the position of the playhead in selected tracks, using keyboard shortcuts or the Fairlight Editing console.

- **Region Selection mode:** An editing mode in which you can select partial regions of one or more clips for partial editing. While this mode can be used with the pointer, it’s designed for letting you make automatic selections using In and Out points to define regions of selected tracks, using keyboard shortcuts or the Fairlight Editing console.

- **Edit Selection mode:** An editing mode that’s optimized for pointer-based editing in the GUI. Multiple selection and editing functions may be accessed by clicking or dragging on different regions of audio clips in the Timeline. Additionally, an important aspect of working in Edit Selection mode is that this is the only mode that lets you edit the Timeline during playback, which you can’t do in Selection and Range modes.

- **Add Cut:** Click to add a cut to every clip on an unlocked track that intersects the position of the playhead.

- **Snapping:** Enables or disables clip snapping. When turned on, clip In and Out points, markers, and the playhead all snap to one another for reference while you’re editing. A drop-down menu lets you choose how to use snapping to quantize clip position, to Bars, Beats, Divisions, Tics, or via Smart snapping.

- **Flag Clip/Flag Colors drop-down menu:** Flags identify clips, and indicate all clips that correspond to the same item of media in the Media Pool. Clips can have multiple flags. Clicking the Flag button automatically adds a flag to whichever clip is currently selected in the Timeline. A drop-down menu to the right lets you choose differently colored flags, and clear all flags from the currently selected clip.

- **Add Marker/Marker Colors drop-down menu:** Markers identify specific frames of individual clips. Clicking the Add Marker button adds a marker of the currently displayed color to the clip at the position of the playhead in the Timeline. A drop-down menu to the right lets you choose differently colored markers, and clear all markers from the currently selected clip.

- **Timeline View Options drop-down menu:** Contains a variety of controls with which to customize the display of clips in the Timeline:
  - **Timeline View Options:** The left button lets you display or hide the video tracks in the current timeline, for use as a reference while you work. The right button lets you set the playhead to be fixed, so that during playback the tracks scroll past the playhead as it remains in place, which is useful when working with the Fairlight control surface.
  - **Scroller:** Three buttons let you turn on one video and two audio scrollers, which act as scroll bars and zoomed-in visual references for the video and audio media immediately surrounding the playhead.
— **Audio View Options:** The left button lets you toggle full waveforms on and off, optionally hiding the divider bar that keeps the waveform separate from the file name area of each audio clip, so the waveform occupies the full space of each audio bar in the Timeline. The right button lets you toggle waveform outlines on and off, drawing a dark border around the edges of each waveform to make them easier to see.

— **Zoom Presets:** These buttons let you choose from one of 7 zoom levels.

![Selecting the Audio Timeline View options](image)

- **Zoom Height slider:** Lets you change the height of all tracks and clips in the Timeline at once. You can also zoom the height of timeline tracks by pressing the Command key while using the scroll control of your pointer, if it has such a control. The scroll wheel of a mouse is most common.

- **Zoom Width slider:** Lets you shrink or expand the width of the contents of the Timeline. You can also control the width of the contents of the Timeline using the scroll control of your pointer, if it has such a control. The scroll wheel of a mouse is most common.

---

### Customizing Clip Display in the Timeline

Choose Fairlight > View Clip Info Display to open a dialog with which you can customize what information is shown at the bottom of each clip in the Timeline. This dialog has options for viewing the clip name versus the display name, and for choosing from among a variety of metadata that you might want available as you work.

![Selecting the audio clip view options](image)
Customizing the Timeline’s Display

There are a variety of ways you can customize the Timeline to better see what you’re working on.

**Fixed Playhead Mode**

Turning on the Fixed Playhead mode in the Timeline View Options drop-down menu, or choosing View > Show Fixed Playhead, puts the Fairlight timeline into an audio-centric mode where the playhead remains fixed in place, and the Timeline scrolls underneath it as you use the transport controls or JKL to play, shuttle, or scrub forward or back.

**Visible Video Tracks**

A checkbox in the Timeline View Options drop-down menu of the toolbar lets you display small versions of the video tracks in the Fairlight timeline, for reference. These video tracks are uneditable; they’re simply there so you can see which audio clips correspond to which video items, and so they can be used as snapping targets for positioning audio.

**Video and Audio Scrollers**

Checkboxes in the Timeline View Options let you optionally show one Video Scroller and up to two Audio Scrollers at the bottom of the Fairlight timeline.

At the default Low zoom level, the Video Scroller provides a scrollable frame-by-frame filmstrip view of the video of your program, where one frame of the scroller equals one frame of your
video. Each of the two Audio Scrollers, on the other hand, let you focus on a continuous waveform view of a particular audio track. You choose which track populates an Audio Scroller via a drop-down menu in the Timeline header.

What Are They Used For?
The Audio Scrollers always provide a zoomed-in view of specific audio tracks that you’re focused on, regardless of the zoom level of the Timeline tracks above. This means you can focus on subtle details of the audio of one or two tracks that you’re working on, while the rest of the Timeline shows you the overall stack of tracks with clips that are playing together at that moment.

Meanwhile, the Video Scroller always shows the exact frame of video that corresponds to the current moment in time, so it’s an aid to precision editing involving frame-specific adjustments.

Additionally, both the Filmstrip and Waveform viewers scroll continuously during playback, giving you a preview of what visual actions and audio cues are coming a few moments forward in time that you can refer to while performing automation or recording foley.

Repositioning the Scroller Playhead
While the scrollers are visible, the Scroller playhead can be dragged to the left or right in the Timeline to give you more or less preview room to the right.

Zooming the Video Scroller
Right clicking on the Video scroller lets you choose a Low, Medium, or High zoom level. At Low, you get a frame-by-frame view of the program that feels like scrolling a strip of film on a Steenbeck. At Medium and High, you get a progressively abbreviated film strip that lets you zoom more quickly.

Scrolling the Fairlight Timeline Using the Scroller Tracks
Dragging the scroller tracks to the left or right smoothly scrubs through the Timeline in greater detail, regardless of the zoom level of the Timeline tracks above.
Mixer

The Audio Mixer provides a set of graphical controls you can use to assign track channels to output channels, adjust EQ and Dynamics, set levels and record automation, pan stereo and surround audio, and mute and solo tracks.

The Audio Mixer exposes two sets of channel strips with controls that correspond to the tracks in the Timeline. The leftmost set of channel strips expose one set of controls for each track in the Timeline, while the rightmost set of channel strips expose another set of controls for each Main and Sub (submix) you’ve created to bus the mixed audio tracks to whatever set of output tracks you want to expose.

- **Track color**: Each track can be differently color-coded, to help you keep organized.
- **Track number**: The number of the Timeline track corresponding to each channel strip appears here.
- **Input**: A drop-down menu that lets you patch inputs, patch buses, and configure the input settings of audio signals routed through Blackmagic hardware interfaces.
- **Effects**: VST and Audio Unit effects that you apply to tracks from the Effects Library appear here, with controls for enabling/disabling each effect, opening an effect’s custom controls, and deleting that effect.
- **Insert**: Enables the routing of effects from Blackmagic audio interface hardware to outboard effects boxes and back again. This button can be toggled to enable/disable such routing.
- **EQ**: Double-clicking exposes a four-band parametric equalizer with additional Hi and Lo Pass filters, that has both graphical and numeric controls for boosting or attenuating different ranges of frequencies of audio on each track. You can select from among four types of EQ filtering from the Equalizer Type drop-down menu, with options for Earth (the default), Air, Ice, and Fire. Each band has controls for the filter type (Bell, Lo-Shelf, Hi-Shelf, Notch), Frequency, Gain, and Q-factor (sharpness of the band), with the available controls for each band of EQ change depending on the filter type.
The channel strip EQ window

- **Dynamics**: Double-clicking exposes a set of dynamics controls with three sets of controls corresponding to an Expander or Gate, a Compressor, and a Limiter that can be used separately or in concert to manage the dynamics of the audio on that track.

The channel strip Dynamics control window

- **Aux**: Lets you route that track’s channels through an Aux send bus. Each Aux bar corresponds to a specific Aux bus that you created. Double-clicking any of these bars opens up the Auxiliaries window, with which you can enable or disable auxiliaries, set each one to be routed Pre the channel strip or Post the channel strip (the default), and set the Send level and Pan value.

The Auxiliaries control window
Whatever level you set an Aux bus will be shown in the bar that represents that Aux bus in the Mixer’s channel strip.

The Auxiliaries levels shown in the channel strip of the Mixer

- **Pan**: A pan control compatible with stereo and surround panning. You can drag within this control to adjust pan, or you can double-click to expose a pan window. What controls are available in the pan window depend on the mapping of the audio track, but both stereo and surround panning controls are available, with corresponding numeric controls.

Option-double-clicking on the Pan control of the Mixer opens an alternate 3D Audio Pan window. Whereas the regular Pan window lets you do stereo and conventional 5.1 and 7.1 surround panning, the 3D Audio Pan window lets you do the kind of spatial audio positioning enabled by advanced surround formats such as Auro 3D and NHK 22.2 (more information about specific support for these and other formats will come later).
• **Main**: These buttons let you assign a track or Sub’s channels to one or more of the main buses.

• **Submix**: These buttons let you assign that track’s channels to one or more submix buses.

• **Track name**: This mirrors the track name found in the header controls of the Timeline. If you customize a track’s name in the Timeline, that name appears here.

• **dB**: Shows you the volume, in decibels, that track is currently set to.

• **Arm, Solo, and Mute buttons**: Identical to the controls found in the track header controls of each timeline audio track. Arm lets you enable a track to be recorded onto. Solo lets you mute all other tracks in order to play that track in isolation (along with any other Soloed tracks). Mute disables audio playback from that track.

• **Fader**: Each track’s vertical faders let you adjust the volume of that track, and perform automation recording.

---

**The Monitoring Panel**

The Monitoring panel that runs along the top of the Fairlight page shows all of the audio meters corresponding to the tracks in the Timeline, as well as the Master Output meter, control room meters, and a video viewer.

At left, a row of audio meters corresponds to the channel strips of the Mixer, one meter for every audio track in the Timeline. Each track displays the number of meters that corresponds to that track’s audio mapping, with mono tracks having a single audio meter, stereo tracks having two, 5.1 tracks having six, and so on. All of these track and bus meters (with the exception of the Loudness meters) display both peak and RMS (root mean square) levels against a dB scale.

To the right of the Track meters are the Bus meters, in which all Mains, Subs, and Aux buses appear, separated by type, and each displaying the number of meters that corresponds to that track’s audio mapping. This way you can see the sum of all tracks that have been routed to a particular bus.

The last set of meters, to the right of all others, are the Loudness meters, which consist of two sets of meters and a numerical readout. These meters let you keep track of the integrated loudness of the overall mix, which is the standard to which all contemporary mixing specifications refer when describing the deliverables you’re expected to provide to the client.

**Viewer**

A small viewer to the left of the Monitoring panel shows the frame of video at the position of the playhead. The only available control is a button in the lower right-hand corner that lets you expand the Viewer into its own floating window.
The Media Pool

In the Fairlight page, the Media Pool serves as the repository of all audio clips in your project, both clips that appear within the Timeline, and clips that you’ve added to your project but have not yet used. When you record audio into the Timeline, the resulting clips are stored in the Media Pool as well, for future use. The Media Pool is also mirrored on the Media and Edit pages, and contains all of the video clips and timelines within that project.

The Bin list at the left shows a hierarchical list of bins used for organizing your media, which is also used to organize your timelines. By default, the Media Pool consists of a single bin, named “Master,” but you can add more bins as necessary to organize timelines and clips by right-clicking anywhere in the empty area of the Media Pool and choosing Add Bin. You can rename any bin by double-clicking on its name and typing a new one, or by right-clicking a bin’s name and choosing Rename Bin. The Bin list can be hidden or shown via the button at the upper left-hand corner of the Fairlight page toolbar.
The browser area to the right shows the contents of the currently selected bin in the bin list. Every clip you import, every timeline you create, and every AAF, XML, or EDL file you import appears here. You can create or import as many timelines as you need within a single project.

As elsewhere, the Media Pool can be displayed in either Icon or List view. In List view, you can sort the contents by any one of a subset of the total metadata that’s available in the Metadata Editor of the Media page. Of particular interest to audio editors are columns for Name, Reel Name, different timecode streams, Description, Comments, Keyword, Shot, Scene, Take, Angle, Circled, Start KeyKode, Flags, and Usage.

For more information on using the myriad features of the Media Pool, see Chapter 11, “Adding and Organizing Media with the Media Pool.” In the sections that follow, some key features of the Media Pool are summarized for your convenience.

**Importing Media Into the Media Pool on the Fairlight Page**

While adding clips to the Media Pool in the Media page provides the most organizational flexibility and features, if you find yourself in the Edit or Fairlight pages and you need to quickly import a few clips for immediate use, you can do so in a couple of different ways.

**To add media by dragging one or more clips from the Finder to the Fairlight page Media Pool (macOS only):**

1. Select one or more clips in the Finder.
2. Drag those clips into the Media Pool of DaVinci Resolve, or to a bin in the Bin list.

Those clips are added to the Media Pool of your project.

**To use the Import Media command in the Fairlight page Media Pool:**

1. With the Fairlight page open, right-click anywhere in the Media Pool, and choose Import Media.
2. Use the Import dialog to select one or more clips to import, and click Open.

Those clips are added to the Media Pool of your project.

For more information on importing media using the myriad features of the Media page, see Chapter 11, “Adding and Organizing Media with the Media Pool.”

**Media Pool Preview Player**

The Media Pool has a preview player at the top that provides a place to open selected source clips in the Media Pool, play them, add marks to log them, and set In and Out points in preparation for editing them into the Timeline via drag and drop. The Media Pool Preview Player effectively acts as a Source monitor for editing in the Fairlight page.
The preview player in the Media Pool

- Various viewing controls populate the title bar at the top. A drop-down menu at the upper left lets you choose a zoom level for the audio waveform that’s displayed. To the right of that, a Timecode window shows you the duration of the clip or the duration that’s marked with In and Out points. Next to the right, a real-time performance indicator shows you playback performance. In the center, the title of the currently selected clip is shown, with a drop-down menu to the right that shows you the most recent 10 clips you’ve browsed. To the far left, a Timecode field shows you the current position of the playhead (right-clicking this opens a contextual menu with options to change the timecode that’s displayed, and to copy and paste timecode).
- The center of the Media Pool Preview Player shows you the waveforms in all channels of the currently selected clip, at whatever zoom level is currently selected.
- Transport controls at the bottom consist of a jog bar for scrubbing, Stop, Play, and Loop buttons, and In and Out buttons.

Bins, Power Bins, and Smart Bins

There are actually three kinds of bins in the Media Pool, and each appears in its own section of the Bin list. The Power Bin and Smart Bin areas of the Bin list can be shown or hidden using commands in the View menu (View > Show Smart Bins, View > Show Power Bins). Here are the differences between the different kinds of bins:

- **Bins**: Simple, manually populated bins. Drag and drop anything you like into a bin, and that’s where it lives, until you decide to move it to another bin. Bins may be hierarchically organized, so you can create a Russian dolls nest of bins if you like. Creating new bins is as easy as right-clicking within the bin list and choosing Add Bin from the contextual menu.
- **Power Bins**: Hidden by default. These are also manually populated bins, but these bins are shared among all of the projects in your current database, making them ideal for shared title generators, graphics movies and stills, sound effects library files, music files, and other media that you want to be able to quickly and easily access from any project. To create a new Power Bin, show the Power Bins area of the Bin list, then right-click within it and choose Add Bin.
• **Smart Bins**: These are procedurally populated bins, meaning that custom rules employing metadata are used to dynamically filter the contents of the Media Pool whenever you select a Smart Bin. This makes Smart Bins fast ways of organizing the contents of projects for which you (or an assistant) has taken the time to add metadata to your clips using the Metadata Editor, adding Scene, Shot, and Take information, keywords, comments and description text, and myriad other pieces of information to make it faster to find what you’re looking for when you need it. To create a new Smart Bin, show the Smart Bin area of the Bin list (if necessary), then right-click within it and choose Add Smart Bin. A dialog appears in which you can edit the name of that bin and the rules it uses to filter clips, and click Create Smart Bin.

**Showing Bins in Separate Windows**

If you right-click a bin in the Bin list, you can choose “Open As New Window” to open that bin into its own window. Each window is its own Media Pool, complete with its own Bin list, Power Bins and Smart Bins lists, and display controls.

This is most useful when you have two displays connected to your workstation, as you can drag these separate bins to the second display while DaVinci Resolve is in single screen mode. If you hide the Bin list, not only do you get more room for clips, but you also prevent accidentally switching bins if you really want to only view a particular bin’s contents in that window. You can have as many additional Bin windows open as you care to, in addition to the main Media Pool that’s docked in the primary window interface.

**Filtering Bins Using Color Tags**

If you’re working on a project that has a lot of bins, you can apply color tags to identify particular bins with one of eight colors. Tagging bins is as easy as right-clicking any bin and choosing the color you want from the Color Tag submenu.

For example, you can identify the bins that have clips you’re using most frequently with a red tag. A bin’s color tag then appears as a colored background behind that bin’s name.

Once you’ve tagged one or more Media Pool bins, you can use the Color Tag Filter drop-down menu (the drop-down control to the right of the Bin List button) to filter out all but a single color of bin.
To go back to seeing all available bins, choose Show All from the Color Tag Filter drop-down.

**Sorting the Bin List**

The Bin list (and Smart Bin list) of the Media Pool can be sorted by bin Name, Date Created, or Date Modified, in either ascending or descending order. Simply right-click anywhere within the Bin list and choose the options you want from the Sort by submenu of the contextual menu.

You can also choose User Sort from the same contextual menu, which lets you manually drag all bins in the Bin list to be in whatever order you like. As you drag bins in this mode, an orange line indicates the new position that bin will occupy when dropped.

If you use User Sort in the Bin list to rearrange your bins manually, you can switch back and forth between any of the other sorting methods (Name, Date Created, Date Modified) and User Sort and your manual User Sort order will be remembered, making it easy to use whatever method of bin sorting is most useful at the time, without losing your customized bin organization.

**Filtering Clips With Audio in the Fairlight Page**

The Media Pool in the Fairlight page has one additional feature: the ability to filter out audio-only clips, or clips with audio, in the currently selected bin. This makes it easy for you to find audio clips that you’re looking for, which are hidden along with lots of video clips in the same bin. To use this feature, click the Option menu of the Media Pool and choose Show All Clips, Show Audio Only Clips, or Show Clips With Audio.
Searching for Content in the Media Pool

An optional Search field can be opened at the top of the Media Pool that lets you quickly find clips by name, partial name, or any of a wide variety of Media Pool metadata.

**To search for a clip by name:**

1. Select which bin or bins you want to search.
2. Click the magnifying glass button at the upper right-hand corner of the Media Pool.
3. Choose the particular column of information you want to search (or All Fields to search all columns) using the Filter by pop-up menu. Only selected bins will be searched.
4. Type your search string into the Search field that appears. A few letters should be enough to isolate only those clips that have that character string within their name. To show all clips again, click the cancel button at the right of the search field.

**TIP:** Smart Bins are essentially multi-criteria search operations that scope the entire project at once and are saved for future use.

Taking Advantage of the Media Pool's Usage Column

In List view, the Usage column does not automatically update to show how many times a particular clip has been used. However, you can manually update this metadata by right-clicking within the Media Pool and choosing Update Usage Data from the contextual menu that appears. Afterwards, each clip will display how many times it’s been used in this column. Clips that have not been used yet display an x.
Effects Library

The Effects Library on the Fairlight page displays both the built-in FairlightFX audio plug-ins that accompany DaVinci Resolve on macOS, Windows, and Linux, as well as whatever Audio FX are available on your workstation.

- FairlightFX are built-in audio processing effects that are fully cross-platform on all platforms DaVinci Resolve supports.
- On macOS and Windows, DaVinci Resolve supports the use of third-party VST audio plug-ins.
- On macOS, DaVinci Resolve supports Audio Unit (AU) audio plug-ins.

Once you install third-party effects on your workstation, they appear in this panel of the Effects Library alongside the FairlightFX that are always available. Audio plug-ins let you apply effects to audio clips or entire tracks worth of audio, to add creative qualities such as echo or reverb, or to take care of mastering issues using noise reduction, compression, or EQ.

Similar to the Media Pool, the Effects Library’s Bin list can be opened or closed using a button at the top left.

Effects Library Favorites

You can click on the far right of any transition, title, or generator to flag that effect with a star as a favorite effect. When you do so, the favorited effects appear in a separate Favorites area at the bottom of the Effects Library Bin list.
ADR

The Fairlight page of DaVinci Resolve has a sophisticated interface for doing ADR, or automated dialog replacement, in a structured and straightforward manner. Simple yet powerful cue list management, industry-standard audio beeps and visual cues, and sophisticated take management with star ratings and layered take organization help you manage the resulting recordings to use the best parts of each take in your program.

When open, the ADR interface consists of three panels to the left of the Timeline: a Record panel, a List panel, and a Setup panel. The controls of these panels are described in the order in which they’re used.

The Setup Panel

As its name implies, the Setup panel is where you configure your ADR session. It presents the controls letting you set up which audio input you want to use and what tracks to listen and record to, as well as preferences governing what the actors will see on the display you output video to, to help them keep their performance in sync.

The List Panel

This is where you create a list of cues you need to re-record, either from within the Fairlight page, or imported from a .csv file that someone provides you. It presents controls for adding, editing, importing, and exporting cues that you want to record.
The Record Panel

This is where you actually run the ADR recording session you’ve set up, using the dialog cues you’ve put into the Cue list. It presents controls for displaying and selecting which cues to record, previewing and initiating recording, and adding metadata to rate the different takes you’ve recorded and to keep track of which cues have been completed.

For more information on using the VO panel, see Chapter 153, “ADR (Automated Dialog Replacement).”
Sound Library Browser

A Sound Library panel is available from the Interface toolbar for browsing sound effects libraries that you have available to you, on your system or on a SAN you’re connected to. It includes the capability of scanning specified file paths to catalog available sound files and their metadata, storing this data within the currently selected project database (or another database that you select) to use when searching for the perfect sound effect within your library. Once you’ve cataloged your sound effects collection, it’s easy to search for sounds, preview what’s been found in the list, and edit the one you like best into the Timeline.

**TIP:** You can download the Fairlight sound library, a royalty-free collection of over 500 professionally recorded foley sounds that you can use in your own projects, from https://www.blackmagicdesign.com/support/family/davinci-resolve-and-fusion. The Fairlight sound library features everything from atmospheric ambient sounds to foley sounds such as foot steps, explosions, hits, effects, and more. This free sound library is designed to work with the Fairlight foley sampler, which lets you use a MIDI keyboard to trigger sounds so they can be recorded at precisely the right time in your program.
Library Controls

Clicking the Library button (to the right of the Search field) reveals a menu that lets you choose which database to use for searching (and cataloging) sound effects collections. Each PostgreSQL database can have a different catalog.

![Choosing a library to search](image)

**NOTE:** The Sound Library is now capable of using the Mapped Mount option in the Media Storage panel of the Preferences, in order to access sound effects located on remote volumes using other operating systems.

To catalog all audio files within a given file path for searching using the Sound Library:

1. Using the Project Manager, create an empty PostGres database in which to store the sound effects catalog.
2. Open a project, open the Edit or Fairlight pages, and open the Sound Library.
3. (Optional) Click the Library button (to the right of the Search field), and select the PostgreSQL-based project database you created to save the resulting metadata analysis to, using the Library drop-down menu that appears. The current database is selected by default. If you’re working within a disk database instead, the top compatible PostgreSQL database in the list will be the default.
4. Do one of the following:
   a. If you’ve not yet connected a library of sound effects, an Add Library button appears in the center of the Sound Library. Click this button, and from the file dialog that appears, select the top-most directory of a file path that contains sound effects; if you’ve selected a directory with subdirectories inside, each subdirectory will be examined for content.
   b. If you’re adding more sound effects to an existing library, then click the Option menu and choose Add Library. From the file dialog that appears, select the top-most directory of a file path that contains sound effects; if you’ve selected a directory with subdirectories inside, each subdirectory will be examined for content.
5. Click Open.

A progress bar will show you how long the operation will take. When you’re finished, a dialog will appear letting you know how many clips were added to the current library.

Display Controls and the Search Field

The Sound Library title bar has controls for sorting the sound effects list, showing it in List or Icon view, and an Option menu with various other settings and commands.

![Display controls let you choose how the contents of the Sound Effects list are viewed](image)
Underneath, a text field lets you enter search terms, while a drop-down menu to the right lets you choose whether to search the current database for sound effects by name, description metadata, or all.

The Search field and Filter By menu

To search for a specific sound effect and edit it into the Timeline:

- Type a search term into the Search field. The case of search terms is ignored, except for boolean operators.

To help you to eliminate false positives, the search field supports different kinds of searches, such as literal searches, and/or/not boolean searches, wildcard searches, and ranges of characters.

NOTE: If you want to perform boolean searches, the boolean operators must be typed in all upper caps, such as AND, OR, and NOT. In lower caps, and, or, and not will be treated as search terms.

Or/And/Not Searches

Simply typing words separated by a space is treated as a series of OR searches for each word independently of one another, either literally or as part of another word. For example, if you type either of the following:

- car door
- car OR door

both yield the same results. Every sound effect in your library containing either the letters “car” or “door” (or both) will appear, whether these letters appear independently, or within other words. Results will include files such as “CarExDoorClose,” “Doormouse_Squeak,” “Carburetor dropped on cement,” and “Carpet Shake.”

Using AND (it must be upper caps) lets you specify multiple criteria for a search, when each file that’s returned should contain every word you type somewhere within, in any order. For example, if you type:

- car AND door

every sound effect in your library containing both the strings “car” and “door” will appear, even if these words appear either singly, in combination, or within other words, such as “NewCarDoorSlam” and “Carpet_Footsteps_Indoors,” and “GarageDoorHitsCar.”

Using NOT lets you omit sound effects that have a particular word. For example, if you type:

- car NOT door

only sound effects with “car” will appear, and all sound effects with “door” will be omitted.
Literal Searches

Using quotations specifies a literal search for only the specified term, separated from other text by a space. For example, if you type:

“cat”

every sound effect in your library with the standalone word “cat” appears. Sound effects with “cats” and “caterpillar” will be omitted. Results will include “Space cat drone” or “Cat meowing.”

Wildcard and Range Searches

The * (asterisk) specifies a wildcard search of any number of characters. Adding an * between two search terms identifies any sound effect with the two search terms connected by any number or combination of characters with no spaces (even no characters). For example, if you type:

close*door

results include “Door-Wood Cheap-Wooden-Closet-Door-Kick-In-Flimsy-Rattle,” “ElevatorCabinCloseDoor,” and “LatchSwingCloseSqueakDoorSecur.” If you instead type:

door*close

results include “DoorHvyMetalCloseSlam,” “DoorLidWoodenChestCloseAntique,” and “ElevatorDoorCloseSlam.” If instead you type:

c*r

results include “lectrohummin,” “KiaShumaEXTBootCloseTrunkaka,” and “Ambience with Piana, Louder.”

The ? (question mark) specifies wildcard search specifying only a single character. The number of question marks you type specifies how many characters of wildcard searching you want to perform. For example, if you type:

door?close

you may get no results at all, unless you have a sound effect named “door-close.” However, if you type:

door????close

results include “DoorWoodClose” since the word wood is four letters, matching the number of wildcard letters you’ve specified.

Preview and Audition Controls

Selecting an item in the Sound Effect list loads it into the preview player where you can play it or audition it in your timeline using the controls underneath the search field.

- **Clip name**: The name of the current clip you’ve selected.
- **Next/Previous buttons**: Two buttons let you select the next or previous sound effect clip in the Sound Effect list.
- **Zoom control**: Controls the zoom level of the Playthrough waveform.
- **Duration field**: Shows the duration of the current clip, or of the section of the clip marked with In and Out points.
- **Playhead timecode field**: The timecode of the playhead’s position.
• **Navigation waveform:** The waveform of the entire sound effect appears here, making it easy to jump to different parts of the selected clip. All channels are summed together in this display.

• **Playthrough waveform:** A zoomed-in section of the selected clip that lets you see more waveform detail for setting In, Out, and Sync points.

• **Jog bar:** Lets you scrub around the clip.

• **Transport controls:** Stop, play, and Loop buttons let you control playback, although you can also use the space bar and JKL controls. Right-click the Stop button to switch it into “Stop and Go to Last Position” mode.

• **Marking controls:** The Sync Point button lets you mark which frame of the sound effect you want to use to sync to a frame of the Timeline when you audition. In and Out points let you mark how much of the sound effect clip you want to edit into the Timeline.

• **Audition controls:** The Audition button puts you into Audition mode where the currently selected sound effect clip appears at the position of the playhead in the currently selected Timeline track. Cancel and Confirm buttons let you choose whether you want to remove the clip from the Timeline and try again with another clip, or leave the sound effect clip in.

**Auditioning clips you've found in the Timeline:**

1. Select a sound effect clip you've found from the list that you want to audition in the Timeline.

2. In the Sound Library, use the scrubber bar to move the playhead to the part of the sound effect that you want to sync to, and click the Sync Point button to place a sync mark on that clip. For example, if you're syncing the sound effect of a car door closing, you might sync the first frame of the door fully closed to the peak of the “slam” sound effect, rather than any door squeaking earlier in the sound effect.

3. Set In and Out points to define the range of the sound effect you want to potentially use.

4. Select a track you want to preview the sound effect in by clicking its track header or Mixer channel strip.

5. Position the playhead at the place in the Timeline you want to align the sync mark you set in Step 2.

6. Click the Audition button in the Sound Library. That clip now appears, temporarily, in the Timeline, and you can play through that section of the Timeline to see how you like the sound effect in context with the rest of the mix.

7. If you like the sound effect, click Confirm to keep it in the Timeline. If you don’t, click Cancel, and it will disappear from the Timeline.

**Sound Effect List**

All sound effect clips that match the current search criteria appear in this scrollable list. Double-clicking anywhere on an item of this list plays that sound effect in its entirety.

• **File Name:** The name of that sound effect file in the storage system.

• **Duration:** The duration of that sound effect file.

• **Channel Mapping:** The number of channels in that sound effect file.
*Star rating:* A clickable control you can use to rate sound effects within DaVinci Resolve. Star rating information is not saved outside of DaVinci Resolve.

*Embedded Metadata:* Any metadata that's embedded within the files of professionally created sound effect libraries appears here.

*Waveform:* The overall waveform of the entire sound effect library is stretched or compressed within the available width of the Sound Library, regardless of the actual duration of each clip.

**Index**

The Index provides a handy interface for listing all of the clips in the current edit, all the tracks in the current Timeline, and all the markers in the current Timeline. Using these lists, multiple items can be selected, tracks can be managed, and marker notes can be consulted with ease. Each of these three categories of information is displayed in separate panels:

**Edit Index**

Displays the Edit Index as seen in the Edit page. Each audio clip in the currently open Timeline corresponds to a row in the Edit Index, with columns for video track, Source In and Out, Record In and Out, Name, and other descriptive metadata. All selected clips (including clips that are automatically selected because they intersect the playhead) are selected in the Edit Index. The Option menu lets you filter the Edit Index by various criteria, for example showing only clips with a particular color of flag, marker, or color, only clips with speed effects, only clips with audio filters, or compound audio clips.

The Tracks panel shows a row of information for each of the tracks in the Timeline

**Tracks**

Every track in the currently open Timeline corresponds to a row of controls and information in this panel. From left to right, each track has a color control, a visibility control, a number, a name, track controls, a format, and a numbered VCA group that it belongs to. These controls can be used to hide or show tracks, color code them, rename them, turn track controls on singly or by dragging over several at a time, change their format, and rearrange them (by dragging one or more rows up and down this list).
If you have MPEG-H enabled for immersive audio authoring, additional columns appear in this panel.

These columns include:

- **Track Type**: Allows definition of either a static component or a dynamic object. When dynamic is selected, the dynamic track-level pan automation from that track is also exported. Only a track can be set to dynamic.

- **Kind**: A content type label, such as mixed content, music, dialogue, effect, etc. When Kind is defined for a bus (rather than the default state of Undefined), that bus is automatically bounced during the export process.

- **Language**: The content-specific language for that track.

- **SW Group**: Allows the track to be assigned to a user-defined switch group. A switch group allows the track to be grouped together with other tracks in the final content, forming an selectable item when rendered. For example, a switch group of dialogue, containing an English and a Chinese language track, could allow the user to select between these languages on playback. In order to define a switch group, click that track’s cell in the SW Group column, and choose “Sw Groups...” to open the Switch Groups Manager window, which lets you create new switch groups.
Once one or more groups has been created, they’re available for selection in the drop-down menu of any cell in the SW Groups column. This lets you quickly make a variety of custom assignments.

**Presets**: Allows a track to be assigned to a user-defined preset. For example, a Bed Mix and Language switch group could form one preset, while the same tracks and a spoken subtitle could form another. In order to define a Preset, click that track’s cell in the Presets column, and choose “Presets...” to open the Preset Manager window, which lets you create new Presets.

Once one or more presets has been created, they’re available for enabling in the drop-down menu of any cell in the SW Groups column. Any track can be added to multiple presets, so the Presets drop-down contains one checkbox per preset so you can make multiple assignments.
The drop-down in the Presets column

Once configured, the metadata from these presets form how the content is exported in the final deliverable, so there will be a set of presets that contain all configured components and switch groups.

Markers:

The markers panel can be displayed in either thumbnail or list mode. In thumbnails mode, each marker in your timeline corresponds to a thumbnail displaying the timecode of its location underneath it, and the color of the marker to the left of the timecode location. In list view, each marker displays a row with the following information; marker number, frame (showing a thumbnail), marker name, start timecode, end timecode, duration, marker color, and notes.

Inspector

When you add an audio effect to a clip or a track, those effects appear in the Inspector when that clip or track is selected.
Metadata Editor

Lets you view and edit the metadata of selected clips in the Fairlight page.

Test Tone Settings for Generating Tone, Noise, and Beeps

The Fairlight page has a general purpose oscillator, the settings of which you can customize by choosing Fairlight > Test Tone Settings. This opens the Test Tone Settings window that you can configure to generate tones, noise, or beeps using five sets of controls:

- **Enable/Disable Test Tones toggle**: Lets you turn the Oscillator on or off system-wide.
- **Frequency dial**: Sets a custom frequency of oscillating tone, from 20 Hz to 10kHz. Defaults to 1kHz.
- **Frequency buttons**: Lets you quickly select 100, 440, 1K, or 2K preset tones, or a continuous rising sweep of frequencies from 1 Hz to 15kHz.
- **Level dial**: Sets the output level for the tone or noise, from –50dB to +10dB. Defaults to –15 dB.
- **Frequency presets**: Four buttons let you choose from four commonly used tones: 100 Hz, 440 Hz, 1 kHz, and 2 kHz.
- **Noise type buttons**: Two buttons let you choose from White noise or Pink noise.

You can set up the Oscillator to output whatever kind of tone or noise you require, and then patch it to tracks for recording tones, or patch it to audio outputs for calibrating speakers. If you use the beep options of the ADR panel, those are performed via the Oscillator.

**To play the Test Tone out of your speakers:**

1. Choose Fairlight > Patch Input/Output to open the Patch Input/Output window.
2. Choose System Generator from the Source drop-down menu, and choose Audio Outputs from the Destination drop-down menu.
3. At the left, click the button of what you want to output, Osc (Oscillator) or Noise.
4. At the right, click the connected audio outputs that you want to patch to, and click Patch. Tone or noise should immediately start playing out of your configured speakers.
5. To stop, select one of the patched buttons, and click Un-Patch.
To record a tone or noise from the Oscillator to an audio track:

1. Choose Fairlight > Patch Input/Output to open the Patch Input/Output window.
2. Choose System Generator from the Source drop-down menu, and choose Track Input from the Destination drop-down menu.
3. At the left, click the button of what you want to output, Osc (Oscillator) or Noise.
4. At the right, click the connected audio outputs that you want to patch to, and click Patch. Close the Patch Input/Output window.
5. Click the Arm Record (R) button in the track header of the track you patched the Oscillator to. If your Main is properly patched to your outputs, you should hear the tone or noise, and that track’s audio meter should immediately rise to the level being output by the Oscillator.
6. Click the Record button of the transport controls to initiate recording of that tone to the patched track. Click the Stop button or press the Spacebar to halt recording when you’re done.

Pro Tools AAF Import

As of DaVinci Resolve 16, you can import AAF projects and media from Pro Tools, enabling you to move an audio project from a Pro Tools workstation to a Fairlight workstation. AAF import supports the import of embedded audio and track automation. To do so choose File > Import Timeline > Import AAF/EDL/XML.

Dual Monitor Layout

The Audio page has a dual monitor layout that provides maximum space for the mixer and audio meters on one screen and a full-screen timeline on the other.

To enter dual screen mode:

Choose Workspace > Dual Screen > On.
To switch which UI elements appear on which monitors: Choose Workspace > Primary Display > (Monitor Name), which reverses the contents of both monitors in dual screen mode.

Customizing the Fairlight Page

The default layout is quite efficient for a number of tasks on most displays. You can always return to the default layout by choosing Workspace > Reset UI Layout. However, the Fairlight page can be customized to create more room for specific areas of the interface to accommodate different tasks.

To resize any area of the Fairlight page:
Drag the vertical or horizontal border between any two panels to enlarge one and shrink the other.

To resize the height of individual audio tracks:
Move the pointer to the bottom border of any audio track header, and when it becomes a resize cursor, drag that border up or down to resize that track. Each track can have an independent size when you do this.

To resize any column of the Index:
Move your pointer over the divider between any two columns and drag when the horizontal resize cursor appears.

To rearrange Index columns:
Drag the header of any column to the left and right to move that column.
Undo and Redo in DaVinci Resolve

No matter where you are in DaVinci Resolve, Undo and Redo commands let you back out of steps you’ve taken or commands you’ve executed, and reapply them if you change your mind. DaVinci Resolve is capable of undoing the entire history of things you’ve done since creating or opening a particular project. When you close a project, its entire undo history is purged. The next time you begin work on a project, its undo history starts anew.

Because DaVinci Resolve integrates so much functionality in one application, there are three separate sets of undo “stacks” to help you manage your work.

- The Media, Edit and Fairlight pages share the same multiple-undo stack, which lets you backtrack out of changes made in the Media Pool, the Timeline, the Metadata Editor, and the Viewers.
- Each clip in the Fusion page has its own undo stack so that you can undo changes you make to the composition of each clip, independently.
- Each clip in the Color page has its own undo stack so that you can undo changes you make to grades in each clip, independently.

In all cases, there is no practical limit to the number of steps that are undoable (although there may be a limit to what you can remember). To take advantage of this, there are three ways you can undo work to go to a previous state of your project, no matter what page you’re in.

To simply undo or redo changes you’ve made one at a time:

- Choose Edit > Undo (Command-Z) to undo the previous change.
- Choose Edit > Redo (Shift-Command-Z) to redo to the next change.
- On the DaVinci control panel, press the UNDO and REDO buttons on the T-bar panel.

TIP: If you have the DaVinci control panel, there is one other control that lets you control the undo stack more directly when using the trackballs, rings, and pots. Pressing RESTORE POINT manually adds a memory of the current state of the grade to the undo stack. Since discrete undo states are difficult to predict when you’re making ongoing adjustments with the trackball and ring controls, pressing RESTORE POINT lets you set predictable states of the grade that you can fall back on.

You can also undo several steps at a time using the History submenu and window. At the time of this writing, this only works for multiple undo steps in the Media, Cut, Edit, and Fairlight pages.

To undo and redo using the History submenu:

1. Open the Edit > History submenu, which shows (up to) the last twenty things you’ve done.
2. Choose an item on the list to undo back to that point. The most recent thing you’ve done appears at the top of this list, and the change you’ve just made appears with a check next to it. Steps that have been undone but that can still be redone remain in this menu, so you can see what’s possible. However, if you’ve undone several changes at once and then you make a new change, you cannot undo any more and those steps disappear from the menu.
Once you’ve selected a step to undo to, the menu closes and the project updates to show you its current state.

To undo and redo using the Undo window:

1. Choose Edit > History > Open History Window.
2. When the History dialog appears, click an item on the list to undo back to that point. Unlike the menu, in this window the most recent thing you’ve done appears at the bottom of this list. Selecting a change here grays out changes that can still be redone, as the project updates to show you its current state.
3. When you’re done, close the History window.
Chapter 150

Setting Up Tracks, Buses, and Patching

One of the first things you need to do when you’re setting up a new project for mixing in the Fairlight page is to define all of the audio tracks and buses you’re going to need, including submixes and mains that route and combine the audio being output. This chapter covers how to create audio tracks, and how to use buses to manage your mixes in the most efficient possible way.

Patching Signal Paths 3166
Using the Patch Input/Output Window 3166
Using a Channel Strip’s Input Menu 3168
Audio Tracks

Each audio track in a Resolve timeline corresponds to a single channel strip on the Mixer’s left side. Depending on how an audio track has been configured, each audio track is assigned a specific audio format such as mono, stereo, LCRS, 5.1 surround, or 7.1 surround, so that multiple audio channels within the clips on that track can be correctly routed to the proper audio output for monitoring and rendering via the lanes that can be seen within each track on the Fairlight timeline.

Audio tracks in DaVinci Resolve have been designed to contain multiple channels of clip audio within a single track, but how those individual audio channels are displayed depends on the page. The Edit page hides these individual audio channels, displaying only a single clip in the timeline to make it easier to edit multi-channel sources without needing to manage a huge number of tracks. However, the Fairlight page has a unique track and lane system for displaying audio.

The Fairlight page displays the same number of tracks as the Edit page, but each track on the Fairlight page is divided into lanes, which expose each individual channel of clip audio for editing and mixing.

(Top) Stereo audio in the Edit page represented by a single track; (Bottom) The same stereo audio in the Fairlight page shows the two lanes that correspond to each of the stereo audio tracks
Now that you understand how tracks work on the Fairlight page, the next important concept you need to understand in order to unlock the power of the Fairlight page is the audio bus, which lets you combine multiple audio tracks in different ways.

**What Is a Bus?**

In audio postproduction, a bus is essentially a destination channel to which you can route multiple audio feeds (typically the audio tracks of the Timeline) so they are mixed together into a single signal that can be controlled via a single channel strip. For example, by default a single bus called a Main (named Main 1) combines the levels of every clip edited onto every track of a timeline into the signal that’s output to your speakers.

Mains are one kind of bus, but there are other kinds of buses with which you can organize the output of tracks in a timeline. For example, if you have five audio tracks into which have been edited all of the dialog audio clips for a particular program, you can route the output of all five dialog tracks to a Submix bus, which combines them so that the combined levels from all dialog tracks can be adjusted (or mixed) using a single set of controls.

Ultimately, you’ll use multiple levels of buses to mix programs in an organized fashion. For example, individual tracks can be routed to Submix buses, as described above. Then, multiple Submixes can be routed to one or more Mains. For example, you could have four submix buses, one for German dialog, one for English dialog, one for Music, and one for Effects. You could route the German, Music, and Effects submix buses to Main 1 to output the German version of the program, and route the English, Music, and Effects submix buses to Main 2 to output the English language version of the program.

Audio tracks from the Timeline are routed to buses via each channel strip’s multiformat surround panner, so buses are configured to accommodate specific audio formats such as mono, stereo, LCRS, 5.1 surround, or 7.1 surround.

**Types of Buses**

There are four types of buses in DaVinci Resolve.

**Mains**

Main buses are typically the primary output of a program; each new project you create starts out with a single Main called M1, to which all tracks are routed by default. You can add additional Mains, and you can use them however you like, as either full or partial mixes of the program you’re working on. Mains can be directly output in the deliver page.

**Sub (Submix)**

Sub buses are often the means by which multiple tracks of audio that belong to the same category (dialog, music, effects, ambience, and so on) are combined together so that everything in that category can be mixed as a single audio signal. Multiple Sub buses can be themselves routed to Main buses, or they can be directly output in the deliver page.

**Aux (Auxiliary)**

Each channel strip includes the ability to expose up to 12 auxiliary bus sends, which are typically used to route audio to software or hardware effects of some kind. Typically, an audio signal is sent to the effect (or hardware) applied to that bus and then is routed back to the channel it came from. Auxiliary send signals can be connected either immediately before or after a channel strip’s fader, based on a Pre setting. Each auxiliary bus can also be configured to accommodate specific audio formats such as stereo, LCRS, 5.1 surround, or 7.1 surround.
Multi Track
Multitrack buses provide bus paths for combining feeds that you want to re-record to disk, or route to other I/O.

Buses in Nested Timelines
When you nest a timeline inside of another timeline that has buses set up for mixing in the Fairlight page, all Sub and Aux routings work as intended within the nested timeline, which exposes all channels of Main 1 in the enclosing timeline. In this sense, the audio of the nested timeline can be considered to be a submix that outputs its resulting audio to the audio track it’s edited onto.

Exposing Bus Tracks in the Timeline
You can expose any bus, including Mains, Subs, and Aux buses, as a track in the Timeline. This makes it possible to view and edit automation that’s applied to parameters on that bus.

To show a bus in the Timeline:
1. Open the Automation controls by clicking the automation button on the Fairlight toolbar.
2. Open the Index, and click the eye button for the Main you want to see in the Timeline.
3. You can choose any automation curve you want to view by choosing it from the drop-down menu in the track header controls.

Controlling Signal Flow
The process of setting yourself up for editing and mixing in the Fairlight page involves:

- First, customizing the tracks of the timeline to be organized and configured as required.
- Second, creating the buses you need in order to organize your signal flow.
- Third, patching the tracks to Subs, and the Subs to Mains, in order to create the signal flow you need.

Managing Audio Tracks
When you’re getting ready to record or edit audio clips into the Fairlight Timeline, you need to make sure you’ve got enough tracks to do the job. The following procedures cover the different methods available for adding, removing, and rearranging tracks as you work. These commands are all available via the contextual menu that appears when you right-click anywhere in the Timeline header area (the header of the Timeline is the area to the left where each track’s various buttons and controls are located).
Defining Timeline Audio Track Channels at Creation

If you decide to create a new audio track, you have to choose what kind of audio track it will be. Right-clicking in the bottom audio portion of the Timeline track header reveals a contextual sub-menu that lets you create different kinds of audio tracks.

- **Mono**: Holds a single channel with only one lane.
- **Stereo**: Holds stereo left and right channels, with two lanes.
- **5.1**: Holds the six channels corresponding to a 5.1 surround mix, for a total of six lanes. For broadcast, SMPTE specifies Left, Center, Right, Left Surround, Right Surround, and LFE. For cinema distribution these tracks are ordered Left, Right, Center, LFE, Surround Left, and Surround Right.
- **7.1**: Holds the eight channels corresponding to a 7.1 surround mix, for a total of eight lanes. For broadcast, SMPTE specifies Left, Center, Right, Left Surround, Right Surround, LFE, Back Surround Left, and Back Surround Right. For cinema distribution these tracks are ordered Left, Right, Center, LFE, Left Surround, Right Surround, Back Left Surround, and Back Right Surround.
- **Adaptive**: Capable of holding up to 24 audio channels, which would display up to 24 lanes within the track. An adaptive audio track can hold clips with different combinations of channels, up to the maximum number of channels allowed within that track. The number of channels allowable on a particular Adaptive track is user-definable (1–24) at the time that track is created. If you edit a clip with more channels into an Adaptive track that was created to hold fewer channels, the extra clip channels are muted.

Creating Tracks

There are two commands with which to create new audio tracks, and both are in the contextual menu found by right-clicking within any audio track’s header controls. Add Track adds a single audio track of the type you choose from a submenu. Add Tracks lets you insert as many tracks as you like, of a type and at a position you designate using the Add Tracks dialog.

Rearranging Tracks

You can rearrange tracks by right-clicking in a track’s header area and choosing either Move Track Up or Move Track Down in the contextual menu that appears.

Changing How Many Channels an Audio Track Has

If you had set up your timeline with one kind of audio track, but you discover you actually need a different kind, you can change any audio track’s type at any time. Just right-click anywhere in that audio track’s timeline header, and choose an option from the Change Track Type To submenu of the contextual menu.

Deleting Tracks

Right-click within a track’s Timeline header and choose Delete Track. If there are clips on a track you remove, they are also deleted from the Timeline, but preserved in the Media Pool.
Linked Groups of Mono Tracks

Linked groups are an organizational construct that you can create using mono tracks (other kinds of tracks such as stereo, 5.1, 7.1, or Adaptive cannot be used in a Linked Group). Unlike a multi-channel track with lanes, a linked group of mono tracks functions as five independently editable tracks in the Timeline. However, each track is mapped just like an audio channel using one of the standard multi-channel mappings (stereo, 5.1, 7.1, Adaptive), and linked groups of mono tracks are mixed using only a single channel strip.

Linked groups are extremely useful when you’ve been given a set of six independent audio files that need to be assembled as a single surround mix, or when you have surround channels that need to be specifically re-edited on a channel by channel basis.

To create a Linked Group from individual mono tracks:

1. Create two or more Mono audio tracks that you want to group together. If you need to create a linked group with a specific channel mapping, such as 5.1, make sure you create enough tracks (in this case, 6).
2. Choose Fairlight > Link Group.
3. When the Link Group dialog appears, Mono audio tracks are represented by active buttons (all other channel mapped tracks are disabled, since they can’t be linked). Click to enable the button of every track you want to include in the group you’re about to create. Which mappings are available to use for creating your group depends on how many tracks you’ve selected.

4. After you’ve selected all the tracks you need to, click one of the available “Link as” buttons below. In this example, six tracks have been selected, so you could click 5.1 Film or 5.1.

Afterwards, the tracks you selected should turn into a single block, showing they’ve been linked.
Close the Link Group window when you’re finished.

Once you’ve created a linked group, the mono tracks in the timeline that you linked appear with a bar to the left in the track header that spans every track that’s linked. If the tracks are tall enough, they’ll also be labeled to identify which track corresponds to which surround channel, L, R, C, Lfe, Ls, Rs, and so on. At this point, you can edit each channel of a surround mix into the appropriate track.

Tracks in a Linked Group are labeled to identify which track corresponds to which surround channel.

If you’ve edited a multi-channel audio clip onto a multi-channel track, you can convert that track and its contents into a Linked Group of mono tracks, each of which contains a single clip for that track’s channel. This can be useful if you’ve been delivered a multi-channel surround audio clip with an incorrect track mapping. You can convert it into a Linked Group, at which point you can easily rearrange the channels.

To create a Linked Group from a single multi-channel timeline:

Right-click the track header of a multi-channel audio track, and choose Convert to Linked Group from the contextual menu. This automatically creates one new audio track for each channel, all of which are linked together. For example, converting a 5.1 audio track results in six new tracks with six individual audio clips (one for each channel), all of which are linked together.

If necessary, you can also unlink a linked group to turn it back into independent mono tracks.

To unlink a Linked Group:

1. Choose Fairlight > Link Group.
2. When the Link Group dialog appears, select the Linked Group you want to unlink.
3. Click Unlink.
4. Close the Link Group window when you’re finished.
Creating Buses

Choosing Fairlight > Bus Format opens the Bus Format window, which lets you create as many buses as you need (up to the limitations of your system) to organize the tracks and channels of your program.

The Bus Format window lets you add buses to the mixer.

Four buttons at the top of the window let you create any type of bus Fairlight supports. Creating a new bus, whether it’s a Main, Sub, Aux, or Multi Track, adds the new bus to the list that appears below.

The Bus list lets you rename the bus, choose the format of each bus (a drop-down menu appears in the Format column of each entry of the list), and color-code each bus (a Color drop-down lets you choose that bus’s color). Simply click any item on the Bus list to select it, and choose different options from the Format and Color drop-down menus, or click on the User Name of any bus to select it, and type a custom name.

At the bottom of the list are two additional buttons that let you Duplicate or Remove selected Buses. When you’re done modifying the available buses, you can click OK to accept the change and close the Bus Format window, Cancel to close the window (although any buses you’ve made remain in place), or Bus Assign to open the Bus Assign window.

**NOTE:** Text at the upper left-hand corner of the window lets you know how many buses you’re using out of how many your workstation will support.
Assigning Buses

Once you’ve created one or more buses, you’ll want to assign different tracks to specific buses, and different Subs to specific Mains. This is accomplished in the Bus Assign window, which you can open by choosing Fairlight > Bus Assign, or by clicking the Bus Assign button in the Bus Format window.

The Bus Assign window lets you choose which tracks are connected to which buses, and which buses are connected to which mains

The top shows all of the available Main, Sub, and Multi Track buses, while the bottom shows all available tracks, Sub buses, and Aux buses. The Bus Assign window defaults to Icon view, in which each Bus and Track is shown as a button, but it can be switched to List view, in which the Available Tracks section is shown as a list.

Methods of making bus assignments:

- **To assign specific tracks to a bus:** Click a button in the Buses section to select that bus, and then either click or drag a bounding box over all the available tracks that you want to assign to that bus. Once assigned, the Available Tracks buttons display which Bus they’ve been assigned to.

- **To assign every track, Sub, and Aux to a bus:** Click a button in the Buses section to select that bus, and then click Assign All.

- **To clear all track assignments from a particular bus:** Click a button in the Buses section to select that bus, and then click Unassign All.

When you’re done making bus assignments, click Save.
Patching Signal Paths

While bus creation and assignment is a straightforward way of creating a cascade of routing from tracks to Subs to Mains, sometimes you need to create more specific signal paths. For example, if you need to record audio to a track, you need to patch the audio input you want to record from to the track you want to record to. This, and many other scenarios, are accomplished using the Patch Input/Output window.

Using the Patch Input/Output Window

Choosing Fairlight > Patch Input/Output opens the Patch Input/Output window, which can be displayed in either Icon or List view. This window is split into two halves, with the left half containing whichever Audio Source controls you choose, and the right half containing whichever Audio Destinations you choose. In the following screenshot, the Audio Inputs from a Scarlett2i2 USB audio interface are shown, while the available Track Inputs are shown on the right.

Creating a Patch

By default, the Patch Input/Output window shows the available Audio Inputs as the Source, and the Track Inputs as the destination. This makes it easy to patch whatever audio source (such as a microphone connected to a USB audio interface) to a specific audio track of the timeline to prepare for recording. Patching and unpatching a source to a destination is straightforward.

To patch a source to a destination:

1. Choose a type of source from the Audio Source drop-down menu at the upper left-hand side of the window.
2. Click the button or list item of the source you want to patch on the left side of the Patch Input/Output window.
3. Choose a destination from the AudioDestination drop-down menu at the upper right-hand side of the window.
4 Click the button or list item of the destination you want to patch on the right side.

5 Click the Patch button at the bottom right of the window. The source and destination will both display the connection they’re patched to.

To unpatch a source and destination pair:
1 Click a button or list item corresponding to a source or destination you want to unpatch.
2 Click Unpatch.

Choosing Audio Source and Destination Controls
The Audio Source and Destination drop-down menus let you choose different categories of source and destination controls to patch together.

The following Audio Source options are available:

- **Audio Inputs**: The available physical audio inputs on your workstation, for example SX-36, MADI, or system audio. Useful when patching to record audio.
- **Track Repro**: Short for Reproduction, this is the signal from the track playback, before any processing
- **Track Send**: Track Insert send
- **Track Direct**: Track Direct Out, can be pre or post the track fader, with an offset
- **MT-Bus Dir**: Multitrack Bus Direct Out, can be pre or post the multitrack bus master fader, with an offset
- **MT-Bus Out**: Multitrack Bus Out, always post the Multitrack bus master fader
- **Aux-Bus Send**: Aux bus master insert send
- **Aux-Bus Dir**: Aux Bus Direct Out, can be pre or post the Aux bus master fader, with an offset
- **Aux-Bus Out**: Aux Bus Out, always post the Aux bus master fader
- **Sub-Bus Send**: Sub bus master insert send
- **Sub-Bus Dir**: Sub Bus Direct Out, can be pre or post the Sub bus master fader, with an offset
- **Sub-Bus Out**: Sub Bus Out, always post the Sub bus master fader.
- **CR-Mon Dir**: Monitor system Direct out. Post fold up/down matrix, pre the Monitor VolumeLevel/Dim/Mute
- **CR-Mon Out**: Monitor system output. Post fold up/down matrix and Monitor VolumeLevel/Dim/Mute
- **Main Send**: Main bus master insert send
• **Main Dir:** Main Bus Direct Out, can be pre or post the Main bus master fader, with an offset

• **Main Out:** Main Bus Out, always post the Main bus master fader

• **Osc:** Oscillator outputs. Sine, Pink noise, White noise.

• **Solo Out:** AFL and PFL Solo Bus Out, always post the respective bus master fader

**The following Audio Destination options are available:**

- **Track Input:** Input to the Record and Thru path; simply put, the available audio tracks in the current timeline.

- **Track Return:** Track insert return

- **Aux-Bus Return:** Aux Bus master insert return

- **Sub-Bus Return:** Sub Bus master insert return

- **Main Return:** Main Bus master insert return

- **CR-Mon In:** Input to the Monitor system’s fold up/down matrices

- **Talk Back:** The Talkback system, showing Comm1 and Comm2

- **Audio Outputs:** The available physical audio outputs on your workstation, for example SX-36, MADI, or system audio.

**Using a Channel Strip’s Input Menu**

The Input drop-down menu at the top of each track’s channel strip in the mixer provides some shortcuts for patching different inputs and buses to the tracks of your mix. Each option in this menu makes the Patch Input/Output window appear with different Audio Source and Audio Destination selections automatically set up.

**Input**

The Patch Input/Output window appears set up to let you patch different inputs (such as the system audio input) to the tracks of the timeline. This makes it fast for setting up audio inputs in preparation for recording.

**Aux Bus**

A shortcut to open the Patch Input/Output window (discussed previously in this chapter), which appears set up to let you patch different Aux buses to specific submix and timeline track channels.

**Sub Bus**

A shortcut to open the Patch Input/Output window (discussed previously in this chapter), which appears set up to let you patch different Sub (submix) bus channels to specific timeline track channels.

**Main Bus**

A shortcut to open the Patch Input/Output window (discussed previously in this chapter), which appears set up to let you patch different Main bus channels to specific timeline track channels.
Path Settings
Choosing Path Settings opens the Path Settings window for that track. This window contains controls for adjusting the input level of audio signals being input via a BMD input/output device.

These parameters control the following:

- **Mic/Instr.**: Adjusts the Mic/Instrument level for this source, from 0 to 100 dB.
  - **On**: Enables Microphone/Instrument level for this source.
  - **48V**: Enables phantom power for that input.

- **Record Level**: Controls the level going to the disk before recording. It does not affect the track when in Thru mode.
  - **Rec**: Enabling this button makes this track ready to record. Only turn this on if there is an audio source patched to the current track.
  - **Thru**: When on, this makes the affected track into the equivalent to a live feed. When enabled, this track will monitor its input, but will not respond to a record command. Only turn this on if there is an audio source patched to the current track.

- **Trim**: This parameter controls the level as the channel enters the mixer. For timeline tracks, this controls the signal coming from disk, and does not affect any current levels being recorded.

- **Direct Output**: Controls the level going from this channel to the direct output.
  - **On**: Toggles direct output on and off.
  - **Pre**: Toggles the direct output to connect either pre or post the main channel fader.

- **Insert**: Controls the insert return only. When enabled, the channel connects to its insert return, otherwise the Channel connects to the straight-through path. The insert send, on the other hand, is always active (though it must be patched somewhere before it can be heard).

**NOTE:** Insert sends and returns are only audible if patched to physical outputs or inputs, or to other paths. Sends can be sent to the input of any path in the system, and returns can come from the output or send of any path. This is done in the Patch I/O screen (press the Patch I/O button).
Chapter 151

Transport Controls, Timeline Navigation, and Markers

The Fairlight page has unique transport control, zooming, and scrolling options not found in the other pages of DaVinci Resolve that help you to work with audio more efficiently. This chapter covers how to get around the Fairlight version of the Timeline.
Transport Controls and JKL Navigation

Because of the Fairlight page’s audio-focused workflow, the transport and playback controls differ from those found in the Media, Edit, Color, and Deliver pages.

Transport Controls

The Fairlight transport controls are also designed to mirror their counterparts on the Fairlight control panels. They include the following functions:

- **Rewind and Fast Forward**: Initiates accelerated playback through the Timeline in either direction. Pressing either of these buttons multiple times speeds up this motion, cycling through 8x, 24x, 60x, 150x, and 360x play speeds.
- **Play**: Plays forward. Identical to pressing the Spacebar or L keys while playback is stopped.
- **Stop**: Stops playback. Identical to pressing the Spacebar or K keys while playback is engaged.
- **Record**: Initiates recording if you have an audio source patched to a track, and if that track is enabled for recording. For more information about recording, see Chapter 152, “Recording.”
- **Loop**: Toggles looped playback off and on. While looped playback is on, playback will loop at the end of the Timeline, and will also loop when you use the Play In to Out command, and will continue to loop automatically until you stop playback.
- **Automation controls**: This button exposes the automation toolbar. For more information about recording automation, see Chapter 157, “Automation Recording.”

Using JKL to Control Playback

The JKL keyboard shortcuts are common to many editing applications, and experienced editors know these to be some of the most useful controls for playback and editing there are. Here’s a list of the many different ways you can use these three keyboard shortcuts to play through clips and timelines as you work.

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>J</td>
<td>Plays 100% backward.</td>
</tr>
<tr>
<td>K</td>
<td>Stops playback.</td>
</tr>
<tr>
<td>L</td>
<td>Plays 100% forward.</td>
</tr>
<tr>
<td>Press J repeatedly</td>
<td>Increases backward play speed each time you press J, for a range of fast-reverse speeds.</td>
</tr>
<tr>
<td>Press L repeatedly</td>
<td>Increases forward play speed each time you press L, for a range of fast-forward speeds.</td>
</tr>
<tr>
<td>Shift-J</td>
<td>Plays in fast reverse.</td>
</tr>
<tr>
<td>Shift-L</td>
<td>Plays in fast forward.</td>
</tr>
</tbody>
</table>
K+J | Plays backward at slow motion (with slow motion audio playback).
---|---
K+L | Plays forward at slow motion (with pitch-corrected audio playback on OS X).
Pressing K while tapping J | Moves the playhead back one frame.
Pressing K while tapping L | Moves the playhead forward one frame.

If you’re using Fairlight with the keyboard, then this will probably become one of the main ways you move the playhead around in DaVinci Resolve.

**Dragging the Playhead to Scrub**

You can also drag the playhead left and right to scrub through the visible area of the Timeline by clicking and dragging anywhere within the Timeline ruler at the top of the Timeline, directly below the toolbar. If you’re zoomed in at a reasonable level for editing, scrubbing the playhead using your pointer will result in smooth, tape-like slow and fast audio playback, giving you a great deal of precision while trimming audio.

**Looping Playback**

Two controls govern looping on the Fairlight page, similarly to how looping works on the Edit page.

- **Loop**: Command-Forward Slash (/). Toggles looped playback off and on. While looped playback is on, playback initiated with any of the following commands will loop automatically until you stop playback.
- **Play In to Out**: Option-Forward Slash (/). If you’ve marked a section of a clip or timeline with In and Out points, this command lets you preview how it will play.

**Loop Jog Scrubbing**

Currently available only on the Fairlight page, choosing Timeline > Loop Jog enables a brief sample preview to be heard while scrubbing the playhead through the Timeline. This can make it easier to recognize bits of dialog or music as you’re quickly scrubbing through tracks, in situations where you’re trying to locate specific lines or music cues. It also enables this brief sample preview to loop endlessly when you hold the playhead on a frame, so you can pause while scrubbing and hear (by default) the current 80 ms prior to the playhead as it loops.

A pair of settings in the User Preferences let you customize this behavior.

- **Loop Jog Alignment**: Three options let you choose whether you loop audio Pre the position of the playhead, Centered on the playhead, or Post the position of the playhead.
- **Loop Jog Width**: A field lets you choose how many milliseconds of audio to loop when Loop Jog is enabled. How many milliseconds of audio corresponds to one frame depends on the frame rate of the video. For example, at a frame rate of 25 fps, there are \(1000/25 = 40\) ms per frame, so the default value of 80 ms equals two frames of looping.
Moving the Playhead Using Timecode

You can use absolute or relative timecode entry to move the playhead in the Timeline. Timecode entry lets you move the playhead very precisely or jump to specific timecode values really quickly.

How to Enter Timecode Values

When entering timecode, type each pair of hour, minute, second, and frame values from left to right, with a period representing a pair of zeros for fast entry. The numbers you enter appear in the timecode field at the upper left-hand corner of the Viewer with focus. When you’re finished typing, press the Return key to execute the timecode command. The rules for timecode entry are as follows:

- The right-most pair of timecode values (or period) you enter is always the frame number.
- A period to the left or to the right of any number you type is considered to be a pair of zeroes.
- A single period between two numbers is considered to either be a single zero or ignored if it’s between two pairs of numbers.
- Any untyped pairs of values to the left of what you enter are assumed to be whatever those values were prior to the timecode you entered; this makes it easy to type partial timecode values even when the Timeline starts at hour one.
- It’s not necessary to enter colons or semicolons.

Absolute Timecode Entry

Absolute timecode is entered simply by typing the timecode value you want to move the playhead to, and when you press the Return key, the playhead will move to that timecode value.

Here are some examples of absolute timecode entry using this method:

<table>
<thead>
<tr>
<th>Original TC Value</th>
<th>User-Typed Value</th>
<th>New TC Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>01:10:10:10</td>
<td>15245218</td>
<td>15:24:52:18</td>
</tr>
<tr>
<td>01:10:10:10</td>
<td>2..</td>
<td>01:02:00:00</td>
</tr>
<tr>
<td>01:10:10:10</td>
<td>15</td>
<td>01:10:10:15</td>
</tr>
<tr>
<td>01:10:10:10</td>
<td>12</td>
<td>01:10:10:12</td>
</tr>
<tr>
<td>01:10:10:10</td>
<td>1.2</td>
<td>01:10:01:02</td>
</tr>
<tr>
<td>01:10:10:10</td>
<td>1115..</td>
<td>11:15:00:00</td>
</tr>
<tr>
<td>01:10:10:10</td>
<td>23...</td>
<td>23:00:00:00</td>
</tr>
</tbody>
</table>
Relative Timecode Entry

Relative timecode is entered by starting the timecode value with a plus (+) or minus (–). Adding a plus results in the value you type being added to the current timecode value for purposes of offsetting the playhead from its current position. Adding a minus will subtract the value you type from the current timecode value.

Here are three examples of relative timecode entry:

<table>
<thead>
<tr>
<th>User-Typed Value</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>+20.</td>
<td>00:00:20:00 is added to the current timecode value.</td>
</tr>
<tr>
<td>+3.</td>
<td>00:03:00:00 is added to the current timecode value.</td>
</tr>
<tr>
<td>-5</td>
<td>00:00:00:05 is subtracted from the current timecode value.</td>
</tr>
</tbody>
</table>

Clip, Marker, and Track Navigation

As of Resolve 15, the Up and Down Arrow keys are used to move the playhead from one edit point to the next in the Fairlight page Timeline, just as in the Edit page Timeline.

However, holding Command-Option down while using the Arrow keys gives you Fairlight page-specific behaviors that are used to navigate among clips, markers, and tracks in the Fairlight page in a way that’s different than other pages of DaVinci Resolve but very useful to the way the Fairlight page operates. This section covers the basics.

Selecting Tracks

Which tracks are selected determine the behavior of the Arrow keys.

- **In Selection mode:** You can select tracks by clicking or Command-clicking (to select multiple tracks) anywhere in the background area or on the track number of the track headers. If you click and drag, you can use a bounding box to select multiple tracks.

- **In Range Selection or Edit Selection mode:** You can select tracks by clicking or Command-clicking anywhere either in the background area or on the track number of the track header, or in any unused area of the track itself in the Timeline. If you click and drag, you can use a bounding box to select multiple tracks.

Moving the Clip Selection

The Command-Option-Left and Command-Option-Right Arrow key shortcuts are used to move the playhead left and right in the Timeline, navigating from clip to clip or from marker to marker. How these keys function depends on whether or not one or more tracks is selected in the Timeline.

- **If no tracks are selected:** The Left and Right Arrow keys will jump the playhead from Timeline marker to Timeline marker. Clip markers will be ignored.

- **If one or more tracks are selected:** The Left/Right Arrow keys will jump the playhead among clip In points, clip Out points, and Timeline markers.
Moving the Track Selection
The Command-Option-Up and Command-Option-Down Arrow key shortcuts are used to move
the track selection up and down in the Timeline, changing which tracks are selected. By
changing which tracks are selected, you can alter which clip’s In and Out points are used to
jump the playhead around the Timeline.
If no tracks are selected, then nothing happens.

Zooming and Scrolling
The Fairlight page has several methods of zooming into and out of the Timeline, and scrolling
when you’re zoomed to the point where your edited sequence of clips extends past the left and
right edge of the visible timeline.

Setting the Zoom Level of the Timeline
Depending on how you like to work, there are several methods of zooming into and out of
the Timeline.

- **Using the Vertical Zoom slider**: A pair of sliders at the right of the toolbar let you
  zoom vertically and horizontally. The first one lets you scroll vertically in order to see
  more detail in the height of your waveforms. If no tracks are selected, then zooming
  is centered on the top audio track in the Timeline. If one or more tracks are selected,
  then zooming is centered on the topmost selected audio track.

- **Using the Horizontal Zoom slider**: A pair of sliders at the right of the toolbar let you
  zoom vertically and horizontally. The second one lets you zoom horizontally in order
  to see more detail in the width of your waveforms. Zooming is always centered on the
  position of the playhead.

- **Pressing Command-Equal (=) and Command-Minus (–)**: Command-Equal (also referred
to as Command-Plus) and Command-Minus let you zoom horizontally into the Timeline.
  Zooming is always centered on the position of the playhead.

- **Use Shift-Z to Zoom to Fit**: Command-Z lets you zoom horizontally to fit all clips in your
  program to the available width of the Timeline.

- **Using scroll controls of your pointing device to scroll horizontally**: Holding the Option
  key down and using the scroll wheel (or scroll control) of your pointing device will zoom
  horizontally into the Timeline.

- **Using scroll controls of your pointing device to scroll vertically**: Holding the Shift
  key down and using the scroll wheel (or scroll control) lets you zoom vertically in
  the Timeline. In this case, if no tracks are selected, then zooming is centered on the
  top audio track in the Timeline. If one or more tracks are selected, then zooming is
  centered on the topmost selected audio track.

- **Using the Fairlight panel’s Jog/Edit wheel**: If you have a Fairlight panel, you can hold
  the ZOOM button down while turning the Jog/Edit wheel to zoom into the Timeline at
  the position of the playhead.
Scrolling Through the Timeline

However closely you’re zoomed into the Timeline, if you’re zoomed enough so that clips extend past the visible area of the Timeline, scroll bars appear below. If the playhead is offscreen, a small orange tic mark indicates its position relative to the entire timeline, which is represented by the total width of the scroll bar’s background.

If you drag the playhead, or otherwise use any of the transport controls or playback key shortcuts to move through the Timeline, the contents of the Timeline refresh every time the playhead hits the left or right edge of what’s visible.

Using Flags

Flags are meant to mark an entire clip, and they also flag every other clip in the Timeline that shares the same Media Pool source clip, making this a handy way of quickly identifying which clips in a given timeline come from the same Media Pool source. Flags are visible in every page of DaVinci Resolve, making them an excellent method of tracking media from page to page.

You can apply multiple flags to clips, with a variety of colors to choose from. In addition to flagging specific media files, flags can be useful for sorting by column in the Media Pool, as well as a variety of other operations.

Methods for flagging clips in the Fairlight page:

- To flag a clip: Select one or more clips, and either click the Flag button to flag that clip with the current color, or click the Flag pop-up in the toolbar to choose a different color and then click the Flag button. In the Edit page, flags appear in the Timeline superimposed in the name bar of each clip.
- To remove all flags from a clip: Select one or more clips with flags you want to remove, then click the Flag pop-up in the toolbar, and choose the top “Clear All” option.

Using Markers

Markers are used to call attention to a particular frame within a specific clip. Markers can be individually colored, and can have customized name and note text. Whenever you enter text into a marker, that marker displays a small dot that indicates there’s more information inside of it. Once placed, markers snap to In and Out points, edit points, the playhead, and other markers whenever snapping is enabled, making it easy to use markers to “measure” edits and trims that you make in the Timeline. Markers are visible in every page of DaVinci Resolve, making them an excellent method of tracking frames in clips and specific moments in the Timeline from page to page.

You can add markers to the Timeline (in the Timeline ruler) or to clips. The full procedures for placing and editing markers in the Fairlight page’s onscreen interface are identical to those for the Edit page, so for more information, see Chapter 31, “Marking and Finding Clips in the Timeline.” For now, here’s a summary.
Adding Markers to Clips

The following procedures describe how to add markers to clips in the Timeline of the Media page.

To mark a clip in the Timeline, do one of the following:

- Select one or more clips you want to mark, then move the playhead to the frame of a selected clip in the Timeline, and click the Marker button in the toolbar (or press M) to place a marker at that frame, using the current color (if multiple overlapping clips are selected, you'll add a marker to all clips).
- To place a marker during playback and immediately open the marker dialog to enter a name or note within it, select one or more clips you want to mark, play through the selection until you want to place a mark, then press Command-M. Playback pauses until you enter some text and close the marker dialog again, at which point playback continues.
- Select one or more clips you want to mark, and then click the Marker pop-up to choose a different color, and click the Marker button.

Adding Markers to Timelines

You can also place markers of any color into the Timeline ruler to denote specific times for future reference, or add notes about issues you want to keep track of. You should note that all markers placed on clips or in the Timeline also appear within the Mini-Timeline of the Color page, making it easy to place notes to reference particular audio cues that might be valuable when editing or grading.

To mark the Timeline itself, make sure all clips are deselected, and do one of the following:

- Click the Marker button (or press M) to place a marker of the currently selected color in the Timeline ruler.
- To place a marker during playback and immediately open the marker dialog to enter a name or note within it, select one or more clips you want to mark, then press Command-M. Playback pauses until you enter some text and close the marker dialog again, at which point playback continues.
- Click the Marker pop-up to choose a different color, and click the Marker button.
- Right-click in the Timeline ruler and choose a marker color from the Add Marker submenu of the contextual menu.
Chapter 152

Recording

It's possible to record to one or more tracks on the Fairlight page, accommodating workflows as varied as editors recording scratch voiceover or temp sound effects, recording engineers recording narration, ADR, or foley as part of the audio finishing process, music studios recording orchestras for the music score, or garage bands recording their latest magnum opus. While DaVinci Resolve is a comprehensive post-production environment for cinema and video, the Fairlight page can be used for any audio recording application you might have, from books on tape to live music to feature films and television.

This chapter covers the somewhat brief basics of audio recording in the Fairlight page. Keep in mind that this is a work in progress, and that the comprehensive recording capabilities of earlier versions of Fairlight will be migrating into DaVinci Resolve as time passes.

Setting Up to Record

Depending on how your workstation is set up, it’s possible to simultaneously record to multiple tracks in the Fairlight page at once. How many tracks you can record to depend entirely on what hardware you have available. This section describes the process of recording to tracks in the Fairlight page.

Patching Inputs

Before you can record anything, you need to use the Patch Input/Output window to patch an available audio input to a track. If you’re computer has nothing else, the inputs of your workstation are available to connect whatever audio device is set up as the default audio input on your system to the track you want to record to.

To open the Patch Input/Output window, do one of the following:

• Choose Fairlight > Patch Input/Output.

• Click the Input menu at the top of the channel strip of the track you want to record to, and choose Input.

To patch an audio source to an audio destination:

1 Make sure that the Audio Source menu is set to Audio Inputs, and the Audio Destination menu is set to Track Input.

2 On the right, click the audio input that you want to patch so it’s highlighted.

3 On the left, click the audio destination that you want to patch so it’s highlighted also, if it’s not already. In this simplified example, channel 1 of the Scarlett 2i2 is being connected to Audio 1, which is the only track in the timeline.

4 Click the Patch button at the bottom of the window, and your recording setup will be patched.
5 Continue steps 2 and 3 until you’ve patched all the inputs you want to record from to all of the tracks that you want to record onto. You can patch as many inputs to as many tracks as your system is set up to accommodate. In this example, there are two available audio sources, but there’s only a microphone connected to the first channel, so that’s the only one being connected.

6 When you’re finished, close the window.

**Arming Tracks**

To record on a track, it must be armed. You should note that it’s impossible to arm a track that hasn’t been patched first, so make sure you’ve patched the audio source you want to record from to the track you want to record to first. Then arming that track is as simple as clicking the R button in the track header controls, or in the channel strip for that track in the Mixer.

Once a track has been armed, you’re ready to record.

**Choosing Where to Record Audio Clips To**

The process of recording in the Fairlight page creates new clips and generates additional media on disk. You can specify the location on disk you want to save these recordings by opening the Capture and Playback panel of the Project Settings and using the Browse button, found underneath the “Save clips to” field, to choose a new location (a folder named “Capture” on your scratch disk is the default location).

To choose where the new clips that are created are placed in the Media Pool, simply open the Media Pool and select any bin in the Bin list, or create a new bin and select it if you want to put your recordings in their own location.

**User-Selectable Input Monitoring Options**

The Fairlight > Input Monitor Style submenu presents five options governing how you want to monitor inputs while recording.

- **Input**: You only hear the live signal being input; you never hear the contents of tracks.
- **Auto**: When one or more tracks are armed for recording, you hear the live input signal; on playback you hear the contents of each track.
- **Record**: You only hear the live input signal while actively recording, meaning the Record button has been pressed while one or more tracks are armed for recording. You don’t hear the input signal while tracks are merely armed.
- **Mute**: You hear nothing.
- **Repro**: While recording, you only hear what’s just been recorded, played from the track. In other words, you’re not listening to the live input, but you’re reviewing what’s just been recorded as it’s recording.
Recording Using the Onscreen Controls

You can record anywhere you want on the currently armed track or tracks by placing the playhead where you want recording to begin. In this way, you can record to specific areas of your program as you record voiceover, sound effects, foley, or other timed performances that need to fit into a particular region of the edit.

To begin recording:
1. Position the playhead where you want recording to begin.
2. Click the Record button in the transport controls. Recording immediately begins, and the material being recorded immediately begins drawing a waveform in real time, giving you immediate feedback that the input you’re recording is properly connected or not, as well as where on the currently armed track material is being recorded.

To stop recording, do one of the following:
- Click the Stop button in the transport controls.
- Press the Spacebar.

Recording and Editing Multiple Takes
Using Layering

There are two ways you can record multiple takes. You can either record them one after the other, sequentially, and then edit them later. However, you also have the ability to record multiple takes to the same region of the timeline, one on top of another, while at the same time preserving every take using track layering.

In the following screenshot, multiple takes have been recorded over the same section of the timeline, including some partial takes to correct specific phrases in the voiceover being recorded. When you do this, the result looks like a series of cuts and overwritten clips, with the most recently recorded segments being the ones that play back over the previously recorded segments.

Overlapping recordings with Audio Track Layers turned off

However, if you choose View > Audio Track Layers, you’ll see that all your recordings have actually been preserved via a vertical stack of overlapping audio clips.
The layering of audio clips in DaVinci Resolve means that the topmost superimposed clips in a layered stack like this mutes the audio of overlapping clips that are lower in the stack.

Using layering, it’s easy to edit the best segments of the best takes, while preserving all other takes, simply by adding edits and rearranging clips in the stack so the best parts are on top.

For more information about audio layering, see Chapter 148, “Editing Basics in the Fairlight Page.”

**Recording VSTi Instruments**

DaVinci Resolve 15 introduced support for VSTi instruments working with connected MIDI controllers to trigger instrument sounds that can be recorded live on audio tracks of the Timeline. This is intended to be used for loading a VSTi sampler with foley sounds such as footsteps or punches, so you can perform these sounds in real time and record the result to another track as you watch performers walking or punching in the edit, even if you lack a recording booth with foley pits and props.

On the other hand, if you’re a musician, there’s nothing stopping you from loading VSTi musical instruments of different kinds for playback, and using the Fairlight page as a multi-track recorder. DaVinci Resolve doesn’t have MIDI sequencing functionality, but you can record live playback straight to the Timeline, using layered audio to manage multiple takes for later re-editing. Bet you never thought you’d be recording music in DaVinci Resolve...
To enable a MIDI controller in macOS:

1. If DaVinci Resolve is running, quit before connecting your MIDI controller and setting it up.

2. On macOS you’ll use the Audio Midi Setup utility to choose output hardware and select a speaker configuration to be made available on your system. In the Finder, use Spotlight and search for Audio Midi Setup to open it.

3. In Audio MIDI Setup, choose Window > Show MIDI Studio. A window showing icons for all connected MIDI controllers appears. Your controller should be showing an icon. If it’s not, you may need to install drivers for it.

4. Select the icon for your controller and turn on the “Enter test MIDI setup mode” button (it looks like a little keyboard) to test if your keyboard is connecting with the computer. If it is, then turn this off.

For more information on setting up MIDI on different systems, see the DaVinci Resolve Configuration Guide, available on the web from the Blackmagic Design support page at https://www.blackmagicdesign.com/support/family/davinci-resolve-and-fusion.

To set up the Fairlight page for VSTi instrument recording using a sampler:

1. Open DaVinci Resolve 15.

2. Make sure you have at least two available audio tracks in the Timeline, one for the instrument you’ll be playing, and one to record into. This example will use tracks A4 and A5 for this.

3. Open the Effects Library, find a VSTi sampler you have installed on your system, and drag it to the track header of the track you want to use for playing, for example track A4.

   Massively-featured sampler/synth combinations such as Native Instruments Kontakt and Steinberg Halion are ubiquitous and useful when you want to specifically map a collection of sound effects to specific keys or pads to create re-usable multi-purpose instruments. However, more streamlined samplers that emphasize automatic audio clip slicing such as Serato Sample (Windows and macOS) or Image Line Slicex (Windows only) can make short work of the more specialized task of loading library sound effects recordings (or custom recordings you create) with multiple footsteps, punches, keyboard presses, cloth rustles, or other foley activities, and quickly splitting them up into individually playable samples you can trigger with pads or a keyboard.

4. When the VSTi interface window appears, open the MIDI menu at the upper right-hand corner of the VSTi window and choose the correct MIDI channel from your MIDI controller’s submenu. If you’ve selected the correct MIDI channel, the instrument should start responding to the keys or pads on your controller.
Next, configure the VSTi instrument you’re using to play the sound effects you want to use for foley. In this example, the Serato Sample VSTi plug-in is being used to automatically slice up a recording of footsteps from one of Sound Ideas’ many sound effects libraries.

Because the VSTi you added is patched to that track’s Insert (if you look at the Mixer you should see that the I button is enabled on the channel strip the instrument is patched to), the Send is PRE the Instrument. This means you need to patch that track’s Track Direct output to the input of another track to record the instrument.

Choose Fairlight > Patch Input/Output to open the Patch Input/Output window, then set the Source pop-up menu to Track Direct and the Destination pop-up menu to Track Input. Click Audio 4 to the left, and Audio 5 to the right, and click the Patch button; this sets you up to play the VSTi plug-in on track A4, and record its output on track A5.

Be aware that after patching Track Direct from the track with the instrument to the track you’re recording onto, you also need to turn “Direct Output” on for that track in the Path Settings of that track’s channel strip in the Mixer.

Open the Mixer (if necessary), click the Input pop-up menu at the top of the channel strip that shows the VSTi instrument you’re using, and choose Path Settings. When the Path Settings window appears, click the ON button for Direct Output, then close the Path Settings window.

At this point, you’re ready to begin recording.

To play and record a VSTi instrument:

1. Click the Record Arming button of the track you’re recording to (in this example A5), move the playhead to where you want to begin recording, and then click the Record button to begin recording.

2. As the video of your program plays, use your MIDI controller to trigger sound effects as necessary. When you’re finished, click the Stop button.

If necessary, you can record multiple takes using track layering until you get the timing right. When you’re finished, you can remove the instrument from the track it’s on since the recorded audio is all you need.
Chapter 153

ADR
(Automated Dialog Replacement)

The Fairlight page of DaVinci Resolve has a sophisticated interface for doing ADR, or automated dialog replacement, in a structured and straightforward manner. Simple, yet powerful, the ADR panel incorporates Cue list management, industry-standard audio beeps and visual cues, and sophisticated take management with star ratings and layered take organization to create and manage the re-recording of dialog in any program. With this sophisticated organization and layering, it’s easy to edit together the best parts of each take into your program.

ADR (Automated Dialog Replacement)

Clicking the ADR button on the Interface toolbar opens up the celebrated Fairlight ADR panel, which provides a thoroughly professional workflow for doing automated dialog replacement. Dialog replacement, for those who don’t know, is the process whereby audio professionals bring in actors to re-record unsalvageably bad dialog recordings from the comfort of their recording studios, line by line and with a great deal of patience.

The ADR panel on the Fairlight page

It’s an old joke that ADR isn’t really automatic, but the Fairlight page aims to give you all the help it can to make this a structured and straightforward process. Simple, but powerful, Cue list management lets you efficiently assemble a re-recording plan. Industry-standard audio beeps and visual cues via your BMD video output device help the actors in the booth nail their timings and their lines. Then, sophisticated take management with star ratings and layered take organization in the Timeline help you manage the resulting recordings to pick and choose the best parts of each take when you edit the results.

The ADR Interface

When open, the ADR interface consists of three panels to the left of the Timeline: a Record panel, a List panel, and a Setup panel. The controls of these panels are described in the order in which they’re used.

The Setup Panel

As its name implies, the Setup panel is where you configure your ADR session.
This panel presents the following controls:

- **Pre Roll and Post Roll**: Specifies how many seconds to play before and after each cue's specified In and Out points, giving actors a chance to listen to what comes before and after each cue in order to prepare. If you enable the Beep options below, beeps provide a countdown during the specified pre-roll.

- **Record Source**: (Disabled until you select a Record Track) A drop-down menu lets you choose the input you want to record from, creating a patch to the Record Track.

- **Record Track**: A drop-down menu lets you choose the track you want to record to. Selecting a track with this menu creates a patch from the Record Source to the Record Track, and automatically toggles Record Enable on.

- **Guide Track**: A drop-down menu lets you choose which track the original production audio you need to re-record is on. This is used for sending audio playback to the talent to use as a guide for recording their own replacement performance.

- **Record File Name**: A text entry field that lets you provide a name for the audio files being recorded to be saved with.

- **Character Setup**: A list for adding the names of all the characters that have dialog cues you'll be re-recording, to help with cue creation and management. An Add New button lets you add additional names to this list, while a Remove button lets you delete characters you no longer need.

- **Beep to In Point**: Enables a three-beep sequence to be heard leading up to the recording. For beeps to be audible, the Beeps channel of the System Generator is a source that must be patched to your audio outputs using the Patch Input/Output window.

- **Beep at In Point**: Enables one last beep at the In point. For beeps to be audible, the Beeps channel of the System Generator is a source that must be patched to your audio outputs using the Patch Input/Output window.

- **Count In**: An onscreen counter that counts down to the start of the cue.

- **Video Streamer**: A visual cue for the talent to watch during pre-roll to ready them for recording. A pair of vertical lines superimposed over the program being output to video move towards one another across your video output screen during the pre-roll to the cue. This gives the talent a visual indication of the time remaining until they should begin talking. When the beeps play, these lines get taller. Both lines come together at the Time In frame, at which point a cross shows that recording is beginning.

- **Smart Timeline**: When turned on, this option automatically moves the playhead to each cue as it's selected in the Cue list, and zooms in to frame the duration of that cue in the Timeline.

- **Mixing Control**: Enables automated switching of audio playback, to independently control what the talent and the audio engineer hear at various stages of the ADR recording process. For example, with this enabled, the Guide track is not routed to the Control room while the engineer is reviewing a take.
The List Panel

This is where you create a list of cues you need to re-record, either from within the Fairlight page, or imported from a .csv file that someone provides you.

[Image of the List Panel in ADR interface]

This panel presents the following controls:

- **Cue editing controls**: Displays the data for the currently selected cue (or a cue that was just created). In and Out timecode fields store the Timeline In and Out points that were set when the cue was created but can be manually edited for fine tuning. A Character drop-down menu lets you choose which character that line of dialog belongs to. A text entry field lets you enter the dialog cue that’s to be re-recorded, so you and the talent can both refer to it.

- **New Cue button**: Clicking this button adds a new cue to the list using whatever In and Out points have been set in the Timeline, and whatever character was last selected.

- **Cue list**: The list of all cues that have been entered or imported. The Cue list can be filtered using the Filter drop-down menu at the top-right of the ADR panel (next to the option menu). You can choose to show the cues for all characters, or for any selected combination of characters. You can also choose to hide all cues that are marked as done to experience the joy of this list shrinking more and more the closer you are to being finished.

Additionally, the ADR interface option menu has three commands pertaining to the List panel:

- **Import Cue List**: Lets you import a properly formatted .csv file to create cues that have been prepared in a spreadsheet. Correct formatting for cue lists you want to import is no headers, one line per cue, with four individual columns for In timecode, Out timecode, Character Name, and Dialog.

- **Export Cue List**: Lets you export the contents of the Cue list to a .csv file, for exchange or safe-keeping.

- **Clear Cue List**: Deletes all cues in the Cue list. It’s recommended you export a copy of your Cue list before eliminating it completely, in case you ever need to revisit a cue.
The Record Panel

This is where you actually run the ADR recording session you’ve set up, using the dialog cues you’ve put into the Cue list.

This panel presents the following controls:

- **Record and rehearse controls:** Four transport controls and two buttons let you control recording during ADR sessions. These controls are only clickable when you’ve selected a cue from the Cue list to record.
  - **Rehearse:** Runs the section of the Timeline specified by a cue without actually recording anything, giving the talent an opportunity to run through their dialog and practice their timing and delivery. Beeps and on-screen streamers are not played during a rehearsal.
  - **Play:** Plays the currently selected take from the Take list (described below). If no take is selected, the most recently recorded one on top is played.
  - **Stop:** Immediately stops rehearsal, playback, or recording.
  - **Record:** Initiates recording of the cue to the specified audio track, with cue beeps and video streamer cues.
  - **Keep Playing:** At the end of a take you may wish to keep playing, so the talent can hear the next section of the track. Pressing the Keep Playing button at any time, even while recording, results in post roll being ignored and normal playback resuming after the cue’s Out time.
  - **Keep Recording:** At the end of a take you may wish to keep recording until you manually stop. Pressing the Keep Recording button at any time, even while recording, results in the Out point of the current cue being ignored and recording continuing until you stop it.

- **Take list:** The Take list shows every take you’ve recorded for the current cue, with take number, name, and a five-star rating that you can set to keep track of which takes worked and which didn’t. Earlier takes are at the bottom of this list, while recent takes are at the top (the same order in which the corresponding layered audio clips appear in the Timeline track they’ve been recorded to).
• **Cue list:** The list of all cues that have been entered or imported. The Cue list can be filtered using the Filter drop-down menu at the top-right of the ADR panel (next to the Option menu). You can choose to show the cues for all characters, or for any selected combination of characters. You can also choose to hide all cues that are marked as done to experience the joy of this list shrinking more and more the closer you are to being finished.

• **Cue list Done column:** A sixth column appears in the Record panel only, labeled Done. It contains check boxes for each cue that you can turn on to keep track of which cues you’ve successfully finished.

Additionally, the ADR interface Option menu has one command pertaining to the Record panel:

• **Record Early In:** Enables recording during pre-roll, in the event you’re working with talent that likes to start early.

### Setting up to Do an ADR Session

Setting up to record ADR is straightforward but requires a few steps.

**Creating tracks in preparation to record ADR:**

1. In the Timeline, create a new audio track to which you’ll be doing ADR recording. Make sure it has the correct channel configuration for your recording (mono is typical for dialog).

2. If you’re recording ADR to your main timeline, you may want to Solo both the Guide track and the Record track, so you and the talent can focus on the audio being re-recorded without hearing all the other tracks of the current mix.

Now you’re ready to configure the Setup panel.

**Configuring the Setup panel:**

1. Open the ADR interface, and then open the Setup panel.

2. Choose the Pre Roll and Post Roll you want to use, in seconds. A pre roll of at least 3 seconds is recommended to give the talent time to get ready.

3. From the Record Source drop-down menu, choose the microphone you patched earlier.

4. From the Record Track drop-down menu, choose the Record track you created.

5. From the Guide Track drop-down menu, choose the track with the original production audio that you’re replacing.

6. At the bottom of this panel, turn on which Preroll Cue options you and the talent want to use as you record each cue. Options include:
   a. Beep to In Point and Beep at In Point provide an audible count down to when to start performing.
   b. An animated Video Streamer gives a countdown to the start time, shows the duration of the cue being recorded, and also displays the text of the dialog for that cue on screen for the actor to refer to, so they can keep their eyes on the screen and not a script.

7. Next, if you’ve enabled Beep to In Point and Beep at In Point, you need to patch the Fairlight oscillator to your output channels so the talent can hear the preview beeps.
Patching the Oscillator to play beeps over your audio output:

1. Choose Fairlight > Patch Input/Output to open the Patch Input/Output window.
2. Choose System Generator from the Source drop-down menu, and click to select Beeps.
3. Choose Audio Outputs from the Destination drop-down, and choose the left/right outputs you want these preview beeps to play out of. You can drag a bounding box to select multiple outputs, thereby connecting the mono Beeps input to stereo output for comfortable listening.
4. Click Patch to make the connection, then close the Patch Input/Output window.

Creating and Importing ADR Cue Lists

You must have a list of cues to be able to use the ADR interface properly. There are two ways you can create a Cue list to record with, make one from scratch on the Fairlight page, or import one. The ADR panel accommodates both workflows.

Manually Creating an ADR Cue List

If you’ve been doing all of your dialog editing inside of DaVinci Resolve, you can go ahead and create a list by marking the sections of the Timeline you need to re-record and creating cues from those timings. To create cues properly, you should start by adding the names of each character you’ll be creating a cue for in the Setup panel. These names make it easier to enter cues and will help you to filter and sort the list as necessary later on.

To add character names before entering cues:

1. Open the Setup panel of the ADR interface.
2. Click Add New.
3. When a selected entry appears in the Character Setup list, type a name.
4. Press Return when you’re done.

To edit the Character Setup list, do one of the following:

- If you mis-spell a name, you can double-click any name in this list to edit it.
- To delete a name, you can select it and click Remove to eliminate it.

Once you’ve created a complete set of character names, you can begin creating your Cue list.

To manually add cues to the Cue list:

1. Open the List panel of the ADR interface. This is where all the controls for creating and editing cues are.
2. In the Timeline, set In and Out points to mark the section of dialog you want to turn into a cue. Those timecode values appear in the Cue Editing section of the List panel.
3. Click New Cue to add a blank cue to the Cue list.
4. In the Cue Editing section, choose the character who’s speaking that cue from the Character drop-down (only names that have been entered in the Setup tab appear in this list).
5 If necessary, select the text field below, and type the dialog that needs to be re-recorded.

6 Repeat steps 2 through 5 until you’re finished creating all the cues you intend to re-record. If you need to edit any cue, simply click to select that cue, and edit it in the Cue Editing section above.

**Importing Cues**

If you or an assistant has already created a Cue list using a spreadsheet with separate columns for character names, dialog, and In/Out timecode values, then you can also create a Cue list by importing this data from an exported .csv file.

**To import a .csv file to the Cue list:**

1 Choose Import Cue List from the ADR option menu, then use the dialog to choose the .csv file containing the Cue list you were given, and click Open.

2 An ADR Setup dialog appears, showing the data from the .csv file previewed as a series of columns. This lets you see if each column of incoming data is being assigned correctly. If it’s not, you can reassign each column of the incoming data to the correct column of the ADR panel.

   Correct formatting for Cue lists you want to import is to have no header text, and to enter information using one row per cue, with four individual columns for In timecode, Out timecode, Character Name, and Dialog. If any of these columns are transposed, you can correct this by choosing the correct data type for each column from the drop-down menus at top.

3 Click Import CSV. The cues should appear in the Cue list.

**To export a .csv file from the Cue list:**

- Choose Export Cue List from the ADR option menu, choose a location to save the file, and click Save.
Recording ADR to the Timeline

Once you’ve configured your workstation for recording, and you’ve set up a Cue list to work with, it’s time to start recording each cue.

To record a cue from the Cue list:

1. Open the Record panel of the ADR interface.

2. If you want to record a particular character’s cues, you can select each unnecessary character in the ADR Option menu to uncheck that character, hiding their dialog in the Cue list.

3. With the list showing the character cues you need, select the cue you want to start recording. That cue contains the timecode necessary to determine which part of the Timeline to record to, and the playhead automatically moves to that part of the Timeline.

4. Click the Rehearse button a few times to run through the cue with the talent. When you click Rehearse, both audio and video corresponding to that cue will play, including pre roll and post roll, along with all beep and onscreen cues.

5. When the talent is ready to try a take, click the Record button, and let the Fairlight page do the work of playing through pre roll with beep notifications and visual streamer cues, initiating recording, and then stopping recording automatically once the cue is done. To record another take, simply click the Record button again.

   Every time you complete a recording, a take appears in the Take list. Making multiple recordings results in multiple takes in the list. In the Timeline, all new takes appear as layered audio, so you can record as many takes as you like into the same area of the Timeline. Once you’ve finished recording takes, you’ll have a neatly organized stack of alternate takes to draw upon as you edit together the best parts of each recording.

6. If you or the talent want to hear a particular take again, select it in the Take list and click Play. You can use the 5-star ratings control to keep track of how you liked each take.

7. When you’re finished recording a cue, click the Done checkbox for that cue, and select the next cue you want to record. When you’re finished re-recording dialog, simply close the ADR interface.
You can use the Fairlight page to refine the editing of audio that was initially assembled in the Edit page, or you can use the Fairlight page to both record and edit audio programs from scratch. Because audio clips have properties that video clips do not, audio editing encompasses additional procedures that are not available in the Edit page. This chapter takes you through the fundamental steps of editing audio the Fairlight way.

Compatible Audio Formats

DaVinci Resolve is compatible with WAVE, Broadcast WAVE, AIFF, MP3, AAC (M4A), CAF (macOS only), both MTS and QuickTime containers that use the AC3 audio format, and Enhanced AC-3 (macOS and Windows only). DaVinci Resolve is compatible with audio at sample rates including 32, 44.1, 48, 88.2, 96, and 192 kHz.

Editing Audio Clips Into the Timeline

The Fairlight page offers a complete audio editing environment that lets you either record and assemble clips from scratch, or refine tracks full of audio clips that have been edited together in different ways. There are four ways of adding media to the Timeline in the Fairlight page, depending on the type of work you do:

- Recording new audio into one or more tracks (for more information, see Chapter 152, “Recording”)
- By dragging and dropping new audio clips from the Media Pool into the Fairlight timeline
- By editing audio clips into audio tracks on the Edit page
- By importing a project with audio clips

However audio clips come to be in your timeline, the rest of this chapter covers the myriad methods available to edit and sweeten the contents.

Overwriting Vs. Layering Clips That Overlap

When you add clips to the Timeline, what happens when you add a clip that overlaps another clip that’s already in the track you’re editing to depends on the Timeline > Layered Audio Editing setting. By default, with Layered Audio Editing turned off, overwriting one audio clip with another results in the overlapping part of the overwritten clip being non-destructively deleted from the Timeline by the incoming clip.

However, if you turn Layered Audio Editing on, then incoming clips do not overwrite overlapping clips in the Timeline; instead, they’re layered within that track, such that the incoming audio clip takes precedence over what was previously there, but overlapping audio segments that were previously in the Timeline are preserved, which can be seen when you choose View > Show Audio Track Layers.

In this way, you can choose whether you want to overwrite previously edited clips, or layer newly edited clips, as your needs require, regardless of whether or not Audio Track Layers are visible. Audio layering can be enabled in both the Edit and Fairlight pages.

For more information about audio layering, see the section later in this chapter.

Choosing Parts of Clips to Edit in the Media Pool

The Media Pool has a preview player at the top that provides a place to open selected source clips in the Media Pool, play them, add marks to log them, and set In and Out points in preparation for editing them into the Timeline via drag and drop. The Media Pool Preview Player effectively acts as a Source monitor for editing in the Fairlight page.
The preview player in the Media Pool

- Various viewing controls populate the title bar at the top. A drop-down menu at the upper left lets you choose a zoom level for the audio waveform that’s displayed. To the right of that, a Timecode window shows you the duration of the clip or the duration that’s marked with In and Out points. Next to the right, a real-time performance indicator shows you playback performance. In the center, the title of the currently selected clip is shown, with a drop-down menu to the right that shows you the most recent 10 clips you’ve browsed. To the far left, a Timecode field shows you the current position of the playhead (right-clicking this opens a contextual menu with options to change the timecode that’s displayed, and to copy and paste timecode).

- The center of the Media Pool Preview Player shows you the waveforms in all channels of the currently selected clip, at whatever zoom level is currently selected.

- Transport controls at the bottom consist of a jog bar for scrubbing, Stop, Play, and Loop buttons, and In and Out buttons.

Dragging Audio Clips Into the Timeline

You can show the Media Pool in the Fairlight page, and edit audio clips into the Timeline in their entirety by dragging and dropping individual clips onto whichever audio track you want them to appear. You can drag any clip onto any track, regardless of whether or not the channels of the clip match the channel mapping of the track. However, if you edit a clip with more channels than a track has (for example, editing a stereo clip onto a mono track), only the channels supported by that track will be output, with all other channels in that clip being muted. If this happens, you can always remap the audio track by right-clicking the track header and choosing a new mapping from the Change Track Type To submenu.

**TIP:** Dragging one or more clips to the empty area underneath the existing audio tracks of the Timeline results in the creation of new tracks, each of which is automatically mapped to however many channels are required by each audio clip being edited.

If you want to edit several clips into the Timeline at once by dragging them from the Media Pool, you’ll probably want to do a bit of preparation to make sure they’re edited in the right order.
Dragging several clips into the Timeline as one contiguous series of edited clips:

1. Change the sort order of the Media Pool’s browser area to put the clips into the order in which you want them to appear. In Thumbnail view you can use the Sort Order menu, but in List view you can click the header of any metadata column to sort by that column’s data.

   ![Using the Sort Order menu to change the sort order of clips in the Media Pool]

2. Use the Media Pool thumbnails, the Media Pool List view Filmstrip, or the Source Viewer to set In and Out points to define the part of each clip that you want to edit into the Timeline.

3. Select the Media Pool clips you want to edit into the Timeline by dragging a bounding box, Command-dragging multiple bounding boxes over different sets of clips, by Shift-clicking a range of clips, or by Command-clicking individual non-contiguous clips.

4. Drag any of the selected clips to the desired position in the Timeline to perform an overwrite edit.

   The clip(s) you drag overwrite whatever other clips they overlap in the Timeline. Multiple clips dragged from the Media Pool will be edited in the order in which they’re sorted in the Media Pool, using each clip’s In and Out points.

It’s possible to edit audio clips into the Timeline so that each clip’s timecode lines up with the Timeline Ruler. This can be useful if you’re organizing multiple source audio recordings that you want to synchronize together on multiple tracks.

Dragging multiple clips to edit them into a track at their timecode positions:

1. Select the Media Pool clips you want to edit into the Timeline by dragging a bounding box, Command-dragging multiple bounding boxes over different sets of clips, by Shift-clicking a range of clips, or by Command-clicking individual non-contiguous clips.

2. Hold Command-Shift down, and drag the selected clips into the track you want them to appear, to perform an overwrite edit.

Each clip edited into that track appears at the same timecode position as its embedded timecode. This means that if you were recording time-of-day timecode, each clip will appear on the Timeline at the time it was recorded. A series of clips recorded during hour 10 through 13 will appear distributed throughout hours 10-13 on your timeline.
You can also edit two or more audio clips into the Timeline as a stack, in preparation for layering multiple sound effects for doing sound design work.

**Dragging multiple clips to edit them into a track as a parallel stack:**

1. Select the Media Pool clips you want to edit into the Timeline by dragging a bounding box, Command-dragging multiple bounding boxes over different sets of clips, by Shift-clicking a range of clips, or by Command-clicking individual non-contiguous clips.

2. Command-drag the selected clips into a track of the Timeline. The first of the selected clips appears in the track you’re dragging to, the other clips appear either in audio tracks underneath the first one, or if there are no audio tracks available, in new audio tracks that will be created to hold those clips.

All clips you’ve edited appear as a parallel stack, in separate tracks, one on top of another.

**Support for Mixed Audio Track Formats from Source Clips**

As of DaVinci Resolve 15, there is support for media with multiple audio tracks that have differently formatted channels embedded within them. For example, a clip with one stereo track, one 5.1 surround track, and six mono tracks can all be appropriately set up in the Audio panel of Clip Attributes after that clip has been imported.

The Audio panel of Clip Attributes now has controls over what format (Mono, Stereo, 5.1, 7.1, Adaptive) the channels embedded within a particular audio track should be configured as. This means you can set up clips with multiple tracks, each one using different formats of audio employing different combinations of channels, which is useful for setting up imported audio mix files that you want to output when mastering a program.
Making Audio Clip Selections in the Timeline

Nearly every editing operation described in this chapter and others requires you to make a selection to define which clips will be affected. Three editing modes in the toolbar give you different ways of selecting clips, depending on what you’re trying to do, and how you like to work. These are (from left to right) the Selection mode, the Range mode, and the Edit Selection mode. Which mode you choose determines how clips and clip segments are selected in the Timeline in preparation for all manner of editorial operations.

The Selection and Range Selection tools seen in the toolbar

Why Are There Three Edit Modes?

While the Selection and Range modes can also be used with the pointer, they’re really designed to enable automatic selections based on the position of the playhead. This is accomplished when using either the Fairlight Editing console or keyboard shortcuts to control Timeline transport, while specific tracks are selected to enable selection and editing on those tracks.

The Edit Selection mode is designed for efficient selections made using the pointer via a mouse, trackpad, or pen and tablet, made in conjunction with a variety of commands for extending and editing selections triggered via keyboard shortcuts. If you’re editing with a keyboard and mouse, this mode is designed to let you work quickly by enabling a variety of different selection functions based on clicking different parts of clips.

Selecting Tracks

In order to understand clip selection, you must first understand track selection. The Timeline on the Fairlight page lets you select entire tracks to facilitate the automatic selection of clips that intersect the playhead on those tracks using keyboard shortcuts or the Fairlight Editing panel, in Selection and Range Selection modes (described in upcoming sections).

For example, were you to select tracks A2, A3, and A4, then moving the playhead to intersect two clips on those tracks in Selection mode automatically selects them, so they’re ready for any operation you want to perform on both clips. To give a few examples, you could now split both clips at the playhead, Cut Head or Tail to the playhead, Delete both clips, or Copy them in preparation for pasting elsewhere.
Command-clicking multiple track headers selects those tracks

Additionally, there are times when clicking or dragging on one or more clips with the pointer results in both those clips being selected, along with the tracks on which they sit. For example, selecting clips using the Edit Selection mode will also select the tracks those clips are on.

**TIP:** Selecting tracks in the Fairlight page is analogous to using the Auto Select controls in the Edit page Timeline, which define which clips on which tracks will be automatically selected whenever you set In and Out points in the Timeline.

If you’re manually selecting tracks using the pointer, there are different ways to do so.

**Methods of selecting and deselecting tracks in the Fairlight page Timeline:**

- **To select a single track:** Click anywhere in the background or on the track number of that track’s header (not on a button). In Range Selection mode you can also click in any unused area of the track itself.

- **To deselect a single track:** Click anywhere in the background or on the track number of a previously selected track’s header (not on a button). In Range Selection mode you can also click in any unused area of the track itself. If multiple tracks are selected, Command-clicking one will remove just that track from the selection.

- **To select multiple tracks:** Command-click in the track header background of every track you want to select. In Range Selection mode you can also Command-click in any unused area of the tracks themselves. Command-clicking an already selected track will deselect it.

- **To select multiple continuous tracks:** Click anywhere in the background or on the track number of a track header, and then drag a bounding box up or down over all other tracks you want to select. In Range Selection mode you can also drag a bounding box over any part of the tracks themselves, while also defining a range in which you want to work.

- **To move the selection to higher or lower tracks:** Press Control-Option-Up Arrow or Down Arrow to move the selection state to the next track higher (Control-Option-Up Arrow) or lower (Control-Option-Down Arrow). If multiple tracks are selected, then the multi-selection will be moved as a block; for example, selecting tracks A2 and A3 and then pressing Control-Option-Down Arrow will result in tracks A3 and A4 being selected.
Using Selection Mode

Selection mode uses the position of the playhead to make automatic selections when using the Fairlight Editing console or keyboard shortcuts to make clip selections on selected tracks. However, you can also use this mode in conjunction with the pointer and keyboard shortcuts to make selections in a different style. Selection mode is primarily intended to allow efficient editing of whole clips.

- **If no tracks have been selected:** Clips that intersect the playhead are not selected. You can use the pointer to select one or more clips by clicking, Command-clicking, or dragging a bounding box. Clips you select in this way are highlighted in orange. Making selections in this way is similar to making clip selections in the Timeline of the Edit page.

- **If tracks have been selected:** All clips that intersect the playhead on selected tracks will be automatically selected in gray, but no In and Out points will be set. Clips on de-selected tracks will be ignored. Selecting one or more clips with the pointer (by Command-clicking or dragging a bounding box) creates an orange-highlighted selection that overrides the gray automatic selection.

- **If you set In and Out points:** Some functions will affect ranges of clips between In and Out points on selected tracks. Clips on unselected tracks are ignored.

To choose Selection mode:

- Click the Selection tool (the arrow) in the toolbar.
- Choose Trim > Selection Mode.
- Press A.

To automatically select clips using the playhead position in Selection mode:

1. Press A to enter Selection mode.
2. Select one or more tracks with clips you want to select.
3. Move the playhead to intersect those clips.

All clips that intersect the playhead on selected tracks of the Timeline are automatically selected in their entirety. Automatic selections are gray. Intersecting clips on unselected tracks are not selected.
Methods of selecting clips using the pointer in Selection mode:

- Click any clip to select it.
- Command-click multiple clips to select them all at once.
- Click anywhere in the background of the Timeline and drag a bounding box over multiple clips.

Using Range Selection Mode

Range Selection mode also uses the position of the playhead to make selections of a partial range of clips in the Timeline when using the Fairlight Editing console or keyboard shortcuts. You can also use this mode in conjunction with the pointer and keyboard shortcuts to make partial selections of clips.

- If no tracks have been selected: Clips that intersect the playhead are not selected. You can use the pointer to click a clip and select it in its entirety along with the track it’s on. You can also use the pointer to drag on one or more clips to select a partial range in preparation for different editing operations. Whenever you make a selection with the pointer, Timeline In and Out points are set to the boundaries of the selection.
- If tracks have been selected: Any clip on a selected track that intersects the playhead will be automatically highlighted in gray. Clips on de-selected tracks will be ignored. Dragging a crosshairs over one one or more clips with the pointer overrides all automatic selections and selects the regions of the clips you drag over, and the tracks they’re on.
If you set In and Out points: Partial regions of all clips on all selected tracks between the In and Out points will be highlighted in gray. Clips on unselected tracks are ignored. While In and Out points are set, the playhead no longer makes automatic selections; you must set new In and Out points to modify the selection in this mode.

To choose Range Selection mode:
- Click the Range Selection tool (the crosshairs) in the toolbar.
- Choose Trim > Range Selection Mode.
- Press R.

To automatically select clips in Range Selection mode using the playhead position:
1. Press R to enter Range Selection mode.
2. Select whichever tracks have clips you want to select.
3. Move the playhead to intersect those clips.

All clips that intersect the playhead, on the tracks you selected, define a selected range from the beginning of the first selected clip to the end of the last selected clip.

To create custom clip ranges using In and Out points in the Timeline:
1. Press R to enter Range Selection mode.
2. Select whichever tracks have clips you want to select.
3. Move the playhead and press the I (Mark In) and O (Mark Out) keys to define a range in the Timeline.
   All clip segments that fall within the range of your In and Out points on selected tracks will be selected.
Methods of selecting clips in Range Selection mode via clicking and dragging:

- **To select a single clip:** Click any clip to select both it and the track it's on, and define a range in the Timeline that matches the duration of that clip.

- **To select multiple clips:** Command-clicking multiple clips to select them all at once defines a range in the Timeline that matches the total overlapping duration of all clips in the selection, from the beginning of the first selected clip to the end of the last selected clip.
**Range selection by Command-clicking multiple clips**

- **To drag to select a range within a single clip:** With the Range Selection tool selected, drag anywhere on top of a clip to drag a bounding box over whatever segment of that clip (or of one or more clips) to select both that clip segment and the track it appears on. This is a good way of selecting part of a recording you want to move or delete.

- **To drag to select a range within multiple clips:** Click and drag a bounding box over whatever segment of one or more clips you want to select to select both those clip segments and the tracks they appear on. Or, Command-click and drag anywhere on top of any clip to drag a bounding box over whatever region of clips and tracks you like.
In Range Selection mode, whenever you make a selection, the In and Out point fields update with the range that you’ve created.

These ranges can be cleared if necessary.

**Methods of clearing In and Out points to clear the current range:**
- Press Option-I to clear the current In point.
- Press Option-O to clear the current Out point.
- Press Option-X to clear both the In and Out points.

**Using Edit Selection Mode**

Edit Selection mode is designed for making efficient pointer-based selections and edits, in conjunction with an assortment of commands for extending and editing selections that can be triggered via customizable keyboard shortcuts. If you’re editing with a mouse and keyboard, this mode is designed to let you work quickly by enabling a variety of different functions based on clicking different parts of each clip in the Timeline.

Additionally, an important aspect of working in Edit Selection mode is that this is the only mode that lets you edit the Timeline during playback, which you can’t do in Selection and Range modes.

- **If no tracks have been selected:** Whenever you make a selection with the hand, Timeline In and Out points are set to the boundaries of the selection. Whenever you make a selection with the crosshairs, Timeline In and Out points are set to the boundaries of the region you dragged. In all cases, the tracks that contain selected clips and regions of clips are also selected.
• **If tracks have been selected**: Any clip on a selected track that intersects the playhead will be automatically highlighted in gray. Clips on de-selected tracks will be ignored. Dragging a crosshairs over one or more clips with the pointer overrides all automatic selections and selects the regions of the clips you drag over, and the tracks they’re on.

• **If In and Out points have been set**: Clicking the bottom half of clips in the Timeline will select that clip and track, and the In and Out points will change to encompass that clip.

**To choose Range Selection mode:**
- Click the Edit Selection tool (the crosshairs at the bottom of a track) in the toolbar.
- Choose Trim > Edit Selection Mode.
- This mode has no keyboard shortcut at this time.

**To select an entire clip using the hand tool of the Edit Selection mode:**
- Move the pointer to the bottom half of a clip until a hand cursor appears, and click once to select that clip in its entirety.

**To select a range using the crosshairs tool of the Edit Selection mode:**
- Move the pointer to the top half of a clip until a cross-hairs cursor appears, and drag to select a region of one or more clips. As you drag, the playhead follows the Out point.
Using the crosshairs, you can also Command-click to expand or contract the selected region across one or more clips.

Using the crosshairs, you can also double-click to select an entire clip.

**To select a single frame using the Crosshairs tool of the Edit Selection mode:**

- Move the pointer to the top half of a clip until a cross-hairs cursor appears, and click once to place a point selection at the frame you clicked. The playhead also moves to this frame.

**To move a selection using the Hand tool of the Edit Selection mode:**

- Once you’ve made a selection of one or more clips or regions using the Hand or Crosshairs tool of the Edit Selection mode, you can move the pointer to the bottom half of any selected clip and drag the selection to another position on the Timeline.
Commands For Editing and Extending the Selection

Once you’ve made one or more selections in the Timeline, there are a series of commands you can use to modify or expand the selection. These commands were designed to be used alongside the Edit Selection mode, but they can be used in any mode.

Editing the Selection

There are six commands for changing the current selection, moving it from one clip or group of clips in the Timeline to another. These commands only move the range of clips/frames that are selected: they do not move the clips themselves. These commands are found within the Timeline contextual menu when you right-click on a clip.

- **Move To Previous/Next Edit**: Moves the current selection to the next clip/edit point to the left or right in the Timeline.
- **Move To Previous/Next Track**: Moves the current selection to the next track up or down in the Timeline.
- **Move to Previous/Next Frame**: Nudges the current selection to the left or right in the Timeline.

Extend Edit Selection

There are four commands for expanding the range of what’s selected in the Timeline, one clip or track at a time. These commands are found within the Timeline contextual menu when you right-click on a clip.

- **To Previous Edit**: Expands the selection to include the previous clip to the left in the Timeline.
- **To Next Edit**: Expands the selection to include the next clip to the right in the Timeline.
- **To Previous Track**: Expands the selection to include the clip in the next track up in the Timeline.
- **To Next Track**: Expands the selection to include the clip in the next track down in the Timeline.

Locking Audio Tracks You Don’t Want to Change

Another step you can take to prepare before performing any kind of editorial operation is to lock tracks with media that you don’t want to be affected by whatever it is you’re about to do. For example, if you have a complex set of music edits on track A3 that you don’t want to be affected by operations that will delete media that overlaps it, you can lock track A3 so those clips remain unaffected.
Clips on locked tracks cannot be moved, deleted, cut, or otherwise affected by editorial operations. Furthermore, parameters of locked clips cannot be edited in the Inspector. However, clips on locked tracks can be played back and mixed like any other audio clips.

**To toggle the lock or unlock state of audio tracks in the Fairlight page, do one of the following:**

- Click any track’s lock control to toggle lock on and off.
- Click any track’s lock control and drag over the lock controls of other tracks in the Timeline to quickly lock or unlock several adjacent clips.
- Open the Index and click/drag one or more track lock controls to toggle lock on and off.

### Splitting Clips

In many situations you may find yourself splitting audio clips in order to separate multiple rolling takes.

**To split one or more clips in either Selection or Range Selection mode:**

1. Select each track that has a clip you want to split.
2. Move the playhead to intersect the clips you want to split at the frame where you want the split to happen.
3. Do one of the following:
   - Choose Timeline > Split Clip or press Command-\ (backslash).
   - Choose Timeline > Razor or press Command-B.

When you split a clip in the Edit page, a through edit appears to show that you currently have an edit with continuous timecode running from the outgoing to the incoming half. This is called a through edit and is displayed in the Edit page with a dotted line running along its edge so you know that it’s special. The Fairlight page doesn’t display through edits as of the time of this writing.

**NOTE:** Clips cannot be joined as of the time of this writing.

### Trimming Clips Without Rippling the Timeline

Most basic adjustments in the Fairlight page only affect the selected clip or region of the Timeline. Clips to the right of the adjusted area of the Timeline are generally left alone so as not to inadvertently change sync when you don’t expect it. This section covers the most basic parts of the Fairlight page’s “seven-point editing” paradigm.
Multi-Point Editing Overview

Each clip in the Timeline has several draggable handles and click targets that let you perform different editing tasks using the pointer.

- **In point:** The left edge of the clip can be dragged to resize the beginning of the clip.
- **Out point:** The right edge of the clip can be dragged to resize the end of the clip.
- **Fade In handle:** A handle at the upper left-hand corner of the clip that only appears when the mouse is positioned over that clip, used to fade the audio in by dragging it to the right, or as part of a crossfade between two audio clips. Fades can be reset (eliminated) by double-clicking the fade handle.
- **Fade In curve:** A handle at the center of the Fade In curve that only appears when the curve is exposed, used to adjust the power of the fade in. This handle can be dragged vertically to change the X-Level of the fade, and horizontally to change the X-Point of the fade. Fade curves can be reset by double-clicking the curve handle.
- **Fade Out handle:** A handle at the upper right-hand corner of the clip that only appears when the mouse is positioned over that clip, used to fade the audio out by dragging it to the left, or as part of a crossfade between two audio clips. Fades can be reset (eliminated) by double-clicking the fade handle.
- **Fade Out curve:** A handle at the center of the Fade Out curve that only appears when the curve is exposed, used to adjust the power of the fade out. This handle can be dragged vertically to change the X-Level of the fade, and horizontally to change the X-Point of the fade. Fade curves can be reset by double-clicking the curve handle.
- **Level:** Considered an editorial characteristic, the level of any given audio clip can be adjusted via a level overlay running across each clip. The level of any clip can be reset to the default 0.0 dB by double-clicking the level overlay.
- **Position:** Clicking anywhere within the middle of a clip in Selection or Range mode, or on the bottom of Edit Selection mode, lets you drag that clip either forward or backward in time, or to another track.

Resizing the In and Out Points of a Clip

Trimming the head or tail of a clip in the Fairlight page means to resize the In or Out point of that clip, making it shorter or longer accordingly.

To resize the beginning or end of a clip:

- **To shorten or lengthen clips:** Move the pointer over the beginning or end of a clip, and when it turns into the Resize cursor, drag the In or Out point to the left or right to change the clip’s length. As you drag the In or Out point of an audio clip in the Fairlight page, an overlay appears showing the waveform of all available media at the head (if you’re dragging the In point) or tail (if you’re dragging the Out point) of the clip you’re resizing.

![The overlay seen when resizing the In point of an audio clip in the Fairlight page](image_url)
To quickly resize the beginning or end of a clip to the very beginning or end of available media:

- Double-click the In point of the clip to move the In point to the very beginning of that clip’s media.
- Double-click the Out point of the clip to move the Out point to the very end of that clip’s media.

If you resize a clip’s In or Out point to overlap one or more neighboring clips in the Timeline, the overlapping parts of the neighboring clips will be overwritten by the clip you’ve resized.

**Trim Start and Trim End**

The Trim > Trim Start (Shift-\[) and Trim End (Shift-\]) commands let you move the In or Out point of all clips that intersect the playhead as either a ripple operation (in Trim mode) or a resize operation (in Selection mode). You do not need to make a selection to use Trim Start and Trim End, making these commands fast to use in the right situation. A classic use of Trim End is when you have several superimposed clips of different lengths that you want to either start or end at the same time.

- Trim Start resizes or ripples (depending on what mode you’re in) all clips that intersect the playhead, so that each clip’s In point is moved to the current playhead position.
- Trim End resizes or ripples intersecting clips so that each intersecting clip’s Out point is moved to the current playhead position.

Clips that don’t intersect the playhead are not affected. Furthermore, you can exclude clips on specific tracks from this operation by locking those tracks.

**Trim to Selection**

The Trim to Selection command simultaneously trims the heads and tails outside of a selection of one or more clips so that the selection is all that remains. This command is found within the Timeline contextual menu when you right-click on a clip.

(Left) A selection that includes parts of two clips, (Right) The result of using Trim to Selection to eliminate the heads and tails outside of this selection
Moving (Sliding) and Overwriting Clips

Formerly called slipping in previous versions of Fairlight, sliding refers to moving a clip to the left or right in the Timeline, changing the timing of that clip's position in the edit.

To move or slide clips in the Timeline, do one of the following:

- **To move one or more selected clips in the Timeline:** Drag any clip in the Timeline to any other position. If you're in Edit Selection mode, you must drag using the bottom half of the selection. If you drag a clip to overlap another clip, the clip you're dragging overwrites the clip you're moving it over.

- **To nudge one or more selected clips in the Timeline using the keyboard:** Make a selection, then press the Comma key (nudge 1 frame left) or Period key (nudge 1 frame right) to roll the selected edit to the left or right. Shift-Comma and Shift-Period nudges by 5 frames.

- **To move one or more selected clips up or down to other tracks at the same time:** Make a selection, then hold the Shift key down while dragging one of the selected clips up or down in the Timeline to lock their position in time while moving them to other tracks. Or, you can hold the Option key down and press Up or Down Arrow.

Sync Offset Indicator

Audio clips in the Fairlight page display an “out-of-sync” or sync offset indicators when they're moved out of sync with the video items they're linked to.

Slipping

Formerly called resyncing, slipping an audio clip keeps that clip in the same place in the Timeline while changing the range of media that appears in that spot. Slip edits do not change the duration of the overall Timeline, and they don’t move the clip's position relative to the other clips in the Timeline. Slipping simply changes the range of media that clip represents.

**NOTE:** While available in previous versions of Fairlight, slipping is not available at the time of this writing.

Duplicating Clips

The Duplicate Selection command duplicates one or more selected clips, placing the duplicates immediately after the Out point of the selection. If you're duplicating a region of a clip with tails, or a clip that’s in between other clips, the duplicated selection will overwrite whatever is to the right of the current selection, for the duration of the duplicate.
Using the Duplicate Selection command to duplicate a selected region

You can also hold the Option key down while dragging a clip in the Timeline; you’ll place a duplicate clip wherever you drop it.

Option-dragging to duplicate a clip in the Timeline

Disabling and Re-Enabling Clips in the Timeline

Sometimes there’s one or more audio clips in the Timeline that you don’t want to play along with the rest of the edited sequence, but you don’t want to remove from the Timeline either, in case you change your mind later. For this reason, it’s possible to disable clips, effectively turning them off without removing them. Previous versions of Fairlight referred to this operation as Mute clip.

Disabled clips appear dimmed in the Timeline. They don’t play back, they’re not rendered, and they’re not output to video. However, their position is preserved in the Timeline, so you can always re-enable them at a later time if you change your mind and decide you want to use them.

To disable or re-enable one or more selected clips:
- Right-click part of the selection and choose Enable Clip from the contextual menu.
- Choose Clip > Enable Clip.
- Press D.

Deleting Audio Clips and Regions

You can delete any clip(s) or clip region(s) that you can select, in either Selection or Range Selection modes by pressing the Delete or Forward Delete keys, or by right-clicking a clip and choosing Delete Selected from the contextual menu. In the Fairlight page, deleting anything leaves a gap. You can not ripple delete anything.
Cut, Copy, and Paste

The Fairlight page has a unique copy and paste methodology that takes advantage of the “ghost” overlays that are used for the waveforms of selected audio clips. This method makes it easy to copy and paste clips using keyboard shortcuts and the JKL keys.

Conventional Cut, Copy, and Paste

The typical cut, copy, and paste commands expected of every software application are available in the Fairlight page, but with a unique twist that’s particularly advantageous for users of the Fairlight control surface, or for anyone who uses the JKL transport key shortcuts to move around the Timeline for keyboard-driven editing.

To cut or copy and paste either all or part of a clip:

1. If you’re cutting or copying a whole clip, then choose either the Selection (press A) or Range Selection (press T) mode. If you’re cutting or copying part of a clip, then make sure you’re in Range Selection mode (press T).

2. To use the playhead to make a clip selection, select the track that contains the clip you want to copy or cut. If one or more tracks are already selected, you can use the Control-Option-Up or Down Arrow key shortcuts to move the track selection state up or down to the tracks with the clip you want to cut or copy.

3. Do one of the following:

   a. To cut or copy a whole clip, move the playhead so that it intersects the clip you want to cut or copy. If the playhead intersects a clip on a selected track, that clip should become selected. You should note that even if you use the mouse to select a clip without selecting a track first, you should still move the playhead to intersect the clip you’re copying or pasting, as this sets up an important reference point for the operation.
To cut or copy segment of a clip, move the playhead so that it intersects the clip you want to cut or copy. If the playhead intersects a clip on a selected track, that clip should become selected. Then, using JKL and the I (In) and O (Out) keys, mark a range in the Timeline that includes the segment of the clip you want. That segment should appear highlighted as a result.

Making sure the playhead is over the section of the waveform that you want to use as the frame to move the clip by, press Command-X to cut or Command-C to copy that clip (you can also right-click a clip and choose Copy or Cut). That clip will immediately become highlighted.

At this point, there are two things you can do to position the cut or copied clip to the position in the Timeline at which you want to paste it:

a) Moving the playhead will now also move the clip you cut or copied, shown as a ghost clip with waveform that’s “attached” to the playhead at the frame you chose. Whether you drag the playhead with your mouse or use JKL to move the playhead through the Timeline, the cut or copied clip will move along with it, so that moving the playhead repositions the cut or copied clip on that track.
If you want to move the cut or copied clip to another track, use the Control-Option-Up or Down Arrow key shortcuts to change the selected track; the ghost clip will move along with change in track selection.

Positioning the cut or copied clip before you paste it

This way, you can use the playhead to align the ghost waveform with other audio clips surrounding it in preparation for pasting it.

When the clip is positioned where you want it, press Command-V to paste the clip at the position you’ve chosen (you can also right-click a track and choose Paste from the contextual menu). The clip becomes solid, and you’re finished.

Using the Cut/Copy Head and Tail Commands

Four additional commands make it easy to cut or copy portions of one or more clips that intersect the playhead, either from the In point to the current position of the playhead (the Head), or from the current position of the playhead to the Out point (the Tail).

To cut or copy the head or tail of a clip, and paste the result:

1. Using these commands, there’s no need to make a partial selection, so you can use either the Selection (press A) or Range Selection (press T) modes.

2. Select the track that contains the clip you want to copy or cut. If one or more tracks are already selected, you can use the Control-Option-Up or Down Arrow key shortcuts to move the track selection state up or down to the tracks with the clip you want to cut or copy.
3 Move the playhead so that it intersects the clip you want to cut or copy at the frame you want to define, either the end of the head or the beginning of the tail. If the playhead intersects a clip on a selected track, that clip should automatically become selected. You should note that even if you use the mouse to select a clip without selecting a track first, you should still move the playhead to intersect the clip you’re copying or pasting, as this sets up an important reference point for the operation.

4 Choose Edit > Cut/Copy Head/Tail to cut or copy the portion of the selected clip you want to paste. That portion of the clip will immediately become highlighted.

5 At this point, there are two things you can do to position the cut or copied head or tail of the clip to the position in the Timeline at which you want to paste it:

a a ghost clip with waveform that’s “attached” to the playhead at the frame you chose. Whether you drag the playhead with your mouse or use JKL to move the playhead through the Timeline, the cut or copied clip will move along with it so that moving the playhead repositions the cut or copied clip on that track.

b If you want to move the cut or copied clip to another track, use the Control-Option-Up or Down Arrow key shortcuts to change the selected track; the ghost clip will move along with change in track selection.

This way, you can use the playhead to align the ghost waveform with other audio clips surrounding it in preparation for pasting it.

6 When the clip is positioned where you want it, press Command-V to paste the clip at the position you’ve chosen (you can also right-click a track and choose Paste from the contextual menu). The clip becomes solid, and you’re finished.

### Paste and Remove Attributes

The Fairlight page has Paste Attributes and Remove Attributes commands that allow for the copying and resetting of audio parameters and effects, similar to the same commands on the Edit page.

### Copying and Pasting Clip Attributes

For clips, this works as simply as copying a clip, then selecting one or more audio clips and right-clicking another clip and choosing Paste Attributes from the contextual menu. A dialog appears letting you choose which audio attributes you want to paste before clicking Apply.
Copying and Pasting Track Attributes

For tracks, it works a little differently. Right-click on a track header and choose Copy Attributes to copy all track settings and effects. Then, select one or more other track headers, right-click the selection, and choose Paste Attributes. A dialog appears letting you choose which track attributes you want to paste before clicking Apply.

Removing Attributes

For either clips or tracks, you can right-click and choose Remove Attributes to open a dialog with which to choose which attributes you want to reset to their default settings.

Audio Clip Layering

Audio layering is a special audio editing mode that lets you superimpose multiple audio clips in the same track, with audio clips edited into the top layers muting overlapping sections of audio clips appearing on lower layers. With audio layering enabled, superimposed audio clips are treated similarly to superimposed video clips that have opacity set to 100%, with clips on top obscuring (or muting) clips underneath.

Audio layering is incredibly useful for any situation where you're combining segments of multiple takes together to create a single voiceover, audio vocal track, or dramatic performance, as you can choose which segments to use via their superimposed position in the stack of clips appearing in that track, while at the same time you're preserving the other takes underneath in case you might want them later.

**TIP:** Track layering can be used on the Edit page as well.
To enable audio layering:
Choose Timeline > Layered Audio Editing so that a check mark appears by the command. All overlapping audio will be layered instead of overwritten from that point forward.

To view audio layering:
1. Choose View > Show Audio Track Layers to reveal track layers for each audio track (and each lane within a given audio track) in the Timeline. When layering is on, space appears at the top of each track in the Timeline which provides a region into which you can edit layered audio clips.

2. To edit an audio clip or segment as a layer within a particular audio track, drag it from elsewhere in the Timeline or from the Media Pool, and drop it into the empty area above whatever audio is already in that track.

3. Edit the different superimposed layers of audio such that the segments of each take that you like are on top. Only the topmost clip segments will be audible. Audio segments that overlap underneath are silent. To put another layer on top, drag it from its current position to the empty area at the top of the track.

4. When you’re finished editing clips in track layers, choose View > Show Audio Track Layers again to hide the individual layers, so that only the topmost clips appear as a flat sequence in each track and lane.

Dragging a bottom audio layer to appear on top

Hiding layers makes all audio layers appear on a single track, as if the top clips are overwriting what’s underneath, except the muted material underneath is preserved.
Audio Compound Clips

DaVinci Resolve supports audio compound clips, which are created just like any other compound clip, by selecting multiple audio clips, right-clicking one of them, and choosing New Compound Clip. Alternately, compound clips with video clips may now contain multiple audio items as well.

When compound clips containing audio are opened in the Edit or Fairlight pages by right-clicking an audio compound clip and choosing Open in Timeline, breadcrumb controls appear beneath the Timeline that let you exit the compound clip and get back to the master Timeline.

Audio Crossfades

You can add Cross Fade transitions to any edit point between two audio clips that have enough handles similarly to how you add video transitions, by dragging and dropping from the Effects Library, by right-clicking an edit and choosing an option from the contextual menu, or by selecting an audio edit point and choosing Timeline > Add Audio Only Transition (Shift-T).

Cross Fade transitions are a quick and easy way to fade the volume of the outgoing clip down while simultaneously fading the volume of the incoming clip up, letting you create a smooth aural transition between two audio clips.

You can double-click a Cross Fade transition to open it into the Inspector, revealing the following parameters:

- **Duration**: The duration of the transition, shown in both seconds and frames.
- **Alignment**: A drop-down that lets you choose the transition’s position relative to the edit point it’s applied to. Your choices are “End on Edit,” “Center on Edit,” and “Begin on Edit.”
- **Transition style**: You can choose –3dB, 0dB, or +3dB to set both the Fade In and Fade Out levels to the same value. For more information on what these levels mean, see the following parameter.
• **Fade In/Fade Out levels:** There are three options that affect the incoming and outgoing halves of the Cross Fade effect independently. 0dB applies a linear fade (this is the default). +3dB applies a boosted curve; when applied to both Fade In and Fade Out, this can compensate for diminished levels in the middle of a Cross Fade. –3dB applies an attenuating curve, which deliberately lowers the level of the Cross Fade.

Crossfades can be created and edited on both the Edit and Fairlight pages.

### Fades and Crossfades

Part of audio editing in the Fairlight page is the use of fades and crossfades. This section shows you how to create these effects for smoothly segueing from one audio clip to another.

#### Using Fades

Like the Edit page, each audio clip has fader handles that appear at the upper right and left corners of a clip you’re hovering the pointer over.

Fader handles appear when you hover the pointer over a clip

Pulling these handles out creates a fade effect with a duration equal to the length you extended the handle.

Creating a fade effect by pulling out one of the fader handles

Once you’ve created a fade effect, you can adjust the curve of the fade by dragging the handle that appears right on top of the fader curve. Dragging the handle up and down affects the angle of the curve, and dragging the handle left and right affects the shape of the curve. In this way, you can create all manner of fade effects.

Adjusting the curve of the fade
Fade In and Out to Playhead

A pair of commands in the Trim menu let you move the playhead over a clip, and use the playhead position to “Fade In to Playhead” or “Fade Out to Playhead.” These commands work in both the Edit and Fairlight pages.

![Fade In and Out to Playhead](image)

Creating Crossfades With Overlapping Fades

While a fade gradually fades a single track of audio up or down, a crossfade fades two overlapping clips at the same time, fading one clip up and another clip down, for the aural equivalent of a cross dissolve. There are currently two ways of creating a crossfade in the Fairlight page. Both depend on clip layering to allow you to have overlapping fades over overlapping clips.

To create a crossfade by overlapping two clips together:

1. Add a fade out to the end of one clip, and a fade in to the beginning of another clip. By default, all fades you add in this way are linear, although you can adjust them to whatever gain you want.

2. Drag the first clip to overlap the second clip by the length of the fade you’ve created.

![Crossfade Example](image)
3 Drop the clip. The overlapping fades will both be preserved thanks to clip layering, and a crossfade will appear in the Timeline.

The resulting crossfade

To create a crossfade over two clips that are already layered:

Drag a fader handle at the beginning or end of a clip that’s layered, and a crossfade will automatically appear.

Creating a crossfade by adjusting the fader handle of a layered clip

Using Crossfades From the Edit Page

You can also add crossfades in the Edit page, but they appear in the Fairlight page as transitions in the Edit page style.

The resulting crossfade

Finding Clips in the Media Pool

You can right-click any clip in the Timeline and choose Find in Media Pool to automatically select that clip in the Media Pool, for instances where you might want to edit another copy of that clip somewhere else in the Timeline, or re-edit another segment from that clip into the same area.
Changing Clip Color in the Timeline

You can right-click one or more selected clips in the Timeline to change the clip color, to be more organized. For example, you might set production audio clips containing dialog from different actors to different colors, or you could set clips with dialog, music, and effects to different colors in order to easily differentiate each clip's purpose.

Editing Audio Clips in External Editors

While working in the Fairlight page, you have the ability to process an audio file using a third-party application if necessary, in the event you need to use another application's capabilities to create an effect or solve an issue that can't be accomplished in the Fairlight page itself. To do this, you must first add one or more applications to the External Audio Process list in the Audio Plug-ins panel of the System Preferences.

To add an external audio process:

1. Open the System tab of the DaVinci Preferences, and select the Audio Plugins panel.
2. Click the Add button in the "Setup External Audio Processes" section.
3. To give the audio process a different name, double click in the Name column and type a new name.
4. Double-click in the empty Path column for the new process, and choose an application to assign to that process from the dialog.
5. Choose the type of process you want it to be from the drop-down menu in the Type column.

Once you have one or more external audio applications configured in Preferences, you can use them to process any audio clip in the Fairlight page by right-clicking an audio clip and choosing the application you want to use from the External Audio Process submenu of the contextual menu.

When you do this, a duplicate of the audio clip media is copied (bounced) to the directory location specified by the "Save clips to" field of the Capture and Playback panel of the Project Settings. At that point, the external application is either opened or launched as a command from the command line (depending on how the external application has been configured in Preferences).
Once the bounced audio is opened in the external application, you can process it however you need to and bake in any changes made by saving/rendering/outputting and overwriting the original copied audio media file. DaVinci Resolve detects when changes have been made, and the altered result is automatically reimported as an additional audio layer on top of the original clip in the Timeline.

The way an audio application is configured in the DaVinci System Preferences dictates how the bounced audio file is passed to the external program. There are three choices:

- **Command Line**: As a command line parameter, if your audio application is able to be run from the Terminal.
- **Clipboard**: By placing the path to the bounced file in the clipboard, so you can paste it into the application which has been automatically launched, or import it via a File > Open dialog.
- **Reveal**: By revealing the bounced copy in the file manager of your workstation, so you can drag and drop it onto the application which has been automatically launched.

### Bouncing Audio Clips to External Files

For any workflow where you need to write clips from the Timeline to external files without whatever levels, EQ, dynamics, filters, or other filters have been applied in the Fairlight page, you can use the Bounce Clips to Files command.

**To bounce clips to external files:**

1. Select one or more clips in the Timeline.
2. Right-click one of the selected files and choose Bounce Clips to Files from the contextual menu.
3. When the Bounce Clip to File dialog appears, do the following:
   a. Click Browse to choose a location to save the bounced audio files.
   b. (Optional) Enter a tag and one of the various Name options.
   c. Choose a Format and Bit Depth for the bounced clips.
4. Click Bounce.

The selected audio files are written to the location you chose.
Sample Editing

You can zoom quite far into audio clips on the Fairlight page timeline, until you see the individual samples that comprise the audio waveform of each clip. Samples are represented by control points once you’ve zoomed in far enough.

When you zoom in far enough, you can see the individual samples of an audio clip as control points

You can non-destructively edit these control points to eliminate clicks and pops, and to effect other fixes to problem audio clips.

**Methods of editing audio samples:**

- **To see the editable audio samples:** Zoom all the way into an audio clip until you see the sample control points, using either Command-Plus or Command-Minus, the scroll wheel of your pointing device, or by holding down the ZOOM button of your Fairlight editing panel and turning the JOG/EDITING wheel.

- **To edit a single audio sample:** Click and drag that audio sample up or down to change its height.

- **To edit a section of samples:** Click and drag horizontally left or right across the samples you want to edit to “redraw” the waveform any way you’d like.

Black points show the previous levels when samples have been edited in a clip

Sample editing can be undone, just like any other editing procedure, as the edited sample points are stored non-destructively within the DaVinci Resolve project.
Chapter 155

Audio Clip Specific Inspector Adjustments

Each audio clip in a track has individual settings that are specific to that clip, which can be adjusted and animated in the Inspector. This makes it easy to adjust the levels and EQ of several clips to match one another, while reserving the track level for your overall mix. An additional set of clip-specific pitch controls make it easy to make small pitch adjustments, either static or keyframed, where necessary.

This chapter describes how to use these clip-specific controls.

Audio Settings in the Inspector

Each selected clip, and each selected Main, Submix, or Auxiliary bus channel strip in the Mixer exposes some simple audio-related parameters in the Audio panel of the Inspector.

- **Clip Volume**: Each clip has a single volume control, which corresponds to the volume overlay over each audio clip.
- **Clip Pan**: (Only exposed for clips) A simple Pan slider that controls stereo panning.
- **Clip Pitch**: (Only exposed for clips) Each clip has two pitch controls, for altering clip pitch without altering clip speed. You can control pitch in Semi Tones and Cents.
- **Clip Equalizer**: (Only exposed for clips) Each clip also has a four-band EQ, complete with low-pass, high-pass, and parametric settings for fine tuning and problem-solving audio issues at the clip level.
- **Audio Effects**: If you’ve applied any FairlightFX, VST plug-ins, or Audio Unit plug-ins, those controls will also appear in the Inspector. For more information, see Chapter 158, “Audio Effects.”

Additionally, when you apply other audio plug-ins from the Audio FX panel of the Effects Library, additional parameters and controls are exposed (covered towards the end of this chapter).

Making Adjustments in the Inspector

Clip-specific Volume, Pan, Pitch, and Equalization are adjusted and can be animated in the Inspector. This section walks you through how this works.

Using the Inspector

Audio clips in the Fairlight page expose similar controls to those found in the Audio Inspector Panel of the Edit page. Additionally, the Inspector will display controls for audio plug-ins that you apply to clips as well. All parameters are organized into groups, with a title bar providing the name of that group, along with other controls that let you control all parameters within that group at the same time.
These controls include:

- **Enable button**: A toggle control to the left of the parameter group’s name lets you disable and re-enable every parameter within that group at once. Orange means that track’s enabled. Gray is disabled.

- **Parameter group title bar**: Double-clicking the title bar of any group of parameters collapses or opens them. Even more exciting than that, Option-double-clicking the title bar of one parameter group collapses or opens all parameter groups at once.

- **Keyframe and Next/Previous Keyframe buttons**: This button lets you add or remove keyframes at the position of the playhead to or from every single parameter within the group. When the button is highlighted orange, a keyframe is at the current position of the playhead. When it’s dark gray, there is no keyframe. Left and right arrow buttons let you jump the playhead from keyframe to keyframe for further adjustment.

- **Reset button**: Lets you reset all parameters within that group to their default settings.

### Making Simple Adjustments

Every group of controls in the Inspector largely consists of sliders, checkboxes, drop-down menus, buttons, and the occasional custom control.

### Adjusting Multiple Clips at the Same Time

There’s an easy way to make adjustments to the Inspector parameters of multiple clips at the same time, without needing to use Paste Attributes (described later in this chapter). All you need to do is simultaneously select every clip you want to alter, and then modify the parameter in the Inspector that you want to change. As a result, every selected clip will be adjusted by the same amount. This works for compositing effects, transforms, text parameters, filters, and audio settings, just about anything that can be simultaneously exposed in the Inspector for multiple selected clips.

When you select multiple clips, the Inspector will display “Multiple Clips” as the title. If each of the selected clips have different values in the parameter you’re adjusting, that parameter will have two dashes in the value field. There are two ways you can make adjustments to multiple clips:

- If you want to make a relative adjustment to all selected clips while keeping their original offsets from one another, then drag the virtual slider in the parameter field which will display a + or – before however many units your adjustment is.

- However, if you want to set all selected clips to the same value, you can double-click in the number field, type the value, and press Return.

![Making a relative adjustment of plus 4.00 in the Volume level of all selected clips](image)
Animated Inspector Adjustments

Keyframing in the Edit page works slightly differently than when using the Keyframe Editor in the Color page. Most simple keyframing tasks can be performed in the Inspector using three buttons that appear to the right of any parameter that’s capable of being keyframed. It takes two keyframes at minimum to create an animated effect.

The three keyframe controls that appear in the Inspector, from left to right: Previous keyframe, Create/Delete keyframe, Next keyframe

Methods of keyframing parameters in the Inspector:

- **To add a keyframe:** Select a clip, open the Inspector, then move the Timeline playhead to the frame where you want to place a keyframe, and click the Keyframe button next to the parameter of the Inspector you want to animate. Once you’ve added at least one keyframe to a parameter, all other adjustments you make to parameters in the Inspector, or using the onscreen Transform/Crop controls in the Timeline Viewer, add new keyframes automatically if the playhead is at another frame.

- **To move the playhead to the next or previous keyframe:** Click the small left- or right-hand arrow to either side of a parameter’s keyframe control to jump the playhead to the next or previous keyframe. You can also press Right-Bracket ( ] ) and Left-Bracket ( [ ) to go from keyframe to keyframe.

- **To edit an existing keyframe of a parameter:** Move the playhead to be on top of the keyframe you want to edit, and then change that parameter, either in the Inspector, or using the onscreen controls of the Timeline Viewer.

Methods of changing keyframe interpolation in the Inspector:

- **To change a keyframe to Ease In or Ease Out:** Eased keyframes create animated changes that begin slowly and accelerate to full speed, or slow down gradually to decelerate to a stop. This only works when you have two or more keyframes creating an animated effect. Move the playhead to a frame with a keyframe using the next/previous keyframe controls, then right-click the orange keyframe button and choose Ease In, Ease Out, or Ease In and Out, depending on which keyframe you’re editing and the effect you want to create.

- **To change a keyframe to Linear:** Move the playhead to a frame with a keyframe using the next/previous keyframe controls, then right-click the orange keyframe button and choose Linear.

Methods of deleting keyframes and disabling keyframed effects:

- **To delete a single keyframe:** Open the Inspector, move the Timeline playhead to a frame with a keyframe, and click the orange Keyframe button in the Inspector to delete it.

- **To delete all keyframes for one parameter:** Click the reset button to the right of a parameter’s keyframe control in the Inspector.

- **To delete all keyframes in a group of parameters in the Inspector:** Click the reset button to the right of a parameter group’s title bar in the Inspector.
• To disable or enable a single parameter’s keyframed effect: In the Timeline, click the toggle control at the left of a parameter’s keyframe track. Orange means that track’s enabled. Gray is disabled.

• To disable or enable a group of parameters in the Inspector: Click the toggle control at the left of a parameter group’s title bar in the Inspector. Orange means that group is enabled. Gray is disabled.

Paste and Remove Attributes

The Fairlight page has Paste Attributes and Remove Attributes commands that allow for the copying and resetting of audio Inspector parameters and effects, similar to the same commands on the Edit page. For more information on how to do this, see Chapter 154, “Editing Basics in the Fairlight Page.”

Seeing Effects in the Timeline

When you adjust any clip’s Inspector controls, or add any kind of plug-in to a clip in the Timeline, be it an adjustment in the Inspector or a plug-in you’ve applied, clips with that effect applied appear a darker shade of whatever color they are. Removing all effects from a clip (for example, using the Remove Attributes command) returns that clip to its original color. This makes it easy to see, at a glance, which clips have effects, and which clips don’t.

Setting Clip Volume

Each audio clip, or audio item in the case of audio clips with linked audio on multiple tracks, has its own Volume level. This means that audio clips with multiple channels share a common Volume setting. There are several ways you can adjust these levels simply.

Adjusting Volume in the Inspector

Each clip has individual Volume parameters that are accessible in the Audio panel of the Inspector when one or more audio clips are selected.
Selecting an audio clip in the Timeline and adjusting its Volume only alters the volume levels of that clip, which lets you adjust basic levels for individual clips in your program. The Volume control affects every channel within that clip simultaneously.

If you select multiple clips in the Timeline, then adjusting the Volume or Pan sliders or virtual sliders for all of them simultaneously will make a relative adjustment to all of the clips, preserving their offsets from one another. If you want to set all clips to the same level, then making a numeric adjustment will set all selected clips to the same absolute level.

**Adjusting Volume in the Timeline**

Each clip (or item) of audio in the Timeline has a Volume overlay that lets you set that clip’s level by simply dragging it up or down with the pointer. This overlay corresponds to the Volume parameter in the Inspector.

Additionally, you can click any clip’s Audio Curve Editor button, at the bottom right-hand corner of each audio clip, to open an audio-specific Curve Editor with which you can keyframe not just Volume, but Pan, and the parameters of any audio filters you might have applied to that clip.

**Adding and Adjusting Volume Keyframes in the Timeline**

Mixing audio by adding and adjusting individual keyframes can be a fast and effective way of balancing clip levels with one another and of fixing clip-specific dynamic level problems. When manually editing any audio parameter curve, you can use the following procedures.

**Methods of adjusting the Volume curve using the pointer:**

- **To adjust any curve segment:** Position the pointer over the overall segment for clips with no keyframes, or position it between any two keyframes, directly on top of the curve segment you want to raise or lower. When the move cursor is displayed, click and drag up to raise the Volume, or down to reduce the Volume.

- **To add keyframes to the level curve:** Hold the Option key down and click the curve to place a keyframe at that frame. You must add at least two keyframes to create an automated change in Volume.

- **To adjust a keyframe in any direction:** Move the pointer over a keyframe so that the four-way cursor appears, and then click and drag up or down to change the Volume, or side to side to change it’s timing.

- **To adjust a keyframe in only one direction:** Move the pointer over a keyframe so that the four-way cursor appears, and then click and drag in the intended direction of adjustment, either vertically to change the volume of the clip at that frame, or horizontally to move the keyframe to a different point in time. Once you start dragging a keyframe into a particular direction, keyframe movement is constrained in that direction until you release that keyframe.
• **To select one or more keyframes:** Click any keyframe to select it.

• **To select multiple discontiguous keyframes:** Command-click all keyframes you want to select, whether they’re next to one another or not.

• **To select multiple contiguous keyframes:** Click the first keyframe you want to select, and then shift-click the last keyframe you want to select, and all keyframes between will also be selected.

**Normalize Audio Levels Command**

The Normalize Audio Levels command automatically adjusts the level of clips to a specific target level, and you can choose the method used to analyze each audio clip’s levels to determine how to normalize each clip’s volume. Options include a variety of loudness normalization algorithms specific to various international standards, which are useful for balancing the perceived overall loudness of several clips to one another, regardless of transient levels throughout each clip. You can also do Peak normalization, with options for both Sample Peak and True Peak.

The various loudness options are designed to analyze an audio signal based on its perceived loudness to the listener, which results in a more accurate automatic balancing of different clips’ audio levels to one another, regardless of transient peaks occurring throughout different clips.

The target peak meter now uses the BS.1774 standard for measuring maximum “true peak,” which means that this meter is capable of measuring “inter-sample peaks,” rather than only the peaks at each sample of a waveform. However, you still have the option to measure Sample Peak, which is the previous method of measuring the actual peak of the samples in a media file.

The change made by the Normalize Audio Volume command is only a volume adjustment; no dynamics are applied, so the result of using this command is that the loudest parts of each selected clip are going to match one another at the target level. This command is also available in the Fairlight page.

**To normalize one or more selected audio clips:**

1. Right-click one of the selected clips and choose Normalize Audio Levels. The Normalize Audio Level dialog appears.

2. Choose the Normalization Mode you want to use. You can choose among a variety of standardized loudness measurement algorithms, or Sample Peak, or True Peak.

3. Choose the reference level that you want to set the peak volume of the selected clips to match, in dBFS.
Choose how you want to set the level of multiple selected clips:

- When Set Level is set to Relative, all selected clips are treated as if they’re one clip, so that the highest peak level of all selected clips is used to define the adjustment, and the volume of all selected clips is adjusted by the same amount. This is good if you have a series of clips, such as a dialog recording, where the levels are consistent with one another, and you want to normalize all of them together.

- When Set Level is set to Independent, the peak level of each clip is used to define the adjustment to that clip, so that the volume of every selected clip is adjusted by an amount specific to that clip. The end result may be a set of very different volume adjustments intended to make the peak levels of each audio clip match one another. This is good if, for example, you’re trying to balance a series of different sound effects with one another that have very different starting levels.

For more information about loudness normalization, see Chapter 160, “Audio Meters and Audio Monitoring.”

**Clip Pan**

Each audio clip in the Timeline has a simple stereo Pan control that lets you pan that clip. While most professional mixes will restrict panning to the more robust panner found in the Fairlight page Mixer, this simple clip-based Pan control is useful for editors of visuals working in the Edit page to quickly create simple panning effects to aid in a craft edit. Dragging the slider lets you pan audio left to right. This control is centered at 0 by default.

![Clip Pan Control](image)

**Clip Pitch Controls**

Each audio clip in the Timeline has Clip Pitch controls that let you alter the pitch of a clip without changing the speed. Two sliders let you adjust clip pitch in Semi Tones (large adjustments, a twelfth of an octave) and Cents (fine adjustments, 100th of an octave).

![Clip Pitch control in the Inspector](image)

**Clip EQ**

Each audio clip in the timeline has a four-band equalizer that has both graphical and numeric controls for boosting or attenuating different ranges of frequencies within that clip, before it even gets to the EQ built into the mixer. Each band has controls for the filter type (Bell, Lo-Shelf, Hi-Shelf, Notch), Frequency, Gain, and Q-factor (sharpness of the band), with the available controls for each band of EQ changing depending on the filter type.
When a channel strip’s EQ is enabled, the EQ button displays the equalization curve that’s being applied. This indicator cannot be adjusted; you must open the EQ window to make modifications.

![The channel strip’s EQ indicator, (Left) EQ is at detent, (Right) EQ is adjusted](image)

**Master EQ Controls**

The Equalizer window has the following overall controls:

- **Enable button**: Turns the overall EQ effect off and on, without resetting the controls.
- **Reset button**: Resets all controls of the EQ window to their defaults.

**Graphical EQ Controls**

A graph at the top shows a curve with handles that correspond to each of the enabled EQ bands listed below. You can drag any numbered handle to boost or attenuate the range of frequencies governed by that band, using whatever type of equalization that band has been set to.

![The EQ graph with user-draggable handles](image)

Dragging the numbered handles on this graph in turn modifies the parameters of the corresponding band, and changing each band’s parameters will also alter the EQ graph, which serves the additional purpose of providing a graphical representation of the equalization being applied to that track.
Bands 1 and 4

The outer two sets of band controls let you make high-pass and low-pass adjustments, if necessary.

- **Band enable button:** Turns each band of EQ on and off.
- **Band filter type:** Bands 1 and 4 can be switched among four specific filtering options for processing the lowest or highest frequencies in the signal. These include (from top to bottom) Hi-Shelf, Hi-Pass, Bell, Notch, Lo-Pass, and Lo-Shelf. Bands 2 and 3 can be switched among Lo-Shelf, Bell, Notch, and Hi-Shelf.
- **Freq:** Adjusts the center frequency of the EQ adjustment.
- **Gain:** Adjusts the amount by which the affected frequencies are affected. Negative values attenuate those frequencies, while positive values boost those frequencies.

Bands 2 and 3

- The middle two sets of band controls let you make a wide variety of equalization adjustments.
- **Band enable button:** Turns each band of EQ on and off.
- **Band filter type:** Bands 2–5 can be switched among four different filtering options (from top to bottom): Lo-Shelf, Bell, Notch, and Hi-Shelf.
- **Frequency:** Adjusts the center frequency of the EQ adjustment.
- **Gain:** Adjusts the amount by which the affected frequencies are affected. Negative values attenuate those frequencies, while positive values boost those frequencies.
- **Q Factor:** Adjusts the width of affected frequencies. Lower values include a wider range of frequencies; higher values include a narrower range of frequencies.

Paste and Remove Attributes for Clips and Tracks

The Fairlight page has Paste Attributes and Remove Attributes commands that allow for the copying and resetting of audio parameters and effects, similar to the same commands on the Edit page.

The Paste Attributes dialog in the Fairlight page
Chapter 156

Mixing in the Fairlight Page

The Mixer is the spider at the center of the web that is the Fairlight page, and provides the primary tools you’ll use to mix the various audio tracks of your program into a harmonious whole using EQ, Dynamics, Panning, level control, and VST and Audio Units audio effects of all kinds, all with full automation, to hone your sound and balance each track’s elements with the others. This chapter focuses on explaining the various functions of the Mixer so you can harness its power for yourself.

Introduction to Mixing

This chapter describes the use of the Mixer to adjust the levels and fine-tune the audio of each track in the timeline. It’s focused on the function of the channel strip controls, with the following exceptions:

- For more information about busing, see Chapter 150, “Setting Up Tracks, Buses, and Patching.”
- For more information about recording audio, see Chapter 152, “Recording.”
- For more information about recording automation, see Chapter 157, “Automation Recording.”

The Mixer

The Audio Mixer provides a set of graphical controls you can use to assign track channels to output channels, adjust EQ and dynamics, set levels and record automation, pan stereo and surround audio, and mute and solo tracks. At its most basic, each audio track in your timeline corresponds to an individual channel strip in the Mixer, and by default there’s a single Main bus labeled M1 that combines all these tracks into an overall mix.

Tracks and Buses

Once you start creating buses, the Audio Mixer exposes two sets of channel strips. The left-most set of channel strips correspond to the audio tracks in the Timeline, while the right-most set of channel strips expose sets of controls for each Main, Sub (submix), and Aux (auxiliary) bus that you’ve created.
The Audio Mixer is divided into two sections, one for tracks (at left) and one for buses (at right).

If you have more tracks and buses than can be displayed all at once given the width of your computer display, then each half of the mixer has independent scroll bars so you can choose which tracks and which buses you want to see next to one another.

Each audio track’s channel strip has a set of Main and Sub bus buttons that let you assign the audio output by that channel strip to a Sub (typically used to combine different subsets of tracks into submixes) or to a Main (typically used to output or render overall mixes). Each Sub and Aux’s channel strip has a set of Main buttons so that different combinations of Subs can be assigned to each Main. Main channel strips have no buttons because, from a busing perspective, they’re the final output.

**Customizing the Onscreen Mixer Controls**

The Option menu at the upper right-hand corner of the Mixer provides a number of different options for customizing the look of the Mixer, as well as which controls are shown or hidden.

First, you have the options of showing the Full Track Mixer or the Small Track Mixer. While the Full Track Mixer provides more room for buttons and controls that are large enough you don’t have to squint to see them, the Small Track Mixer lets you have many more channel strips onscreen at one time, for those times where you’re doing incredibly ambitious mixes.
Second, there’s an option to Show Labels, which are the control names listed in a column to the left of the mixer channel strip area. If you’re first getting started, these Labels are useful, but once you’ve gotten used to the layout of the Mixer, hiding these will give you a bit more room to work with for another channel strip or two.

Third, there’s a set of options that let you toggle the visibility of specific channel strip controls, so you can hide controls you know you’re not going to be using, or that you’ve used but no longer need to adjust or want to protect from accidental adjustment by a wandering mouse or pen.

Managing Channel Strips Using the Index

The Index is a consolidated list view of all the tracks in the current Timeline, designed to make it easier to manage timelines with lots of tracks. Columns let you see each track’s visibility, track number, name, controls, channel format, and Group assignment. The controls in these columns let you manage the tracks in the current Timeline by showing or hiding them, toggling track controls, or rearranging them. You can also right-click on one or more selected tracks to color code them, or change the channel assignment.

Showing and Hiding Tracks

You can use the Tracks panel of the Index to hide tracks you don’t need to work on in order to create more room for tracks you need to see. To quickly show or hide a number of tracks, you can click and drag up or down over the eyeball button of each track for which you want to reverse the visibility.

Color Coding Tracks

Select one or more tracks, then right click one of the selected tracks and choose a color from the Change Track Color submenu of the contextual menu.

Toggling Lock, Record, Solo, and Mute

You can also use the Lock, Record, Solo, and Mute controls to quickly enable or disable multiple tracks by clicking and dragging up or down over the Lock, R, S, or M buttons you want to toggle.

Rearranging Tracks

Finally, you can rearrange tracks using the Index by clicking any track strip area between other controls, and then dragging that track up or down in the Index. As you drag, a white line shows you where that track will be inserted when you drop it. You can even select a contiguous series of tracks and drag them all to a new position in the Timeline at once.
Reassigning Channel Mappings
Select one or more tracks, then right click one of the selected tracks and choose a channel assignment from the Change Track Type to submenu of the contextual menu.

Selecting Channel Strips and Tracks
When you select a track in the Timeline, you also select that track’s accompanying channel strip, and vice versa. It’s possible to select multiple tracks in the Timeline and thereby select multiple channel strips, but you can also Command-click to select multiple channel strips in order to select multiple tracks.

Track Organization
Each channel strip has three organizational properties that let you keep track of which channel strip is responsible for which part of the mix.

- **Track color:** Each track can be differently color-coded, to help you keep organized. These colors appear in the timeline track header, the mixer, and the meters to help you keep track of which track corresponds to which channel strip and meter.
- **Track number:** The number of the timeline audio track corresponding to each channel strip appears here.
- **Track name:** This mirrors the track name found in the header controls of the timeline. If you customize an audio track’s name in the timeline, that name appears here.
**Input**

A drop-down menu that lets you patch inputs, patch buses, and configure the input settings of audio signals routed through Blackmagic hardware interfaces.

The Input drop-down menu provides shortcuts for patching different buses using the Patch Input/Output window.

For more information on using the options of the insert menu, see Chapter 144, “Setting Up Tracks, Buses, and Patching.”

**Effects**

When you apply VST or Audio Unit effects to a track from the Effects Library, those effects appear here. Clicking the Plus button opens a drop-down menu with which you can apply any VST or AU effects installed on your machine to that track.

Moving the pointer over the plus to add effects

Hovering the mouse over any listed effect reveals controls for enabling/disabling each effect, opening an effect’s custom controls, and deleting that effect.

Moving the pointer over an effect reveals controls for that effect

For more information on using audio effects, see Chapter 152, “Audio Effects.”
Insert

Enables the routing of effects from Blackmagic audio interface hardware to outboard effects boxes and back again. This button can be toggled to enable/disable such routing.

EQ

Double-clicking exposes a four-band parametric equalizer with additional Hi and Lo Pass filters, that has both graphical and numeric controls for boosting or attenuating different ranges of frequencies of audio on each track. You can select from among four types of EQ filtering from the Equalizer Type drop-down menu, with options for Earth (the default), Air, Ice, and Fire. Each band has controls for the filter type (Bell, Lo-Shelf, Hi-Shelf, Notch), Frequency, Gain, and Q-factor (sharpness of the band), with the available controls for each band of EQ changing depending on the filter type.

The channel strip EQ window

When a channel strip’s EQ is enabled, the EQ button displays the equalization curve that’s being applied. This indicator cannot be adjusted, you must open the EQ window to make modifications.

The channel strip’s EQ indicator,
(Left) EQ is adjusted, (Right) EQ is detent

Master EQ Controls

The Equalizer window has the following overall controls:

- **Enable button**: Turns the overall EQ effect off and on, without resetting the controls.
- **Reset button**: Resets all controls of the EQ window to their defaults.
- **Equalizer Type**: Changes the EQ control functionality to emulate different EQ characteristics from “classic” mixing consoles. There are four options:
  - **Earth**: (Default) Native Fairlight controls
  - **Air**: Emulates the SSL 4K
  - **Ice**: Emulates the Neve V
  - **Fire**: Emulates the Focusrite

- **Gain fader**: A post-EQ level control that lets you boost or attenuate the signal to compensate for the EQ adjustment you’re making raising or lowering the level.

### Graphical EQ Controls

A graph at the top shows a curve with handles that correspond to each of the enabled EQ bands listed below. You can drag any numbered handle to boost or attenuate the range of frequencies governed by that band, using whatever type of equalization that band has been set to.

![The EQ graph with user-draggable handles](image)

Dragging the numbered handles on this graph in turn modifies the parameters of the corresponding band, and changing each bands parameters will also alter the EQ graph, which serves the additional purpose of providing a graphical representation of the equalization being applied to that track.

### Bands 1 and 6

The outer two sets of band controls let you make high-pass and low-pass adjustments, if necessary. They’re off by default.

![The Band 1 and 6 controls](image)

- **Band enable button**: Turns each band of EQ on and off.
- **Band filter type**: Bands 1 and 6 can be switched among four specific filtering options for processing the lowest or highest frequencies in the signal. These include (from top to bottom) Hi-Shelf, Hi-Pass, Lo-Pass, and Lo-Shelf.
• **Frequency:** Adjusts the center frequency of the EQ adjustment
• **Gain:** Adjusts the amount by which the affected frequencies are affected. Negative values attenuate those frequencies, while positive values boost those frequencies.

### Bands 2–5

The middle four sets of band controls let you make a wide variety of equalization adjustments. They’re on by default, to make it easy to begin making adjustments.

![The Band 3 controls](image)

*Band enable button:* Turns each band of EQ on and off.
*Band filter type:* Bands 2–5 can be switched among four different filtering options (from top to bottom) Lo-Shelf, Bell, Notch, and Hi-Shelf

• **Frequency:** Adjusts the center frequency of the EQ adjustment
• **Gain:** Adjusts the amount by which the affected frequencies are affected. Negative values attenuate those frequencies, while positive values boost those frequencies.
• **Q Factor:** Adjusts the width of affected frequencies. Lower values include a wider range of frequencies, higher values include a narrower range of frequencies

### Dynamics

Double-clicking exposes a set of dynamics controls with three sets of controls corresponding to an Expander or Gate, a Compressor, and a Limiter that can be used separately or in concert to manage the dynamics of the audio on that track.
When you enable whatever combination of dynamics controls you need for that track, the dynamics graph updates with curves that show you how the signal is being affected by the Expander or Gate, Compressor, and/or Limiter settings that are being applied.

The dynamics graph shows how the signal is being affected by the current settings.

With these dynamics enabled, the Dynamics button on the channel strip displays these curves, so you know what’s happening to that channel. This indicator cannot be adjusted, you must open the Dynamics window to make modifications.
Master Dynamics Controls

The Dynamics window contains the following overall controls at the top of the window:

- **Reset button**: Resets all controls of the EQ window to their defaults.
- **Make Up fader**: A post-Dynamics level control that lets you boost the signal to compensate for dynamics settings that have lowered the level.

Expander/Gate

The first of three sets of dynamics parameters, these controls can be switched between expansion and gating. Expansion emphasizes differences in volume by lowering the level of soft parts of the signal relative to the level of louder parts, and can be used to minimize noise while increasing the dynamic range of a signal. Gating reduces the level or even silences parts of a signal that fall below a certain level threshold in order to reduce or eliminate noise in quiet parts of a recording.

- **Expander**: A button that lets you enable these controls and switch them to perform expansion.
  - **Threshold**: Sets the signal level below which gain reduction occurs. Defaults to –35dB. The range is from –50 to 0dB.
  - **Range**: Unused for expansion.
  - **Ratio**: Sets the gain reduction ratio (input to output) that's applied to signals which fall below the threshold level. Defaults to 1:1. The range is 1.0:1 to 10:1.
  - **Attack**: Adjusts how quickly the sidechain detector applies expansion when a signal exceeds the threshold. Defaults to 1.4mS (milliseconds). The range is 0 to 100mS.
  - **Hold**: Keeps dynamics from being triggered again until a certain amount of time has passed, in mS. Defaults to 0mS. The range is from 0 to 4000mS.
  - **Release**: Adjusts how quickly or gradually the sidechain detector stops applying dynamics when a signal goes back below the threshold. Defaults to 93mS. The range is 0.03 to 4.03mS.

- **Gate**: A button that lets you enable these controls and switch them to perform gating.
  - **Threshold**: Sets the signal level below which gain reduction occurs. The range is from –50 to 0dB.
  - **Range**: Sets the maximum amount of gain reduction that will be applied when the signal falls below the gate threshold. Once the signal has fallen below the level determined by the gate threshold minus the gate range, no gain reduction is applied. The default is 18. The range is from 0 to 60.2dB.
  - **Ratio**: Unused for gate.
  - **Attack**: Adjusts how quickly the sidechain detector applies gating when a signal exceeds the threshold. Defaults to 1.4mS. The range is 0 to 100mS.
  - **Hold**: Keeps dynamics from being triggered again until a certain amount of time has passed, in mS (milliseconds). Defaults to 0mS. The range is from 0 to 4000mS.
  - **Release**: Adjusts how quickly or gradually the sidechain detector stops applying dynamics when a signal goes back below the threshold. Defaults to 93mS. The range is 0.03 to 4.03mS.
Compressor

The second set of dynamics parameters let you apply compression, which detects the envelope of an audio signal in order to automatically change its level. Typically used to detect and reduce the peaks of an audio signal so that the overall level can be boosted without clipping, thus reducing the dynamic range of a given signal. Compression is often used to allow voices to have more presence within a mix, and to smooth out changes in the levels of tracks with too much dynamic range for the task at hand.

- **Compressor**: A button that lets you enable compression.
  - **Threshold**: Sets the signal level above which compression is applied. The default is −15dB. The range is −50 to 0dB.
  - **Ratio**: Adjusts the compression ratio. This sets the gain reduction ratio (input to output) applied to signals which rise above the threshold level. The default is 2.0:1. The range is 1.0:1 to 10:1.
  - **Attack**: Adjusts how quickly the sidechain detector applies compression when a signal exceeds the threshold. The default is 1.4mS (milliseconds). The range is 0 to 100mS.
  - **Hold**: After the attack phase has been completed, the Hold parameter controls how long this initial attenuation is maintained, before entering the release phase. Defaults to 0mS. The range is from 0 to 4000mS.
  - **Release**: Adjusts how quickly or gradually the sidechain detector stops applying dynamics when a signal goes back below the threshold. The default is 93mS. The range is 0.03 to 4000mS.

- **Send**: Enable Send when you want to use the audio levels of the currently selected track to attenuate those of another track using sidechain compression. For example, you can turn on the compressor and enable Send for all tracks with dialog, in order to use those levels to attenuate the levels of another track containing music.

- **Listen**: Enable Listen when you want to use the audio levels of tracks that you set to Send to attenuate the levels of the currently selected track. If there are no tracks with Send enabled, then the current track is compressed as usual, using itself as the sidechain.

The following procedure shows how to set up a Compressor to automatically attenuate, or “duck” a music track whenever someone speaks in clips on one or more other tracks of the Timeline.

**To use sidechain compression to automatically “duck” music in the presence of dialog on other tracks:**

1. Edit dialog into one track of the Timeline, and edit overlapping music into another track of the Timeline.
2 Click the track header or channel strip of a track with dialog to select that track, and then double-click the Dynamics indicator on the channel strip to open the Dynamics window.

3 Turn on the Send button to automatically send all levels from that track to the sidechain of a Compressor on another track (it’s not necessary to turn on Compressor for this). If you hover the pointer over the Send button, a tooltip will show you which tracks of the current timeline are set to Send.

4 If you have multiple tracks with dialog, you can repeat steps 2-3 for each so that the output levels of all dialog are sent to the sidechain.

5 Next, click the track header or channel strip of a track with music to select that track. If you haven’t closed the Dynamics window, the header will show you that the Dynamics controls are now those of the newly selected track.

6 Turn on Compressor, and then turn on the Listen button to automatically feed all “sent” levels to the sidechain of the Compressor on this track. If you hover the pointer over the Listen button, a tooltip will show you which tracks of the current timeline are set to Listen.

7 At this point, you need to lower the Threshold and raise the Ratio controls to the appropriate levels so that as dialog is heard, the music is compressed to be less loud. You may also want to raise Hold so this gain reduction doesn’t fluctuate too wildly, and raise Release so the volume adjustment doesn’t end too abruptly.
If you’ve set this up correctly, then during playback the Sidechain meter should show the levels of the dialog tracks with Send enabled, and the Gain Reduction meter should show you how much the gain of the music track is being reduced when triggered by the dialog being fed to the Sidechain.

As a result, you should hear that whenever speech plays, the music volume is automatically lowered. Adjust Threshold and Ratio to set the amount of this gain reduction, and adjust Attack, Hold, and Release to set how quickly gain reduction responds to changes in the Sidechain level (as defined by the Send levels).

**Limiter**

The third set of dynamics parameters let you apply limiting, which imposes a hard limit on the maximum level allowed for a particular signal.

- **Limiter:** A button that lets you enable Limiting.
  - **Threshold:** Sets the maximum allowable output level. The default is –21dB. The range is from –50 to 0dB.
  - **Attack:** Adjusts the attack rate time constant of the sidechain detector. The default is 0.71mS. The range is 0 to 100mS.
  - **Hold:** Keeps dynamics from being triggered again until a certain amount of time has passed, in mS (milliseconds). Defaults to 0mS. The range is from 0 to 4000mS.
  - **Release:** Adjusts how quickly the sidechain detector stops applying dynamics when a signal goes back below the threshold. The default is 90mS. The range is 0.03 to 4.03mS.

**Aux**

Lets you route that track’s channels through an Aux send bus. Each Aux bar corresponds to a specific Aux bus that you created. Double-clicking any of these bars opens up the Auxiliaries window, with which you can enable or disable auxiliaries, set each one to be routed pre the channel strip or post the channel strip (the default), and set the send level and pan value for each Aux bus. The controls for multiple Aux buses appear stacked within a single window.

Each Aux bus you create exposes the following controls in the Auxiliaries window:

- **On:** Turns that Aux send on or off.
- **Pre:** Switches that Aux send to be processed either pre or post fader. Turning this button on enables that track to send levels to the Aux bus before level adjustments on that track are applied. One common use of this is to enable a plug-in applied by the
Aux bus to continue to produce a “wet” version of that track’s audio while the mixing level is set all the way down, while raising the mixing level up mixes a “dry” version of the audio track against the “wet” levels produced by the Aux bus effect. For example, with Pre turned on you could slowly mix fade the original track level up over time over an Aux bus with a Delay effect to create the illusion that the echos of someone talking down a long hallway are giving way to a character’s own voice as they walk closer to the microphone.

- **Send Level**: Adjusts the amount of signal sent from the selected feed to the auxiliary bus. The range is OFF to +10dB.
- **Pan**: Provides panning across stereo Aux bus destinations.

The level to which you set an Aux bus will be shown within the bar that represents that Aux bus in the Mixer’s channel strip.

The Auxiliaries levels shown in the channel strip of the Mixer

**Pan**

The Mixer provides access to two kinds of pan controls, depending on whether you’re doing stereo and surround or 3D positioning in your mix.

**The Stereo and Surround Pan Controls**

A Pan control that’s compatible with stereo and surround panning. You can drag the panning handle within this control to adjust panning for stereo or surround mixing, or you can double-click this control to expose a large Pan window. What controls are available in the Pan window depend on the mapping of the audio track, but both stereo and surround panning controls are available, with corresponding numeric controls. You can either adjust panning using the graphical Pan control, or you can adjust specific panner characteristics using the controls to the left.

The Pan control window
When a channel strip's Pan control is enabled, the Pan area displays the panning that's being applied. Unlike the EQ or Dynamics controls, you can adjust a channel's panning by dragging the handles that appear within this small area of the channel strip.

The channel strip's Pan indicator

The Audio Pan window contains the following controls:

- **Left/Right:** Changes the balance of signal between the left and right side speakers you're outputting to, depending on what speaker format you're mixing to. At its simplest, accommodates stereo output.

- **Front/Back:** Changes the balance of signal between the front and back sets of speakers you're outputting to, depending on what speaker format you're mixing to.

- **Rotate:** Simultaneously adjusts the left/right and front/back pan controls in order to rotate a surround mix about the centre of the room.

- **Spread:** Only available when a linked group of mono tracks is selected. Spread adjusts the perceived size of a surround mix.

- **Divergence:** Spreads the signal for an individual feed across more of the adjacent loudspeakers, making the perceived size of the sound source larger.

- **Boom:** The send level of that track to the LFE part of the mix.
  - **On:** Enables this functionality.
  - **Pre:** Lets you adjust the “dry” part of the signal separately from the “wet” part of the signal when effects are applied.

**The 3D Audio Pan Controls**

Option-double-clicking on the Pan control of the Mixer opens an alternate 3D Audio Pan window. Whereas the regular Pan window lets you do stereo and conventional 5.1 and 7.1 surround panning, the 3D Audio Pan window lets you do the kind of spatial audio positioning enabled by advanced surround formats such as Auro 3D and NHK 22.2 (more information about specific support for these and other formats will come later).
The 3D Audio Pan window has a few more controls than the ordinary Pan window:

- **Pan enable:** Toggles the entire panning effect on and off.
- **Panner viewer:** A large 3D representation of the listener’s perceived sound stage, with a blue sphere that represents the position of the track’s audio being positioned within that space, which casts a shadow straight down on the floor and projects a blue box on the four walls of this space to indicate its position more concretely.
- **Front panner:** A 2D panning control that represents the horizontal left/right axis and the vertical up/down axis, letting you make these specific spatial adjustments.
- **Side panner:** A 2D panning control that represents the horizontal front/back axis and the vertical up/down axis, letting you make these specific spatial adjustments.
- **Top panner:** A 2D panning control that represents the horizontal left/right axis and the vertical front/back axis, letting you make these specific spatial adjustments.
- **Left/Right:** A 1D knob that changes the balance of signal between the left- and right-side speakers you’re outputting to, depending on what speaker format you’re mixing to.
- **Front/Back:** A 1D knob that changes the balance of signal between the front and back sets of speakers you’re outputting to, depending on what speaker format you’re mixing to.
- **Rotate:** A 1D knob that simultaneously adjusts the left/right and front/back pan controls in order to horizontally rotate a surround mix about the center of the room.
- **Tilt:** A 1D knob that simultaneously adjusts the left/right and up/down pan controls in order to vertically rotate a surround mix about the center of the room.
- **Spread:** Only available when a linked group is selected. Spread adjusts the perceived size of a surround mix.
- **Divergence:** Spreads, or bleeds, the signal of an individual feed across the adjacent loudspeakers, making the perceived size of the sound source larger. A 2D button lets you set how this is done. With the 2D button turned off, divergence creates a one-dimensional bleed between the left/right planes only. With the 2D button turned on, divergence creates a two-dimensional bleed between both the left/right and front/back planes of sound.
- ** Boom:** The send level of that track to the LFE part of the mix. An On button enables this functionality, while a Pre button lets you adjust the “dry” part of the signal separately from the “wet” part of the signal when effects are applied.

### Bus Assignment Buttons

Two sets of buttons let you route audio from one channel strip’s output to Sub and Main buses that you’ve set up for your mix.

![Bus Assignment Buttons](image)

- **Main:** These buttons let you assign a track or Sub’s channels to one or more of the main busses.
- **Submix:** These buttons let you assign that track’s channels to one or more submix busses.
Fader Groups (VCA Groups)

You can assign multiple faders to a Fader Group, also referred to as “VCA group,” which is controlled by a dedicated group channel strip that appears at the right of the mixer. Fader Groups let you simultaneously adjust multiple faders using one group fader, for instances where that will help you manage the levels of complex collections of audio tracks.

The controls for doing this are found in the Group label area of each control strip, which also display which group each fader has been assigned to.

Making Fader Group Assignments

You can assign any fader to one of 16 groups by right-clicking the group label area and choosing a group from the drop-down that appears. If a fader is already assigned to a group, you can choose “No Group” to remove it.
Using Fader Groups

Once you’ve assigned multiple faders to a group, a dedicated channel strip for that group appears. Making adjustments to the group channel strip simultaneously controls all the faders, solo buttons, and mute buttons of all channel strips that are members of that group, as seen below.

Adjusting the Group 1 fader also adjusts the faders for Audio 1, 3, and 4 that are assigned to that group.

While in a group, you can still move the faders of each individual channel strip independently to make relative adjustments. Channel strip faders only move together when you adjust the group fader, and while the group fader is being moved, each individual fader’s relative offset from other faders in that group is maintained, as seen in the previous screenshot, where the Group 1 fader is moving the faders in tracks Audio 2, 3, and 4, but each individual channel strip fader in this group is offset from the others.

Recording Fader Automation for Groups

You can record automation data to the group fader, and all faders in that group will follow even though they’re not actually automated themselves. This makes it easy to record complex automation involving multiple faders when you still might want the freedom to finely adjust each individual fader later on.

Arm, Solo, and Mute Buttons

Identical to the controls found in the track header controls of each timeline audio track.
• **Record Arm:** (highlights red when enabled) Lets you enable a track to be recorded onto.

• **Solo:** (highlights green for Solo, blue for Solo Safe) Lets you mute all other tracks in order to play a track you need to focus on in isolation. If solo is enabled for multiple tracks, all soloed tracks will play, and all non-soloed tracks will be muted. This affects rendering, so if one or more tracks are soloed, the muted tracks won’t be output or rendered.
  
  - **Solo Safe:** Command-Option-click a Solo button to put it into “Solo Safe” mode. Tracks set to Solo Safe, in which the Solo button is highlighted in blue, always play even if Solo is enabled for other tracks. This is good for tracks you want to continue listening to for reference even as you solo other specific tracks you want to pay more attention to.

• **Mute:** (highlights orange when enabled) Turning on Mute disables audio playback from that track. This affects rendering, so if one or more tracks are muted, they won’t be output or rendered.

**TIP:** You can click a button and drag across multiple channel strips to turn that button on or off for multiple tracks easily.

---

**Fader Controls**

Each track’s vertical fader lets you control the level that’s output by that track, either using your mouse, or using the physical fader of your Fairlight console. If you’re working with a console, then the onscreen faders serve as a visual reference of what levels are set.
- **dB**: Shows you the volume, in decibels, that track is currently set to.
- **Fader**: Each track’s vertical fader can be dragged with your mouse or other pointing device to adjust the volume of that track and perform automation recording. Dragging up increases volume, dragging down decreases volume. Fader handles turn red while you record levels automation, and they turn green when automation has been recorded for that track.

**Methods of adjusting channel faders:**
- **To change the level of that channel with the mouse**: Click and drag any fader up or down.
- **To reset the level of that channel to 0 dB**: Double-click a fader’s handle. This does not work after you’ve recorded automation for a track.

### Bouncing Audio

Bouncing audio refers to mixing and rendering audio from one or more Timeline tracks onto another track of the Timeline, in the process “baking in” processor intensive effects and complicated or intricate audio edits to create a new continuous piece of audio media that’s written to the directory location specified by the “Save clips to” field of the Capture and Playback panel of the Project Settings.

There are two commands available for bouncing audio on the Fairlight page when you hit the wall with how many tracks and effects you can mix in real time.
- Timeline > Bounce Selected Tracks to New Layer
- Timeline > Bounce Mix to Track

#### To use Bounce Selected Tracks to New Layer:
1. Set In and Out points to define the range of the Timeline you want to bounce. If you don’t do this, nothing will happen.
2. Command click the track headers or mixer channel strips of all tracks you want to bounce in order to select them.
3. Choose Timeline > Bounce Selected Tracks to New Layer.
   - The audio on each track is processed and rendered and appears as the top layer of audio on that track. While View > Show Audio Track Layers is turned off, it will appear as if the new bounced audio is the only clip on that track. However, the original audio with live effects is still available as the bottom of the stack of layered audio on that track, and turning View > Show Audio Track Layers on will show this. The bounced audio is a new audio media file that’s written to the directory location specified by the “Save clips to” field of the Capture and Playback panel of the Project Settings.

#### To use Bounce Mix to Track:
1. Choose Timeline > Bounce Mix to Track. The Bounce Mix to Track window appears, showing each main, submix, and auxiliary that’s currently available.
2. In the Destination Track column, set which mixes you want to bounce by choosing either New Track, or choosing a specific existing track from the drop-down menus.
3. Click OK.
The specified mix is processed, mixed, and bounced to the specified track as a new piece of audio. This creates new audio media that's written to the directory location specified by the “Save clips to” field of the Capture and Playback panel of the Project Settings.

**TIP:** There’s also a Bounce Audio Effects command in the contextual menu of audio clips in the Timeline that have audio plug-ins applied to them. For more information, see Chapter 158, “Audio Effects.”

---

**Third-Party Control Panel Support for Mixing**

DaVinci Resolve supports HUI- and MCU-compatible third-party mixing control panels with up to eight faders, such as the Mackie MCU Pro Control Surface, connected via USB MIDI, and selectable in the Control Panels panel of the Resolve System Preferences. Supported basic panel controls that correspond to Fairlight features at the time of this writing include the following.

**Transport controls including:**
- Rewind (REW)
- Fast Forward (FF)
- Stop (double-press the Stop button for Home in the Timeline)
- Play (double-press the Play button to "play again")
- Record (press Record+Play to begin recording if one or more tracks is record-enabled)
- Jog control (Press SCRUB and rotate the jog wheel)

**Channel Strip controls including:**
- Rotary controls for panning, with Rotary Value display and Rotary touch
- Alphanumeric Track Name display
- Record button to record-enable tracks (only works if an input is patched to a track input)
- Solo, with a double-press selecting or de-selecting that track
- Mute
- Select to select the track corresponding to that channel strip
- Fader control and optional Level display
- Channel and Fader Bank buttons to move left and right among banks of channel strips
- Double-press the Fader Bank Left button to move the playhead Home in the mixer (track 1)
- Double-press the Fader Bank Right to move to the Master channel strips
Marker buttons:
- Marker to add a marker
- Pressing the Marker+Stop buttons sets Home
- Pressing the Marker+FF/REW buttons jumps the playhead forward or backward

Additional supported controls for control panels that have them include:
- Master Solo clear/restore
- Undo (pressing the Undo+Option buttons does Redo)
- Arrows to move the selection
- Zoom horizontal and vertical controls
- Audio Tracks, to turn Automation On/Off
- Write/Trim/Touch/Latch switches
- Nudge controls
- Cut, Copy, and Paste

Monitoring controls include:
- Level control
- Dim
- Mute
- Alt Speaker

For more information on third-party mixing control panel support, see the Blackmagic Support site at https://www.blackmagicdesign.com/support/family/davinci-resolve-and-fusion.
Chapter 157

Automation Recording

The Fairlight page provides simple, flexible, and comprehensive facilities for recording and editing mix automation data. Once recorded, all feed and bus mix parameter automation can be played back in perfect synchronization with the audio, including channel parameters, bus assignments, inserts, and direct outs.

The Fairlight page is designed to allow the operator to record every static and dynamic parameter change you make in the process of balancing the mix of tracks in the timeline. Mixer adjustments may be recorded for one or multiple parameters or channels at a time. Additionally, more adjustments may be added with each automation recording pass, which lets you create complex and detailed mixes that can be frame-accurately replayed at will.

This chapter covers automation mixing using the combined controls of the onscreen mixer and timeline. For more information on basic mixing operations, see Chapter 156, “Mixing in the Fairlight Page.”

Automation Recording

While the recording of keyframe automation is most commonly associated with either the onscreen mixer or the Fairlight console, you can also record automation using controls found in the Inspector, or using the controls of the EQ, Dynamics, and Pan windows, thereby enabling you to record automation for the various audio effects that you’ve applied to a track.

Recording automation refers to creating high-fidelity data that records changes you make to onscreen controls and/or Fairlight console controls, in real time as the Timeline plays, that will then control how those parameters will play back. In this way, you can create a dynamic mix where different audio level, pan, and EQ, dynamics, and other audio filter settings change over time to fade swells of music up and down, pan the sound effect of a car driving by from the left to the right speaker, or slowly increase the strength of a reverb effect applied to foley footsteps as a character walks into a long, dark cavern.

What You Can Automate

You can record automation for nearly every control in the mixer for channel strips corresponding to individual tracks, track groups, or busses, including the fader. Additionally, you can record automation for controls found in audio plug-ins that you use in your mix.

Automation Controls

The automation button, to the right of the transport controls, lets you show and hide the Automation toolbar.

Clicking the Automation button displays the automation toolbar

The Automation toolbar has buttons for each option that’s available for preparing to record automation in your mix.

Options found in the Automation toolbar

The Automation toolbar displays the following options:

- **Automation**: Controls how automation data is recorded.
  - **Write**: Records absolute changes to control automation.
  - **Trim**: Records relative changes to control automation in order to increase or reduce levels that have already been recorded.
- **Touch**: Defines what happens when you first adjust an automatable control.
  - **Off**: No automation is recorded.
  - **Latch**: Automation is recorded once you begin moving a control and continues recording after you release the control.
  - **Snap**: Automation is recorded once you begin moving a control and stops recording after you release the control; there is a brief interpolation from the last level you set to the prior recorded level.
• **On Stop:** Defines what happens when you release an automatable control.
  – **Event:** The last recorded automation value overwrites previous levels to the start of the next available recorded automation data (or event) in that track.
  – **Hold:** Deletes all previously recorded mixing data after what you’ve just recorded, to hold the last recorded level for the rest of that track.
  – **Return:** The last recorded automation value is interpolated to ramp back to the previously recorded automation values on that track.

• **Enables:** The following buttons let you enable or disable different controls for recording automation.
  – **Fader:** Automates track and bus volume.
  – **Mute:** Automates the mute button.
  – **Pan:** Automates all pan controls.
  – **EQ:** Automates all EQ controls.
  – **Comp:** Automates just the Compressor controls in the Dynamics window.
  – **Gate:** Automates just the Gate controls in the Dynamics window.
  – **Lim:** Automates just the Limiter controls in the Dynamics window.
  – **Aux:** Automates the Auxiliary controls in the Auxiliaries window.
  – **Plug-ins:** Automates all plug-ins.
  – **Misc:** Automates the parameters of VST and Audio Unit plugins.

**How to Record Automation**

There are two different ways you can set up the recording of automation for levels, panning, EQ, Dynamics, and other audio controls in the mixer.

**Recording Automation for Multiple Tracks**

You can use the following steps to record automated changes to any audio control in any control strip:

1. Open the Automation toolbar, and do the following three preparatory steps:
   a. Choose whether you’re going to write new automation, or trim automation that’s already recorded. Write mode is appropriate when you’re recording automation for the first time, or when you’re overwriting previous automation with brand new values. Trim mode is appropriate when you’re making incremental changes to previously recorded automation.
   b. Next, choose Touch and On Stop behaviors that are appropriate for the kind of automation recording you need to do.
2. Move the playhead to the beginning of the section of the timeline you want to record automation for.
3. Next, initiate playback using any method (Spacebar, L, Play button, third-party or Fairlight audio control panel), and make whatever adjustments you want to the controls for which you’ve enabled automation recording. As you make adjustments, the affected fader control turns red to let you know you’re recording automation.
4. When you’re finished, stop playback using any method (Spacebar, K, Stop button, third-party or Fairlight audio control panel). Automation recording stops as well.
Recording Automation for Specific Individual Tracks

You can use the following steps to record automated changes to controls in specifically armed control strips:

1. Open the Automation toolbar, and do the following three preparatory steps:
   a. Choose whether you’re going to write new automation, or trim automation that’s already recorded. Write mode is appropriate when you’re recording automation for the first time, or when you’re overwriting previous automation with brand new values. Trim mode is appropriate when you’re making incremental changes to previously recorded automation.
   b. Next, set Touch to Off, which disables across-the-board automation recording and requires you to arm specific tracks that you want to automate.

2. Click the automation arm button above the fader of any Mixer track to which you want to record automation. Even though the Touch control is set to off, moving a control on an armed channel strip will record automation in Latch mode.

3. Move the playhead to the beginning of the section of the timeline you want to record automation for.

4. Next, initiate playback using any method (Spacebar, L, Play button, third-party or Fairlight audio control panel), and make whatever adjustments you want to the controls for which you’ve enabled automation recording. While you make adjustments, the affected fader control turns red to let you know you’re recording automation. If you’re displaying the same automation data in the Timeline that you’re recording, you can see the new automation being drawn in real time, in red.
When you’re finished, stop playback using any method (Spacebar, K, Stop button, third-party or Fairlight audio control panel). Automation recording stops as well. Displayed automation turns green once recording has stopped.

If you don’t like what you’ve done, you can undo and start over, or you can edit the automation using methods described later in this chapter. Or, you can back the playhead up and overwrite automation at any time with new automation.

### Automation Preview Mode

Preview is an additional mix automation workflow, specifically for working across scene-based material. When enabled, mix items that are in preview are not controlled by pre-recorded automation, so they respond manually to their controls. These can subsequently be placed into write (or trim) to write actual automation.

Typically, Preview mode is used to audition new mix settings for one particular section of a timeline, while other sections already have recorded automation data. Preview mode prevents pre-recorded automation from moving the controls the user is trying to adjust in the targeted section. As soon as the user is happy with the new adjustments, they can be written to the targeted section.

Preview mode frees the faders (and other controls) from automation control, and lets you move them while you experiment with different levels and settings. Ordinarily, moving one or more controls implies writing automation data for those controls, but entering Preview mode lets you play with the controls as much as you like without committing to anything, only writing automation data when you’re ready.

To engage the Preview state on enabled mix items, first enter Preview mode by doing one of the following:

- Toggle Preview in the Automation toolbar.
- Press the Preview key on the Mix page of the Fairlight controller.

Once Preview is engaged:

- Individual parameters can be switched into Preview Touch Latch.
- You can use the AUTO key next to a fader to preview all enabled parameters on a channel.
- You can use the Auto button on the screen mixer strips.

When you’re in Preview mode, all parameters in Preview are indicated by a BLUE automation indicator.

Once in Preview mode, mix items can be placed into write (or trim) by:

- Dropping in manually via the “Punch In” menu item.
- Dropping in manually with the In key on the Fairlight controller.
- Automatically using the Active In and Out points on the Fairlight controller.

Once enabled for Preview, parameters remain in that state regardless of transport starts and stops. This is different from putting mix items into WRITE, which must be done again after each transport stop.

Other Preview-related operations include:

- Filling a range defined by In and Out points with all parameters currently in Preview.
- Gliding all parameters from their existing values at the Range In point to the Preview values at the Range Out point.
Viewing Automation in the Timeline

Once you’ve recorded automation keyframes for a particular parameter, they can be made visible in an automation graph in the Timeline. While the automation controls are visible, an additional pair of controls appear in the header of each audio track. A drop-down lets you choose which automation waveform to view, with options for Fader, Mute, Pan, EQ, Compressor, Limiter, Aux, and Plugins controls.

![Mixing automation for the Fader shown in the Timeline](image)

At the time of this writing, automation data cannot be cut, copied, or pasted.

Overwriting Automation

Once you’ve recorded automation for a particular clip, you can overwrite that automation in subsequent passes. Using either of the previously described methods of recording automation, adjusting the levels of a track control with previously recorded automation displays a red line that shows the new level relative to the previously recorded level.

![Setting new levels to overwrite previously recorded automation displays a red line](image)

Pressing play to actually record this new automation will overwrite the previous levels at this new value.

![New automation overwrites the previous levels](image)
Editing Automation

When the automation toolbar is displayed, two additional tools appear in the regular toolbar. From left to right, these are the Pencil and the Select Range tools. These tools let you edit automation in different ways.

The Pencil and Select Range tools appear when you open the Automation toolbar

Drawing Automation Keyframes

You can use the pencil tool to literally draw new automation curves in the Timeline for whichever parameter’s automation data is visible. This can be a good way to smooth out ragged sections of automation without needing to re-record everything you did.

Simply click the Pencil tool, choose the automation data you want to edit in a track of the Timeline using the drop-down menu in the track header, and then click and drag to draw a new curve. While you’re drawing, the new curve appears in red, while the old curve appears in green, to help you see what you’re doing. When you’re finished, release the pointer button and the automation curve will be redrawn.

Using the Pencil tool to smooth out a section of automation

Adjusting and Deleting Automation Keyframes

The Select Range tool lets you adjust automation in two different ways.

Adjusting Individual Keyframes

Using the Select Range tool, you can click and drag any automation keyframe up or down and left or right (bounded by its neighboring keyframes) to adjust it directly. When zoomed in, this can be an effective way of making minute adjustments to troublesome keyframes. The segment of automation affected by the keyframe you’re dragging appears red to show you the new curve you’re creating, while the previously recorded curve remains green. When you release the pointer button, the new shape will be drawn.
Using the Select Range tool to adjust an automation keyframe

Adjusting and Deleting Multiple Keyframes

You can also use the Select Range tool to drag a bounding box to select multiple keyframes, in preparation for moving them or deleting them.

Once you release the box, that section of keyframes becomes highlighted.

Once it’s highlighted, you can drag the selection to move it, or you can press the Delete key to delete it. The remaining section of the curve flattens out to fit the first and last keyframe of the selection.

The newly flattened section of the automation curve after deleting the selected keyframes
Adding New Keyframes

You can also use the Select Range tool to add new keyframes to an automation curve. However, these are not Bezier keyframes, so they only let you create a single level adjustment at that frame. If you make a large adjustment with only a single new keyframe, you’ll end up with a squared off section of automation. For this reason, adding new keyframes should only be done when making small adjustments, unless you intend to create an abrupt change.

Playing Automation

After you’ve automated a mix, playing it back is as simple as moving the playhead to an area of the timeline prior to the recorded automation, and initiating playback. As the timeline plays, the onscreen controls for each automated parameter are shown in green, and move and update to show the recorded levels for those controls.
Audio plug-ins let you apply effects to the audio clips in your mix, such as echo or reverb, noise reduction, aural enhancement, click and pop removal, and so on. DaVinci Resolve is compatible with a wide variety of third-party VST and Audio Unit effects for audio processing, and these can then be used either in the Edit or Fairlight pages. This chapter goes through the different methods available for applying and customizing effects for clips and for tracks.

Elastic Wave Audio Retiming

Elastic Wave retiming is a fast and easy keyframe-based way of dynamically retiming audio, squishing and stretching different parts of a waveform to subtly retime audio playback for a variety of reasons, all while maintaining constant pitch. For example, if you’re using the audio from another take to replace that of the current take, but the performer’s timing is just a little bit different, you can use Elastic Audio to make small adjustments to retime the second performance to match the first.

To use Elastic Wave retiming on an audio clip:

1. In this example, two tracks of foley effects have been recorded, and the bottom one needs to be retimed to match the top one.

2. Right-click an audio clip and choose Elastic Wave retiming from the contextual menu to reveal the Elastic Wave retiming controls.

3. Command-click anywhere on the clip to add speed keyframes to parts of the waveform you want to retime by stretching or squishing. You can also place speed keyframes to lock parts of a waveform you don’t want to retime.
4 Dragging the speed keyframe to the left or right speeds up the audio on one side of the keyframe and slows down the audio on the other side of the keyframe, from that keyframe to the neighboring keyframes applied to that clip. Using an audio clip’s waveform as your guide, you can use multiple speed keyframes to match the waveform of one performance to the waveform of another, in order to make the timing match. Or, you can adjust speed keyframes freeform to manipulate performances or sounds for creative effect.

5 If you’ve made some speed keyframe adjustments, but you find yourself wishing a speed keyframe you created had been placed at a different position relative to the audio waveform being adjusted, you can hold the Command key down and drag any speed keyframe to move it closer to or farther away from a part of the waveform you want it to retime. This fine-tunes the audio retiming adjustment occurring at that point in the clip.

6 When you’re done, you can click the close button at the upper-left-hand corner to hide the Elastic Wave retiming controls.
To remove Elastic Wave retiming keyframes, do one of the following:

- **To remove a single speed keyframe:** Right-click on a speed keyframe and choose Remove Speed Keyframe from the contextual menu.
- **To remove all speed keyframes and eliminate the Elastic Wave retiming effect:** Right-click a clip and choose Reset Speed Curve.

**NOTE:** All Elastic Wave retiming adjustments you make in the Fairlight page appear in the Edit page as variable speed effects, accessible using the Retime controls. Be aware that while all Elastic Wave retiming effects can appear as Edit page retime effects, not all Edit page retime effects can appear as Elastic Wave retiming effects on the Fairlight page.

### About Audio Plug-Ins

Single or multiple plug-ins can be applied to clips and to tracks. A total of 96 mono channels of plug-ins can be applied (a stereo plug-in uses two of these channels, a 5.1-aware plug-in six channels, and so on). Plug-ins are accessed via each track’s control strip, or via the Inspector which provides access to both clip and track plug-ins.

**FairlightFX**

FairlightFX are a DaVinci Resolve-specific audio plug-in format that runs natively on macOS, Windows, and Linux, providing high quality audio effects with professional features to all DaVinci Resolve users on all platforms.

**VST and VSTi**

VST (Virtual Studio Technology) is an audio plug-in standard created by Steinberg. The VST standard allows third-party developers to create VST plug-ins for use within VST host applications, or to create VST host applications themselves. The VST plug-in standard is the most widespread audio plug-in standard in use today, with thousands of available plug-ins spanning the gamut from EQ and compression to reverb, denoising, de-essing, aural exciting, and much more.

The Fairlight page supports VST effects from Mono to 7.1 and beyond. These effects can be inserted on mono channels or Link Groups. If a stereo VST effect is inserted on a LCR, LCRS, or 5.1 Link Group, the left and right channels will be allocated to left and right Link Group channels automatically.

As of this writing, DaVinci Resolve supports VST version 2.4. VST effects are available on macOS and Windows workstations, but not on Linux.

**VST Effects versus VST Instruments (VSTi)**

A VST effect is a type of VST plug-in that is used to process audio. A VST effect might be a Reverb, Compressor, or EQ. VST Instruments are typically used to synthesize sound or play back sampled audio. VSTs have rapidly replaced hardware synthesizers and dedicated samplers due to their flexibility, repeatability, and low cost.
**Audio Units**

Audio Units are an audio plug-in API created by Apple. Similarly to VST, Audio Units (AU) can either process audio, or work as instruments. Audio Units are only available on macOS workstations.

**Using Audio Plug-Ins**

FairlightFX are pre-installed on all DaVinci Resolve installations. If you install additional VST or Audio Unit effects on your workstation, they appear in the Audio FX panel of the Effects Library, organized in separate categories.

Audio plug-ins in the Effects Library

You can click on the far right of any effect to flag it with a star as a favorite effect. When you do so, the favorited effects appear in a separate Favorites area at the bottom of the Effects Library Bin list, and it also appears at the top of the Effects button’s menu on the Mixer when you click the “plus” button.

Stars indicate a flagged favorite effect; all favorites are currently filtered

Audio plug-ins let you apply effects to individual audio clips or entire tracks worth of audio, to add creative qualities such as echo or reverb, or to take care of mastering issues using noise reduction, compression, or EQ.
Methods of applying audio plug-ins to clips on the Fairlight page:

- **To apply an audio filter to a clip:** Drag any filter from the Audio FX panel of the Effects Library onto the clip in the Timeline you want to apply it to.

- **To apply an audio filter to multiple clips:** Select all of the clips you want to apply an audio filter to, then drag any filter from the Audio FX panel of the Effects Library onto any of the selected clips.

When you apply an audio plug-in to a clip, a badge appears to the left of that clip’s name bar in the Timeline to let you know there’s an effect applied to it.

When you apply any kind of an effect to a clip in the Timeline, be it an adjustment in the Inspector or a plug-in you’ve applied, clips with that effect applied appear a darker shade of whatever color they are. Removing all effects from a clip (for example, using the Remove Attributes command) returns that clip to its original color. This makes it easy to see, at a glance, which clips have effects, and which clips don’t.

Methods of applying audio plug-ins to tracks on the Fairlight page:

- **To apply an audio filter to an entire track in the Timeline:** Drag any filter from the Effects Library onto the track header.

- **To apply an audio filter to a track or bus in the Mixer:** Drag any filter from the Audio FX panel of the Effects Library onto the clip in the Timeline you want to apply it to.
To apply an audio filter to a track or bus using the Mixer controls: Click the plus button in the channel strip of the track you want to apply an effect to, and then choose a filter from the drop-down menu that appears. All filters appear within categories to make them easier to find. If you’ve clicked the star button of any filters in the Effects Library to favorite them, these favorite filters appear at the top of the plus button’s drop-down list.

![Image of Mixer controls showing filter options]

**TIP:** The categories that audio filters are organized into in the Mixer can be edited in the audio plug-ins panel of the DaVinci Resolve System Preferences window. All plug-ins on a workstation are shown in the Available Plug-ins list, and clicking within the Category column lets you use a drop-down menu with which to change categories.

To edit a clip’s audio plug-ins:

- Select that clip and open the Inspector. All audio plug-ins applied to that clip appear under the volume and pan controls, with that filter’s controls appearing directly in the inspector.

To edit a track’s audio plug-ins, do one of the following:

- Click in the background of the Timeline header to select that track, and then open the Inspector. Click the custom UI button for that filter to open its controls.

![Image of custom UI button for audio plug-ins in the Inspector]

The custom UI button for audio plug-ins in the Inspector
• Move the pointer over the plugin’s name in the Effects area of the Mixer, and click on the custom UI button to open its controls.

The custom UI button for audio plug-ins in the Mixer

Nearly all FairlightFX, VST, and Audio Unit audio plug-ins have a custom user interface that makes it much easier to manipulate that filter’s controls. These can be opened from within DaVinci Resolve.

The custom audio filter interface for iZotope RX4

Methods of working with audio plug-ins in the Inspector:

• To rearrange the order of multiple video filters applied to a clip: Click the move up or move down buttons in any filter’s title bar, to the left of each filter’s Trash Can button.
• To disable or re-enable a filter: Click the toggle button at the far left of each filter’s title bar.
• To remove a filter: Click the Trash Can button.
• To reset any filter parameter: Click the Reset button at the far right of the parameter you want to reset.
• To open or collapse a filter’s parameters: Double-click the title bar.
• To open or collapse the parameters of all filters: Hold the Option key down and double-click any filter’s title bar.

Once applied to a clip or track, audio plug-ins can also be keyframed or automated just like volume and pan settings, to create dynamic audio effects that change over time.
Applying Audio Plug-Ins to Buses

You can apply audio plug-ins to Main and Sub buses just like any other track, with which to apply any audio mastering effects operations you require to individual submixes, or even to an entire main.

Dealing With Processor Intensive Plug-Ins

As you apply more and more plug-ins directly to clips in complicated mixes, you may discover you lack the processing power to play all audio tracks and effects in real time. When this happens, there are two ways you can ease the burden that audio clip effects are placing on your workstation.

Caching Audio Clips With Plug-Ins

One quick fix is to manually enable the caching of one or more selected audio clips with audio effects applied to them to improve your project’s performance. Once an audio clip is cached, all plug-in effects are "baked in" and that clip’s audio waveform updates to reflect the altered audio. Cached clips appear with a small badge to the right of the FX badge in the name bar of the clip.

A cache badge lets you know this audio clip has cached effects

This is a non-destructive operation that has no lasting effect on the source media of cached clips. You can still alter a cached clip’s plug-in parameters whenever you want. Opening the graphical controls of a cached clip temporarily suspends audio caching, and when you’re finished, the clip is automatically re-cached and its waveform is updated to reflect the change so long as Cache Audio Effects remains enabled.

To cache audio effects for one or more selected clips:

- Right-click an audio clip with a plug-in applied and choose Cache Audio Effects to enable audio effect caching for that clip. If you right-click one of multiple selected clips, you’ll enable Cache Audio Effects for all selected clips at once. Once enabled, that clip will be continue to be cached (and re-cached if you change the plug-in’s parameters) until you manually disable audio caching.

To disable audio caching for one or more selected clips:

- Right-click an audio clip that’s been cached and choose Cache Audio Effects to disable audio effect caching for that clip.
**Bouncing Audio Clips With Plug-Ins**

Another way of easing the burden of audio clip effects on your system is to bounce the effected clip to another layer. This creates a new piece of audio media with the effect “baked in,” which is written to the directory location specified by the “Save clips to” field of the Capture and Playback panel of the Project Settings.

**To bounce one or more selected audio clips with effects to another layer:**

- Right-click an audio clip with a plug-in applied and choose Bounce Audio Effects. If you right-click one of multiple selected clips, you’ll Bounce Audio Effects for each selected clip all at once. After bouncing an audio clip with effects, the original clip will be muted.

Bounced clips no longer have editable effects, but you can always choose View > Show Audio Track Layers to see the original underlying clip that still has the original plug-in effect applied, and you can unmute it, move it back up to the top, edit the effect, and bounce another version of the clip, which appears as the topmost layer.
FairlightFX are a DaVinci Resolve-specific audio plug-in format that runs natively on macOS, Windows, and Linux, providing high-quality audio effects with professional features to all DaVinci Resolve users on all platforms. Thirteen new audio plug-ins that can be used both in the Edit and the Fairlight page include a wide variety of plug-ins for repairing faulty audio, creating effects, and simulating spaces. This chapter explains what they do and how to use them.

Common Controls For All FairlightFX

Before going into the specific controls of each FairlightFX plug-in, there are some common controls that all plug-ins share, found at the top of the custom GUI window for each plug-in.

- **Presets**: A cluster of controls that let you recall and save presets specific to each plug-in.
  - **Add Preset button**: Click this button to save the current settings of the FairlightFX you’re using. A dialog lets you enter a Preset name and click OK.
  - **Preset drop-down menu**: All presets for the currently open plug-in appear in this menu.
  - **Previous/Next preset buttons**: These buttons let you browse presets one by one, going up and down the list as you evaluate their effects.

- **A/B Comparison**: A set of buttons that lets you compare two differently adjusted versions of the same plug-in. The A and B buttons let you create two sets of adjustments for that plug-in, and toggle back and forth to hear which one you like better. The arrow button lets you copy the adjustments from one of these buttons to the other, to save the version you like best while experimenting further.

- **Reset**: A single reset control brings all parameters in the current plug-in to their default settings.

Chorus

An effects plug-in. A classic Chorus effect, used to layer voices or sounds against modulated versions of themselves to add harmonic interest in different ways.

An animated graph shows the results of adjusting the Modulation parameters of this plug-in, giving you a visualization of the kind of warble or tremolo that will be added to the signal as you make adjustments.
Chorus has the following controls:

- **Bypass:** Toggles this plug-in on and off.

- **Input Format:** (Only visible when Echo is inserted on a multi-channel track.) Lets you choose how multiple channels are input to the echo. Stereo sets separate Left and Right channels. Mono sums Left and Right to both channels. Left inputs the Left channel only, and Right inputs the Right channel only.

- **Delay:** The amount of delay between the original sound and the Chorus effect.
  - **Delay Time:** Length of the Chorus delay lines.
  - **Separation:** Time separation of the delay voices.
  - **Expansion:** Sets L/R length differences, phase offset of modulators

- **Modulation:** These controls adjust the low frequency oscillator (LFO) that drives the tremolo of the chorus effect in different ways.
  - **Waveform:** Specifies the shape of the LFO that modulates the rate of the Chorus, affecting the timing of the oscillations. There are six options: Sine (smooth oscillations), Triangle (sudden oscillations), Saw1, Saw2 (jerky oscillations), Square (hard stops between oscillations), and Random (randomly variable oscillations).
  - **Frequency:** Rate of LFO controlling the Chorus. Lower values generate a warble, higher values create a tremolo.
  - **Pitch:** Amount of frequency modulation, which affects the pitch of the Chorus.
  - **Level:** Depth of level modulation. Affects the “length” of the segment of Chorus that’s added to the sound. Low values add only the very beginning of the Chorus effect, high values add more fully developed Chorus warble or tremolo.

- **Feedback:**
  - **Amount (%):** The percentage of signal fed back to the Chorus Delay Line. Values can be positive or negative, the default is 0 (no effect). Increasing this parameter adds more of the Chorus effect to the signal, lowering this parameter adds more of the inverted Chorus effect to the signal. At values closer to 0, only a faint bit of Chorus can be heard in the audio, but at values farther away from 0 (maxing at +/- 99), a gradually pronounced Chorus becomes audible.
  - **Bleed (Hz):** Amount of feedback which bleeds into the opposite channel (Stereo mode only).

- **Output:** Controls for adjusting the final output from this plug-in.
  - **Dry/Wet (%):** A percentage control of the output mix of “dry” or original signal to “wet” or processed signal. 0 is completely dry, 100% is completely wet.
  - **Output Level (dB):** Adjusts the overall output level of the affected sound.
De-Esser

A repair plug-in specific to dialog. The De-Esser is a specialized filter that's designed to reduce excessive sibilance, such as hissing "s" sounds or sharp "ts" sounds, in dialog or vocals.

A graph shows you which part of the signal the controls are set up to adjust, while reduction and output meters let you see which part of the signal is affected and what level is being output.

The De-Esser has the following controls:

- **Bypass**: Toggles this plug-in on and off.
- **Frequency Range**: Two controls let you target the frequency of the "s" sound for a particular speaker.
  - **Target Frequency**: A knob that lets you target the frequency of the offending sibilance. Sibilant sounds are usually found in the range of 5 - 8kHz.
  - **Range**: switches the operational mode of the De-esser. Three choices (from top to bottom) let you switch among Narrow Band, Wide Band, and All High Frequency which processes all audio above the source frequency.
- **Amount**: Adjusts the amount de-essing that's applied.
- **Reaction Time**: Adjusts how suddenly de-essing is applied. There are three choices.
  - **Relaxed**: Equivalent to a slow attack.
  - **Fast**: Equivalent to a fast attack.
  - **Pre-emptive**: A "lookahead" mode.
De-Hummer

A repair plug-in with general applications to any recording. Eliminates hum noise that often stems from electrical interference with audio equipment due to improper cabling or grounding. Typically 50 or 60 cycle hum is a harmonic noise, consisting of a fundamental frequency and subsequent partial harmonics starting at twice this fundamental frequency.

A graph lets you see the frequency and harmonics being targeted as you adjust this plug-in’s controls.

De-Hummer has the following controls:

- **Bypass**: Toggles this plug-in on and off.
- **Frequency**: Target source fundamental frequency. A knob lets you make a variable frequency selection, while radio buttons let you select common frequencies that correspond to 50Hz/60Hz electrical mains that are the typical culprits for causing hum.
- **Amount**: Adjusts how much De-Hum extraction you want to apply.
- **Slope**: Adjusts the ratio of fundamental frequency to partial harmonics, the adjustment of which lets makes it possible for various kinds of hum to be targeted. For example, a value of 0 biases hum extraction towards the fundamental frequency, while a value of 0.5 gives equal extraction of all harmonics (up to 4), and finally a value of 1.0 targets the higher frequency partials.
Delay

An effects plug-in. A general purpose stereo delay effect, suitable for tasks varying from track doubling, to early reflection generation, through simple harmonic enhancement. Processes in stereo or mono, depending on the track it’s applied to.

A graph shows the timing and intensity of the echoes generated by this plug-in on each channel, and an Output meter displays the output level of the resulting signal.

The Delay FairlightFX

Delay has the following controls:

- **Bypass**: Toggles this plug-in on and off.
- **Input mode**: (Only visible when Delay is inserted on a multi-channel track.) Lets you choose how multiple channels are input to the delay. Stereo sets separate Left and Right channels. Mono sums Left and Right to both channels. Left inputs the Left channel only, and Right inputs the Right channel only.
- **Filters**: Alters the proportion of frequencies that are included in the delay effect. When the Delay plug-in is inserted on a Mono Channel, the Left and Right sections are replaced with a single “Delay” section.
  - **Low Cut (Hz)**: A global High Pass filter.
  - **High Cut (Hz)**: A global Low Pass filter.
- **Delay**: Adjusts the timing of the delay.
  - **Left/Right Delay (ms)**: Delay time of each channel.
  - **Left/Right Feedback (%)**: Feedback % of the Left or Right channel back to itself. A negative value equates to % of feedback with a phase reverse from the original signal.
- **Feedback**: Controls for adjusting the amount of bleed between channels.
  - **High Ratio**: Adjusts the frequency of a damping filter for the feedback signal.
  - **Stereo Bleed**: Adjusts the proportion of signal from Left and Right channel feedback which feeds into the opposite channel. When the Delay plug-in is inserted on a Mono channel, Stereo Bleed control does not appear.
- **Output**: Controls for adjusting the final output from this plug-in.
  - **Dry/Wet (%)**: A percentage control of the output mix of “dry” or original signal to “wet” or processed signal. 0 is completely dry, 100% is completely wet.
  - **Output Level (dB)**: Adjusts the overall output level of the affected sound.
Dialog Processor

The Dialog Processor chains together six different common audio processing operations inside of a single plug-in, each tuned to the specific needs of making adjustments to improve human speech. The specialized De-Rumble, De-Pop, De-Ess, Compressor, Expander, and Excite controls each have a streamlined set of controls tailored to speeding up the types of common adjustments every dialog track uses.

Distortion

An effects plug-in. Creates audio distortion that’s useful for sound design and effects, ranging from simple harmonic distortion simulating an audio signal going through primitive or faulty electronics (such as bad speakers, old telephones, or obsolete recording technologies), all the way to mimicking an overdriven signal experiencing different intensities of hard clipping (think someone yelling through a cheap bullhorn, megaphone, or PA system). This plug-in includes soft tube emulation in the output stage.

An animated graph shows the results of adjusting the Distortion parameters of this plug-in, giving you a visualization of the kind of harmonic distortion, waveshaping, and clipping that will be modifying the signal as you make adjustments. Input and Output meters let you see how the levels are being affected.
Distortion has the following controls:

- **Bypass**: Toggles this plug-in on and off.
- **Filters**: Two filters let you simulate devices reproducing limited frequency ranges.
  - **LF Cut**: Low frequency distortion shaping.
  - **HF Cut**: High frequency distortion shaping.
- **Distortion**: Three sets of controls let you create the type and intensity of distortion you want.
  - **Mode buttons**: Switch the operational mode of distortion. The one to the left, Distortion, creates harmonic distortion. The button to the right, Destroy, is a more extreme polynomial waveshaper.
  - **Distortion**: Adjusts the amount of distortion that’s applied to the signal. Higher values distort more.
  - **Ceiling**: Adjusts the level of input signal that triggers clipping.
  - **Output**: Controls for adjusting the final output from this plug-in.
  - **Dry/Wet (%)**: A percentage control of the output mix of “dry” or original signal to “wet” or processed signal. 0 is completely dry, 100% is completely wet.
  - **Output Level (dB)**: Adjusts the overall output level of the affected sound.
  - **Auto Level button**: Applies automatic compensation for gain added to the signal due to the distortion being applied. Having this button turned on prevents the signal from becoming dramatically and unexpectedly increased, while turning it off frees you to do what you want, if what you want is to hear a lot of distortion.

---

**Echo**

An effects plug-in. A classic Echo effect, simulating the fate of the cursed Oread from Greek mythology. Processes in stereo or mono, depending on the track it’s applied to.

A graph shows the timing and intensity of the echoes generated by this plug-in on each channel, and an Output meter displays the output level of the resulting signal.

![The Echo FairlightFX](image)
Echo has the following controls:

- **Bypass**: Toggles this plug-in on and off.
- **Input Format**: (Only visible when Echo is inserted on a multi-channel track.) Lets you choose how multiple channels are input to the echo. Stereo sets separate Left and Right channels. Mono sums Left and Right to both channels. Left inputs the Left channel only, and Right inputs the Right channel only.
- **Filters**: Alters the proportion of frequencies that are included in the delay effect. When the Delay plug-in is inserted on a Mono Channel, the Left and Right sections are replaced with a single “Delay” section.
  - **Low Cut (Hz)**: A global High Pass filter.
  - **High Cut (Hz)**: A global Low Pass filter.
  - **Feedback**: Adjusts the frequency of a damping filter for the feedback signal.
- **Left Channel**: Parameters that independently affect delay on the Left Channel. When the Echo plug-in is inserted on a Mono Channel, the Left Channel and Right Channel sections are replaced with a single “Echo” section with only the Delay Time, Feedback Delay, and Feedback controls.
  - **Delay Time**: Global Delay time for the Left Channel.
  - **Feedback Delay**: Echo Delay time for the Left Channel.
  - **Feedback**: Feedback percentage of the Left channel back to itself.
  - **L > R Feedback**: Percentage of Left feedback signal which feeds back to Right Channel.
- **Right Channel**: Parameters that independently affect delay on the Right Channel.
  - **Delay Time**: Global Delay time for the Right Channel.
  - **Feedback Delay**: Echo Delay time for the Right Channel.
  - **Feedback**: Feedback percentage of the Right channel back to itself.
  - **R > L Feedback**: Percentage of Right feedback signal which feeds back to Left Channel.
- **Output**: Controls for adjusting the final output from this plug-in.
  - **Dry/Wet (%)**: A percentage control of the output mix of “dry” or original signal to “wet” or processed signal. 0 is completely dry, 100% is completely wet.
  - **Output Level (dB)**: Adjusts the overall output level of the affected sound.

**Flanger**

An effect plug-in, giving that unmistakable Flanger sound dating from the days of dual tape machines with a slight delay added to one in periodic intervals causing flanging as they got back in sync with one another. Typically used to add a sort of warbling harmonic interest to a signal, in a wide variety of ways.

An animated graph shows the results of adjusting the Modulation parameters of this plug-in, giving you a visualization of the kind of warble that will be added to the signal as you make adjustments.
The Flanger has the following controls:

- **Bypass**: Toggles this plug-in on and off.
- **Input mode**: (Only visible when the Flanger is inserted on a multi-channel track.) Lets you choose how multiple channels are input to the Flanger. Stereo sets separate Left and Right channels. Mono sums Left and Right to both channels. Left inputs the Left channel only, and Right inputs the Right channel only.
- **Modulation**: A low frequency oscillator (LFO) used to drive the Flanger effect.
  - **Waveform (Hz)**: Specifies the shape of the LFO that modulates the rate of the Flanger. The three choices are Sine (a smooth change in rate), Triangle (a jerky change in rate), and Sawtooth (an abrupt change in range). Affects the timing of the warble that is added to the sound.
  - **Rate (%)**: Speed of the LFO, affects the speed of the warble that is added to the sound. Low rate values create a slow warble, while high rate values create more of a buzz.
  - **Depth**: Affects the "length" of the warble that is added to the sound. Low values add only the very beginning of a warble, high values add more fully developed warble.
- **Width**: Consists of a single parameter, Expansion, which sets Left/Right channel length differences, along with the phase offset of modulators.
- **Feedback**: These controls determine, in large part, how extreme the Flanging effect will be.
  - **Amount (%)**: The percentage of signal fed back to the Delay Line. Values can be positive or negative, the default is 0 (no effect). Increasing this parameter adds more of the Flange effect to the signal, lowering this parameter adds more of the inverted Flange effect to the signal. At values closer to 0, only a faint phase shift can be heard in the audio, but at values farther away from 0 (maxing at +/- 99), a gradually increasing warble becomes audible. The type of warble depends on the Modulation controls.
  - **LPF Filter (Hz)**: Lets you filter the range of frequencies that will affect the feedback signal.
• **Output**: Controls for adjusting the final output from this plug-in.
  
  – **Dry/Wet (%)**: A percentage control of the output mix of “dry” or original signal to “wet” or processed signal. 0 is completely dry, 100% is completely wet.
  
  – **Output Level (dB)**: Adjusts the overall output level of the affected sound.

---

**Foley Sampler**

The Foley Sampler is a built-in sampler that makes it easy to add sound effects that you want to play using a keyboard, pad, or other MIDI performance device connected to your computer, to add timed sound effects to sync with onscreen visuals. This new plug-in has also been designed to simplify the process of recording performed audio cues on the current track to which the sampler has been added.

**Setting Up the Foley Sampler**

Using the Foley Sampler to record samples played with a MIDI controller is easy.

1. Create an audio track you want to record sound effects or instruments to.
2. Drag the Foley Sampler onto the track header to assign it to that track. The Foley Sampler window automatically appears. The Fairlight page knows this is an instrument with no inputs to the plug-in, so this effect is automatically patched to that track’s input, ready for recording.
3. If you have a MIDI controller of some kind connected to your computer and properly configured, it will appear in the MIDI drop-down menu at the upper-right corner of the Foley Sampler window (next to the Keyboard button). Choose your device from this menu, and the Keyboard button will highlight to show it’s enabled.

At this point, the Foley Sampler is ready to be used, but by default it has no samples loaded to play. The next step is to add sound effects.

**Adding Sound Effects**

You can add prerecorded sound effects or instruments to the Foley Sampler in the following ways:

- Drag and drop an audio file in a supported format from the file system onto the Foley Sampler window
- Drag and drop a sound effect from the Sound Library onto the Foley Sampler window
- Click the Foley Sampler window’s Option menu and choose

Once you’ve loaded a sound effect of some kind, it’s automatically mapped to the top four keys of your instrument, starting at C2. Pressing a key or pad of your controller will play that sound.

If you want to see the sound’s waveform, you can click the Sample button at the top of the Sound panel. In this example, there are a series of continuous footsteps recorded in a row that we can use.
Splitting Sound Effects

It’s common to use pre-recorded library sound effects that consist of a series of recorded footsteps, cloth rustles, punches, or other “foleyed” sound recordings, in order to play variations of a specific kind of repetitive sound effect in sync to action that’s happening on screen. The Foley Sampler lets you do this easily.

1. After you’ve loaded a sound effect, click the Foley Sampler window’s Option menu and choose Split Sample to automatically split the current sample into slices based on an analysis of its noise floor, and assign each slice to a set of keys or pads on your selected MIDI device. Continuing with the previous example, each footstep has been split and assigned to a different key.

2. To adjust the timing of each slice of the sound effect that’s been split apart, you can click on the assignment text above the keyboard at the bottom of the window to see that slice in the Sample view.

3. You can adjust the Range Start and Range End parameters to encompass as much or as little of that slice as you want to play back.

4. If you want a sample to loop if a note is held down, you can enable the Loop button, and then adjust the Loop Start and Loop End parameters to choose how much of each slice will loop.

5. To delete slices that aren’t useful, you can select a slice you don’t like and press Shift-Delete to clear that slice from the virtual keyboard.
Assigning Sound Effects Manually

When you first load sound effects into the Foley Sampler, they’re automatically assigned to a series of notes. Each additional sound effect that you load is automatically assigned to the next series of notes to the right. Once all notes are occupied, additional sound effects will shuffle all previous assignments to the left.

You also have the option of manually assigning sound effects that you load. This is useful when you want to manually load a variety of different sound effects all at once (such as a combination of punch sounds, human grunts, and cloth rustles to use in a fight scene), and assign them to particular notes of your choosing.

1. Load a sound effect you want to map.
2. Click the Mapping button to remap the range of notes it corresponds to.
3. Use the Low and High parameters to select a range of notes for the selected sound.
4. You also have the option of tuning the pitch of specific sound effects, if necessary.
Adjusting Sound Effects

If you want to customize a sample or slice further, you can select it above the virtual keyboard and use the controls on the Level panel to control the dynamics of audio playback, or you can use the controls on the Filter panel to EQ the sound.

TIP: If a sample or slice is set to loop, you can press the Control key and click a key on the virtual keyboard to initiate looping, so you can hear these adjustments as you’re making them.

Playing and Recording Sound Effects

Once you’ve set up the Foley Sampler with sound effects you can play from a MIDI controller, recording those sound effects is simple.

1. Make sure that the “Save clips to field” in the Capture and Playback panel of the Project Settings is correctly set up to record to the desired storage volume, using the Browse button, if necessary.

2. Click the R button in the track header of the audio track to which you applied the Foley Sampler, to put that track into Record Enable mode.

3. Click the Record button in the Fairlight toolbar.

4. While Fairlight records, use the keys or buttons of your MIDI controller to play sounds in sync to the picture on your display. When you’re done, click the Stop button.

You should now have a recorded clip containing the sound effects you played, in sync to the picture. If they’re a bit out of sync, you can always use the Elastic Wave audio retiming controls to tighten the sync without re-recording everything.

A new clip of audio created by recording sounds played via the Foley Sampler
Frequency Analyzer

This lets you see a visualization of the levels across all frequencies of a clip or track. A Mode drop-down lets you choose to see the full audible spectrum, or to restrict the visualization to low, medium, or high frequencies.

![The Frequency Analyzer plug-in](image)

LFE

A low-pass filter that you can apply to a main that’s in a surround sound format, to feed low-frequency sound to an LFE channel as part of a surround sound mix. If there is no LFE channel available, this plug-in does nothing. A Frequency control lets you choose which low frequency range you want to include, and a Trim control lets you set the level of the resulting LFE channel.

![The LFE plug-in](image)
**Limiter**

A true peak limiter that is capable of looking 64 samples ahead of the input, in order to limit the audio in a very smooth fashion. An Input control lets you adjust the level of the incoming signal, while Threshold and Release controls let you adjust the limiting that’s being done. A graph shows you an analysis of the audio as it’s processed, with a visual indication of what parts of the signal are being affected by this plug-in.

![The Limiter plug-in](image)

**Meter**

A sample peak processing meter that’s useful for temporarily adding a meter to a specific track, Sub, Aux, or Main. These are sample peak processing meters that are useful for instances where you want a large meter that focuses on a specific bus while you’re working.

These meters are presented very simply, with a gray bar indicating level and a red peak line that holds for two seconds, which indicates the highest peak. A numeric reading at the top of the meter gives the exact level, in dB. This number continues to hold, indicating the loudest level measured for any given stretch of playback.

![The Meter FairlightFX](image)
Meter has the following controls, all located in the option menu:

- **Width**: Lets you resize the width of the meter window. Options are: Narrow, Normal, and Wide.
- **Height**: Lets you resize the height of the meter window. Options are: Small, Medium, and Large.
- **Reset Peak on Play**: When enabled, the numeric peak level is reset every time playback stops and starts again. When disabled, the numeric peak level persists until changed by a higher peak.
- **Reset**: Resets the numeric peak level.

## Modulation

An effect plug-in. General purpose modulation plug-in for sound fx/design. Four effects combine an LFO, FM adjustment, AM adjustment, Sweep and Gain filters to allow simultaneous frequency, amplitude and space modulation. In conjunction with the additional Rotation controls, simple Tremelo and Vibrato effects can be combined with auto-filter and auto-Pan tools in order to provide texture and movement to a sound.

An animated graph shows the results of adjusting the Modulator, Frequency, and Amplitude parameters of this plugin, giving you a visualization of the kind of modulations that will be applied to the signal as you make adjustments. Output meters let you see what level is being output.

![Modulation Graph](image)

The Modulation FairlightFX

Modulation has the following controls:

- **Bypass**: Toggles this plug-in on and off.
- **Modulator**: A low frequency oscillator (LFO), shown in blue in the animated graph.
  - **Shape**: Specifies the shape of the LFO waveform that modulates the audio. Six options include Sine, Triangle, Saw1, Saw2, Square, Random.
  - **Rate (Hz)**: Adjust the speed of the modulating LFO. Lower settings result in warbling audio, while extremely high settings result in buzzing audio the timbre of which is dictated by the shape you’ve selected.
• **Frequency**: Frequency modulation (FM) of a secondary oscillator, shown as green in the animated graph.
  - **Level (%)**: Controls the amount of Frequency Modulation that’s applied, intensifying or easing off the effect.
  - **Phase**: Since each of the four primary effects within this plug-in can be applied together, along with the fact that modulation with level components (Tremelo/Rotation/Filter) have the ability to combine or cancel out another, phase controls are available. Altering the phase of an individual effect allows control of such interaction (e.g., cancel out a high level change, or offset a cancellation).

• **Filter**: Sweep and gain filters.
  - **Level**: Lets you set the amount of filter sweep and gain to additionally use to modify the signal. The amount you’ve selected is previewed in a 1D graph to the side.
  - **Tone**: Adjusts the center frequency of sweep.
  - **Phase**: Since each of the four primary effects within this plug-in can be applied together, along with the fact that modulation with level components (Tremelo/Rotation/Filter) have the ability to combine or cancel out another, phase controls are available. Altering the phase of an individual effect allows control of such interaction (e.g., cancel out a high level change, or offset a cancellation).

• **Amplitude**: Amplitude modulation (AM) of a secondary oscillator, shown as green in the animated graph.
  - **Level**: Amount of Amplitude modulation applied. (Disabled in Ring Modulation Mode.)
  - **Phase**: Since each of the four primary effects within this plug-in can be applied together, along with the fact that modulation with level components (Tremelo/Rotation/Filter) have the ability to combine or cancel out another, phase controls are available. Altering the phase of an individual effect allows control of such interaction (e.g., cancel out a high level change, or offset a cancellation).
  - **Ring Modulation Mode**: Enables a Ring Modulation effect (where the signal is multiplied by the modulator, rather than modulated by it).

• **Rotation**: These controls are only available when applied to a multi-channel track.
  - **Depth**: Amount of Rotation applied.
  - **Phase**: Since each of the four primary effects within this plug-in can be applied together, along with the fact that modulation with level components (Tremelo/Rotation/Filter) have the ability to combine or cancel out another, phase controls are available. Altering the phase of an individual effect allows control of such interaction (e.g., cancel out a high level change, or offset a cancellation).
  - **Offset**: Start offset of rotation in order to further place the signal in space.

• **Output**: Controls for adjusting the final output from this plug-in.
  - **Dry/Wet (%)**: A percentage control of the output mix of “dry” or original signal to “wet” or processed signal. 0 is completely dry, 100% is completely wet.
  - **Output Level (dB)**: Adjusts the overall output level of the affected sound.
Noise Reduction

A repair plug-in designed to reduce a wide variety of noise in all kinds of recordings. Based on spectral subtraction, it’s able to automatically detect noise in sections of dialog, or it can be used manually by “learning” a section of noise that can be subsequently extracted from the signal. A graph shows a spectral analysis of the audio being targeted, along with a purple overlay that shows what noise is being targeted. Two audio meters let you evaluate the input level (to the left) versus the output level (to the right), to compare how much signal is being lost to noise reduction.

![The Noise Reduction FairlightFX in action](image)

Noise Reduction has the following controls:

- **Bypass**: Toggles this plug-in on and off.
- **Auto Speech Mode/Manual radio buttons**: These buttons toggle the overall functionality of the Noise Reduction plug-in between two modes:
  - **Auto Speech Mode**: Specifically designed for human speech/dialog, applying dialog extraction to the incoming signal to dynamically detect the noise profile outside of the detected speech. As a result, Auto Speech Mode does not require an initial “learn” pass, and adapts itself better to noise that changes over time.
  - **Manual Mode**: Enables the Learn button, as this mode requires the user to locate a section of the audio recording that is only noise that the plug-in can analyze. To initiate this analysis, position the playhead at the beginning of a section of the recording that is only noise, click the Learn button so it’s highlighted, and play forward through the noise, stopping before any sound you want to preserve is reached, and clicking the Learn button to turn it back off. A noise profile is generated (shown in Purple on the graph), which is subsequently extracted from the remaining signal.

- **Threshold (in dB)**: Relates to the signal-to-noise ratio (SNR) in the source recording. Recordings with a poor signal-to-noise ratio will require a higher threshold value, resulting in more noise reduction being applied.
• **Attack (in ms):** Primarily useful in Auto Speech mode, this controls the duration over which the noise profile is detected. Ideally, the attack time should match the variability of the unwanted noise. A low value corresponds to a faster update rate of the noise profile and is useful for quickly varying noise; a high value corresponds to a slower update rate and can be used for noise that’s more consistent.

• **Sensitivity:** Higher sensitivity values exaggerate the detected noise profile; the result is that more noise will be removed, but more of the dialog you want to keep may be affected.

• **Ratio:** Controls the attack time of the signal profile relative to the attack time of the noise profile. A faster ratio detects and preserves transients in speech more easily, but the resulting speech profile is less accurate.

• **Frequency Smoothing:** Smoothes the resulting signal in the frequency domain to compensate for harmonic ringing in the signal after the noise has been extracted.

• **Time Smoothing:** A toggle button enables smoothing of the resulting signal in the time domain as well.

• **Dry/Wet:** A percentage control of the output mix of “dry” or original signal to “wet” or processed signal. 0 is completely dry, 100% is completely wet.

• **Makeup Gain:** To let you compensate for level that may be lost due to the noise reduction operation you’re applying, this applies a pre-gain in, from -6dB to +18dB, just before the dry/processed mix.

### Phase Meter

Phase cancellation is a phenomena where the waveforms of a stereo recording (for example a stereo recording of a music performance) go slightly out of sync with one another for whatever reason, and begin to cancel one another out in unpredictable ways, resulting in the audio sounding strange. This results in poor quality audio and can cause problems when you’re trying to compress a mix to a distribution format such as AAF or MP3.

The Phase Meter plug-in is a visual meter that lets you evaluate whether or not a signal is in phase and is meant to be applied to a bus so you may evaluate the phase of a mix and correct whatever problems may be occurring. The position of a green dot within a horizontal meter indicates the phase of the signal. When there’s no signal or a signal on only one half of a stereo bus, the dot appears in the center (0). When the signal is out of phase, the dot appears all the way to the left (–). When the signal is in phase, the dot appears all the way to the right (+).

![The Phase Meter plug-in](image)
Pitch

An effects plug-in. Shifts audio pitch without altering clip speed.

Pitch has the following controls:

- **Bypass**: Toggles this plug-in on and off.
- **Semitones**: A “coarse” adjustment that can shift audio pitch up to +/- 12 semitones.
- **Cents**: A “fine” adjustment that can tune audio pitch in +/- 100ths of a semitone.
- **Dry/Wet**: A percentage control of the output mix of “dry” or original signal to “wet” or processed signal. 0 is completely dry, 100% is completely wet.

Reverb

A spatial simulation plug-in, capable of recreating multichannel reverberation corresponding to rooms of different sizes, adjustable via a graphical 3D cube control. This plug-in lets you take a “dry” recording and make it sound as if it’s within a grand cathedral, an empty room, or a tiled bathroom.

To understand this plug-in’s controls, it helps to know that the signal follows three paths which are combined to create the final effect:

- A direct path.
- An early reflection path (ER) simulating early reflection rays obtained from the first multiple reflections on the walls, traveling from the virtual source to the virtual listener.
- A late reverberation path (Reverb) simulating the behavior of an acoustic model of the room.

A graph shows an approximate visualization of the reverb’s effect on the frequencies of the audio signal.
The Reverb FairlightFX

- **Reverb has the following controls:**

  - **Bypass:** Toggles this plug-in on and off.
    - **Room Dimensions:** By controlling the size of the virtual room a sound is to inhabit, these parameters simultaneously control the configuration of Early Reflection and Late Reverberation processing. The acoustic modes from this simulated room are computed and fed to Late Reverberation processing. The shape, gain, and delay of the first reflections are computed and then fed to Early Reflection processing.
    - **Height, Length, Width:** Defines the dimensions of the reverberant space, in meters.
    - **Room Size:** The calculated Room Width x Length, in meters².
  
  - **Reverb:** Additional controls that further customize the configuration of Early Reflection and Late Reverberation processing.
    - **Pre Delay:** Increase or negate the propagation time from the virtual source to the virtual listener. As a result, it modifies the initial delay time between the source signal and the first reflection.
    - **Reverb Time:** Decay time of the Reverb tail. It controls the overall decay time of the acoustic modes from late reverberation processing.
    - **Distance:** Modifies the distance between the virtual source and the virtual listener. It modifies only the configuration of early reflections processing.
    - **Brightness:** Modulate the shape of the decay time over frequency. At maximum brightness, decay time is identical at any frequency. At minimum brightness, higher frequencies result in shorter decay time and therefore duller sound.
    - **Modulation:** Adds random low-frequency phase modulation from the tapping point of ER processing. At 0%, modulation is not used.

  - **Early Reflection Tone:** Four post equalization controls modify the tone of early reflections to suit a particular room’s characteristics.
    - **Low Gain**
    - **Low Frequency**
    - **High Gain**
    - **High Frequency**
• **Reverb Tone:** Four post equalization controls modify the tone of the reverb tail to suit a particular room’s characteristics.
  
  – **Reverb Tail Low Gain**
  – **Reverb Tail Low Frequency**
  – **Reverb Tail High Gain**
  – **Reverb Tail High Frequency**

• **Output:** These controls recombine the three audio processing paths into a single output signal.
  
  – **Dry/Wet:** A percentage control of the output mix of “dry” or original signal to “wet” or processed signal. 0 is completely dry, 100% is completely wet.
  
  – **Direct Level:** The amount of the direct level to mix into the final signal.
  
  – **Early Reflection Level:** The amount of early reflection to mix into the final signal.
  
  – **Reverb Level:** The amount of reverb to mix into the final signal.

### Soft Clipper

The Soft Clipper is a limiting processor that reduces the output level above a defined threshold in a rounded manner so that peaks are more cleanly attenuated. The Soft Clipper plug-in will impart saturation effects when pushed hard above the threshold, allowing for the introduction of warmth and subtle distortion to the sound. A graph shows the shape of the curve adjustment this plug-in makes to the audio.

A soft clipper is often combined with a standard limiter in order to increase perceptual loudness of material without imparting harshness.

![Soft Clipper FairlightFX](image)

• **Threshold:** Introduces input gain to the signal prior to hitting the clipper, forcing audio peaks over the threshold by that amount. As such, it will drive the saturation and distortion.

• **Shape:** The shape of the clipper can be varied to change the character of the soft clipper from full soft-clipping (all the way right, where the peaks are rounded) to full hard-clipping (all the way left, where the peaks are squared off).

• **Audio Level:** Lets you adjust the output gain to compensate for signal lost during soft clipping, if necessary.
Stereo Fixer

A simple plug-in designed to fix stereo source material in cases where only one side of a stereo signal was recorded, where one side of a stereo recording is a different level to the other, or where the stereo channels have been incorrectly Left/Right swapped.

This plug-in can also be used as a "Mid/Side" decoder, for recordings that were made using this microphone technique.

This plug-in is for stereo clips only.

The Stereo Fixer FairlightFX

- **Format:** The input processing mode you want to use to fix the stereo output.
  - **Stereo:** (Default) No format conversion is performed.
  - **Reverse Stereo:** Swaps the Left and Right side.
  - **Mono:** The output from the plug-in is a mono mix of the two inputs.
  - **Left Only:** The left input is sent to both left and right outputs.
  - **Right Only:** The right input is sent to both left and right outputs.
  - **M/S:** The left output is the left (Mid) input minus the right input (Side). The right output is the left (Mid) input plus right input (Side).

- **Left/Right Gain:** Lets you apply independent gain on the left or right outputs. This gain is applied after (post) the input processing mode.

**TIP:** For a comprehensive M/S decoder solution, simply chain two Stereo Fixer plug-ins together. Use the first unit to control the Side signal level, thus controlling the width of the second unit (set to M/S).
Stereo Width

An enhancement plug-in that increases or reduces the spread of a stereo signal in order to widen or reduce the separation between channels. If this plug-in is added to a Mono channel, it will be disabled, as there is no stereo width to either distribute or control.

A graph shows the currently selected width of stereo distribution as a purple arc, while inside of that graph a stereo meter shows the Left and Right distribution of the audio signal. Two audio meters measure levels, an Input meter to the left, and an Output meter to the right.

Stereo Width has the following controls:

- **Width**: Lets you control the spread of the stereo output. Settings range from 0 (Mono) to 1 (Stereo) to 2 (extra wide stereo).
- **Diffusion**: Adds more complexity to the output.
- **Sparkle**: Adds more high frequencies to the spread.
Vocal Channel

An enhancement plug-in for general purpose vocal processing consisting of High Pass filtering, EQ, and Compressor controls.

Side by side EQ and Dynamics graphs are presented above the controls. An output audio meter lets you monitor the final signal being produced by this plug-in.

Vocal Channel has the following controls:

- **High Pass**: Enabled by a toggle, off by default. Has a single frequency knob that sets the threshold below which frequencies are attenuated to reduce boominess or rumble.

- **EQ**: A three-band EQ for fine tuning the various frequencies of speech, enabled by a toggle, including Low, Mid, and High Mode, Frequency, and Gain controls
  - **Low/Mid/Hi Mode**: Lets you choose from different filtering options to use for isolating a range of frequencies to adjust. Different bands present different options.
  - **Low/Mid/Hi Freq (Hz)**: Lets you choose the center frequency to adjust.
  - **Low/Mid/Hi Gain (dB)**: Lets you boost or attenuate the selected frequencies.

- **Compressor**:
  - **Thres (dB)**: Sets the signal level below which compression occurs. Defaults to -25dB. The range is from -40 to 0dB.
  - **Reaction**: Adjusts how quickly compression is applied when a signal exceeds the threshold. The default is 0.10.
  - **Ratio**: Adjusts the compression ratio. This sets the gain reduction ratio (input to output) applied to signals which rise above the threshold level. The default is 1.5:1. The range is 1.1 to 7.0.
  - **Gain (dB)**: Lets you adjust the output gain to compensate for signal lost during compression, if necessary.
Audio Meters and Audio Monitoring

The Meters panel, which appears at the top of the Fairlight page when it’s enabled, provides a visual reference of the levels of each track in your mix, along with specialized meters showing the buses, monitoring mix, loudness, and a Viewer for seeing the video of the current project as you work. This chapter describes the use of these meters, and provides information about the different options that are available.

The Monitoring Panel

Turning on the meters in the UI toolbar displays the Monitoring panel that runs along the top of the Fairlight page, which shows all of the audio meters that correspond to the tracks in the Timeline, as well as the Bus meters that correspond to the Mains, Subs, and Aux buses of your mix, the Control Room meters, and a video viewer.

Track Meters and Monitoring Controls

At left, a row of audio meters corresponds to the channel strips of the Mixer, one meter for every audio track in the timeline. Each track displays the number of meters that corresponds to that track’s audio mapping, with mono tracks having a single audio meter, stereo tracks having two, 5.1 tracks having six, and so on.

Each track and bus meter (with the exception of the Loudness meters) display RMS (root mean square) levels against a dB scale. A single line indicating the maximum value at any given moment in time is held briefly just above the current RMS levels, which appear as a solid bar extending from the bottom of the meter. RMS meters display a weighted “average” representation of the audio level that’s closer to the way audio is actually perceived, although not as accurate as the loudness meters discussed later in this section.

Each meter bar is color coded to indicate two different thresholds of sound level, from low (green) to high (yellow) to very high (red).
Each meter is identified by the track number it represents (track names are not shown over track meters) as well as the color of that track.

Using Post Fader or Track Source Meters

The Track Meters setting in the General Options of the Project Settings lets you choose how meters in the Fairlight page display their audio analysis. There are two options:

- **Post Fader:** Meters always display the level of each clip’s signal after whatever fader adjustments have taken place. Fading a track’s level down diminishes the visible level of that audio signal in the meter. This setting is good if you prefer a visual indication of the relative levels you’ve set your various audio tracks to, which is a very NLE-oriented behavior.

- **Track Source:** Meters always use the volume levels of the audio clips in that track, even if you’ve lowered the level using the sliders. If you’ve keyframed a clip’s volume, that change will be reflected by the audio meters, even though fader changes are not. Viewing meters this way means you can always see how much level is available to clips in your mix regardless of what the current fader levels are set to, in the event you want to keep track of audio you want to bring back into the mix later on. This is a very DAW-oriented behavior.

**Bus Meters**

To the right of the track meters are the bus meters, in which all Mains, Subs, and Aux buses appear, separated by type, and each displaying the number of meters that corresponds to that track’s audio mapping. This way you can see the sum of all tracks that have been routed to a particular bus.
Meter Plug-in

There is a Meter plug-in available for temporarily adding a meter to a specific track, Sub, Aux, or Main. These are sample peak processing meters that are useful for instances where you want a large meter that focuses on a specific bus while you’re working.

These meters are presented very simply, with a gray bar indicating level and a red peak line that holds for two seconds, which indicates the highest peak. A numeric reading at the top of the meter gives the exact level, in dB. This number continues to hold, indicating the loudest level measured for any given stretch of playback. The option menu in this meter’s floating window presents different settings you can choose. For more information, see Chapter 159, “FairlightFX.”

![The Meter FairlightFX](image)

Compound Meters and Output Bus Selection Menu

The compound meters, to the right of the bus meters, consist of Control Room meters and Loudness meters, shown side-by-side to provide a comprehensive analysis of your overall audio mix. Below, drop-down menus let you choose which bus you want to monitor, as well as which set of speakers you want to use to do the monitoring.

![The Control Room meters (at left), and Loudness meters (at right)](image)
Monitoring Menus

The monitoring menus determine which bus gets analyzed by the compound meters. When the compound meters are displayed, the Monitoring drop-down menu that otherwise appears to the left of the monitoring controls in the Transport toolbar instead moves to a position underneath the Loudness meters.

This drop-down menu lets you choose which bus you want to monitor as you work. You can choose one of your mains, or you can choose a Sub or an Aux that you want to focus on for more detailed work.

Control Room Meters

The mustard-colored Control Room audio meters show the sum of all audio channels that are routed to the currently selected bus being monitored (as selected in the drop-down menu below). These are peak meters measured in dBFS.

Loudness Meters

The set of meters all the way to the right are the Loudness meters, which consist of a set of two graphical meters and a numerical readout. These meters let you analyze the “integrated loudness” of the overall mix, which is the standard to which all contemporary mixing specifications refer when describing the deliverables you’re expected to provide to the client. Unlike the RMS audio meters found in the Timeline or mixer which measure audio in dB, loudness meters do a different kind of analysis, measured in LU (loudness units).
What Is LU?

A value of 1 LU (loudness unit) represents the smallest difference in audio levels that humans can actually perceive. Human hearing naturally sums all channels that reach the ear, so the summed channel meter to the right in the compound meters is an analysis of the loudness you actually hear.

Loudness Meter Options

Two options in the General Options of the Project Settings let you customize the Loudness meters.

- **Target Loudness level**: Lets you set the LUFS value that’s used as a reference level for loudness metering. Defaults to –23 LUFS, which conveniently makes the display of these meters scale similarly to traditional audio meters that you’re already used to.

- **Loudness Scale**: Lets you choose which scale you want to use with which to measure the meters. Options currently include the default of EBU +9 Scale (–18 to +9), and EBU +18 Scale (–36 to +18).

Support for Multiple Loudness Standards

The Loudness Meter can be switched among a variety of international industry-standard loudness monitoring standards. The standard you choose uses the integrated loudness value (along with a specified tolerance defined by each selected standard) to indicate whether or not the current mix level is of acceptable loudness via color coding of the Integrated Loudness value, and in the Integrated Loudness graph described below. Blue values indicate loudness levels that are below tolerance, yellow indicates loudness values that are within tolerance, and red indicates loudness values that are above tolerance.

The built-in standards you can switch among include the following:

- **BS.1770-1**: An older loudness standard used by DaVinci Resolve version 15 and before
- **BS.1770-4**: The most up-to-date loudness standard as of DaVinci Resolve 16; the algorithms specified by this standard govern the other standards that are listed below in this drop-down menu
- **ATSC A/85**: The American standard for acceptable loudness in broadcast
- **EBU R128**: The European standard for acceptable loudness in broadcast
- **OP-59**: The New Zealand and Australian standard for acceptable loudness in broadcast
- **TR-B32**: The Japanese standard for acceptable loudness in broadcast
- **AGCOM 219**: The Italian standard for acceptable loudness in broadcast

**NOTE**: The target peak meter now uses the BS.1774 standard for measuring maximum “true peak,” which means that this meter is capable of measuring “inter-sample peaks,” rather than only the peaks at each sample of a waveform.
Graphical Loudness Meters
Two separate meters give you a dynamic graphical measurement of the loudness of the selected bus being monitored according to the loudness standard you’ve selected, which determines how to analyze the subjective loudness of a given audio mix for purposes of compliance with required quality control (QC) standards.

- A steel-blue meter labeled M (for momentary) has as many channels as the selected bus you’re monitoring, excluding the LFE channel(s) of surround formats, which aren’t factored into loudness metering. This meter measures LEQ (equivalent sound level), within a 400ms window following the playhead as measured every 100ms. This lets you evaluate the LUFS (Loudness Units Full Scale) level of the mix at the current frame as you play. This discrete-channel analysis is used to calculate all other values of the loudness metering system.

- A second steel-blue mono meter to the right displays the sum of all channels in the M meter, displayed in LU (loudness units). The number value displayed at the top of this meter is the maximum LU value that’s been analyzed during any stretch of timeline playback. This value is held until it’s reset, either by stopping and initiating playback a second time while Link to Playhead is enabled, or when you click the Reset button at the bottom of the loudness meter area.

Numeric Loudness Meters
A set of values to the right of the meters give running reports on the audio level of your mix. While the graphical meters are useful for analyzing your mix as you work, these numeric readouts are particularly valuable for providing the strict information you need to adhere to written QC standards. Their meaning is as follows:

- **Short**: Measures the average LU level over a 30-second window following the playhead.
- **Short Max**: Shows the maximum level over the same 30-second window. This analysis is required by EBU R128.
- **Range**: Measures the dynamic range of the Loudness of your mix (in LU), which is the difference between the average soft and average loud parts of your mix. Analyzes the overall loudness over a played range of the mix, discounts the lowest 10% and highest 5%, and then gives a standardized expression of the difference between the remaining soft and loud levels that were analyzed. The window of analysis is as long as you’ve been playing. This analysis is required by most QC specifications.
- **Integrated**: Measures the LUFS value of the portion of the range of the mix you’ve played through. As you play, this integrated value accumulates. This analysis is required by most QC specifications.

Using the Loudness Meters
When using the Loudness meters to do a structured analysis of your mix to determine QC adherence, a group of controls let you determine when analysis begins and ends.

- **Lock Metering to Transport**: This setting is found in the compound meter option menu. When enabled, all loudness metering analysis is automatically reset whenever you move the playhead to another location in the Timeline. This is useful when you’re spot-checking different parts of your mix, or working on a particular scene.
- **Pause and Reset buttons**: When you’re doing a formal analysis of your mix, the Reset button lets you reset all currently accumulated analyses, and the Start button initiates loudness value accumulation. If you need to stop playback briefly to do something else, you can click Pause, and then click Resume when you’re ready to continue the analysis.
Visualizing Loudness Monitoring

When you show the track of a Main bus in the Timeline, as long as the track is high enough (ahem, tall enough), you can show or hide a series of “Loudness History” curves to visualize the loudness analysis of the mix on that bus over the duration of the mix.

The available curves are:

- **Integrated**: A thick curve shows the averaged “integrated” loudness analysis of the current mix, which is a measurement that’s taken from the beginning to the end of playback. This graph is the primary gauge of whether or not measured loudness is acceptable. The color of each segment of this curve indicates whether that part of the mix is “to spec.” Blue indicate loudness levels that are below tolerance, yellow indicates loudness values that are within tolerance, and red indicates loudness values that are above tolerance. By evaluating the colors of the curve, you can easily spot which parts of your mix might need adjustment to meet the necessary specification.

- **Momentary**: A measurement of the loudness measured in the past 400ms, shown by a thin green-blue curve, which provides an analysis of transient level changes.

- **Short Term**: A measurement of the loudness of the past 3 seconds, shown by a thin blue line, which provides a more averaged analysis than the Momentary curve, yet still indicates the dynamics of the mix.

To show the loudness history for Main 1:

1. Open the Automation controls by clicking the automation button on the Fairlight toolbar.
2. Open the Index, and click the eye button for the Main you want to see in the Timeline. Loudness History appears as an option in the track header controls as long as the track is tall enough to show the controls. These controls will be hidden on short tracks.
3. Turn on the Loudness History toggle, and check the curves you want to see. The Integrated, Momentary, and Short Term loudness analyses can be individually displayed or hidden, to expose overlapping graphs in that track in which you can see your program’s loudness over time.

**NOTE**: At the time of this writing, loudness history is only supported for Main 1.
**Viewer**

A small viewer to the left of the Monitoring panel shows the frame of video at the position of the playhead. This is the same image that’s output to the external broadcast display of your workstation if you have one connected.

The Viewer lets you see the picture you’re mixing to.

Clicking the Expand Viewer button at the bottom right-hand corner lets you open the Viewer into a floating window, which you can then position anywhere you want.

To close the floating Viewer, click the Dock Viewer button at the upper right-hand corner of the floating viewer window.

Click the button at the upper right-hand corner to dock the Viewer again.
The diagrams in this chapter describe the audio signal flow that takes place within the Fairlight audio processing used by DaVinci Resolve. They’re intended for people who want an in-depth understanding of how audio is processed.

Chapter – 161  Signal Flow Diagrams
Audio Processing Path
Chapter 162

Using the Fairlight Audio Editor

The Fairlight Audio Editor lets you quickly navigate large projects and precisely edit audio much faster than using a regular mouse and keyboard. Using the Audio Editor to control the Fairlight page provides fingertip access to nearly every Audio tool, function and workflow you’ll need to create incredible soundtracks within DaVinci Resolve. In addition to editing audio tracks, clips and waveforms, the Fairlight Audio Editor can also be used to set up, record, arrange, sweeten, mix and master your projects.

Whether you are using a Fairlight Desktop Audio Editor or a Fairlight Audio Editor panel in a Fairlight console, the tools and functionality of both models are the same. This chapter covers details about the Fairlight Audio Editor’s powerful design features, controls, edit modes, multi-functional keys and how they work with DaVinci Resolve.

Please refer to the previous Fairlight chapters for details on using the Fairlight page.

About the Fairlight Audio Editor

Fairlight Audio Editor panels are designed to meet modern audio post production workflow demands while providing ease of use so that audio professionals can quickly and precisely execute both simple and demanding audio editing tasks. These dedicated Fairlight editing control panels are available in either desktop or console models. The difference is that the desktop model is a stand-alone panel designed for audio editors working at individual computer workstations, while the console model has an extended frame that fits into the Fairlight console chassis and is then connected to all of the console’s modular panels. Both models are essentially the same panel, aside from how they are mounted, so if necessary, you can use a Console Audio Editor on your desktop, and likewise a Desktop Audio Editor can be connected to a Fairlight console that does not already include an Audio Editor component.

With its modest size that fits any desk or workspace, the Fairlight Audio Editor keeps every function within reach for simple navigation as well as performing complex two-handed operations. Plus, the user-friendly design is easy to learn and master with a variety of highly visual, intuitive controls including: touch-sensitive control knobs, macro buttons, built-in Editor screen with soft buttons, number keypad, jog wheel, and a full QWERTY keyboard with multi-functional picture keys.

The Fairlight Audio Editor is organized into six sections, each with a specialized set of controls that work in tandem with the Fairlight page interface to perform high-speed, audio tasks within your DaVinci Resolve project.

Audio Editor Sections in Clockwise Order

On the upper-right of the Editor, you’ll find the Monitor section complete with knobs and buttons to control the level of the speakers in both the control room and studio as well as talkback. Below the Monitor section is a numeric keypad for entering timecode and go-to operations. The lower-right of the Editor includes an electronic jog wheel for full shuttle and jog transport control, along with a handy set of fixed transport buttons, Undo, Redo, Zoom and Shuttle.
playback and Jog response keys. To the left of the jog wheel and control buttons is the full-sized QWERTY keyboard with multi-functional self-labeling picture keys for nearly every audio action, tool, function, or workflow. Located directly above the keyboard is the built-in Editor screen which offers an interactive graphical display of the signal processing parameters for the selected track or master bus. The Editor screen is surrounded by sixteen soft menu buttons and three touch-sensitive knobs on the left- and right-side of the screen for dial parameter control. Finally, along the top there is a row of 15 fixed buttons that include ESC and 14 user-defined Macro Quick keys.

Audio Editor Functional Overview

At face value, the control knobs, jog wheel, buttons, and keys function as expected, based on the current Audio Editor mode. However, the way you press keys and the addition of modifiers can place even more options at your fingertips, without the need for changing editing modes or mousing through menus on the Fairlight page interface. So, before diving into a detailed rundown of the Fairlight Audio Editor, it’s important to understand some of the multifaceted controls and functional nuances designed to minimize your keystrokes while maximizing your speed and productivity.

This section offers a quick overview of the types of controls, editing modes, transport and modifier keys, key-press options, as well as pointing out the designated Track Selection, Menu and DaVinci Resolve interface page keys.

Types of Controls

A good starting point for getting to know the Fairlight Audio Editor is to acquaint yourself with the different types of physical controls.

- **Jog Wheel**: To quickly navigate, zoom, change clip levels and more, this fully integrated, highly responsive electronic dial offers smooth free rotation or clutch action control.

- **Knobs**: When you want to make fast changes to specific parameters, these versatile knobs give you precision rotary control, as well as touch-sensitive input for enabling automation or resetting levels. The Audio Editor includes two fixed-parameter knobs with the monitoring controls and six multifunctional soft menu knobs around the Editor screen which are assigned to parameters based on the current Editor mode and active toolset. Holding the Shift modifier key changes the gearing for finer controls, while holding the Control modifier key while touching one of these knobs will reset...
the knob’s current parameter to its default value. For example, if the Audio Editor is in Monitor mode, holding the Control key while touching the knob controlling Fixed Level resets the parameter to 0 dB.

- **Fixed Keys:** These keys are located along the top and right side of the Audio Editor. Unlike the multi-functional soft menu buttons and picture keys, the fixed keys have printed labels based on their designated purpose. Among the fixed keys you’ll find the Macro quick keys, Monitoring Control keys, Numeric keypad keys, Jog and Transport Control keys, along with Undo, Redo, Record, Zoom, and Enter. Fixed keys are white with black labels, with the exception of the two red Mute keys in the Monitoring controls.

- **Soft Menu Buttons:** Above and below the Editor screen are two rows of eight soft menu buttons for a total of 16 buttons used to either toggle or show alternate pages of controls in the Editor screen based on the current Editor mode. The upper row of soft menu buttons are always toggles, such as the EQ In or EQ Bypass, when the EQ parameters are active, or a Boom toggle that alternates between: Boom Post, Boom Pre and Boom Only when the Pan parameters are active. The eighth button in the upper row toggles between page 1 and page 2 of functionality assigned to the first seven soft menu buttons. The lower soft menu buttons control parameters assigned to the six knobs, with the middle six lower soft menu buttons controlling which primary set of parameters are assigned to the knobs, like Track Level, Left/Right and Front/Back controls when the Pan parameters are active in the Editor screen. The left and right lower soft menu buttons reveal alternative controls assigned knobs, such as the alternate Pan parameters, Rotate, Tilt and Up/Down, assigned to the right three knobs.

- **Picture Keys:** These self-labeling picture keys change their appearance and function dynamically, based on whatever the user is doing at that time and offer control for nearly every tool, panel, action, and task on the DaVinci Resolve Fairlight page. Additionally, the picture keys default to a standard QWERTY keyboard whenever user text input is needed (this setting is governed by the QWERTY: Auto/Off setting in the Setup mode), or when the DaVinci Resolve software displays a page other than Fairlight.

---

**Audio Editing Modes**

To accommodate the numerous audio post production toolsets and workflows, the Fairlight Audio Editor includes six primary Editor modes that change the picture keyboard layout and Editor functions based on the operational task at hand. These six “mega” Editor modes are conveniently named after their toolsets as follows:

- **Setup:** This mode provides quick access to non-editing operational windows, view options, and functions such as opening the Bus Format and Bus Assign windows, toggling on and off audio track layers, and saving a project.

- **Record:** As you probably guessed, this mode presents the precision tools you’ll need to perform manual, punch-in and ADR recording.

- **Monitor:** Use this mode to quickly change your fixed monitoring levels, isolate speakers, buses or mains, switch to alternate speaker sets, toggle phase, and other control room playback monitoring functions.

- **Macros:** This mode presents 30 programmable Macro keys where you can record sequences of keystrokes for repetitive tasks to each Macro key.
- **Mix**: Transforms the Fairlight Audio Editor into a robust mixing tool with full control of Fairlight page Mixer functions like track EQ, Dynamics and Pan settings, copy and paste settings between tracks, as well as utilizing the full automation recording and editing toolset.

- **Edit**: This is where the Fairlight Audio Editor got its name and reputation for unparalleled speed and accuracy for every aspect of audio post editing from auditioning and syncing sound effects to checkerboard editing dialogue tracks on the fly.

**Transport, Modifier, and Escape Keys**

While working with the Fairlight Audio Editor, you will always have access to the standard Transport, Modifier, and Escape keys, even while using the QWERTY keyboard for entering data. The Transport and Modifier keys are located at the bottom of the keyboard, and the Escape (ESC) key is at the top row of the editor with the Macro Quick keys.

You’ll use the Transport keys: Rewind, Fast Forward, Play, Stop, and Record for navigation, playback and recording along with the jog wheel and its adjacent fixed transport keys.

The standard modifier keys: Shift, Control, Command and Alt, work in conjunction with the QWERTY keys for default and user-defined keyboard shortcuts along with your mouse while operating other pages of DaVinci Resolve. When you are using the Fairlight Audio Editor to control the Fairlight page, the Control key (CTRL) is an essential modifier for revealing secondary functions on the self-labeling picture keys. For example, when you press the Control modifier key, the Rewind and Fast Forward transport keys become Project Start and Project End keys. Additionally, the Shift modifier key can be used in conjunction with the knobs for refined incremental parameter control.

Another important key that you’ll find on a standard computer keyboard as well as the Audio Editor is the Escape key. This key lives up to its name as an all-purpose “escape” that can be used at any time to exit an operation, action, data entry or menu without saving the changes since the last save. The Escape key works as an operational override for a variety of functions including: GoTo functions, naming clips, setting values in dialog boxes, opening, closing and saving files, and any time a Cancel button is shown in a dialog on the computer screen.

As you learn your way around the Editor, you’ll soon appreciate the convenient locations of the Transport, Modifier and Escape keys in the lower-right, lower-left, and upper-left positions respectively.
Escape

Modifier Keys

Transport Keys

Escape key

Modifier keys: Shift, Control, Command, and ALT

Transport keys: Rewind, Fast Forward, Play, Stop, and Record

Transport keys with Control modifier engaged to reveal Project Start and Project End keys

**NOTE:** If your Audio Editor is connected to a Fairlight console, the Control key on the Editor works in tandem with the Control buttons on the Fairlight Console Channel Control panel and Channel Fader panels to access secondary functions, parameters and controls. Also, there is an independent ALT key below the built-in Editor screen that is used to toggle between additional parameters on the left- and right-side of the screen. This ALT key is dedicated to the Editor Screen controls.
Latch, Long, and Momentary Key Press Functions

Unlike standard keyboard and numeric keypad keys, which deliver the same result whether the keys are typed or held down, many Fairlight Audio Editor keys have multiple operational states which elicit different results depending on how you press or hold the key. The three types of key presses are:

- **Latch**: Quickly pressing and releasing a key, just as you would with normal typing, is referred to as latching and results in toggling on or off that key’s function.

- **Long-press**: A long-press is performed by simply pressing a key longer than you would if you were simply typing it. When performing a long-press, you only need to press the key long enough to see the desired result, such as opening or closing a window on the Fairlight page GUI. Long-presses are only slightly longer than typing, about 300 milliseconds, so they don’t slow you down, they just offer more functions within a fixed number of keys. These long-presses can be real time savers, and in many cases replace the need to reach for the mouse to click the Fairlight page interface.

- **Momentary hold**: A momentary hold involves pressing and holding a key with one hand to reveal additional keys and functions that can be quickly latched with the other hand.

**NOTE**: From this point forward, descriptions such as type or press indicate a latched operation, long-press means to press longer than usual until you see the desired result, and instructions to hold and release refer to momentary operations.

Examples of Long-Press and Momentary Key Press Actions

Here are three examples of these types of button presses in action.

**Using a long-press to open or close GUI windows:**

There are five signal processing picture keys, including Pan, EQ, Dynamics, Aux, and Plug-in. These correspond with the graphical display in the built-in Editor screen as well as the Fairlight Mixer on the computer screen. If you latch one of these keys, such as EQ, the Editor screen displays EQ parameters for the selected track. In turn, these parameters can be controlled by the adjacent soft buttons and knobs without opening the GUI controls on the computer screen. However, long-pressing the EQ key both selects these controls and opens the EQ window on the computer screen. The EQ window will stay open until you long-press the EQ key again to close it. This works the same as double-clicking the EQ control on the Fairlight Mixer UI, and then clicking the Close button on the EQ window to close it.

Signal Processing keys: Pan, EQ, Dynamics, Aux, and Plug-in with EQ key latched
NOTE: Once you open a signal processing window using a long-press, the GUI window will automatically change to follow the current latched signal processing displayed in the Editor Screen and vice versa. So if you open the EQ window with a long-press, then latch the Pan key, the GUI window on the computer screen will change to the Pan window and the Editor screen will display controls for the Pan signal processing. If you want to see more than one signal processing window at a time on the computer screen, you'll need to double-click them independently with the mouse.

Using a momentary key press to briefly enter a different Editor mode:
Each Editor mode includes a picture key toolset unique to that mode, however, audio work is a fluid process that sometimes requires users to jump back and forth quickly between toolsets while they work. Rather than reach for the mouse to access a menu, panel, setting, or tool via the Fairlight page interface, you can momentarily jump into another mode to access the tool you need, then jump back and continue your current task.
For example, you could be monitoring playback levels and recording automation data in Mix mode when you decide to reset the Loudness meters to check the section that is coming up. The Loudness Reset controls are accessed via the Monitor mode Editor Screen controls. To get to them, momentarily hold the Monitor mode button with your left hand to reveal the Monitor mode picture keys and Editor screen controls. With your right hand, quickly latch the Loudness soft key below the Editor screen to display the Loudness settings, then press the Reset Loudness toggle key above the Editor screen to reset the Loudness meters. Release the Monitor mode button to return to Mix mode without interruption in playback or automation recording. This type of momentary operation is one of the secrets to harnessing the Fairlight Audio Editor’s speed and power because at any time, in any workflow, you can momentarily jump to a different mode to access a key to do something else and return to the previous task without stopping. In fact, it is common to momentarily jump into the Setup mode toolset while you work because that is where you’ll find keys to quickly toggle on and off track layers, show or hide the Video Scroller, set the playhead (CTI) to fixed or moving, as well as save your project and modify the Audio Editor’s playback controls.

Another advantage of momentary key presses is that they don’t change the latched state of the key you are holding. Working with momentary key presses requires a bit of skill to master, but it can greatly increase your overall speed and efficiency.

Using a momentary key press to reveal related menu option keys:
Latching the Play Jog key starts playback and unlatching the same key engages the jog wheel. Momentarily holding the Play Jog key reveals six related menu option keys in the picture keys along the left side of the jog wheel without changing the current latched or unlatched state of the Play Jog key. While momentarily holding the Play Jog key, you can quickly latch any of the menu option keys. When you release the Play Jog key, the menu option keys are no longer visible. This maneuver can easily be done with the right hand while controlling the jog wheel.

Track Selection Keys
Quickly identifying and selecting tracks and buses is a vital part of recording, editing, and mixing workflows. Therefore, the Fairlight Audio Editor includes a dedicated row of picture keys, at the top of the keyboard, for selecting either tracks or master buses.
Track Selection keys utilize the Fairlight Audio Editor’s unique self-labeling picture key technology to display each track’s user-defined name and color just as it appears in the Fairlight page Timeline. Additionally, the Track Selection keys change appearance to reflect their current state so that you can quickly identify which tracks are selected and which track is actively displayed in the built-in Editor screen. When multiple tracks are selected, the most-recently selected track is always the track actively displayed on the Editor screen. Track Selection keys also reflect each track’s status with a colored icon that indicates if the track has been muted (M), soloed (S), or armed for recording (R).

**TIP:** Holding the CTRL key down reveals alternate commands, including Mute Clear and Solo Clear (to clear either Mute or Solo states from all tracks). Holding the CTRL key and pressing Mute Clear or Solo Clear a second time acts as a specialized undo/redo toggle to restore all tracks to their previous Mute or Solo state prior to being cleared. This is incredibly useful during mixing so that you can focus on a set of soloed tracks, un-solo them all simultaneously to hear them with the mix, then quickly return them to their soloed state.

**Track Selection key states and appearance changes include:**

- **Unlatched:** The track is deselected, with the track’s color showing as a bar above the track’s name.
- **Latched:** The track is selected, with the track’s color expanding over two thirds of the button.
- **Active:** The active track can easily be identified by a white bar on the lower third of the key and the track’s color in the upper two thirds. Additionally, the active track’s name, track number, track color and signal processing parameters are displayed on the Editor screen.

ADA VO wFX and ROOM tracks are selected, Room track is active, PFX muted, MEDLAB 1 and MEDLAB 2 tracks are soloed, and the DRONE track is deselected.
Master buses showing in the Track Selection keys with Main 1 active and the main named 5.1 muted.

**NOTE:** Pressing a Track Selection key is the same as clicking a track header or channel strip in the Fairlight page Mixer with your mouse.

**Pressing a Track Selection key does all of the following simultaneously:**

- Latches or unlatches that Track Selection key with visual feedback accordingly.
- Selects or deselects that track in the Fairlight page Timeline and Mixer.
- Displays that track’s signal processing in the built-in Editor screen.
- Tallies on or off that track’s Channel Select button and calls up that channel’s parameters on the Fairlight Console Channel Control panel, if you are working on a Fairlight console.

The dedicated Track Selection keys are located in the top row of the picture keyboard, where the number keys would be on a standard keyboard. Here you’ll find 12 track selection keys as well as All Tracks, Page Up (^), and Page Down (v) keys.

You can select multiple tracks by pressing additional Track Selection keys. However, there can only be one active track at a time and it’s always the last Track Selection key pressed. Like most Fairlight Audio Editor keys, the Track Selection keys include some unique selection nuances to improve your efficiency without the need for a mouse.

**Track Selection keys and key-press options:**

- **Track Selection keys:** There is one Track Selection key for each track in the Fairlight page Timeline. From left to right the first 12 keys are Track Selection keys that follow the order of the tracks in the Timeline from top to bottom. Press once to select or deselect a track. Select as many tracks as needed, one track at a time, by simply latching the corresponding Track Selection keys. Double-press any Track Selection key to deselect all other tracks and actively select the current track. Hold a Track Selection key, then double-press another Track Selection key to select both tracks as well as all contiguous tracks between them. In this case, the key that was double-pressed will become the active track.

- **All Tracks:** Press this key to quickly select or deselect all tracks in the Timeline. Long-press the All Tracks key to change the entire picture keyboard to Track Selection keys for up to 48 tracks from left to right top to bottom. When All Tracks is latched, you'll also have the option to continue to show tracks, or display master buses such as the Mains, Submix and Aux buses, and VCA groups. Below the All Tracks key, on the far right side of the picture keyboard, you’ll see the Tracks and Masters keys. Here you can choose which type of feed is displayed in the top row of the picture keyboard. Tracks are all of the Timeline tracks, and Masters are the buses for mixing and output. Long-press the key again to return to the default picture keyboard with one row of 12 Track Selection keys at the top.
• **Page Up (верхнее звездочное клавиши)**: Pages up to display the previous 12 tracks in the top row of Track Selection keys, or the previous 48 tracks when the picture keyboard is set to display 48 Track Selection keys. Holding Ctrl- changes the Page Up key to a Bank button for loading a user-defined bank of tracks.

• **Page Down (нисходящее звездочное клавиши)**: Pages down to display the next 12 tracks in the top row of Track Selection keys, or the next 48 tracks when the picture keyboard is set to display 48 Track Selection keys. Holding Ctrl- changes the Page Down key to a Bank button for loading a user-defined bank of tracks.

**NOTE:** Hiding track visibility in the Timeline, using the Index, or using the Hide Track key on the Audio Editor hides a track from the Timeline and Mixer, but does not change the corresponding track’s state, output or Track Selection key. Additionally, in DaVinci Resolve 16 and higher you can show all master buses including Mains, Subs and Aux buses as tracks in the Timeline as long as the Automation toolset is showing and the buses are marked visible in the Tracks Index.

---

### Moving Track Selection with the Jog Wheel

Whether you select a single track or multiple tracks, you can quickly move the entire selection up or down with the use of the Move Selected picture key and the jog wheel. The Move Selected key is available in both the Record and Edit mode toolsets. This is incredibly useful when working with high track counts so that you can select a track or group of tracks much higher or lower in the Timeline without the need to grab your mouse to scroll. Simply hold the Move Select key while you turn the jog wheel clockwise to scroll the selection down to lower tracks, or counter-clockwise to scroll up to higher tracks. Keep in mind this only moves the selection and does not move the tracks or the contents of the tracks.

![Move Selected key](image)

**Move Selected key available in Record mode and Edit mode**

### Switching Pages

Although the Fairlight Audio Editor is designed to work exclusively with the Fairlight page in DaVinci Resolve, there may be times when you need to switch to a different page in DaVinci Resolve, such as importing and syncing audio files in the Media page, or rendering a finished mix in the Deliver page. The Menu key, located next to the modifier keys in the lower-left corner of the picture keyboard, lets you quickly access the QWERTY keyboard, or any of the other pages in DaVinci Resolve. A momentary-press on the Menu key reveals keys for each of the DaVinci Resolve pages in the order that they are listed at the bottom of the software interface: Media, Cut, Edit, Fusion, Color, Fairlight, and Deliver. There is also a QWERTY key to temporarily change the picture keys to a QWERTY keyboard.
NOTE: The Fairlight Audio Editor is designed to work with the Fairlight page. If you switch to a different page in DaVinci Resolve, you’ll need to use your computer keyboard and mouse for any operations in the user interface. While other pages are open, the Fairlight Audio Editor shows a QWERTY keyboard that you can use to trigger keyboard shortcuts while working on those pages, just like an ordinary computer keyboard. Once you return to the Fairlight page, the Audio Editor will resume working.

Fairlight Audio Editor

Now that you are familiar with the general layout, types of controls, Editor modes and key-press options in the Fairlight Audio Editor, it’s time to dive deeper into the different areas of operation and how everything works together. Keep in mind that the Fairlight Audio Editor is essentially an over-sized mouse designed specifically to control the DaVinci Resolve Fairlight page. Therefore, the better you understand the Fairlight page, the more proficient you’ll be with your Audio Editor panel.

Please refer to the previous Fairlight chapters for detailed information on the software interface, tools, functions, and audio workflows. However, with the increased functionality and physical controls available on the Fairlight Audio Editor, there are some functions and workflow enhancements that are only available via the Editor panel. This section will give an overview of the entire Fairlight Audio Editor and focus more in-depth on unique features and functions that go beyond the standard keyboard and mouse options in the Fairlight page.

Monitor Section

The Monitor section in the upper-right corner of the Fairlight Audio Editor panel is where you control playback levels for the Control Room and Studio speakers. Control Room monitor levels can be changed at any time using the Control Room knob. Adjusting these controls also adjusts the corresponding onscreen monitoring controls in DaVinci Resolve.
Control Room monitoring controls include:

- **Control Room knob**: this can be used to quickly dial the level of the speakers selected in the control room. You can select alternate control room speaker sets in the Monitor mode toolset.

- **DIM**: This button reduces the Control Room monitor volume by a user-defined amount. Press to toggle Dim on or off. You can set the Dim level on the Editor screen in Monitor mode.

- **MUTE**: Use this button to mute or unmute the Control Room monitors.

The Studio controls control the Studio monitoring circuit of a Fairlight Accelerator card installed on your workstation.

**Studio monitoring controls include**:

- **Studio knob**: Use this to dial the level of the speakers in the Studio.

- **Talk**: Latch this button to toggle on or off a talkback microphone. When latched, the talkback mic remains live. Momentary-press the talk button to use talkback without latching, in this case, the talkback mic will remain live only during the momentary-press and shut off when you release. Press Control with the Talk button to open or close the Talkback Settings window on the computer screen. Engaging Talk also dims the Control Room circuit. You can modify the talkback functionality and general purpose input and output (GPI/GPO) via the Talk Setup menu option keys in the Setup mode picture keys.

- **MUTE**: Use this button to mute the Studio monitors.
User-defined Fixed Control Room and Dim levels

Sometimes the monitoring environment must be set to a standard level and not changed. This is called Fixed Level monitoring. For example, if your control room has been calibrated with a sound pressure level (SPL) meter, you will probably want to set a Fixed monitoring level. When fixed, the Control Room knob has no affect on the monitoring levels. You’ll find controls for Fixed Level monitoring on the built-in Editor screen in Monitor mode. Here you can also toggle on and off Fixed level monitoring and adjust the Dim level. When Fixed Level monitoring is toggled on, the Control Room meter in the GUI turns from green to blue.

To set and reset Fixed and Dim Control Room monitor levels:

1. Latch or momentary-press the Monitor mode key to enter the Monitor toolset and show the Dim Level and Fixed Level controls on the left side of the Editor screen.
2. Use the top control knob to adjust the adjacent Dim level amount onscreen. As you turn the knob left or right, the Dim level GUI changes accordingly.
3. Use the middle knob to adjust the adjacent Fixed Level control using the GUI display in the Editor as a guide.
4. To toggle Fixed Level monitoring on or off, press the soft button directly above the Fixed Level On/Off button on the Editor screen. This can be done anytime during playback, recording, or mixing sessions by simply using a momentary-press on the Monitor mode key then toggling on or off the Fixed Level On/Off soft button.
5. Hold the Control key while touching a touch-sensitive knob to reset it to the default value. In this case, the default Dim level is -15dB and the default Fixed Level is 0.0dB.
6. When finished, release the Monitor key if you were performing a momentary-press. Otherwise, simply latch a different Editor mode key to exit Monitor mode.
TIP: Setting monitor levels is an example of how different areas of the Fairlight Audio Editor work together to quickly achieve a goal. To further define an example, a user could be in the middle of a session and decide to change the Dim level. Without interrupting the current task, the user could momentarily hold the Monitor mode key with one hand and with the other hand, quickly adjust the Dim Level. When finished, the user only needs to release the Monitor key to resume whatever they were working on. Latching the Dim button on the Monitor controls will now reduce the Control Room monitors to the newly defined Dim level.

Numeric Keypad

For the most part, the numeric keypad on the Fairlight Audio Editor is self-explanatory and functions exactly the same as the numeric keypad on an extended keyboard for entering timecode and number values. There are, however, a few specialized keys, such as Colon (:), Clear, and GoTo, that can be used to expedite timecode entry, set locators, and quickly move the playhead or clip to a specific time. Additionally, there are some user-definable operations, such as Review, where you can combine a momentary hold on the Review key plus a Number Key (1 to 9) to set the number of seconds you’d like the playhead to jump back for the Review operation. The timecode is displayed in the Timecode field in the upper-left corner of the Timeline on the computer display, so you can always see the new timecode values as you type.

Numeric Keypad Keys:
- Number Keys 0 to 9: Used for entering number values and timecode entry. Timecode entry requires latching the GoTo Key first.
• **GoTo:** When latched, the numeric keypad is in GoTo entry mode and numbers you enter determine where the playhead will move when you unlatch the GoTo key. Numeric entry can include numbers, timecode, or timecode increments. Positive numbers move forward in the Timeline and negative numbers move back.
  
  – Use a momentary press on the GoTo key to jump to one of the three user-definable locator positions in the Timeline.
  
  – Additionally, when the GoTo key is latched, the standard Play and Stop transport keys become GoTo Play and GoTo Stop keys. This can save a keystroke for the operator so they can type in timecode and immediately go to that location and play or stop without first unlatching the GoTo key.

[Image: Transport controls while GoTo key is latched on the numeric keypad.]

• **Plus (+):** Used in typing or to increment numbers. Typing a Plus before entering a numeric timecode value moves the playhead forward by that value. For example, latching the GoTo key, then typing +0500 and unlatching the GoTo key moves the playhead forward five seconds. When typing values with Plus or Minus keys, the values are entered as timecode from right to left. In this example, +0500 = move playhead 05:00 later.

• **Minus (-):** This key is used in typing or to increment numbers. Typing a Minus before entering a number value moves the playhead forward by that value. For example, latching the GoTo key, then typing -0500 and unlatching the GoTo key moves the playhead back five seconds earlier in the Timeline. When typing values with Plus or Minus keys, the values are entered as timecode from right to left. In this example, -0500 = move playhead 05:00 earlier.

• **Clear:** Clears the current number or timecode entry while in GoTo entry mode. The Clear key can also be used to clear user-defined number values, such as locators.

• **Colon (:):** This key can be used to separate Hours:Minutes:Seconds:Frames in timecode entry, or as a numeric shortcut key that represents a timecode position and replaces 00 when entering timecode. When you type two numbers, a colon is automatically added before the third number. Likewise, typing two numbers followed by a colon also places the colon directly after the two numbers you just typed. This follows standard timecode entry rules for typing in timecode numbers. In this case, to substitute 00 with the colon key, you need to type a second colon. Subsequent typed colons in the same timecode entry event will automatically substituted 00.

The number of colons typed before or after a number indicates the timecode position of the number in the GoTo command. For example, latching GoTo then typing 02:::02 (zero, two, colon, colon, colon, zero, two), then unlatching GoTo moves the playhead to 02:00:00:02. Additionally, the Colon key is a real time saver for navigating to specific areas of the Timeline without the need to type the entire number. The position of the Colon in the numeric shorthand value typed determines if the numbers entered as timecode start from the right as frames, or if you keep the current timecode and move to a designated hour from the left.

For example, if the playhead is currently positioned at 01:00:00:00 and you latch GoTo, then type :20 (colon, two, zero) when you unlatch GoTo, the playhead will move to 01:00:00:20. However, if you then latch GoTo and type 02: (zero, two, colon), then unlatch GoTo, the timecode entry is incremental from right to left, so the result is 01:00:02:00.
TIP: Timecode entry appears in the upper-left corner of the Fairlight Timeline on the computer screen. If you wish to change the timecode to display subframes, you can right-click the timecode display and choose the display setting you wish from the drop-down menu. You can also open a floating Timecode window that displays the playhead position (CTI) from the Workspace menu.

Numeric Keypad Locators
The Fairlight Audio Editor includes three user-defined locators that are used to quickly move the playhead to a stored timecode location. These non-permanent locators are designed to use freely in editing and mixing, but are not saved with the project. A momentary-press on the GoTo key is required to use, set, or clear the locators, which are assigned to the 1, 2 and 3 keys on the numeric keypad. Navigating with locators is a fast and easy way to jump to key positions in the Timeline. Setting a locator based on the current timecode position is often the first and last operation when recording macros so that the macro can start and end at the current timecode position. At this time, locators are only available in the Fairlight Audio Editor.

To set one of the three user-defined locators:
1. Move the playhead to the timecode position that you wish to save as a locator position. In this example you will assign the current playhead position to the first locator on the 1 key.
2. Momentary-press the GoTo key. This illuminates the 1, 2, and 3 keys on the numeric keypad. Continue to hold the GoTo key.
3. Momentary-press the 1 key until it tallys on to show that it has been set.
4. Release both the GoTo and 1 keys. You can follow the same steps to set the second and third locators that are assigned to the number 2 and 3 keys. Locators can be set to new timecode positions anytime while you work and do not have to be cleared before setting a new location.

To use a locator for navigation:
1. Momentary-press the GoTo key. The number keys, 1, 2, and 3 illuminate. In this example, you will go to locator number 2.
2. Continue to press the GoTo key. Quickly press and release the 2 key.
3. Release the GoTo key. The playhead jumps to the second locator timecode position.

NOTE: You need to first set a locator before it can be used. Locators are not saved with the project.

To clear all locators:
1. Momentary-press the GoTo and Clear keys. The number keys, 1, 2, and 3 illuminate, but continue pressing the GoTo and Clear keys.
2. Long press each of the 1, 2, and 3 number keys to tally them on.
3. Release the GoTo and Clear keys. The locators are now clear and will not affect the playhead position until they are set to new timecode locations.
Jog Wheel with Fixed Keys and Soft Menu Picture Keys

The jog wheel and surrounding Fixed keys offer a complete set of transport commands, designed to let you keep your hand in one position while editing. Here you can not only navigate the Timeline from end to end or anywhere in between in seconds, but also go from seeing all tracks to a focused zoom on a single clip at the sample level faster than you could reach over and pick up a traditional mouse. The combination of the jog wheel and Fixed keys offer standard and advanced playback and navigation options that can be defined in Setup mode and with the adjacent picture keys. The soft menu picture keys to the left of the jog wheel display menu options related to Fixed key and Shuttle functions. Since this section of the Fairlight Audio Editor includes such an extensive set of features and functionality, let’s start with the jog wheel as a means of navigation and playback, then move on to the Play menu picture keys, Fixed keys, and subsequent additional soft menu picture keys.
Shuttle/Jog Wheel

The jog wheel is the most versatile control on the Fairlight Audio Editor, and is designed for ease-of-use with all of the associated keys within reach. As a means of navigation and playback, the wheel has two modes of operation, shuttle and jog, that are initiated by the respective Shuttle Position and Play Jog keys above the wheel.

In Shuttle mode, turning the wheel forward (clockwise) or back (counter-clockwise) starts playback in fast forward or rewind at variable speeds based on the amount the wheel is turned. Releasing the wheel while shuttling forward or back will continue constant playback at the current speed until the playhead reaches the beginning or end of the project.

In Jog mode, the playhead movement is contingent on the movement of the wheel, so you can freely jog forward or in reverse at variable speeds while turning the wheel and playback stops immediately when the wheel is released. Jog mode is generally used to scrub a specific area to focus on audible cues for editing and trimming, or for subframe loop-jog scrubbing to pinpoint issues and fine-tune edits. Shuttle mode is used to quickly navigate to a specific location or start playback at a variable speed. Additionally, the wheel can be used for common functions such as zooming, quickly scrolling track selection to different tracks, changing clip volume levels or even dialing the shape of clip fades.

**TIP:** Holding CTRL and latching Play/Jog puts the heel into Shuttle mode. This maneuver also initiates Free shuttle movement even if the Editor setup controls are set to Fixed Shuttle. Thus, pressing CTRL + Play/Jog is a common audio editor shortcut for Free Shuttle control. Additionally, holding CTRL while turning the jog wheel increases the speed 8X. Releasing CTRL returns the wheel to standard jog speed.

Soft Menu Picture Keys

The six picture keys to the left of the jog wheel display soft menu options when you momentarily press the Play/Jog, Rewind, Fast Forward, and Zoom keys. The default soft menu keys that are always available are the Play Menu and Loop keys. Latching the Play Menu key shows six specialized playback options and likewise a long-press on the Loop key shows the Loop Playback options keys that change the looped playback mode assigned to the Loop key.

**Latching the Play Menu key displays special play commands on the adjacent soft menu picture keys:**

- **Play Again:** Plays from the same place as the last time, such as the timecode where the transport last entered Play. This could also include Play and Record at the same time. This key is the same as the Play Menu key so when the Play Menu keys are not displayed, you can simply press Play Menu twice for Play Again.

- **Play Range:** This operation plays from the In Point (beginning) to the Out Point (end) of a range in the Timeline.

- **Play Clip:** This plays the clip beneath the playhead on the active selected track. If there is no clip beneath the playhead, the next clip on selected track is played.

- **Play In:** Plays from one second before the In Point of a range in the Timeline.

- **Play Out:** Plays from one second before the Out Point of a range in the Timeline.

- **Exit:** Exits the Play Menu.
A long-press on the Loop key displays the Loop Playback Options menu keys:

- **Loop Range**: Loops playback around the marked range, from In Point to Out Point in the Timeline.

- **Loop Clip**: This operation loops playback around the clip beneath the playhead on the most-recently-selected track. If there is not a clip beneath the playhead on the active track, the next clip in the track is played. If a track is not selected, this key has no affect on playback.

- **Loop +/- 1**: This creates a two second playback loop around the current playhead position that starts one second before the playhead and ends one second after the playhead.

- **Loop +/- 3**: This creates a six second loop around the current playhead position that starts three seconds before the playhead and ends three seconds after.

- **Exit**: Exits the Loop Options menu without changing the current loop playback mode.

Fixed Keys in Clockwise Order Starting in the Upper-left Above the Jog Wheel:

- **Shuttle/Position**: Latch this key to engage the wheel as a shuttle control for navigation and playback. Un latch or press Stop to stop playback and disengage the shuttle wheel. While Shuttle is active, the Rewind and Fast Forward transport keys light up to indicate which direction the transport is moving. In the Setup mode, Editor Setup keys you can change the shuttle to either Free or Fixed mode.

  - **Free Shuttle mode**: When engaged, the shuttle wheel turns freely clockwise or counter-clockwise, can change direction instantaneously, and shuttles at variable speeds based on the amount and direction you turn the wheel.

  - **Fixed Shuttle mode**: Turning the wheel forward or back starts fast-forward or reverse playback at a fixed speed with built-in stops whenever you change direction.

  - **Position mode**: Hold the Shuttle/Position key while turning the wheel to quickly position the playhead (CTI) in the Timeline. In position mode, you can move the playhead from the beginning to the end of the Timeline in a single rotation of the wheel.
**TIP:** When the shuttle is set to Fixed Shuttle mode you can temporarily override the fixed setting with a long-press on the Shuttle/Position key after it is latched.

- **Review:** This key jumps the playhead back a number of seconds, then plays. Press this key repeatedly to make multiple jumps. The default review jump back time is four seconds. You can change this setting to any number of seconds by long-pressing the Review button and pressing any button between one and nine on the numeric keypad.

- **Rewind/Jump Back:** This key can operate as either a Rewind key or Jump Back key. You can toggle between key functions in the Setup mode, Editor Setup option keys.
  - **Rewind key:** The operation works exactly as the Rewind key in the Transport keys section of the keyboard; you can press the Rewind key repeatedly to increase speed.
  - **Jump Back:** Use this key to jump back to the previous target based on user selection in the Jump soft menu picture keys to the left of the shuttle wheel. Press and hold either the Fast Forward or Rewind key to choose jump to targets, including To Clip, To Mark, and To Fade from the soft menu picture keys. Jump Back moves to the previous Clip or Fade based on track selection.

- **Fast Forward/Jump Forward:** This key can operate as either a Fast Forward key or Jump Forward key. You can toggle between key functions in the Setup mode, Editor Setup option keys. Since there is already a dedicated Fast Forward key, as well as a shuttle wheel for engaging variable speed Fast Forward, this key is often set to Jump Forward instead.
  - **Fast Forward:** This operation works exactly as the Fast Forward key in the Transport keys section of the picture keyboard. You can press the Fast Forward key repeatedly to increase speed.
  - **Jump Forward:** You can use this key to Jump forward to the next target based on user selection in the Jump soft menu picture keys to the left of the shuttle wheel. Press and hold the Jump Forward key to choose jump to targets, including Clip, Marker, and Fade. Jump forward to the next Clip and Fade targets are based on track selection. Marker targets can be either Timeline markers or Clip markers.

Momentary-press on Rewind or Fast Forward fixed keys shows jump targets in the soft menu keys: To Clips, To Marks and To Fades; latch the jump targets you wish to use for navigation with the Jump Forward and Jump Back keys.
• **Play/Jog:** Use this key to start playback or engage the jog wheel for manual jog control. By default, the first press of the Play/Jog key engages the jog wheel. The second press latches the key in Play mode and starts playback. If the Play/Jog key is latched, unlatching the key re-engages the jog wheel. Once the key has been latched, it toggles between Play and Jog. To disable the jog wheel, press the Stop key. Press and hold Play/Jog to show the associated soft menu options in the adjacent picture keys on the left side of the jog wheel.

  - **Loop Jog:** This key toggles Loop Jog on and off. When Loop Jog is on, the transport plays a small length of audio (between 5ms and 2000ms), repeatedly, at play speed. The loop moves as you jog the transport forward or backward. This is a great tool for editing, because it maintains the correct pitch of the audio, allowing you to hear clicks, pops, sibilants in the middle of words, and so on. Some of the other soft keys in this menu control additional Loop Jog parameters.

  - **Rescale Jogger:** Use this key to change the gear ratio based on the current zoom level so that three revolutions a second of the jog wheel reaches normal play speed.

  - **Jog DIM:** Toggles Jog Dim on and off. When on, it causes the monitoring level to automatically dim during Loop Jog to the user-defined value set in the Monitor mode Dim level.

  - **Gear:** This changes the “gear ratio” when jogging between 1 and 20. In other words, it determines how quickly the transport moves in response to turning the jog wheel. You can change the Gear ratio by pressing the Gear key while turning the jog wheel. The lower the Gear number, the slower the transport will go; the higher the Gear number, the faster the transport will go.

  - **Width:** Sets the width for the Loop Jog in milliseconds between 5ms and 2000ms. This is the amount of audio that is repeated in each loop. You can set this amount by holding the Width key and turning the jog wheel.

  - **Follow Zoom:** This toggles Follow Zoom on or off. When on, the gear ratio of the jog wheel is affected by the Zoom setting. The default setting for this control is toggled on.

• **Record:** Latch this key along with the Play key in the standard Transport keys to begin recording to the armed track or tracks. Press the Stop key to stop recording. To arm a
track for recording, press and hold the Record key, then press the Track Selection key for the track you want to arm. Tracks must be patched to an input before they can be armed for recording.

- **Stop**: As you may have guessed, this key stops playback or recording.
- **Up**: You can use this key to move the track selection up to the previous track in the Timeline.
- **Down**: Use this key to move the track selection down to the next track in the Timeline.
- **Redo**: Reverses the effect of the last Undo. This can be used repeatedly to step forward through the editing history.
- **Undo**: Reverses the effect of the last edit and can be used repeatedly to step back through the editing history. Also returns to the location and track selection of the edit being undone. A list of the actions can be seen in the Edit menu > History. There you can also Open History Window to see a full edit history list.

**NOTE:** Undo and Redo works on all editing actions while in Editing mode. While in Mix mode, you can choose either Undo All or Undo Editor. The default Undo setting for mixing is Undo Editor, which limits Undo to editing functions and disables Undo for mixing and automation in Mix mode. The Undo settings can be changed in the Setup mode. For more information about Undo and Redo operations in DaVinci Resolve, see Chapter 1, "Introduction to DaVinci Resolve."

- **Zoom**: The Zoom key in combination with the jog wheel and modifier keys offers numerous quick zooming and scaling options while you work.
  - Hold Zoom and turn the jog wheel to change the horizontal scale of the Timeline on the computer screen.
  - Hold Control + Zoom and turn the jog wheel to change the vertical scale of the Timeline, which in turn, changes the height of the tracks and the subsequent number of tracks visible in the Timeline. Horizontal scaling always zooms around the playhead, while vertical zooming focuses on the active selected track.
  - Double-tap Zoom to zoom your entire program to fit within the current visible width of the Timeline.
  - Press and hold Zoom to show the Zoom menu option keys in the adjacent picture keys. These Zoom menu option keys are a fast way to change vertical scaling while zooming horizontally with the jog wheel for dynamic scaling while you work. These options are:

| 1 Track | Vertically scales the Timeline tracks to show only the active track. |
| 2 Tracks | Vertically scales the Timeline to show two tracks, including the active track. |
| 4 Tracks | Vertically scales the Timeline to show four tracks, including the active track. |
| 8 Tracks | Vertically scales the Timeline to show eight tracks, including the active track. |
| 16 Tracks | Vertically scales the Timeline tracks to show sixteen tracks, including the active track. |
| All Tracks | Vertically scales the Timeline tracks to show all tracks. |
- Hold Control + Zoom to show a secondary set of Zoom menu option keys, including the following:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>32 Tracks</td>
<td>Vertically scales the Timeline to show 32 tracks, including the active track.</td>
</tr>
<tr>
<td>48 Tracks</td>
<td>Vertically scales the Timeline tracks to show 48 tracks, including the active track.</td>
</tr>
<tr>
<td>U1</td>
<td>Scales the Timeline to a user-defined view.</td>
</tr>
<tr>
<td>U2</td>
<td>Scales the Timeline to a user-defined view.</td>
</tr>
<tr>
<td>U3</td>
<td>Scales the Timeline to a user-defined view.</td>
</tr>
<tr>
<td>U4</td>
<td>Scales the Timeline to a user-defined view.</td>
</tr>
</tbody>
</table>

- **Enter:** When using the Fairlight Audio Editor for Cut, Copy, and Paste operations, the Enter key functions as a Paste key. Additionally, the Enter key completes and executes many operations. For example, if you are renaming a track using the QWERTY picture keyboard, pressing Enter after typing the name updates the track name, clears the keyboard, and returns to the previous Editor mode.

**NOTE:** In DaVinci Resolve 16.2 and later, a second Zoom button was added to the left side of the picture keyboard while in Mix and Edit mode, so editors can easily reach it with either the left or right hand while working.
The Review, Shuttle mode, Rewind, and Fast Forward keys can all be customized and used in a variety of ways.

**To change the Review jump back amount, do the following:**

1. Momentary-press the Review key to illuminate the current Review setting in the numeric keypad.
2. Long-press a different number of seconds from 1 to 9 on the numeric keypad until it tallies on to set a new review duration.
3. Release the number and the Review key.
   a. **Free Shuttle mode:** When engaged, the shuttle wheel turns freely clockwise or counter-clockwise, can change direction instantaneously, and shuttles at variable speeds based on the amount and direction you turn the wheel.
   b. **Fixed Shuttle mode:** Turning the wheel forward or back starts fast-forward or reverse playback at a fixed speed with built-in stops whenever you change direction.

**To toggle Shuttle mode between Free Shuttle and Fixed Shuttle, do the following:**

1. Latch or Momentary-press the Setup mode key.
2. Latch the Editor Mode key in the Setup toolset to show the Editor Mode menu option keys.
3. In the Editor Mode menu option keys, latch or unlatch the Shuttle option key to toggle between Shuttle Fixed and Shuttle Free settings.

**To toggle the Rewind and Fast Forward keys to Jump keys or vice versa, do the following:**

1. Latch or Momentary-press the Setup mode key.
2. Latch the Editor Mode key in the Setup toolset to show the Editor Mode menu option keys.
3. In the Editor Mode menu option keys, latch the Mode Wind key to toggle on Mode Jump. The Fixed Rewind and Fast Forward keys above the jog wheel are now set as Jump keys.
4. If the Fixed Rewind and Fast Forward keys are in Jump mode, you can toggle them to Wind mode by following steps 1 and 2, then unlatch the Mode Jump key to toggle it back to Mode Wind.

**To set a user-defined Zoom view in the Timeline.**

1. Momentary-press the Zoom and CTRL keys.
2. In the soft menu picture keys, long-press one of the user keys (U1, U2, U3, or U4) until the main picture keyboard shows all tracks.
3. In the picture keyboard, latch the track selection keys for all of the tracks you would like to include in the user-defined view.
4. At the bottom of the picture keyboard, momentary-press the Menu key and the Fairlight key to exit the user Zoom setup mode.
5. You can repeat steps 1-3 for each of the four user-defined Zoom view keys.
To use a user-defined Zoom view in the Timeline.

1. Momentary-press the Zoom and CTRL keys.
2. In the soft menu picture keys to the left of the jog wheel, press the user view key (U1, U2, U3, or U4) to choose that view.
3. Release the Zoom and CTRL keys.
4. Latch or unlatch track selection keys to add or remove them from the current zoomed view.

Self-Labeling Picture Keyboard

The picture keyboard offers six different key layouts based on the six Editor modes. It also functions as a QWERTY keyboard for typing and data entry. Each Editor mode includes a specialized toolset of keys, unique to that mode. If you are familiar with the Fairlight page in DaVinci Resolve, the picture key functions are self-explanatory as they are clearly labeled with text and icons. For even easier identification, you can change the appearance of the picture keys to text only in the Editor Setup options on the Setup mode keyboard toolset by toggling the Icon Buttons key to reflect as Text Only.

Since there are hundreds of picture key tools for nearly every function on the Fairlight Page in DaVinci Resolve, this section will focus on the types of picture keys, the different Editor mode toolsets, and keys in each Editor mode that offer tools and options that are only available in the Fairlight Audio Editor.

Types of picture keys:

- Editor Mode Keys: These keys determine the current mode of operation in the Fairlight Audio Editor. There can only be one active mode at a time, however, you can momentarily jump into a different mode to choose a setting, tool, or task, then jump back to the current mode. These modes include: Setup, Record, Monitor, Macro, Mix, and Edit.

- Menu and Menu Option Keys: Pressing or latching a Menu Key reveals a group of Menu Option keys adjacent to the latched Menu key. In most cases the Menu Option keys remain visible until you unlatch the parent menu key. For example, in Edit mode, you can latch the Track Menu key to show seven Track Menu-related option keys, including Unlock Height, Lock Micro, Lock Mini, Lock Large, Track Safe, Hide Track, and Un-Hide All. These options are also available when you right-click a track’s header, or click the Visibility icons on the Tracks pane of the Index Panel in the Fairlight page. When the picture keys are in Text Only mode, the Menu keys can be easily identified by the colored tag in the upper-left corner of the key.

**NOTE:** At this time, there is not an Un-Hide all tracks function on the Index panel in the Fairlight page. However, you can click your mouse on the Hide icon and drag it down over other hidden tracks to quickly swipe on or off track visibility. The Un-Hide All key is an example of a feature that is only available in the Fairlight Audio Editor.
• **Toolset Group Keys:** These are groups of similar operation keys that are placed together within an Editor mode toolset. For example, in Mix mode there is a group of Paste tools for pasting attributes from one track to others, including Paste EQ, Paste Dynamics, Paste Aux, Paste Path, Paste Plug-ins, and Paste All. This toolset group offers the same options that are available in the Paste Attributes sub-menu options in the Edit menu and right-click menu on a Track Header.

• **Toggles:** Toggle keys choose between a pair of options, often On or Off. In some cases, toggle keys toggle through multiple options. For example, in Record mode, the OSC key toggles the Oscillator on or off. However, the Input Monitor mode key toggles between all five Input Monitoring modes: Input, Auto, Record, Mute, and Repro. You can also latch the Input Monitor key to show the five input monitoring modes as menu option keys, similar to a drop-down menu. These same Input Monitoring modes are available via the Fairlight > Input Monitoring Style menu.

• **Open/Close:** These keys open or close the associated panel or window on the Fairlight page interface. If pressing the key opens the panel or window, pressing the key again closes it, in most cases.

• **Action:** Action keys cause an immediate result when pressed, such as Mark In, Mark Out, Trim Head, and Trim Tail in Edit mode.

• **Secondary Functions:** Instead of reaching for the mouse for some commonly used operations, you can simply press the Control modifier key to reveal them as secondary functions in the picture keyboard. For example, press the Control key to transform the Mix, Edit, and Monitor mode keys into toggle keys to Show/Hide the Mixer, Index, and Meters panels respectively on the Fairlight page. Having the option to quickly show and hide these panels can really speed up your workflow.

---

**Selecting a Clip vs a Range**

The Fairlight page in DaVinci Resolve has two prioritized selection options for recording and editing functions, both of which use track selection to determine the contents included in the selection.

• **Clip selection:** Selects clips beneath the playhead on a selected track or tracks. The exception is if clips are manually selected with the mouse. Clips that have been manually selected with the mouse are outlined in red and override selection based on the playhead and selected tracks. Clip selection is ideal if you only wish to edit a single clip or clips beneath the playhead on selected tracks.

• **Range Selection:** Involves setting In and Out points in the Timeline by either using the In and Out keys, or marking either In or Out and moving the playhead to create a range. Marking a range automatically toggles on the Range key. Range selection allows you to select a portion of a clip or multiple clips on all of the selected tracks. When the Range key is latched, recording and editing operations may include all selected tracks within the range. If no tracks are selected, all of the timeline material within the Range boundary will be selected. This is useful if you are copying or cutting and pasting an entire range of the Timeline and pasting it elsewhere in the Timeline.
As you learn the different Record and Edit mode toolsets, remember that they will change based on the state of the Range key and the type of selection you have at the time of the operation.

**Setup Mode Toolset**

The Setup mode toolset is for the behind-the-scenes setup of operational elements that in many cases are set up when you start a project and left alone for the duration of the project. Here you’ll find specialized keys for setting up the Audio Editor’s functionality, toggling controls, or opening and closing settings windows that would otherwise require a mouse and menu selections on the Fairlight page. There are also some specialized setup keys that are only available on the Audio Editor, where you may wish to momentarily jump into Setup mode to enable or disable functions, then jump back to your current task.
Setup mode keys for enhanced features only available in the Fairlight Audio Editor:

- **Video Online/Offline**: When toggled On (Online) the playhead is sync locked to the current video timecode in the Timeline. When toggled off (Offline), the playhead moves freely, and can be used to go to another area of the Timeline or Media Pool to add or edit a clip. Toggling this key back On (Online), returns the playhead to the exact position it was prior to going offline. This is a great way to temporarily move the transport offline so that you can go to a clip in another part of the Timeline, use the playhead as a sync point to copy or cut the clip, then toggle the Video back Online to jump the playhead and copied clip to the previous timeline location.

- **Display Setup**: This menu key reveals Display Setup Source keys to accommodate all of the Fairlight LCD screens on a console. Each Source key toggles between DATA, HDMI and SDI as needed.

- **Fader Spill**: Temporarily spilling the member tracks of a master bus or VCA group to nearby faders is a fast way to finesse member track levels while mixing. Use this menu key to reveal two menu Spill option keys that determine the type of fader channel and direction in which member tracks are temporarily mapped to the adjoining faders on the Fairlight Channel Fader panel.
  - **Spill Left/Spill Right**: This menu options key toggles between Spill: Left and Spill: Right, which in turn dictates whether the member tracks of a bus are assigned to neighboring faders to the left or right of a bus when Spill is engaged in the Channel Fader panel.
  - **Spill Any/Spill Tracks**: When in the default (unlatched) state, the Spill: Any menu option allows member tracks of a bus to be spilled to the nearest faders to the left or right, including faders assigned to Master buses and VCA groups. When latched to the Spill: Tracks option, member tracks of a bus spill either left or right, starting with the nearest track fader in the designated direction. This option is useful if you need to maintain fader control of your buses while you spill their constituent tracks to the nearest track faders.

**NOTE**: Fader spill is engaged on the Channel Fader panel with a momentary-press on the Bank/Flip key, then latching the call button on a bus channel in the current fader bank. For more detailed instructions on using Fader Spill and creating custom Fader Banks, see Chapter 163, “Fairlight Consoles.”

- **DL Off**: This is the Decklink Offset key that lets you offset the Decklink Output so the picture and audio are in sync. Momentary press the DL Offset key and turn the jog wheel to increase or decrease the frame offset between 0 and 7 frames. This feature is also available in the Fairlight, Video I/O Offset section of the DaVinci Resolve User Preferences.

- **ADV In Jog**: Latch this key to apply the Decklink Output offset while playback is in Jog or Shuttle mode. This feature is also available as a checkbox in the Fairlight section of the DaVinci Resolve User Preferences.
• **Talk Setup:** This menu key reveals three menu option toggle keys to customize the Editor’s Talkback functionality:
  
  - **Smart Talk/Push-2-Talk:** This key toggles between the default unlatched Smart Talk option and the latched Push-2-Talk option. Smart Talk allows the user to either latch the Talk button for extended hands-free talkback, or Push-2-Talk with a momentary press on the Talk button. Latching this key toggles on the Push-2-Talk mode, which limits talkback to the momentary-press Push-2-Talk method similar to using a 2-way radio.
  
  - **GPI:** Talk/DIM/None: This key toggles the Monitoring Controls for the general purpose input (GPI) between None, Talk plus DIM, or DIM only.
  
  - **GPO:** Talk/None/Armed/Record: Use this menu options key to determine when the general purpose output (GPO) sends a signal during a session. This key toggles between Talk, None, Armed and Record.

• **Editor Setup:** This menu key reveals toggle keys to customize the Editor functionality, including:
  
  - **Mode Jump/Wind:** This key toggles between Jump and Wind modes for the Rewind and Fast Forward keys above the jog wheel.
  
  - **Shuttle Fixed/Shuttle Free:** This key toggles between Fixed or Free Jog Shuttle mode.
  
  - **Jump/Wind:** This key toggles between Jump and Wind modes for the Rewind and Fast Forward keys above the jog wheel.
  
  - **Icon Buttons/Text Only:** Use this key to toggle the picture keys between Icon and Text or Text only.
  
  - **ALT Layout:** Latch this key to switch from the Normal layout to a new alternative text-only keyboard layout. This new Alt text-picture key layout shows keys that are relevant to the current task, with keys grouped toward the middle and lower rows of the keyboard for easy access. In this layout, the Editor Mode keys are located in the center of the lower two rows of the picture keyboard. They are easy to spot with white text labels and a white line at the bottom of each mode key. The alternative layout also utilizes the six soft menu picture keys to the left of the jog/shuttle wheel for toolset group keys based on the current Editor mode and task at hand.
To return to the normal layout of the picture keyboard, do the following:

1. Press the white SETUP mode key, if necessary.

2. Press the yellow UTLS (Utilities) key. To reveal the Utilities menu options keys in the row above the UTLS key. The yellow tag in the upper-left corner of the UTLS key indicates it is a menu key.

3. Press the orange ALT LAYOUT menu options key to return to the normal layout in Text Only mode. To return to standard Icon and Text mode, unlatch the Text Only key in the Editor Setup menu options keys in Setup mode.

**NOTE:** You’ll find pictures of each of the Alt Layout toolsets later in this chapter.
Additional enhanced features only available in the Fairlight Audio Editor:

- **Call Follows key:** In addition to selecting a track, there are other criteria for making a track active and "calling" its information into the Editor screen and corresponding Channel Control bay if you are on a Fairlight Audio Editor connected to a Fairlight console. These Call Follows menu options depend on the physical buttons, touch-sensitive knobs, and faders on the Fairlight console. The Call Follows menu key offers five Call Option keys that can be used alone or in combination to determine which track or master bus is active:
  - **Current Track:** When toggled on, the most recently selected track is the active track.
  - **Fader Touch:** When toggled on, touching a fader on the Fader panel makes it active.
  - **Pan Touch:** When toggled on, touching the Pan knob on the Fader panel makes it the active track.
  - **Inline Touch:** When toggled on, touching any touch sensitive knob on the Channel Control panel, while set to Inline mode, calls that track and makes it active.
  - **Solo Button:** Latching the Solo button on the Fader panel makes it active.

  Using a mouse or the Solo button on the Fairlight Audio Editor does not "call" the track active. Only the Solo button on the Fairlight Fader Control panel works in this scenario.

- **Undo Editor/Undo All:** This key is a matter of operator preference. When set to the default (unlatched), Undo Editor, tasks performed in Mix mode, including recording and editing automation data, will not be undoable. You can, however, simply record new mixing data to override the previous data as needed. Latching this key enables the Undo All mode, which in turn will undo all actions including automation applied in Mix mode.

- **CTI Fixed/Moving:** This key lets you choose whether the playhead (CTI) moves across the Timeline, or is fixed in place with the Timeline scrolling past.

- **Preview Track/Mon:** This key determines where preview monitoring goes when auditioning a sound and comes in handy when you need to preview a clip in the Media Pool or Sound Library. When toggled to Preview Track, you will put the track in Thru mode so it works like a live mic input and the sound you preview will be subject to the track’s fader levels, solo or mute state, and any processing applied to the track. If toggled to Preview Mon, the sound goes directly to the monitors without any processing or controls via the track’s channel strip in the mixer or console.

- **Normal Solo/Solo Follows:** This lets you customize how the Solo commands work. Normal Solo/Solo Follows is a bypass toggle for the Call Follows, Solo Button option. If the Call Follows, Solo Button menu options key is latched, and the Normal Solo/Solo Follows key is latched, soloing a track in the Audio Editor or Channel Fader panel "calls" that track’s information into the Editor display on the Audio Editor, and the Channel display in a Fairlight Console Channel bay. Unlatching the Normal Solo/Solo Follows key bypasses the Solo Call feature and returns Solo functionality to Normal Solo behavior, as the name suggests.

**Using the Playhead as a Sync Point indicator to sync sound to picture using Video Online/Offline key:**

1. With the Video Online/Offline key latched on, move the Playhead to the desired frame in the Timeline. For this example, let’s make it the frame where a door slams closed in the Viewer.

2. Unlatch the Video Online/Offline key so that it is offline.
3 Move the playhead to another location in the Timeline where there is a door closing sound effect that you’d like to copy.

4 Select the track with the clip you want to copy, and move the playhead over the frame that you want to sync with the door closing frame.

5 In Edit mode, press the Copy Clip key.

6 Latch the Video Online/Offline key so that it is Online. The playhead jumps to the previous location using the playhead as a sync point to match the door closing audio clip to the video frame of the door closing.

7 If necessary, press the Track Selection key for the track where you wish to paste the synced clip.

8 Press the Enter key to paste the clip.

Record Mode Toolset

The Record mode toolset is where you do your recording and offers specialized toolsets for both Manual and ADR recording. There are keys for every recording feature available on the Fairlight page including keys to open and close the Patch Input/Output window and ADR panels as well as rate takes without needing your mouse. Latch the ADR List, ADR Record or ADR Setup keys to open the associated panels on the computer screen. When either the ADR List or ADR Record keys are latched, you’ll see picture keys for each interface button in the associated workflows. For example, latching the ADR Record key reveals a set of seven specialized keys for ADR Recording, including Previous Cue, Next Cue, Previous Take, Next Take, Rehearse Cue, Record Cue, and Play Cue. These keys work exactly the same as using a mouse and keyboard on the ADR Record panel on the Fairlight page interface.

The Fairlight Audio Editor includes a special set of Manual recording options that are only available on the Editor. These options use either playhead, clip, or range boundaries, as well as user-defined pre-roll and post-roll that can be set in the User Preferences, Editing panel.

**NOTE:** When recording in the Fairlight page, tracks must be armed before recording, and only tracks with inputs patched to them can be armed. Luckily, there is a key in the Record Mode toolset for opening the Patch Input/Output window. Use a momentary press on the Record key and Latch a Track Selection Key to arm that track.
Record Mode Manual Recording special toolset keys include:

- **Record Here**: Playhead goes back the pre-roll duration, then punches into Record at the location where you issued the command. This can be useful when you zoom in to find the exact timecode position where you want to punch in to record, then simply issue this command by pressing the Record Here key and the system does everything for you.

- **Record Range**: The playhead includes a pre-roll and punches into Record at the Range In point, and then punches out at the Range Out point.

- **Record Clip**: After pre-roll, the playhead punches in and out to match the duration of the clip under the playhead on the selected track. If no clip is beneath the playhead, the transport moves forward to the next clip in the track and records there.

- **Record Again**: Pressing this key repeats the last recording you made, both entry and exit, whether it was manually or automatically punched in.

- **Punch In Again**: The system pre-rolls, then enters record at the exact same place as last time, whether it was manually for automatically activated. When entering this record operation, you still need to manually punch out. This allows you to get the same start point for recording but with a manual exit.

- **Record Head**: Pre-rolls, then starts recording at the head of the first clip to come beneath the playhead in the selected track. When entering this record operation, you still need to manually punch out.

Monitor Mode Toolset

As the name suggests, this mode is for setting up your monitor system. In most cases, this is set up at installation, but there are also controls for setting up the monitors for a particular session and quickly switching between different sources, including external sources, speaker sets, and surround formats. You can even mute any of the current speakers by latching its associated picture key marked with a Speaker icon.

Monitor mode default keys showing Control Room monitoring

**Monitor mode keys for enhanced features only available in the Fairlight Audio Editor:**

- **C/R / Studio toggle**: This key toggles the Monitor mode keys between Control Room (C/R) and Studio monitoring keys.

- **Phase**: Hold this key and press any speaker button to toggle its phase.
• **Alt Source:** Use this key to toggle between the Main system bus and the most recently selected Alternative source. The standard monitoring source is the Main system bus. However, you can choose many other sources, including other system buses or external sources, such as a CD player. The system remembers the last non-standard source that you chose as the Alternative source.

• **Mono Comp:** If your current speaker set is not mono, you can press this button to monitor playback in mono.

• **Stereo Comp:** If the current speaker format is not stereo, you can press this key to monitor the playback in stereo.

**Macros Mode Toolset**

Macros are programmable keys where you can record sequences of keystrokes. The Macro mode toolset includes 30 programmable Macro keys, as well as Delete, Rename, and Record keys for recording and managing your macros. The first 14 Macro keys are also assigned to the Macro quick-keys at the top of the Audio Editor’s display (Pad). Macros can record any keystroke on the Fairlight Audio Editor, including a momentary press to enter a different mode and keypresses in that mode during the momentary press. For example, it is common, when recording a macro, that you start in the mode with the first key you want to record, then momentary-press the Macro mode key to enter Macro mode just long enough to start recording the macro. Upon releasing the Macro mode key, the first key you press on the original mode will be the first one recorded.

The most important thing to remember when recording macros is that they are reliable once created, but have no context except what you program. It’s a good idea to think of the starting and ending context for your macro prior to recording. For example, if the macro requires moving clips from one track to an empty track, make sure you create the new track before executing the macro. If the macro uses jump keys, make sure you have them set up ahead of time and so on. It is up to the user to remember a starting point and ending point, if relevant. Once a macro has been recorded, the associated quick key at the top of the Editor lights up to show that it is available as a macro.

**NOTE:** To prevent accidentally recording, renaming or deleting a Macro key, the Macro action keys require a momentary press plus a numbered Macro key.
Macro Mode action keys:

- **Delete**: Press and hold this key and press a Macro key to delete the macro.
- **Rename**: Press and hold this key and press a Macro key to open the User Macros dialog and rename the macro.
- **Record**: Press and hold this key and press a numbered Macro key to record. Press Control and the Menu key to stop recording. The Menu modifier key changes to Menu (rec) when recording a macro and Stop Recording when you press the Control modifier key while recording a macro.

Recording a Macro:

1. Set up the Editor for whatever steps you plan to record in the Macro and latch that mode.
2. Momentarily press the Macros mode key to enter that mode temporarily.
3. Do not release the Macros key.
4. With the other hand, in the Macro mode toolset, momentarily press the Record key and the numbered Macro key that you want to record. Release the Record and numbered Macro key.
5. Release the Macros mode key to return to the latched Editor mode.
6. Press the keys one at a time as needed to complete the steps that you want to record to the macro.
7. Stop playback, if necessary.
8. Press the Control key and press the Stop Recording key in the modifiers section of the keyboard.

**NOTE:** You can take as long as you need to record a macro, and if you make a mistake you can either delete the macro or re-record it using the Delete or Record keys.
Example of recording a simple macro to move a clip from one track to the track below:

1. Prepare the Editor for recording the first macro. In this case, press the Edit mode key and latch the A1 track selection key to select that track. Move the playhead over the first clip in the track.

2. Momentary press the Macros key with the left hand. Do not release the Macros mode key.

3. In the Macros toolset, press the Record key and the Macro 1 key, to initiate recording of the Macros 1 key. Release both keys. The Macros keys disappear from view in the Macros toolset.

4. Release the momentary press on the Macros key to return to the Edit mode. The next keypress will be the first recorded to the Macro 1.

5. Press the Cut Clip key to cut the clip on the selected track beneath the playhead.

6. Press the Down key to the left of the jog wheel to move the track selection, and the shadow of the clip that was cut, down one track.

7. Press the Enter key to paste the clip.

8. Press the Up key next to the jog wheel to move the selection back up to the A1 track.

9. Press the Control modifier to change the Menu key to a Recording Stop key. Press the Recording Stop key.

From this point forward, pressing the Macro 1 key in the Macros Mode toolset, or the Macros 1 quick key at the top of the Editor will perform the macro of cutting a clip on one selected track and moving it to the track below then returning to the original track. With this macro, you could easily use jump keys to move down the Timeline a clip at a time, and move any clips that need to go to the A2 track with the press of the Macro 1 key.

**NOTE:** You could also use this same macro to move a clip from any selected track to the track below because it contains the Up and Down arrow keys instead of specified track selection keys. Additionally, you could take this macro idea to a whole new level and include jump keys and fades at the edges of the clips as you edit.

Renaming a Macro key

1. Enter the Macros mode toolset.

2. Long-press the Rename key and press the Macro key that you want to rename.

3. In this case Macro 1. Release both keys.

4. The picture keyboard changes to QWERTY keys and the User Macros dialog opens on the computer screen.

5. Type a new name for the Macro and press Return.

6. The Macro is named in the Macro mode keys.
TIP: If you are going to name your macros, it’s a good idea to give them a brief but literal name to help you remember the macro’s function. In the above example, the macro was named A1 to A2 because it was designed to move a clip from the A1 track to the A2 track.

Mix Mode Toolset

Whether you are using the Fairlight Audio Editor with your computer, or as part of a Fairlight Console, the Editor’s Mix mode offers easy access to a powerful array of mixing and automation tools. Here you can copy and paste EQ, Dynamics, Aux, Path, Plug-ins or all of the above to other tracks and buses as well as automate any parameter. The heart of the Mix mode toolset is the Mix On/Off key. Latching Mix On brings all of Fairlight’s powerful automation tools and menu options to the picture keyboard so you can control every aspect of your automation without ever reaching for the mouse. If you are familiar with Fairlight’s mixing and automation tools in DaVinci Resolve, you’ll have no trouble finding your way around this toolset because there is a picture key for every switch, toggle, menu, and sub-menu option available in the Fairlight page’s robust automation toolset.

The functionality of each specialized key is exactly the same as using the software alone. However, the advantage of mixing with the Fairlight Audio Editor or a Fairlight Console is that you’ll have physical controls including touch-sensitive knobs for precision automation recording and mixing maneuvers without the distraction of a mouse and menus.

NOTE: For a detailed rundown of the Fairlight Automation tools and features, please refer to Chapter 157, “Automation Recording.”
The Mix Mode automation keys are organized and grouped as action keys, toggles and menus with related submenu keys with the same tools and menu choices that you’ll find on the Fairlight page and Fairlight menu in DaVinci Resolve.

**Mix Mode toolset toggles, groups, and menu keys:**

- **Copy/Paste:** This key automatically toggles on when automation is turned off. You can manually latch this key while the automation toolset is showing. When latched, the Copy/Paste key reveals the Copy and Paste toolset group.

- **Copy and Paste Toolset Group:** When the Mix On key is unlatched, the Copy/Paste key latches, and you will see a Copy key next to a toolset with six paste action keys, including Paste EQ, Paste DYN, Paste AUX, Paste PATH, Paste PLUGS, and Paste ALL. These keys are all used to copy attributes from the active track and paste them on a selected track. To use these keys, press the Copy key to copy all of the track attributes for the active track. Select another track and choose the Paste action key that corresponds with the attributes you want to paste to the newly selected track.

- **Mix ON:** This key toggles on or off the Automation toolset. When toggled on, the Copy/Paste key toggles off and the Copy and Paste toolset group switches to the automation specific toolset such as the Mix, Punch Menu, and Preview menu keys.

- **Automation Menu keys:** Enable, Mix list, Mix Menu, Punch Menu, and Preview Menu all reveal a set of submenu option keys when latched. The subsequent option keys offer the exact same options available on the Fairlight page interface. For example, latching the Enable menu key reveals ten option keys that represent each of the ten Enable buttons on the Fairlight page Automation toolbar, in the exact order that they appear onscreen. The Enable option keys are as follows from left to right: Write FADER, Write MUTE, Write PAN, Write EQ, Write COMP, Write LIMITER, Write AUX, Write PLUGINS, Write MISC, including a dedicated All button.

- **Open/Close GUI window keys:** The Patch, Mix List, and Presets keys open and close the corresponding windows on the computer screen.

- **Toggles:** The Touch and @Stop keys toggle between the different Touch and Stop automation modes when toggled. The Touch toggles between OFF, LATCH, and SNAP while the @Stop key toggles between RETURN, EVENT, and HOLD.

- **Preview:** Switches the Automation controls into Preview mode for auditioning settings without writing new automation data.

- **Write Quick Keys:** Write FADER, Write MUTE, Write PAN. These keys can be used to quickly enable the three most common Automation parameters.
**Edit Mode Toolset**

If you’ve read the previous Fairlight chapters, you’re already familiar with the Audio Editing tools and menu options. The Edit mode toolset includes over twenty specialized picture keys for adding, moving, editing, and trimming clips in the Timeline. The keys represent all of the audio editing options available in the Fairlight page via the Edit and Trim menus as well as a handful of tools that are only available in the Audio Editor. You’ll also find keys to open, preview, and edit clips from the Sound Library and Media Pool.

Fairlight audio editing is by nature fast and fluid, even when you are working with the software and computer alone. Where the Fairlight Audio Editor enhances the process is that with the combination of the jog wheel and Edit mode action keys, you can move and edit clips at incredible speeds and even edit clips on the fly without ever picking up your hands. In fact, the Fairlight Audio Editor is designed for two-handed operations. The added functionality of two-handed workflows really comes into play when working in the Edit mode. For example: with your left hand, you can easily select tracks and press action keys, while you use your right hand to drive the jog wheel controls and press the Enter key to paste material that its copied to the clipboard.

The Edit mode action keys work off of two principals: removing material you don’t want to keep in the Timeline, or moving material to another location. To remove material, you use tools that erase or trim. To move material, you use the Clipboard tools that cut or copy and therefore store the material in memory to be pasted elsewhere. When you cut or copy material, a semi-transparent version of the Clipboard clip appears in the Timeline and can be moved to another track or location and pasted. Another consideration when editing is to determine if you are modifying the head, tail, whole clip, or a range containing only part of a clip or multiple clips. All audio edits are non-destructive and reversible with the Undo key.

**NOTE:** For more details about the fundamentals of editing audio clips in the Fairlight page, please refer to Chapter 154, “Editing Basics in the Fairlight Page.”

**Default Edit mode actions and associated keys include:**

- **Cut:** Cut Head, Cut Clip, Cut Tail keys all cut the material based on the selected track, clip and playhead position and place the removed material in the clipboard for pasting with the Enter key. For more fluid editing, hold down a Cut key, such as Cut Tail, and use the jog wheel to move the cut portion of the clip to a new location, then release the Cut Tail key to automatically paste the cut clip in the new position.

- **Copy:** Copy Head, Copy Clip, Copy Tail keys all copy the material based on the selected track, clip and playhead position and place the copied material in the clipboard for pasting with the Enter key.
• **Trim**: Trim Head, Trim Tail uses the playhead’s position to remove the current clip’s head or tail. You can also press and hold Trim Head or Trim Tail while using the jog wheel to extend either the head or tail of the current clip. While doing this, you see the full waveform the clip you’re trimming as you turn the jog wheel, but when you release the Trim Head or Trim Tail button, the Head or Tail of the selected clip appears trimmed at the current frame at the playhead.

• **Split**: The Split key splits the clip at the playhead position creating a new edit point between two clips.

• **Fade**: The Fade Head and Fade Tail keys add fades respectively from the playhead to the head or tail of a clip.

• **Erase**: Erase clip deletes the clip from the Timeline.

**Edit mode actions when Range is active:**

• **Cut Range**: Use this key to cut all clips and partial clips within the range on the selected track or tracks. The Cut Range key replaces the Cut Clip key when Range is toggled on. This cuts clips within the range on all selected tracks.

• **Copy Range**: Use this key to copy all clips and partial clips within the range on the selected track or tracks. The Copy Range key replaces the Copy Clip key when Range is toggled on. This copies clips on all selected tracks within the range.

• **Split Range**: This key splits any clips lying across the range boundaries into two pieces at the range In Point and Range Out Point. This affects clips at the range boundaries on selected tracks.

• **Erase Range**: Erase Range deletes the range from the Timeline. This Erase Range key replaces the Erase Clip key when Range is toggled on.

**NOTE:** For ease of use and quick mastery, the Edit mode action keys are logically grouped in pairs or trios so that keys involving the head of a clip are first and tails are last. For example, the Cut Head, Cut Clip, and Cut Tails keys are grouped together as a trio. Placing three fingers over those keys make it easy to remember the first key is the head, middle key is the full clip, and last key is the tail.

In addition to the default Edit mode action keys, there is also a set of refinement action keys that can be used to finesse edits, fades, and clip positions. The refinement action keys require the Control modifier key as well as the jog wheel in most cases. These refinement action keys are logically placed for quick decisions so you can first execute an edit and then refine it without lifting your left hand or searching for a refinement key.

**Control modifier-based editing refinement actions and associated keys include:**

• **Erase**: Erase Head and Erase Tail keys appear on the same keys as Cut Head and Cut Tail so that you can quickly choose between a cut, which keeps the material in the clipboard and erasure of the material, with the touch of your left Pinky finger on the Control key.

• **Fade**: Head X-Level and Tail X-Level keys appear on the Fade Head and Fade tail keys so that you can first add a fade, then press Control and use the same key to refine the fade level with the jog wheel. Additionally, long-press SHIFT to reveal Head XPoint and Tail XPoint that can be changed with the jog wheel or long-press CTRL + SHIFT to use the jog wheel to refine Head Shape and Tail Shape.
- **Slip**: Slip Head, Slip Clip, and Slip Tail keys are located on the same keys as Copy Head, Copy Clip, and Copy Tail. That way you can seamlessly copy, move, and paste material to a new location, then hold the Control key while pressing the respective Slip key, and turn the jog wheel to refine the Head, Clip position or Tail based on the jog movement of the playhead.

- **Trim**: The Trim Clip refinement tool shares a key with the Split Clip key so that you can split a clip at the playhead position, then hold Control and the same key while using the jog wheel to refine the position of the edit point created by the split.

- **Clip Level**: This key plus the jog wheel and the Control modifier key adjusts the Display level of the selected clip’s waveform.

**Edit mode keys for enhanced features only available in the Fairlight Audio Editor:**
The Edit mode tools work exactly as expected if you are familiar with the Fairlight page in DaVinci Resolve. There are, however, a few specialized keys that don’t have counterpart tools in the Fairlight page. These unique tools perform valuable time-saving tasks.

- **Clip Level**: This key is both a Menu and Jog Wheel modifier key. Hold the Clip Level key to reveal seven option keys to raise or lower the selected clip’s volume up +/- 3 dB. Incremental menu options keys from left to right include: -3dB, -2dB, -1dB, 0dB, +1dB, +2dB, +3dB. As a Jog Wheel modifier key, hold the Clip Level key with the left hand and turn the jog wheel with the right hand to raise or lower the clip’s volume level dynamically based on the amount and direction that you turn the wheel. This can be performed on the fly during playback, so you can dial up or down the volume level of any clip on the selected track as the playhead passes over the clip. Clip level changes can also be applied to multiple clips on multiple selected tracks simultaneously.

**NOTE:** At the time of this printing, The Edit page in DaVinci Resolve includes a Clip menu option and keyboard shortcuts for incremental decibel changes, however there is no comparable shortcut, or menu in the Fairlight page.

- **Reverse Clip**: This key is available as one of the Clip Menu action keys. When pressed, this key reverses the clip beneath the playhead on the selected track. This creative sound design tool is also available in the Record mode Clip Menu toolset.

- **Range Menu Keys**: A momentary-press on the Range key revels six invaluable Range-defined tools for speeding up your tasks. Although they are also available in the Record and Mix mode toolsets, you will primarily use them in Edit mode.

- **Copy Segment**: This action key copies all timeline material within a marked range.

- **Paste Segment**: This key pastes a copied segment to a new timeline location based on the playhead position.

- **Previous Gap**: Use this key to extend a range by moving the range In Point to the previous gap in the selected track or tracks.

- **Next Gap**: Use this key to extend a range by moving the range Out Point to the next gap in the selected track or tracks.

Chapter – 162 Using the Fairlight Audio Editor
• **Fill**: Fills the current range on a track from end to end with the clipboard clip. Without the need to cut, copy and paste, Fill automatically duplicates the clipboard clip, with a slight overlap and fade to stitch together background noise or room tone within the marked range.

• **B/F Fill**: Back/Front Fill works exactly the same as Fill, except that it reverses the audio in every second copy of the clipboard used for filling. Alternating the direction of the stitched clips is useful for creating a seamless background sound because the waveform is continuous.

### Alternate Picture Key Toolsets

In the Alternate picture key layout mode, all of the picture keys are text only, with the Editor mode keys arranged in the lower center white text. The menu keys are easy to spot with yellow text and a mark in the upper left corner. Alternate Edit, Monitor, and Mix mode toolsets include action keys in the six soft keys to the left of the jog wheel for quick access. For example, in Edit mode, the Cut, Copy, Erase, Fade, Nudge, and Trim action keys are all located in the upper-left corner of the picture keyboard, while the action keys associated with the active action key appear in the picture keys near the jog wheel. For example, if the Copy action key is latched, the Copy Clip, Copy Head, and Copy Tails keys are available near the jog wheel. If you latch the Cut action key, the middle keys near the jog wheel change to Cut Clip, Cut Head, and Cut Tail.

Alternate picture key toolsets include the same keys as the default normal layout. The difference is the location of the keys, how they are grouped, and the additional usage of the picture keys near the jog wheel.

![Alternate Macro toolset](image)

![Alternate Setup toolset](image)
Alternate Record toolset

Alternate Monitor toolset with Phase, Main/Near Speaker selection, and Alt Source keys available near the jog wheel

Alternate Mixer toolset with Mix On unlatched, Copy/Paste latched, and Copy/Paste keys available near the jog wheel
**TIP:** One way to get to know your way around the Audio Editor keyboard is to start with knowing how to perform a task in the Fairlight page using a mouse and standard keyboard. Then, consider which Editor mode category the task belongs to, and find the associated keys from there. Making the transition from mouse and keyboard to the Audio Editor is a journey of discovery where you will find numerous ways to execute different tasks, shortcut keys and advanced controls and options that can increase your speed and productivity exponentially the longer you use it.
Editor Screen with Soft Controls

The Editor screen, located above the picture keyboard, displays all signal processing and mixing information related to the most-recently-selected (active) track or master bus. It also displays labels and visual feedback for the soft keys and knobs that surround the screen. Additionally, the ALT key below the screen extends its functionality with an alternative set of parameters when necessary. This is where you can quickly view and adjust various mixing parameters associated with the active track or master bus. Whether you select a track manually with a mouse click, press the associated Track Selection key on the Audio Editor, or latch a Channel Select button on the Fairlight Channel Control panel, the most-recently-selected track’s parameters appear in the Editor screen.

These parameters include Level and Pan, EQ, Dynamics and AUX, and Plug-in parameters that correspond with the active track of bus. The graphical display for signal processing remains the same in the Editor screen for nearly all Editor modes and types of signal processing, except for Monitor mode and Aux signal processing.

As you learn your way around the Fairlight Audio Editor you'll soon find that glancing at the Editor screen is akin to glancing at your dashboard while you drive your car. Following this example, your primary computer screen is like your windshield where you can always see what is happening as you drive the Fairlight Console or Audio Editor. However, like a dashboard, you can glance at the Editor screen at any time to see which track or master bus is selected, as well as the current signal processing settings. Also, like your car’s dashboard, you can reach out and change settings for any of the interactive graphical parameters by simply choosing that element and modifying the adjacent controls.

At this time there are five different Editor Screen layouts that you will encounter while you work with the Fairlight Audio Editor, including Clip EQ, Standard Mixing, Plug-In, Aux sends, and Monitor mode layouts.

The Clip EQ layout gives you soft menu controls of the 4-Band EQ parameters for the selected clip when you latch the Clip EQ key. The Clip EQ key is one of the Clip Menu option keys available in the Record and Edit mode toolsets. Here you have all the same EQ controls that are available in the Clip Inspector in DaVinci Resolve. Along the top of the the second page of Clip EQ controls (shown above), you’ll find new Clip EQ preset options that are not currently available in the Fairlight page UI. These options include: Save Preset, Apply Preset, Copy, and Paste.
Standard Mixing layout used in all Editor modes, except Monitor, or when the Aux controls are showing. At a glance you can see that the Pan controls are active based on the illuminated soft button in the bottom row with the bright red line over the Pan label adjacent to the latched button.

Plug-In layout used to control first plug-in on the selected track and is available in all Editor modes, except Monitor mode and when Aux controls are showing. The Plug-In Editor screen controls include a three page layout. Page 1 provides the Insert IN toggle to bypass the plug-in. Page 2, shown above, has toggle options to Reset the plug-in as well as options to Save, Load, and Apply presets, Automate, and Lock the plug-in. Page 3 offers Mapping mode where the user can map specific plug-in parameters to the six Editor rotary knobs.

Aux layout showing send levels and panning for up to 24 Aux channels simultaneously. In this example, the sends for Aux 1 and Aux 3 are enabled (green) for the active track, while Aux 2 has been disabled for this track. The soft buttons along the top enable the different Aux channels for the active track. Red text over black labels indicate which Aux channels and soft buttons are toggled On.
Visual Feedback between Soft Controls and the Editor Screen

The Editor screen offers highly visual feedback that is easy to follow and corresponds with the identical controls in the Fairlight page, as well as the visual feedback on the Channel bay if you are working with a Fairlight Console. When looking at the soft buttons and touch-sensitive knobs, here are some guidelines to help you recognize their current state and options:

- Soft buttons and knobs around the Editor screen directly control the closest on-screen parameter.
- The soft buttons above and below the screen have three visual states; Bright, dim and off.
- At a glance all soft buttons with adjacent controls are illuminated (dim), while soft buttons without controls are black (off).
- The upper row of soft buttons are toggles that either toggle a parameter On/Off or toggle between options, such as the type of curve for EQ filtering. The last soft button on the top row toggles between pages of controls.
- Soft buttons above the Editor screen brighten when active or latched on, and the corresponding soft menu control onscreen shows in black with red text.
- Soft buttons below the Editor screen display alternative pages of controls assigned to the left and right knobs.
- It is easy to identify which page of controls is active because the latched soft button below the Edit screen is illuminated along with the adjacent label that is also marked with a bright red line.
- When you touch one of the knobs to adjust the current settings, the background of the corresponding visual feedback onscreen darkens.
- You can reset any of the parameters controlled by a touch-sensitive knob by pressing the Control key then touching the knob.
- The first and last soft buttons on the bottom row are modifier keys that offers momentary control of additional parameters for the controls for the knobs when available. For example, when the Aux controls are shown in the Editor screen, the knobs control the send level. While, a momentary press on the modifier soft button changes the knob controls to the Aux channel Pan settings.
Visual cues, like the red line over the illuminated soft button below the screen and the darkened parameter control next to the active knob on the left of the screen, indicate which EQ parameters are currently assigned to the control knobs, as well as which touch-sensitive knob is in use.

**Macro Quick Keys**

The top row of the Fairlight Audio Editor is dedicated to the Macros quick keys. Here you’ll find Macro quick keys for triggering each of the first 14 programmed macros. Once a Macro key has been recorded in the Macro mode layout, the associated Macro quick key illuminates to show it can be used to trigger the corresponding macro. These are a fast way to use macros as you work, without switching to the Macro mode toolset.

Escape and 14 Macro quick keys at the top of the Fairlight Audio Editor for the first 14 macros.
The Fairlight consoles make it easier to perform audio editing, recording, and mixing tasks by providing professional audio controls for nearly every function and feature in the DaVinci Resolve Fairlight page. Additionally, using a Fairlight console to control the Fairlight page is vastly more efficient and ergonomic than working with a traditional mouse and keyboard. This is especially important when your audio post-production job requires long hours doing complex, focused, and often repetitive work.

This chapter covers details about the different modular Fairlight console components, the available console configurations, and how they work with DaVinci Resolve.

**NOTE:** To set up a Fairlight Audio console to work with your DaVinci Resolve system, you first must perform a custom installation of DaVinci Resolve Studio and check the box to include the Fairlight Studio Utility. For complete setup and installation instructions, refer to the Fairlight Console Assembly Instruction Manual.

About the Fairlight Console Components

Fairlight consoles are a modular design that let you build your console to suit your production requirements. Within each console, four different Fairlight console components work together as Fairlight page control panels in a stand-alone chassis. These modular console components are either channel bay panels or audio-editing bay panels, and are paired with an adjoining Fairlight LCD Monitor component. The channel bay components work in tandem to control specific parameters on tracks, buses, and mains and include the Fairlight Console Channel Control, the Fairlight Console Channel Fader, and the Fairlight Console LCD Monitor that is used as a dedicated channel control screen. The audio editing bay components consist of the Fairlight Audio Editor and adjacent Fairlight Console LCD Monitor, which mirrors your computer screen and displays the DaVinci Resolve interface.

Four different Fairlight console configurations range in size from 2-bay to 5-bay, with each bay spanning the width of a console module. The primary difference between the Fairlight consoles is the number of channel bays they contain. For example, a standard Fairlight console 2-bay comes with one set of channel bay panels plus one set of audio editing bay panels for a total of three control panels and two LCD screens, while a standard 5-bay console includes enough panels to fill four channel bays and one editing bay for a total of nine control panels and five LCD screens.

Because you will still need to control your computer and other software functions from the console, it is also important to have a wireless keyboard and mouse within reach. To accommodate wireless computer controls, Fairlight consoles include a Channel Control Blank and an Infill module. The Channel Control Blank fits in the Channel Control slot between the Audio Editor and editing LCD monitor, and easily holds a full-sized wireless computer keyboard. The Fairlight console Infill module provides a convenient flat surface for a wireless mouse, track-pad, or notebook. You can place the Infill module at the left or right of any bay within the console chassis. The most common Infill position is on the right side of the audio editing bay; however, a left-handed sound designer may prefer to place the Infill set on the left side of the editing controls.

Each self-contained modular console is designed to meet the demands of modern work flow ergonomics and ease of use so that audio editors, sound designers, and re-recording mixers can quickly and accurately complete both simple and highly complex audio post-production tasks with minimal fatigue.
This chapter provides details and functions descriptions of each console component and should be read in conjunction with the previous Fairlight chapters to get the best from your console.

For professional sound editors working on tight deadlines, the Fairlight Audio Editor, gives you quick access controls for high speed, precision audio editing. This dedicated Fairlight editing control panel is available in either desktop or console models. It’s easy to learn and master with a variety of highly visual, intuitive controls including touch-sensitive control knobs, macro buttons, LCD editor screen, number pad, electronic clutch-action shuttle, and a full keyboard with multi-functioning keys.

For high-resolution viewing of your DaVinci Resolve interface as well as channel controls, meters, video, and more, you’ll use the Fairlight Console LCD Monitor. These custom designed LCD monitors fit perfectly at the top of each console bay to form a bridge of screens at just the right angle for comfortable viewing while you work. Each modular LCD monitor includes switchable inputs from console screen to HDMI or SDI inputs for flexible display of plug-ins and reference video.
The Fairlight Console Channel Control is a multi-functional panel that works in conjunction with the Fairlight Console Channel Fader and LCD Monitor to provide 12 groups of touch-sensitive control knobs, buttons, and visual feedback for each of the 12 fader channels. These controls offer instant access to the parameters available in the DaVinci Resolve Fairlight page Mixer.
For precision recording, mixing, and mastering, the Fairlight Console Channel Fader module offers 12 touch-sensitive motorized faders and Pan knobs with corresponding Fader Channel Control buttons, automation controls, and bank buttons for mapping tracks and buses to the 12 faders.

Fairlight Console Audio Editor

The legendary Fairlight Console Audio Editor lets you quickly navigate large projects and precisely edit audio much faster than using a regular mouse and keyboard. The Fairlight Console Audio Editor has an identical feature set and controls as the Fairlight Desktop Audio Editor. The difference is that the Console Audio Editor is connected to all the console’s control panels, so recording, playback, and editing functions are reflected on the corresponding channel bays and vice versa. For example, if a track is called in the Fader Panel, it is also loaded in the Audio Editor’s built-in display. Another example is if a track button is selected in the Audio Editor, the track is also selected in the Fairlight Page interface on the Editing LCD monitor, and the corresponding selection button shows active in the In-Line Channel Control Extension buttons as well as the Channel Control LCD monitor. A Fairlight Desktop Audio Editor can also be connected to a Fairlight console that does not include an Audio Editing bay.

Please refer to the previous chapter, “Using the Fairlight Desktop Audio Editor,” for details on the Fairlight Console Audio Editor’s features and functions.
Although the three channel bay components are separate modules, they work together in tandem as a single multifaceted unit to display and control various channel parameters. The Channel Fader panel offers traditional channel mixing controls, while the multifunctional Channel Control panel focuses on controlling specific parameters as needed as well as how they are displayed on the Channel LCD monitor.

Channel Control Modes

Within a Fairlight channel bay, the Channel Control panel works in three distinct channel control modes. These modes, in turn, change the functions of the multipurpose channel control knobs and buttons as well as the corresponding display in the LCD module:

- **In-line**: This mode effectively separates the knobs and buttons on the channel control module into 12 groups that line up vertically with the 12 faders on the channel fader control. As the name suggests, in-line mode shows each set of parameters in a line that continues from the fader channels up through the channel controls and into the display on the LCD monitor. In-line Display buttons on the right side of the Channel Control panel determine which in-line parameters are shown. This mode is common in live recording so that the operator can easily see and control parameters of multiple microphone inputs simultaneously.
• **Channel:** Use Channel mode to control up to 192 parameters on one channel. In channel mode, the 12 groups of controls on the channel control module are used collectively to adjust parameters for a specific channel from left to right as displayed on the LCD Monitor. In Channel mode, there are several ways to choose which channel is displayed, including the Channel Call buttons on the Channel Fader panel, the Channel Select buttons on Channel Control panel, the Call Follows menu, the edit controller, or by selecting a track in the Fairlight page Timeline or Mixer. This is the most common channel control mode in audio post production, as it provides quick access to all parameter controls for a specific track.

![Channel Control components in Channel mode](image1)

• **Master:** This mode utilizes all channel controls to adjust parameters for the buses and main output. In Master mode, the 12 groups of controls on the channel control panel adjust the adjacent main output parameters displayed on the LCD. The channel controls in Master mode are organized from left to right in order of processing. Master mode is commonly used while mixing and mastering soundtracks.

![Channel Control components in Master mode](image2)
Fairlight Console Channel Control

The secret to managing high track counts for large projects is the Fairlight Console Channel Control, because it provides instant knob-per-function access to channel parameters along with real-time high resolution visual feedback on-screen. The Fairlight Console Channel Control module fits directly below the LCD monitor so that you can always see the graphical representation of each parameter as it is modified with the adjacent channel controls. There are four types of channel controls organized in three areas of the panel.

On the far left and right sides of the panel, you’ll find dual-function Channel Display buttons that determine the current channel control mode and which parameters are displayed on the LCD monitor.

The middle of the panel contains 12 groups of multi functional Channel Control buttons and knobs that align with the 12 faders on the Channel Fader panel. The knobs are used to adjust parameter values, while the control buttons act as toggles, On/Off, or In/Out switches for active parameters.

The fourth type of controls are the In-Line Channel Extension Buttons, which are arranged in groups of six below each of the 12 channel control groups. Here you’ll find dedicated channel-specific buttons for functions available in the Fairlight page Mixer and Timeline track headers.

The primary display controls for the channel control components are the dual-function channel display buttons located on the left and right sides of the Channel Control panel. These bi-colored LED buttons determine the channel mode and current parameters displayed on-screen. There are a total of 16 display buttons split evenly into groups of eight buttons on each side of the panel. On the left side of the panel, you’ll find eight channel display buttons used to select the channel control mode as well as display plug-ins and automaton parameters; while the display buttons on the right side of the panel are used to show the in-line channel parameters found in the Fairlight page Mixer, such as Pan, EQ, and Dynamics. The top and bottom display buttons are identical on both sides of the panel to provide easy access to the CTL (control) and ALT (alternate) functions for selecting secondary display features, resetting parameters to default values, and showing alternate controls in the LCD.
The default color for all display buttons is yellow, except for the Control button, which is always blue. When the Control button is pressed, inactive display buttons with secondary functions turn blue or purple. Active display buttons remain in their active state color until another display button is selected. For example, if a secondary function is selected, that display button remains purple as long as it is active, while the other display buttons return to yellow when the Control button is released.

**Left side of panel, Channel display buttons from top to bottom:**

- **CTL:** This display button is the same as the Control modifier key on the computer keyboard and can be used to switch to the secondary functions for the dual-function display buttons below. The handy blue color makes it easy to locate and use as needed, to switch inactive display buttons to their secondary functions. Additionally, holding the Control button while touching one of the knobs or faders will reset any of the touch-sensitive controls to their default values. For example, holding the Control button while touching a fader or Aux send knob resets the value to 0 dB and is the Fairlight Console Control equivalent to double-clicking the mouse on a fader or knob in the Fairlight page GUI. There are a total of three conveniently located Control buttons on a Channel Control bay; two on the Channel Control panel, and one on the Channel Fader panel.

- **MSTR/U1:** This button is used to set the channel controls to Master mode which displays all the system bus controls for the Main output bus on the LCD monitor, while all the adjacent channel control buttons and knobs are dedicated to controlling the busing parameters as displayed. The secondary U1 function is not implemented in this version of the software.

- **PLUG/U2:** Use this button to show active plug-ins on the LCD monitor and allocate controls for the plug-in parameters to the corresponding channel controls. The Plug function as well as the secondary U2 function are not implemented in this version of the software.

- **CHAN/U3:** To change the channel controls display mode to Channel mode, use this button. Once in Channel mode the channel control buttons and knobs control the parameters for a single channel. Use Control + CHAN to get to the channel’s Aux Sends. If multiple channels are selected, you’ll see parameters for the last track selected or called. In this version of the software, the secondary U3 function is not implemented.

- **ENAB/COPY:** To quickly enable parameters for automation, you can hold this button and touch any channel control button, knob, or fader. The alternative function, COPY, is used to copy parameters between channels by simply touching the control knob or fader where you’d like to copy the specific parameter values. At the time of this writing, these functions are not yet implemented.

- **CURVE:** When you want to display a parameter’s automation curves on the active track in the Timeline, hold this button and touch any channel control or the fader, mute, or pan pot on the Channel Fader panel.

- **SPLL:** SPLL is not used in this version of the software.

- **ALT:** To access additional display button options or alternate parameter controls on any channel control, use this modifier button.
Right side of panel, In-Line Channel display buttons from top to bottom:

- **CTL:** Use this button to select the secondary functions for the dual-function display buttons below. Also, holding the Control button while touching one of the knobs or faders will reset any of the touch-sensitive controls to their default values. This is one of three identical Control buttons on the channel control components set, and it works the same as pressing the Control modifier key on a computer keyboard.

- **PAN/PATH:** This button displays all the in-line surround panning controls including Left/Right, Front/Back, Down/Up, and Spread. Press the ALT display button to see the alternate Rotate, Tilt, Divergence, and LFE controls. Hold the Control button and press the PAN/PATH button to display the Path setting controls, including Record level, Trim, Insert, and Direct Out. Press ALT while the PATH controls are active to see the alternate Path controls: Mic Gain, Group, and the Direct Output Pre/Post fader switch. These Path settings are the same as the controls in the Path Settings window available via the Track Input drop-down menu on the Fairlight page Mixer.

- **EQ/FILT:** To control the In-Line channel parametric Equalizer (EQ), use this button without a modifier to display four frequency bands, including High Frequencies (HF), High-Middle Frequencies (HMF), Low-Middle Frequencies (LMF), and Low Frequencies (LF). Press the ALT button for Gain control of each of the four bands. Use the Control key for the secondary button function to display and modify the two channel filters for High-pass, Low-pass, High-shelf or Low-shelf filtering. While in EQ/FILT In-Line display mode, the Channel Control touch-sensitive knobs are used to sweep Frequencies or Gain, and the Channel Control buttons toggle between Bell, Notch, High Pass Filter (HPF), Low Pass Filter (LPF), High Shelf (Hi-Sh), and Low Shelf (Lo-Sh) filtering curves. The functionality of EQ/FILT works the same as using the Channel EQ window available on the Fairlight page Mixer.

- **AUX/AUX:** This button displays in-line controls for Aux sends 1 to 16 in sequential groups of 4 Aux buses at a time. You can toggle between Aux 1-4 and 5-8 by pressing the Aux key again. Hold Control while this button is active to display controls for Aux sends 9 to 16. Pressing the Aux key while holding Control will toggle between Aux 9-12 or 13-16. Press the ALT button for the alternate Pre/Post fader controls for the Aux send.

- **COMP/U1:** This is for In-Line Dynamics controls for the Compressor, including: Threshold, Attack, Hold, and Release. Use this button without a modifier. Press the ALT button for the alternate Ratio controls. Hold Control and press any of the dynamics display buttons: COMP, LIM, or EXP to access the Makeup gain controls. The secondary U1 function is not implemented in this version of the software.

- **LIM/U2:** To display the In-Line Limiter controls, use this button. Without a modifier, you’ll see the limiter controls, including Threshold, Attack, Hold, and Release. Hold Control and press LIM to access the Makeup gain controls. The secondary U2 function is not implemented in this version of the software.

- **EXP/U3:** This display button is for the in-line Expander/Gate controls. The unmodified Expander controls include Threshold, Attack, Hold, and Release. Press the ALT button to switch to the alternate Gate controls, including Ratio, Range, Hold, and Release. Hold Control and press EXP/U3 to access the Makeup gain controls. The secondary U3 feature is not implemented in this version of the software.

- **ALT:** This is the alternate option modifier button and functions the same as the ALT/Option key on the computer keyboard. To access additional display button options or an alternate control on any channel control, use this button.
The left-side Channel Display buttons without modifiers and with Control button pressed to show secondary functions.

**NOTE:** Non-functioning Channel Display buttons, such as PLUG and ENAB, remain unlit. These buttons will be operational in future software updates.

Pan Settings window in the Fairlight page interface, available in the Mixer.
The right-side In-Line Channel Display buttons with Pan/Path button pressed and corresponding Pan controls in the Channel Control LCD.

The right-side In-Line Channel Display buttons with ALT + Pan/Path button pressed and corresponding ALT-Pan controls in the Channel Controls LCD.
Path Settings window in the Fairlight page interface, available in the Mixer, Input drop-down menu

The right-side In-Line Channel Display buttons with CTRL + Pan/Path button pressed and corresponding Path controls in the Channel Controls LCD

The right-side In-Line Channel Display buttons with ALT + CTRL + Pan/Path button pressed and corresponding ALT-Path controls in the Channel Controls LCD
Channel Control Buttons and Channel Control Knobs

Spanning the middle of the Channel Control panel, you’ll find 12 parallel groups of multifunctional channel controls that align with the 12 faders on the Channel Fader panel. Within each of the 12 groups are four highly visible LED buttons and four touch-sensitive rotary knobs. If you touch knobs with Control held this will reset the value, and if you turn a knob with Shift held you will have fine control for the parameter.

Since the functions of these buttons and knobs change based on the channel display mode and selected channel and active parameters, these “soft” controls remain unlabeled, and are identified by the corresponding controls on an adjacent LCD monitor. Additionally, each channel control button is illuminated with bi-colored LEDs to make it easy to identify active buttons, parameters, and groups of controls at a glance.

Channel Control buttons appear red or green when they are matched to a parameter on the Channel LCD monitor, and can be used as either toggles, On/Off, or In/Out switches for the adjacent parameter on-screen. Similar parameters will all have the same colored buttons while the Channel Controls are set to In-Line mode. However, in Channel or Master display mode, you’ll see alternating rows or groups of red or green buttons to separate the different parameter groups as shown on the Channel display.
In-line Pan display mode showing one green In/Out toggle switch and four dial controls for each channel.

Additionally, Channel Control buttons brighten to show that they have been pressed, or remain unlit and therefore without color when there is no corresponding parameter with a switch in the current channel display mode.

Channel display mode showing alternating colored buttons to separate parameter groups and unlit buttons where there are no matching on-screen parameters.
In-Line Channel Extension Buttons

Along the bottom of the Channel Control panel are 12 groups of six In-Line Channel Control Extension buttons that match the buttons at the bottom of the Channel LCD Monitor. These dedicated LED buttons are toggle switches for channel-specific controls like Select, Solo Safe, and Arm. In-Line Channel Control Extension buttons are always available, regardless of the channel control mode, and correspond with similar functions in the Mixer or Timeline track headers on the Fairlight page.

In-Line Channel Extension buttons, clockwise from the top right:

- **INS IN:** Insert In enables routing of up to six VST plug-ins or one hardware effect per channel from Blackmagic Design’s Fairlight audio interface hardware to outboard effects boxes and back again. This button can be toggled to enable/disable insert routing.

- **SAFE:** This button toggles on Solo Safe mode the same as Command-Option-clicking a Solo button on the Fairlight page. Tracks set to Solo Safe will always play, even if Solo is enabled for other tracks, and are easily identified by the blue-highlighted Solo button.

- **ARM:** Arms the track for recording. This is the same as clicking the Arm button [R] on the corresponding Timeline track header or Mixer channel strip on the Fairlight page timeline. Tracks must be patched to a microphone or another source input prior to arming.

- **SEL:** This button selects a channel in the Fairlight Console Channel Control bay, and is the same as clicking a Timeline track header or channel strip in the Mixer on the Fairlight page. You can select multiple tracks by pressing additional Channel Select buttons.

- **Middle-left button:** This is not implemented in this version of the software.

- **Upper-left button:** This is not implemented in this version of the software.

NOTE: You can only have a Channel Control panel for a bay that also has the Channel Fader and Channel LCD monitor.
**Fairlight Console Channel Fader**

In addition to 12 Channel strips complete with designated control buttons, touch-sensitive faders, and pan knobs, the Fairlight Console Channel Fader panel includes an LCD display of channel information and eight display buttons for bank selection and mapping of up to 144 tracks and buses to the 12 faders. The Fairlight Console Channel Fader panel works in tandem with DaVinci Resolve and the Fairlight Channel Control module for completing professional audio post-production work flows using traditional mixing controls.

![Channel Fader Display](image)

**LCD Fader Channel Display**

At the top of each channel strip you’ll find a high-resolution color display that shows the track name, track color, level, and pan status. If the channel is part of a VCA group, the VCA group number appears above the meters. The information displayed for each track directly correlates with the Fairlight page Mixer and track headers.
Rotary Knob

Below the LCD display on each channel strip you’ll find the touch-sensitive rotary knob designated as the panoramic potentiometer, or pan pot for short. This versatile dial control is assigned to Left-Right track panning by default, but may also be assigned to other parameters. Press the Control button while you press and release the 2/FDR button to use the rotary knob to control the last-used alternate parameter. This is especially useful during automation or complex mixing procedures when you need to keep alternative parameters, like the Ratio for your Compressor, within easy reach of the faders. Like all touch-sensitive controls on the Fairlight console components, holding the Control button and touching the knob resets the parameter to the default value, and if you turn the knob with Shift held you’ll have fine control.

Fader Channel Control Buttons

Each channel strip includes four dedicated control buttons for common channel-specific mixing functions. These brightly colored LED buttons are easy to read, logically placed above each fader, and can be used independently or in combination with other channels.

- **SOLO:** Use this button to select only this channel for playback. Multiple tracks can be soloed simultaneously to isolate selective tracks for playback while all non-soloed tracks will be muted. Pressing Solo while holding the Control button clears all soloed track buttons, and pressing Control again restores soloed tracks. Solo buttons on the Channel Fader panel correspond with the Solo buttons on the Fairlight page Mixer and track headers.

- **MUTE:** This button turns the channel off and on for playback. Mute buttons on the Channel Fader panel correspond with the Mute buttons on the Fairlight page Mixer and track headers.

- **CALL:** As the name suggests, the Channel Call button simply calls up a track’s parameters in the Channel Control panel and LCD monitor while in Channel display mode. Additionally, the Channel Call button loads the channel into the built-in Audio Editor display, regardless of the channel control mode. Using the Channel Call button is a fast way to work with a channel’s parameters, plus you can quickly press other Call buttons to change focus from track to track for detailed comparison and control. Channel Call on the Fader Panel is similar to the Select button at the bottom of the Channel Control panel; the difference is that the Select button also selects the track in
the Fairlight page Timeline and Mixer, which enables additional editing options. Using the Call button while tracks are selected does not change the state of the selected tracks. Call buttons are also used for manually mapping banks of channel faders and spilling the member tracks of a master bus to nearby faders.

Call buttons tally on or off when pressed and change color based on the current task as follows:

- **Yellow Call buttons**: The default color and indicate standard call functionality. When the Call buttons are yellow, only one Call button can be tallied on at at time.

- **Red Call buttons**: Appear when fader mapping is engaged. Auto fader mapping, automatically maps faders to groups of 12 channels in sequential order. When in manual fader mapping mode, you can use the red Call buttons in the Fader panel, or the track selection keys showing in the picture keyboard to manually assign channels to the 12 faders for each fader bank.

- **Green Call buttons**: Indicate master buses and VCA groups in the current fade bank when using the Fader Spill function. Pressing a green Call button spills the member channels of a bus or VCA group to the neighboring faders according to the Fader Spill option keys in the Setup mode layout on the Audio Editor.

- **AUTO**: When automation controls are active, the AUTO button arms this channel for automation, preview, write, and trim. Like the Solo and Mute buttons, the Auto button on the Fader Panel corresponds with the Auto buttons on the Fairlight page Mixer and track headers. Automation buttons turn amber when automation is active.

**Touch-Sensitive Faders**

The bottom-half of the Fader Panel comprises 12 touch-sensitive motorized faders that offer precision gain controls for 12 signal paths. These faders correspond with faders on the Fairlight page Mixer, and can be mapped to 12 different fader banks using the Bank Display buttons located on the left side of the Fader Panel. Additionally, each 100mm fader can be assigned to control other channel parameters like send levels, channel trim, or record levels. Holding the Control button while touching a fader resets it to the default position, which is 0 dB.

**Fader Bank Display Buttons**

On the left side of the Channel Fader module are seven multicolored LED Bank Display buttons that are used to display, map, bus, set, and lock banks of channels to the 12 faders on the panel. The top two buttons are CTL (control) and BANK, which are modifier buttons used to access secondary button functions or additional fader banks for the subsequent numbered Fader Bank Display buttons. Each of the six numbered Fader Bank Display buttons serve three functions, including load a primary fader bank, load an additional fader bank when pressed with the Bank modifier button, or perform a secondary function when the Control button is pressed. You can easily identify the blue Control button at the top of the Fader Bank Display buttons, while the other seven buttons are yellow in their normal state, and blue or purple when the secondary function is selected via the Control button.

With the Fader Bank Display buttons, you can map each of the 12 fader banks with 12 different faders to control a total of 144 tracks and buses to the 12 faders. The more Fairlight Console Channel Fader panels you have in your console, the more faders and tracks you can control. For example, the Fairlight Console 5.bay, is designed for high-end mixing and mastering with four Fader Panels to control up to 576 channels and busses at a time.
Fader Bank Display Buttons from top to bottom:

- **CTL:** This button selects secondary functions for the seven display buttons below and works the same as the Control key on the computer keyboard or the two identical Control display buttons on the Channel Control panel.

- **BANK/FLIP:** You can use the Bank button to switch between the primary fader set for each of the numbered bank buttons labeled 1 to 6, or the additional fader set for the same numbered buttons to show banks 7 to 12. Without a modifier, the Bank button is yellow along with the numbered bank buttons below. When pressed, the yellow Bank button brightens to indicate that it is latched, and the active numbered bank button also brightens to indicate which additional fader set has been loaded. The secondary FLIP function, via the Control button, is used to spill the member tracks of a master bus or VCA group to the neighboring faders.

- **1/POT:** The 1 button chooses Fader Set 1 without a modifier or Fader Set 7 when selected with the Bank button. The alternate POT function for this button involves the touch-sensitive Pan pot above the channel fader. Pressing and releasing the 1/POT button while Control is pressed toggles the knob control between normal Left/Right Pan mode and the secondary mode where the knob controls the last-used alternative parameter.

- **2/FDR:** The 2 button chooses Fader Set 2 without a modifier or Fader Set 8 when selected with the Bank button. Pressing and releasing the 2/FDR button while Control is pressed toggles between normal mode where the fader controls channel level, and secondary mode where the fader controls the last-used alternative parameter.

- **3/MAP:** The 3 button chooses Fader Set 3 without a modifier or Fader Set 9 when selected with the Bank button. If Control is pressed, the 3/MAP button enters the secondary Fader Mapping tool for the current fader set on the Audio Editor.

- **4/BUS:** The 4 button chooses Fader Set 4 without a modifier or Fader Set 10 when selected with the Bank button. Pressing Control along with the 4/BUS button toggles the secondary Bus mode on and off. When Bus mode is on, the system puts all used buses on as many faders as needed to accommodate all non-zero format buses. Pressing a Fader Bank display button from 1 to 6 returns control to the appropriate fader set.

- **5/MSET:** The 5 button chooses Fader Set 5 without a modifier or Fader Set 11 when selected with the Bank button. If Control is pressed, the 5 button toggles the secondary Mixer Set function on and off. While Mixer set is on, any track that is enabled for Editing is automatically allocated to a fader.

- **6/LOCK:** The 6 button chooses Fader Set 6 without a modifier or Fader Set 12 when selected with the Bank button. LOCK is not implemented in this version of the software.
Manually mapping faders to banks:

1. In the Fader Bank Display buttons, press CTRL and the 3/Map key to enter fader mapping mode. You’ll know that you entered bank mapping mode because all of the Call buttons turn red. The bank mapping is set to Auto mode by default, which automatically maps channels to faders in sequential order in groups of 12 up to 144. When you enter channel mapping mode, the top four rows of picture keys in the Audio Editor change to track selection keys, while the bottom row of picture keys shows the following dedicated channel mapping function keys:

   - **Exit**: Exits the channel mapping mode.
   - **Delete**: Deletes the channel assigned to the active channel indicated by the tallied red Call button.
   - **Blank**: Leaves a blank fader bank beneath the active red Call button. This is useful for adding a space between groups of similar tracks such as dialogue, background sound effects, and music.
   - **Insert**: As the name suggests, this key inserts an unassigned fader in the position of the active red Call button.

2. In the bottom row of the picture keyboard, press the first key (MODE: Auto/MODE:Manual) to toggle the fader mapping to Manual mode.

3. Press the red Call button on the fader you would like to assign, then choose a channel from the track selection buttons on the adjacent picture keys in the Audio Editor. Once you assign a track or bus to a fader, the next fader to the right becomes active with a red tallied Call button so that you can continue assigning faders sequentially. This automatic call selection also applies to the Delete, Blank, and Insert manual mapping functions.

4. Select up to 12 track selection keys to assign to the current fader bank. Use the Bank display buttons to manually assign additional banks as needed.

5. When you are finished mapping tracks to faders, press the Exit button in the bottom row of picture keys. Once you exit manual mapping mode, the picture keyboard layout returns to the current mode.

Example of Fader Bank 1 in Auto Mapping Mode

![Example of Fader Bank 1 in Auto Mapping Mode](image-url)

Fader Bank 1 in Auto mapping mode showing sequential tracks 1-12 with red Call buttons to indicate bank mapping mode is engaged and the first fader channel's Call button is active
Picture keyboard in Auto Fader Bank mapping mode

Auto Fader Bank mapping action keys in the lower left corner of the picture keyboard

Example of Fader Bank 1 in Manual Mapping Mode

Fader Bank 1 in Manual mapping mode showing the custom mapping: A21, blank, A30, A40, and DIALOG to the first five tracks
Spilling bus member tracks to nearby faders:

1. In the Fader Bank Display buttons, select a fader bank that contains at least one bus. Buses include main, submix, Aux buses, and VCA groups.

2. Momentarily press and hold the Bank/Flip key to change the yellow Call buttons to green Call buttons on the bus fader channels.

3. Press the green Call button for the bus fader you wish to spill to the neighboring faders. Once spilled, the Bank/Flip button turns purple to indicate that the current fader bank is displaying spilled faders for the active bus.

4. To modify the fader spill direction or type of fader that is temporarily remapped, use the Fader Spill options keys available in the Setup mode picture key toolset.

Fader Spill option keys include:

- **Fader Spill**: Use this menu key to reveal two menu Spill option keys that determine the type of fader channel and direction in which member tracks are temporarily mapped to the adjoining faders on the Fairlight Channel Fader panel.

- **Spill Left/Spill Right**: This menu options key toggles between Spill: Left and Spill: Right, which in turn dictates whether the member tracks of a bus are assigned to neighboring faders to the left or right of a bus when Spill is engaged in the Channel Fader panel.
• **Spill Any/Spill Tracks:** When in the default (unlatched) state the Spill: Any menu option allows member tracks of a bus to be spilled to the nearest faders to the left or right, including faders assigned to Master buses and VCA groups. When latched to the Spill: Tracks option, member tracks of a bus spill either left or right starting with the nearest track fader in the designated direction. This option is useful if you need to maintain fader control of your buses while you spill their constituent tracks to the nearest track faders.

Fader Spill and Fader Spill option keys available in Setup Mode toolset on the Audio Editor Picture keys.

Fader Bank 5 with Main 1, Sub 1, and Sub 2 buses assigned to the last three faders; yellow Call buttons indicate standard channel bank display.

Bank/Flip Bank Display Button momentarily held to display the buses within the active track; these buses (in the right 3 channels) can be easily identified by the green Call buttons.
Channel LCD displays Sub 2 bus, including A8, A10, A11, and A12, spilled on the nearest tracks to the left of the Sub 2 bus.

Purple Bank/Flip button indicates there is a spilled bus in the current bank. In this case, Bank 5 is showing, with Sub 2 spilled to the left of the other buses, and includes A8, A10, A11, and A12 as the member tracks that comprise Sub 2.

**NOTE:** While a bus fader is spilled, you may still use the standard bank display buttons to display any of the other banks normally.

**To un-spill a bus fader:** (OR) To disengage fader spill:

1. In the Fader Bank Display buttons, press the Bank button that contains the spilled bus.
2. Momentarily hold the Bank/Flip button to reveal green Call buttons for the bus faders. The spilled fader’s green Call button will be tallied on.
3. Press the active green Call button to un-spill the fader.
Sub 2 bus with active (talled) green Call button, which indicates it has been spilled to neighboring faders.

**NOTE:** You can only spill bus member tracks to faders within the same fader bank. Use the Fader Spill option keys in the Audio Editor Setup mode toolset to spill either left or right within the current bank of 12 faders. Additionally, if you press the Bank/Flip button on a bank without any bus faders, you will not see any green Call buttons or subsequent bus faders to spill.

**Fairlight LCD Monitors**

Standard Fairlight consoles include one high-resolution 1920 x 1080 Fairlight LCD Monitor for each bay. These custom designed LCD monitors align perfectly along the top of the console, forming an embedded eye-level monitor bridge that spans the width of the console.

Fairlight LCD Monitor
Each Fairlight LCD Monitor is paired with either Channel Control modules as a dedicated channel control display, or the Audio Editing module as a dedicated DaVinci Resolve GUI edit screen. Additionally, the switchable HDMI and SDI inputs on the back of each screen allow flexible display of plug-ins and reference video.

Fairlight Console 3-bay with three Fairlight LCD monitors forming a display bridge across the top of the console.

**Fairlight Console Configurations**

The Fairlight console can be purchased with all the standard panels as a bundle, or customized to meet specialized production requirements. With the Fairlight console’s unique modular design, you always get the flexibility to place the Audio Editor, Infill module, and Channel Component sets, in whichever order works best for you.

Each bundled console includes a console chassis ranging in size from 2-bay to 5-bay, an LCD Monitor component for each bay, one Fairlight Audio Editor, and a set of Fairlight Channel bay components for each additional bay. For custom configurations, you choose the chassis size, and then purchase the console components individually.

Before purchasing a console, it is important to consider the size of your workspace as well as your current and future audio post-production needs. For example, if you have a mid-sized mixing stage and are primarily working on short-form projects like commercials and trailers, a standard Fairlight Console 3-bay may work well. However, if you have the room, a customized Fairlight Console 4-bay chassis may work better in the long run because you’ll also have room to grow in the future for larger feature-length productions. Plus, empty console bays can be filled with custom machined Fairlight Console Blanks that add valuable flat surface space for assistant audio editors and mixers. Additionally, you can add a Fairlight Console LCD Monitor in the 4th bay to display video playback or plug-ins, and even add a Fairlight Channel Rack Kit to the channel section to mount standard 19-inch equipment such as the Fairlight Audio Interface or Blackmagic Design Smart View duo to your bay.
Additional Fairlight Hardware

To effectively connect to and operate a Fairlight console with DaVinci Resolve Studio, you'll also need a supported audio interface and PCIe audio card. If you are using a Mac or PC without a PCIe slot, you'll also need an expansion box to connect the PCIe card to your computer, and a supported audio interface. You can use 3rd-party devices or purchase the Fairlight products designed specifically for the Fairlight consoles, including, the Fairlight PCIe Audio Accelerator, Fairlight Audio Interface and the Fairlight PCIe MADI Upgrade.

NOTE: For more information about the Fairlight Console Chassis, bundles, and hardware options, go to the Fairlight Console page on the Blackmagic Design website. https://www.blackmagicdesign.com/products/davinciresolve/
NOTE: For more information about the Fairlight PCIe Audio Accelerator, Fairlight Audio Interface and the Fairlight PCIe MADI Upgrade, go to the Fairlight Console page on the Blackmagic Design website. www.blackmagicdesign.com/products/davinciresolve/
PART 13
Deliver
Chapter 164

Delivery Effects Processing

This chapter discusses how different video effects will be handled when you use the controls of the Deliver page.
Contents

Delivery Effects Processing
When Rendering a Single Clip or When Outputting to Tape 3414
When Rendering Individual Source Clips for Round-Trip Workflows 3414
More About Rendering Speed Effects 3415
Determining the Rendered Output Resolution of Clips in Mixed Timelines 3415
Rendering Edit and Input Sizing Adjustments 3415
Rendering Mixed Frame Rate Timelines 3416
Export Alpha Channels 3417
Delivery Effects Processing

For your final output, how effects are rendered depends on whether you’re rendering in Single Clip or Individual Clips mode.

When Rendering a Single Clip or When Outputting to Tape

Whether you’re rendering a QuickTime or MXF master of your project as a single clip, rendering a DPX image sequence for film output, or outputting directly to tape, all supported compositing, speed, and transform effects are rendered by DaVinci Resolve and “baked” into the output media. Unsupported effects are completely ignored, cannot be seen, and have no effect on media that’s rendered and output.

When Rendering Individual Source Clips for Round-Trip Workflows

In workflows where you’re rendering individual media files to send a project back to an NLE or finishing application for final finishing (adding titles and other effects before final delivery), DaVinci Resolve handles different types of effects in different ways.

Unsupported effects do not appear in DaVinci Resolve. However, this effects data is internally preserved, and when you export an XML or AAF file to send back to your NLE of choice, these effects reappear, applied to the color corrected media that you rendered out of DaVinci Resolve and sent back.

Effects that DaVinci Resolve does support such as composite modes, opacity settings, speed effects, and transitions are handled differently. Even though these effects are visible in DaVinci Resolve while you work, they’re not “baked” into the final media that you render in preparation for sending back to your NLE or finishing application. Instead, the portion of each media clip that’s used in your project is rendered as an individual file, and the XML file that you export from DaVinci Resolve contains all of the effects information necessary to reassemble the rendered media into a timeline that uses Final Cut Pro effects applied to DaVinci Resolve-graded media.

</table>

The chart shows which effects are rendered by DaVinci Resolve, and which effects are passed back in different round trip workflows.

* These effects are only sent back in AAF round trips when you’re updating an existing AAF file, rather than generating a new AAF file.
After you’ve reimported your project back into your NLE or finishing application, you’re free to readjust these effects while completing your program, without the need to re-render individual clips in DaVinci Resolve.

**IMPORTANT** One exception to the preservation of media and effects in round-trip workflows is that nested sequences from Final Cut Pro 7 and Media Composer are not compatible with DaVinci Resolve; XML and AAF files containing nested sequences cannot be imported. On the other hand, Final Cut Pro X projects containing compound clips can be imported.

**More About Rendering Speed Effects**

If you’re rendering a project with speed effects, you should be aware that DaVinci Resolve can optionally render speed effects using Optical Flow processing, resulting in high-quality slow motion and fast motion effects delivered straight out of DaVinci Resolve. If you’re satisfied with Optical Flow processing in DaVinci Resolve, there may be no need for you to do a round-trip export if the main reason you were doing so was to send the processing of slow motion clips to another application for rendering, and rendering the Timeline in Single clip mode will “bake” the speed effects in using whatever settings you’ve selected for the project, or for each clip if you’ve selected individual Retime Process settings for different clips.

However, if you want to send unrendered speed effects to another application, rendering your project in Individual source clips mode guarantees that the full range of each original clip of media will be rendered, with the speed effect itself exported within the XML, AAF, or EDL file that’s exported.

**NOTE:** DaVinci Resolve adds three frame handles to clips with speed changes applied to them, and to rendered clips that don’t match the project’s frame rate. This is done to facilitate reconform in NLEs that require handles beyond the actual length of each of these clips.

**Determining the Rendered Output Resolution of Clips in Mixed Timelines**

Ordinarily, rendering individual source clips results in each clip being rendered at either the project resolution or the Resolution drop-down in the Render Settings (which overrides the project resolution), with clips that don’t match the project resolution being resized or not according to the settings you’ve chosen in the Image Scaling panel of the Project Settings.

However, if you’re rendering dailies for projects containing clips with mixed resolutions, you can choose to render each clip at its original resolution by turning on the “Render at source resolution” checkbox in the Video group of controls.

**Rendering Edit and Input Sizing Adjustments**

Whether or not sizing is rendered into your final media depends on the “Disable sizing and blanking” checkbox in the Advanced Settings options of the Render Settings panel. You can disable sizing and blanking either when rendering the current Timeline as a single clip, or when rendering individual clips.
• If “Disable sizing and blanking output” is turned off: Output Blanking, Cut and Edit page sizing adjustments, Color page Input and Output Sizing adjustments, and Image Stabilization are rendered into the final rendered media using the optical-quality sizing algorithms available to DaVinci Resolve. This is best if your sizing adjustments are approved and final, and you want to “bake” sizing adjustments into the final media you’re delivering.

• If “Disable sizing and blanking output” is turned on: Output Blanking, Cut and Edit page sizing adjustments, Color page Input and Output Sizing adjustments, and Image Stabilization are not rendered, and each clip will be rendered either at the source resolution if “Render at source resolution” is enabled in individual clips mode, or to the currently specified resolution of the Timeline or project. However, the sizing adjustments you’ve made will be exported as part of the XML or AAF file that you’re exporting. This is best for workflows where the editor wants to continue adjusting sizing after you’ve handed off the graded project relative to the original size of the clips.

Keep in mind that if you want to render Input Sizing adjustments into the media you’re outputting, the “Force sizing to highest quality” checkbox guarantees that DaVinci Resolve will use the highest-quality sizing setting, even if you’ve temporarily chosen a faster-processing option for a slower computer.

NOTE: “Disable sizing and blanking output” does not disable any transform operations that happen within the Fusion page, nor does it disable transforms happening as a result of an OpenFX or ResolveFX plug-in applied to one or more clips in the Cut, Edit, or Color pages. All of these effects will continue to be rendered into the final output.

Rendering Mixed Frame Rate Timelines

Mixed frame rates are supported by DaVinci Resolve when any option other than none is selected in the “Mixed Frame Rate format” drop-down menu, either in the Conform Options section of the General Options panel of the Project Settings, or in the Import AAF or XML dialog. When you choose the appropriate option that corresponds to the application you’re exchanging projects with (or DaVinci Resolve if you’re working entirely within DaVinci Resolve), then DaVinci Resolve conforms and processes all clips in the Timeline to play at whichever frame rate is selected in the “Timeline frame rate” drop-down menu. For example, 23.98, 29.97, 30, 50, 59.94, and 60 fps clips will all play at 24 fps if that’s what “Timeline frame rate” is set to in the Master Settings panel of the Project Settings.

How clips in mixed frame rate timelines are rendered out depends on whether the Render Settings are set to render Individual source clips or a Single clip.

• Individual source clips: All clips are rendered individually at their original frame rate.

• Single clip: All clips are converted to the “Timecode calculated at” frame rate and rendered as a single media file. Clips are converted using whatever method is selected in the Retime process drop-down of the Master Settings panel of the Project Settings, or in the individual Retime process setting found in the Video inspector of each clip that overrides the project-wide setting. You can choose Optical Flow processing for the highest quality conversion that’s available in DaVinci Resolve.
Export Alpha Channels

This option only appears if you’re rendering to a media format that supports alpha channels. If your media contains an Alpha Channel, you have the option to turn on the Export Alpha checkbox in the Video panel of the render settings whenever you render individual source clips. When you do so, DaVinci Resolve renders clips with alpha channels in either of two cases:

- Whenever there is an alpha channel embedded in the source media for that clip, the embedded alpha channel will be copied to the rendered version of that clip.
- Whenever a clip’s grade has a key connected to an alpha output, the alpha output will be rendered as an alpha channel for that clip.

In either case, you may only render alpha channels out when you render individual source clips to an RGBA format such as TIFF, OpenEXR, ProRes 4444, ProRes 4444 XQ, or DNxHR 444.
Once you've finished grading your project, you need to either render it, or output it to tape to deliver it to your client. This is where the Quick Export window and Deliver page comes in. This chapter describes how to use Quick Export, how to use the overall interface of the Deliver page, and provides some general information about how effects are output from DaVinci Resolve in different situations.

Using Quick Export

Not every situation requires a complicated delivery setup. When you just need to quickly export a project, and the full power of the Deliver page is unneeded, you can choose File > Quick Export to use one of a variety of export presets to export your program from any page of DaVinci Resolve. You can even use Quick Export to export and upload your program to one of the supported video sharing services, including YouTube, Vimeo, and Frame.io. You can also add your own presets to the Quick Export window.

To use Quick Export:

1. (Optional) In the Cut, Edit, Fusion, or Color page, set In and Out points in the Timeline to choose a range of the current program to export. If no timeline In or Out points have been set, the entire timeline will be exported.

2. Choose File > Quick Export.

3. Select a preset to use from the top row of icons in the Quick Export dialog, and click Export.

4. Choose a directory location and enter a file name using the export dialog, then click Save. A progress bar dialog appears to let you know how long the export will take.

The Quick Export dialog

To customize Quick Export:

1. Open the Deliver page.

2. Create the preset you want to add using the Render Settings panel.

3. Click the Render Settings panel’s Option menu and choose the preset or presets you want to add from the Quick Exports submenu so that they’re checked. You can also remove your own presets from the Quick Export window by unchecking them in this menu.

Adding presets to the Quick Export dialog
The Deliver Page

The Deliver page is divided into five areas of functionality, each of which lets you set up a different part of a render or output to tape.

The Interface Toolbar

At the very top of the Deliver page is a toolbar with buttons that let you show and hide different parts of the user interface. These buttons are as follows, from left to right:

- **Delivery full/half height button:** Lets you set the Render Settings panel to take up the full height of your display, if you need more area for browsing the various render settings, at the expense of a narrower Timeline.
- **Render Settings:** This panel lists all of the render settings that are available for configuring rendering jobs in DaVinci Resolve. By default, you're presented with a short list, but more options are available by clicking “Advanced Settings.”
- **Tape:** Puts the Deliver page into Tape Output mode.
- **Clips:** Hides or shows the Thumbnail timeline above the Deliver page timeline
  - **Render Queue:** A list of all jobs that you’ve set up to render in the current project. Previously rendered jobs remain in the queue, for your reference or for you to reuse to re-render those jobs, unless you manually delete them from the queue.
  - **Render Queue full/half height button:** Lets you set the Render Queue to take up the full height of your display, if you need more area for listing render jobs at the expense of a narrower Timeline.
Rendering Files vs. Outputting to Tape

Because the Deliver page does double duty, you control whether you’re rendering files or outputting to tape using the Tape button in the Interface toolbar. Doing so replaces the controls in the Viewer with tape controls.

The Render Settings

The Render Settings contains the customizable settings that determine how media is rendered out of DaVinci Resolve. If you’re using the Tape option, these settings are disabled.

The Render Settings are divided into four general sections:

- **Render Presets**: At the very top, a scrollable row of icons lets you choose one of a series of presets to quickly set up the type of render you want. The Custom option exposes all render settings so you can set up a render manually.

- **Render Location**: A Browse button opens a dialog that lets you choose a volume and directory to render to.

- **Render**: Two options let you either render the entire selected area of the Timeline as a single clip suitable for reviewing or mastering, or as a series of individual clips more suited to round-trip workflows. The option you choose here changes which render settings are available below.

- **Video, Audio, and File Render Settings Panels**: All other render settings are divided among three panels. Checkboxes at the top of the Video and Audio panels let you selectively disable video export (if you want to export the audio only) or disable audio export (if you want to export video only).
The Deliver Page Timeline

You’ll use the Timeline in the Deliver page to define the range of clips you want to render or output to tape, and to choose which versions for each clip you want to output. The Deliver page Timeline consists of a Thumbnail timeline at top (that can be shown or hidden via the Clips button) that makes it easy to select individual clips or ranges of clips that you need to render, and a more ordinary timeline below that you can use to set In and Out points for rendering arbitrary regions of your program. A Timeline toolbar lets you choose the render range of the Timeline, and has controls for customizing the look of the Timeline, and for zooming in and out.

TIP: Press Shift-Z to fit the entire program into the available width of the Timeline.

Filtering the Thumbnail Timeline

The Deliver page Thumbnail timeline also has the Timeline Filter drop-down, available to the right of the Clips button in the Interface toolbar.

Using this drop-down to filter the contents of the Timeline lets you restrict the range of media you want to output in different ways. For example, if you’ve already rendered a timeline, but you’ve since made some changes, you can use one of the “Modified Clips” options to display only the clips that have changed within a particular timeframe. Another commonly used option is to choose “Unrendered Clips” to isolate all clips that have not yet been rendered in workflows where you’re only rendering a part of the Timeline at a time.

When you filter the Thumbnail timeline, you can only set up jobs to render in Individual Clips mode. You can tell if Thumbnail filtering is enabled by an orange underline under the Clips button in the UI toolbar.
The Viewer

When rendering file-based media, the Viewer shows you exactly how the media being output will look using the current settings, and the transport controls move the playhead throughout the current Timeline.

When outputting to tape, the Viewer shows you the tape output so you can set up insert or assembly edit points, and the transport controls move the tape in the deck if device control is enabled. You can also put the Viewer into Cinema Viewer mode by choosing Workspace > Viewer Mode > Cinema Viewer (P), so that it fills the entire screen. This command toggles Cinema Viewer mode on and off.

Disabling Viewer Updates While Rendering

An Updates During Renders submenu in the Render page Viewer option menu lets you choose to disable, minimize, or enable Viewer updates while a program is being rendered. Disabled or minimized Viewer updates will speed rendering, especially on slower workstations.
The Render Queue

The Render Queue is a list of all the jobs you’ve queued up for delivery. Each job can have an individualized range of clips and render settings, which you can use to render multiple sections or clips of a timeline, the same timeline output to multiple formats, or multiple timelines.

The Render Queue displays all jobs

The Render Queue also has the option to show either just the jobs within the current project, or jobs queued up and saved within all projects in the currently open SQL database (for the current user) or disk database (at the currently selected disk location). This can be exceptionally useful in situations where you’ve broken a program into multiple reels, with each reel being a different project. This can be turned on and off via the “Show All Projects” option of the Render Queue Option menu.

Jobs in the Render Queue can be edited (by clicking the pencil button), they can be assigned to remote rendering workstations, and they can be deleted. Jobs that have already been rendered can be kept in the Render Queue and re-rendered at a later time.

TIP: There is an option to show the Render Settings of each item in the Render Queue, by selecting “Show Job Details” in the Render Queue Option menu. This provides specific details of each job’s dimensions, frame rate, codec etc. This is a great help in managing a complex render queue at a glance.
Chapter 166

Rendering Media

This section describes the options that are available for file-based delivery. The workflow is simple; you define the format and other settings that dictate how the media is to be rendered, define a range of clips in the currently selected session, and then add a job containing these settings to the Render Queue.

You can queue up as many different render jobs as you like, each with different formats, output options, and ranges of clips, depending on what you’re trying to accomplish. When you’re ready to render, simply click the Start Render button.

Using Presets for Fast Rendering

The very top of the Render Settings list has a set of presets for many of the most common rendering workflows you’ll need to accomplish. If you want to create your very own settings, then choose custom. Each preset automatically sets up what you need and locks you out of settings that are not necessary for rendering that type of media.

Custom

When custom is selected, nothing is automatically set, and all conventional media rendering options are available, except for those that are specifically associated with particular presets. You must manually choose the settings and options you need. All Render settings are saved on a per-project basis.

YouTube and Vimeo Presets

Two presets let you render media specifically for video sharing services, with the option to upload the rendered files automatically.

YouTube 720p/1080p/2160p

A drop-down menu lets you choose three different resolutions to render to. Selects the appropriate settings for exporting your program as a QuickTime H.264-encoded file suitable for uploading to Vimeo, YouTube, and many other video file sharing services. Renders a single clip, and sets the Video Format to QuickTime, the Codec to H.264, and the Audio Codec to AAC. In addition to providing the option to automatically upload to YouTube, a Description field and Visibility and Category pop-ups let you choose how you want your video to be presented when uploaded.

Vimeo 720p/1080p/2160p

A drop-down menu lets you choose three different resolutions to render to. Selects the appropriate settings for exporting your program as a QuickTime H.264-encoded file suitable for uploading to Vimeo, YouTube, and many other video file sharing services. Renders a single clip, and sets the Video Format to QuickTime, the Codec to H.264, sets the video data rate to 10,000 Kb/s, the Audio Codec to AAC, and the audio data rate to 320 Kb/s. In addition to providing the option to automatically upload to Vimeo, a Description field lets you enter text to be added to your video when uploaded and adjust the various visibility options that Vimeo offers, including password protection.

Setting Up Video Sharing Uploads

DaVinci Resolve 16 introduced integration with YouTube, Vimeo, and Frame.io that allows you to render and upload directly to each service. An Internet Accounts panel in the System tab of the DaVinci Resolve Preferences lets you sign into your YouTube, Vimeo, and Frame.io accounts, as well as specify a local cache location for media being synced with Frame.io.
For each service you sign into, a floating window presents the interface in which you’ll need to enter your login name and password to enable integration, followed by whatever two-factor identification and other required steps are necessary. Once entered, DaVinci Resolve will sign in to each of these services automatically when DaVinci Resolve opens.

The Internet Accounts panel of the System tab of the DaVinci Resolve Preferences window

**NOTE:** For Frame.io, the local cache location is used to store clips you import into a DaVinci Resolve project from the Frame.io volume in the Media Storage panel of the Media page.

**Deliver and Upload to YouTube and Vimeo**

When you’ve configured YouTube and/or Vimeo access in the Internet Accounts panel of the System Preferences, the YouTube and Vimeo presets both expose an “Upload directly to YouTube/Vimeo” checkbox, which lets you choose whether or not to automatically upload the rendered result.

Choose the desired export options, then click the Add to Render Queue button to add this job to the Render Queue as you would with any other export. When that job is rendered, it automatically proceeds to upload to the selected video sharing service, and an upload percentage indicator appears in the job listing to show how far along this upload is. This upload is done in the background, so you can continue working on other things in DaVinci Resolve while the file uploads. If you want to see how long the upload will take on any other page, you can choose Workspace > Background Activity to see the Background Activity window.

**IMPORTANT:** Once a video has been uploaded, you’ll want to log onto your video sharing account in a web browser to customize whatever general or privacy settings are necessary for this program, since the uploaded file inherits only the default settings for uploaded media, and your video will likely be publicly available immediately after upload.
ProRes Master

For quickly outputting ProRes Master files of a whole program. When selected, defaults to
derendering in single clip mode, with the Format set to QuickTime, the Codec set to Apple ProRes,
and the Type set to Apple ProRes 422 HQ. Audio defaults to the Codec being Linear PCM and
the Bit Depth being 16.

H.264 Master

For outputting H.264 files of a whole program. When selected, defaults to rendering in single
clip mode, with the Format set to QuickTime, and the Codec set to H.264. Quality, Encoding
Profile, and Entropy Mode are set to Auto, Passes defaults to Single, and Key Frames default to
Automatic with Frame Reordering turned on. Audio defaults to the Codec being AAC with the
Data Rate set to 320 Kb/s and the Bit Depth set to 16.

H.265 Master

For outputting H.265 files of a whole program. When selected, defaults to rendering in single
clip mode, with the Format set to QuickTime, and the Codec set to H.265. Quality is set to
Automatic, Encoding Profile is set to Main, and Key Frames default to Automatic with Frame
Reordering turned on. Audio defaults to the Codec being AAC with the Data Rate set to 320
Kb/s and the Bit Depth set to 16.

IMF

Available in DaVinci Resolve Studio Only

A drop-down menu to the right of this preset provides options for Generic, 20th Century Fox,
and Netflix-qualified presets. This preset is for facilities that deliver IMF files as digital-only
deliverables. A Preset Type drop-down lets you choose the appropriate settings to populate
the various locked IMF-specific parameters that appear.

Frame.io

A Frame.io preset at the top of the Deliver page’s Render Settings panel lets you render and
upload a program for review. All options in the Render Settings panel update to present suitable
controls for this process. At the bottom of the Render Settings list, an “Upload directly to Frame.
io” checkbox lets you choose whether or not to upload the rendered result. A Description field
lets you add a description to be uploaded along with the rendered media.

Choosing the Frame.io preset
When you choose the Frame.io preset, the Location field turns into a Frame.io field, and the Browse button lets you choose a project and folder path to which to upload the exported result.

Choosing a Frame.io account to deliver a program to

When you export to Frame.io, the available choices in the Resolution, Format, Video Codec, and Type drop-down menus are limited to those that are most suitable for Frame.io file sharing. Choose the desired export options, then click the Add to Render Queue button to add this job to the Render Queue as you would with any other export. When that job is rendered, it automatically proceeds to upload to Frame.io, and an upload percentage indicator appears in the job listing to show how far along this upload is. This upload is done in the background, so you can continue working on other things in DaVinci Resolve while the file uploads. If you want to see how long the upload will take on any other page, you can choose Workspace > Background Activity to see the Background Activity window.

For more information about Frame.io integration, see Chapter 170, “Frame.io Integration.”

**Final Cut Pro 7 or X XML**

A drop-down menu attached to this preset lets you choose from two different XML formats to be exported along with the media you’re rendering:

- Selects the appropriate settings for projects that were sent from Final Cut Pro 7 to DaVinci Resolve using XML. This is meant for situations when you’re rendering media intended for a return trip to Final Cut Pro (by exporting an XML file from the Edit page). Renders Individual Clips, the “Codec” setting on macOS, defaults to Apple ProRes 422 (HQ), Output Size defaults to the current Timeline Resolution (as set in the Master Settings panel of the Project Settings), and Use Unique Filenames is turned on.

  When you choose this preset, an XML of the timeline is automatically exported along with the media, with path names that reflect the rendered clips.

- Selects the appropriate settings for projects that were sent from Final Cut Pro X to DaVinci Resolve using XML. This is meant for situations when you’re rendering media intended for a return trip to Final Cut Pro X (by exporting an FCPXML file from the Edit page). Renders Individual Clips, the “Codec” setting on macOS, defaults to Apple ProRes 422 (HQ), Output Size defaults to the current Timeline Resolution (as set in the Master Settings panel of the Project Settings), and Use Unique Filenames is turned on.

  When you choose this preset, an XML of the timeline is automatically exported along with the media, with path names that reflect the rendered clips.
Premiere XML
Selects the appropriate settings for projects that were sent from Premiere Pro to DaVinci Resolve using XML. This is meant for situations when you’re rendering media intended for a return trip to Premiere Pro. Renders Individual Clips, the “Codec” setting on macOS defaults to Apple ProRes 422 (HQ), Output Size defaults to the current Timeline Resolution (as set in the Master Settings panel of the Project Settings), and Use Unique Filenames is turned on.

When you choose this preset, an XML of the rendered timeline is automatically exported along with the media, with path names that reflect the rendered clips.

Avid AAF
Selects the appropriate settings for projects that were sent from Avid Media Composer or Symphony to DaVinci Resolve using AAF. This setting is NOT for exporting to Pro Tools. This is meant for situations when you’re rendering media intended for a return trip to Media Composer (by exporting an AAF file from the Edit page). The “Codec” setting defaults to DNxHR 444 12 bit, Output Size defaults to the current Timeline Resolution (as set in the Master Settings panel of the Project Settings), and Render Clip with Unique Filename is turned on.

When you choose this preset, an AAF of the timeline is automatically exported along with the media, with path names that reflect the rendered clips.

Pro Tools
As of DaVinci Resolve version 16, Pro Tools export has been dramatically improved. This preset presents the appropriate options for exporting a specifically formatted AAF project file, linked audio files, and a linked reference video file to Pro Tools, or any application capable of importing a Pro Tools formatted AAF file.

When exporting using the Pro Tools preset, you must use the AAF file that’s automatically created and written to the target location, because it’s formatted specially for Pro Tools and it contains path names reflecting the rendered clips. Do not export an AAF using the File > Export AAF/XML command, as this will not provide the correct exchange file for Pro Tools, and it won’t work correctly.

When you use the Pro Tools preset, DaVinci Resolve outputs the following:

1. What you choose in the Codec drop-down menu of the Audio panel dictates whether you export the audio from the Timeline as a collection of files that link to a separate AAF, or an AAF with audio file embedded within as a single deliverable.
   - Choose Linear PCM to export individual files linked to a separate AAF interchange file
   - Choose Embedded in AAF to export an AAF with embedded Broadcast WAV audio files within it as a single deliverable

Whether you export separate files or a single embedded AAF deliverable, each of the audio clips in the current Timeline are exported as individual files. Each exported file contains every audio channel from the source media, regardless of channels that have been muted in the audio panel of Clip Attributes. This means no matter how the video editor organized the channels of audio in the Timeline, you’ll always deliver every channel of each audio clip to whomever is doing your audio postproduction.
2 You can also choose to include handles using the “Add X frame handles” option in the Advanced Settings of the Video panel to add extra frames to the beginning and end of each exported audio clip. This will provide needed editing flexibility to whomever is refining your audio.

3 The type of audio file that’s exported is determined by your choice of video format in the Video panel:
   – If you choose the MXF OP-Atom video format, then MXF audio files will be exported.
   – If you choose the QuickTime format, then Broadcast Wave files will be exported.

4 All video in your timeline will be rendered and output as a single reference movie, in the format that’s selected in the Video panel, with all effects and titles baked in. Subtitles can also be burned into the reference movie or exported as a file. If you want to provide a window burn, you can enable visible metadata using the Workspace > Data Burn-In window. If you do not wish to export a reference movie, you can uncheck the Export Video box in the Video panel.

When you output using the Pro Tools preset, an AAF of the audio tracks of the current Timeline is exported that’s formatted for import into Pro Tools, or any other digital audio workstation (DAW) software that’s compatible with the Pro Tools style of AAF import.

• Exported audio files have the file name and timecode of the source media they were extracted from, to enable relinking to the source media in Pro Tools, if necessary. In the case of Video+Audio files that have been synced in DaVinci Resolve, exported audio files are given the timecode and name of the synced audio source file, not that of the video clip.
• Each audio track exports whatever custom name you may have given it, for use by Pro Tools.
• All track and clip volume automation is exported, with all keyframes.
• iXML metadata is also exported, including channel names when available.

**IMPORTANT:** When you export to Pro Tools in the Deliver page, audio effects are neither exported nor baked in, which means that FairlightFX, EQ, Compression, Pitch, and Elastic Wave effects will be ignored. If you are experiencing problems with imported AAF files, check to see if there are audio effects or audio compound clips in the Timeline, and replace any you find with duplicates of the same audio clips that have no effects.

### Audio Only

This preset is specifically for rendering an audio-only media file from the Timeline. Video rendering is disabled, and this preset defaults to rendering the Main 1 bus as a single clip, rendering one track per channel using the MXF OP-Atom format set to the Linear PCM codec, at 16-bits. However, the QuickTime, MP4, and WAVE formats are also available, and you can also render 24- or 32-bit output. Additionally, you have the option to render other Mains or Submixes, or to choose a specific Timeline Track to render. Finally, you can choose to render the current program as Individual Clips.
Creating and Using Your Own Presets

If there is a particular group of settings that you find yourself using repeatedly, you can turn it into a custom Easy Setup, for easy recall.

To create a new Easy Setup:

1. If you want to start from scratch, make sure to choose Custom from the preset panel to unlock every setting in the Render Settings pane.

2. Choose the particular settings you require in the Video, Audio, and File panels for your new preset.

3. Open the Render Settings Options menu, and choose Save as New Preset.

4. Type a name into the “Render Preset” dialog, and click Save. The new preset now appears in the Preset panel.

To load a preset:

Click any preset. Every setting in the Render Settings pane updates to reflect the preset you selected.

To change a custom preset that you’ve created

Click a preset you want to change, make whatever changes you need to in the Video, Audio, and File panels, then click the Render Settings Option menu, and choose Update Current Preset.

To delete a custom preset that you’ve created:

Click a preset you want to delete, then click the Render Settings Option menu, and choose Delete Current Preset.

Choosing a Location to Render

The first decision you have to make when rendering your output is where it’s going to be rendered. Accordingly, this is the first set of controls appearing at the top of the Render Settings parameters.

- **Filename**: A preview of what the file name will be based on the settings found in the File panel described later. The Custom/Timeline name and File suffix fields, as well as the “Use x digits in the filename” settings all determine what name appears here. The editable portions of this filename preview can also be edited here.

- **Location**: Click the Browse button to choose a directory in which to write the media being output by DaVinci Resolve. After you’ve selected a directory, the path name appears in the “Render job to” field.
Single Clip vs. Individual Clips

While there are numerous options available in the Render Settings of the Deliver page, there are basically two overarching ways you can render your project, depending on which of the “Render” radio buttons you click in the Output group.

Single Clip

When you select the Single clip option, you’re setting up a render wherein all clips in the session are output together, as a single media file in whatever format you choose. This means you’ll be rendering the selected range of the session to a single MXF or QuickTime file, or as a single collection of image sequences.

- **Timecode**: The timecode that’s written out is dictated by the “Start timeline timecode at” setting of the timeline being rendered. Media files contain a continuous timecode track, while image sequences have timecode written into each frame’s data header, and integrated into the file name (as a frame count).
- **Frame Rate**: If you’re rendering a project that uses mixed frame rates, rendering to a single clip converts every clip in the entire session to the project frame rate, using either the project-wide or clip specific “Retime process” setting.
- **Effects**: Most effects are “baked into” the rendered output when you render a single clip.

**IMPORTANT** Whenever clip filtering is enabled (via the drop-down menu to the right of the Clips button), Single Clip rendering cannot be selected. You can see if clip filtering is enabled by an orange line underneath the Clips button in the UI toolbar.

Individual Clips

Selecting the Individual clips option sets up a render where each clip is rendered as an individual media file in whichever format you choose. The result will be a collection of as many media files as there are clips in the range you’ve selected to render.

- **Timecode**: The timecode written to each clip is cloned from the original source media, making it easy to reconform media for projects being passed between DaVinci Resolve and NLEs.
- **Frame Rate**: If you’re rendering a project that uses mixed frame rates, rendering to source renders each clip at its own individual frame rate, to accommodate round-trip workflows.
All Other Render Settings for Output

This section covers the different render settings that are available for customizing your output. Depending on which Render Setting mode you chose, some of these may be hidden, but this section covers the full list found in the Advanced panel of controls.

If you choose one of the Easy Setups, then some of these settings will be locked, and others will be editable, depending on the requirements of that setup. If none of the Easy Setups is suitable for the task at hand, you can leave the Easy Setup drop-down menu set to none, and manually choose the necessary settings for the task at hand.

Video Panel

This panel contains all video-oriented parameters.

Format and Codec Controls

These top-level parameters let you choose whether or not to render video, and which format to render it to. Depending on which Format, Codec, and Type you choose, other options may or may not appear.

- **Export Video**: Turn this checkbox on to render the source video. Turn this checkbox off if you want to render the source audio all by itself; this disables all video controls, and shows an Audio Format drop-down menu in the audio section of settings.

- **Format**: A drop-down menu that gives access to the container formats that are currently available on your system. The available options depend on whether you have Final Cut Pro and QuickTime installed, and on the operating system you’re using. This list is constantly growing, as new file formats are added over time, so be sure to check each new version for the latest supported formats.
  - **AVI**: A now-deprecated file-based media format that, despite its age, remains popular with Windows applications. Supports delivery using the Cineform, Grass Valley HQ and HQX, and Uncompressed RGB and YUV codecs.
  - **Cineon**: An older uncompressed image sequence format developed by Kodak, designed for film scanning and digital mastering, which delivers RGB 10-bit.
  - **DCP**: Native DCP encoding and decoding for creating unencoded DCP files only. If you have a license for Fraunhofer’s EasyDCP, a setting in the Configuration panel of the System Preferences enables you to choose whether to use EasyDCP (for creating encrypted DCP output), or the native DaVinci Resolve encoding.
  - **DPX**: An uncompressed image sequence format favored by the film industry for mastering and delivery for DCDM mastering, which can be delivered as RGB 10-, 12-, 16-bit integer and half float, or RGBA 8-bit.
  - **easyDCP**: (when installed) An option that allows you to master a DCP or IMF directly from DaVinci Resolve in conjunction when you have an installed license of Fraunhofer’s EasyDCP software.
  - **EXR**: The OpenEXR format is a high-dynamic-range image sequence format developed by ILM for applications requiring high quality and multiple channels. Used for outputting ACES and HDR deliverables. You can deliver to a variety of RGB Half and RGB Float settings. When choosing the RGB half (DWAA) or (DWAB) compression codecs, an additional “Compression level” setting appears that lets you choose how much compression to apply.
- **IMF:** A native IMF encoding option that lets you export to the SMPTE ST.2067 Interoperable Master Format (IMF) for tapeless deliverables to networks and distributors, with support for encoding of JPEG2000 using a library licensed from Kakadu software. No additional licenses or plug-ins are required to output to IMF. The IMF format supports multiple tracks of video, multiple tracks of audio, and multiple subtitle and closed caption tracks, all of which are meant to accommodate multiple output formats and languages from a single deliverable. This is done by wrapping a timeline’s different video and audio tracks (media essences) and subtitle tracks (data essences) into a “composition” within the Material eXchange Format (MXF).

- **JPEG 2000:** DaVinci Resolve 15 introduced support for the encoding and decoding of JPEG2000 using a library licensed from Kakadu software. This includes a complete implementation of the JPEG2000 Part 1 standard, as well as much of Parts 2 and 3. JPEG2000 is commonly used for IMF and DCP workflows.

- **MJ2:** The Motion JPEG 2000 format. DaVinci Resolve 15 introduced support for the encoding and decoding of JPEG2000 using a library licensed from Kakadu software. This includes a complete implementation of the JPEG2000 Part 1 standard, as well as much of Parts 2 and 3. JPEG2000 is commonly used for IMF and DCP workflows.

- **MP4:** Dedicated MP4 encoding lets you export H.264-encoded movies.

- **MXF OP–Atom:** A simple standard for the Material eXchange Format, a file-based media format, that’s often used when delivering DNxHD. This version conforms to the SMPTE 390M standard, and can deliver using the DNxHD, DNxHR, Kakadu JPEG 2000, NTSC and PAL Avid, RGB Avid 10-bit, and XDCAM MPEG2 codec options.

- **MXF OP1A:** A version of the Material eXchange Format that conforms to the SMPTE 378M standard, and can deliver using the 1080i Avid 8-bit, DNxHD, DNxHR, Kakadu JPEG 2000, NTSC and PAL Avid, RGB Avid 10-bit, Sony MPEG4 422 and 444, and Sony XAVC Intra CBG and VBR, and XDCAM MPEG2 codec options.

- **QuickTime:** Apple’s file-based media format, used when delivering Apple ProRes, DNxHD or DNxHR wrapped in QuickTime, GoPro Cineform RGB 16-bit and YUV 10-bit, Grass Valley HQ and HQX, Kakadu JPEG 2000, H.264, HEVC, H.264 (single or multi-pass), Photo JPEG, Kakadu JPEG 2000, Uncompressed 8- and 10-bit formats with ARGB/RGBA/RGB/YUV channel orders, and VP9 at 8-, 10-, and 12-bits.

- **TIFF:** “Tagged Image File Format,” an image sequence format compatible with many desktop video applications on many platforms and is also used when delivering for DCDM mastering.

- **Codec:** A drop-down menu that lets you choose from a selection of codecs that are available to the format you’ve selected above.

- **Type:** Different codec options may also present different bit depth and color space combinations, as well, which are available from this menu.

- **Maximum Bit Rate:** (Does not appear for all codecs) Codecs such as Kakadu JPEG 2000 let you specify a maximum bit rate, in Mbits per second, with which to encode the delivered video.

- **Field rendering:** If you’re processing interlaced source material, this checkbox sets DaVinci Resolve to render each field individually before reintegrating them back into a single frame, in order to process clips most accurately with filtering operations that would otherwise violate field boundaries and cause problems. If you’re not rendering interlaced media, you should leave this checkbox turned off, as it is more processing intensive.
- **Export HDR10 Metadata:** (Available in Single clip mode if HDR10+ is enabled in Project Settings) Exports HDR10 metadata to the rendered file when you’re doing an HDR workflow.

- **Embed HDR10 Metadata:** (Available in Single clip mode if HDR10+ is enabled in Project Settings) Exports HDR10 metadata to the rendered file when you’re doing an HDR workflow. Embeds HDR10 metadata within the exported media of selected formats.

- **Render at Source Resolution:** (When rendering Individual Clips) This checkbox lets you render each clip at the same resolution as its source media file, letting you preserve mixed frame sizes for final delivery.

- **Resolution:** The output resolution for rendering. This setting defaults to the current resolution of the project as set in the Master Settings panel of the Project Settings, modified by whatever transforms are applied in the Sizing palette in Output mode. However, you can change the resolution here if you need to output at a different resolution. Using this setting, you can queue up different render jobs at different resolutions, in order to output both HD and SD resolution media in the same render session, for example. Some file formats require specific resolutions, in which case the Output Size settings will be automatically set to the necessary resolution.

- **Frame rate:** (When rendering Single Clip) This setting is typically identical to the “Timecode calculated at” frame rate in the Master Settings panel of the Project Settings. However, you may wish to set this to a variation of the current conformed rate, for example choosing from between 23.98 or 24 fps. Doing so will adjust the metadata written within the file, which is used to aid playback for the range of systems available worldwide.
  - **3:2 Pulldown Insertion Options:** Starting with DaVinci Resolve Studio 12.5, you have the option of outputting either 29.97 or 30 fps media with 3.2 pulldown insertion if your project’s playback frame rate is either 23.98 or 24 fps. To output 29.97 media, the project must be 23.98 fps; simply choose (23.976 3:2) from the Frame rate drop-down. Projects with 24 fps frame rates can only be output at 30 fps.

- **Export Alpha:** (When rendering Individual Clips) Turning this checkbox on results in alpha channels found in each clip’s source media file being output to each delivered clip, as well as alpha information that you’re creating in DaVinci Resolve and inserting into that clip via the Alpha output of the Color page Node Editor being output to each delivered clip.

- **Alpha Mode:** (When rendering Individual Clips) Lets you choose how to export alpha channels when Export Alpha is enabled. You can choose Straight or Premultiplied.

- **Render Stereoscopic 3D:** (Only appears if there are stereo clips in a timeline) Three options let you choose how to render stereoscopic timelines, rendering just one eye’s worth of media at a time, or rendering a single set of stereo media in one of four ways, depending on the option you choose from the “Both eyes as” drop-down menu.
  - **Left eye:** Lets you render only the left-eye media from a stereo timeline.
  - **Right eye:** Lets you render only the right-eye media from a stereo timeline.
  - **Both eyes as:** Lets you select from four ways of rendering the left and right eyes of stereo media as a single set of media files. “Separate files” lets you output both the left-eye and right-eye media as individual media files, all at once. Side-by-side, Line-by-Line, and Top-Bottom let you output frame-compatible media that can be output to stereo-capable displays. Anaglyph lets you output a traditional anaglyph red/cyan stereo image for viewing on any display using red/cyan glasses.

- **Use Constant Bit Rate:** If the Format and Codec you’ve specified allows you to switch between variable and constant bit rate output, this checkbox lets you force video to render at a constant bit rate.
Optional MP4, H.264, H.265, VP9, or HEVC Controls

If you choose MP4 as the format, or QuickTime with H.264 or VP9 as the codec, additional options appear, described below. Workstations using NVidia GPUs that offer NVENC will present alternative accelerated options, while other workstations offering QuickSync hardware encoding instead will be able to use that option.

- **Use hardware acceleration if available:** DaVinci Resolve supports QuickSync hardware encoding of H.264 and HEVC, if available on your workstation.
- **Quality:** If the currently selected option in the Render to drop-down menu has options for changing the compression quality, this drop-down menu lets you choose the quality you want to use. Otherwise, it's disabled.
- **Restrict to X Kb/s:** (Available for QuickTime H.264) You can choose Automatic, or select a maximum data rate with which to export H.264.
- **Encoding Profile:** A drop-down that lets you choose among different encoding profiles, each of which has been optimized for different purposes. The tradeoff is between quality and computational intensity for encoding and playback. The available options are:
  - **Auto:** Automatically selects an encoding profile.
  - **Base:** For H.264, intended for video conferencing and mobile phone use; highly compressed.
  - **Main:** For H.264, intended for SD analog transmission. For H.265, intended for the compression of 4:2:0 video at up to 4K 60fps with a bit depth of 8-bits per channel.
  - **Main10:** (H.265 only) Intended for the compression of 4:2:0 video at up to 4K 60fps with a bit depth of 10-bits per channel.
  - **High:** For H.264, intended for Blu-Ray and HD transmission.
- **Entropy Mode:** (called Entropy Coding Mode for compatible Nvidia GPUs) A drop-down that lets you choose which algorithm the encoder should use for compression. The choices are:
  - **CALVC (context-adaptive variable-length encoding):** A lower-quality algorithm that's less computationally intensive to process and play.
  - **CABAC (context-based adaptive binary arithmetic coding):** A higher-quality algorithm that yields better visual quality at lower bandwidth, at the cost of being more computationally expensive to process and play.
- **Multi-pass encode:** (Available for QuickTime H.264) You can choose between Single and Multi-pass encoding. Single pass is faster, but multi-pass yields superior results when quality is important. When you enable Multi-pass, the number of passes performed is automatic.
- **Key Frames:** (Available for QuickTime H.264) You can choose Automatic, or select a duration for manual keyframe insertion.
- **Frame Reordering:** (Available for QuickTime H.264) On by default, Frame Reordering enables the encoding of B frames to improve the quality of the resulting compressed movie file. Turning off Frame Reordering will speed encoding performance at the expense of visual quality.
- **Rate Control:** (Available for compatible Nvidia GPUs) Provides six options for controlling Encoding Profile and Entropy Mode.
- **Lookahead:** (Available for compatible Nvidia GPUs) Lets you specify how many frames for the encoder to examine in advance of compression.
Optional DCP and IMF Controls

If you choose DCP or IMF as the Format, additional options appear, described below.

- **Use interop packaging**: (DCP only, located under Type parameter) Lets you create an Interop DCP package, based on an earlier standard of DCP delivery that is not forward compatible with SMPTE DCP packages.
- **Package Type**: (IMF) Defaults to App2 Extended (App2e), for encoding JPEG 2000 up to 4K.
- **Bit Depth**: (IMF) The bit depth of the encoded IMF video.
- **Encoding Profile**: (IMF) A drop-down that lets you choose among Auto, IMF, and Broadcast.
- **Encoding Level**: (IMF) Provides different choices based on what is selected in Encoding Profile.
- **Maximum bit rate**: (DCP, IMF) Lets you choose how much to compress the result.
- **Lossless Compression**: (IMF) Lets you choose to encode using lossless compression.
- **Slope-Rate Control**: (DCP, IMF) A checkbox lets you specify lossless compression.
- **QStep**: (DCP, IMF) Lets you choose either automatic or manually specified DCP quantization levels at which to compress the video signal when using the Kakadu JPEG 2000 encoder.

Advanced Controls

An advanced settings disclosure button hides the following additional controls, by default.

- **Pixel aspect ratio**: Lets you override the Project Settings and change the PAR of the rendered output to either Square or Cinemascope.
- **Data levels**: Defaults to “Auto,” which simply renders all clips with the data level appropriate to the currently selected codec in the “Render to” drop-down menu, which is usually the preferred behavior. Choosing one of the other options (“Video” or “Full”) outputs all clips using the selected data range. For more information, see Chapter 7, “Data Levels, Color Management, and ACES.”
- **Retain sub-black and super-white data**: Turning this checkbox on lets you choose to output media files that preserve overshoots and undershoots, data that’s above the maximum and minimum data levels of the data level you’ve selected, assuming this is supported by the video format and codec you’re exporting to. Otherwise, DaVinci Resolve clips these “out-of-bounds” parts of the signal in an effort to keep your deliverables from violating whatever QC standards you’re adhering to in your grade.
- **Color Space Tag**: A drop-down menu that lets you choose a color space to embed as metadata in the rendered file. This setting defaults to the Output Color Space if your project’s color science is set to DaVinci YRGB Color Managed, or the ACES Output Device Transform if your color science is set to ACEScc or ACEScct.
- **Data burn-in**: A drop-down menu that defaults to “Same as Project,” which leaves the current Data Burn In palette settings enabled while rendering, inserting a window burn into the media being output. Choosing “None” disables window burns while rendering. Note that when rendering as Individual Source Clips, individual clip burn in presets can be assigned if they’ve been created in the Data Burn In palette.
- **Use optimized media:** When this checkbox is turned on, DaVinci Resolve will use optimized media, when available, to do the final render, to save time. If your media has been optimized to the same format as the one you’re outputting to (or better), this is convenient. However, if you’ve optimized to a lower quality format than what you’re outputting to, you should turn this checkbox off to force DaVinci Resolve to process all clips using the original media, guaranteeing the best quality available.

- **Use render cached images:** When this checkbox is turned on, DaVinci Resolve will write media from the cache to the files being output to save time. If you’re caching using the same media format you’re outputting to (or better), this can be convenient. However, if you’re caching in a lower-quality format than the one you’re outputting to, you’ll want to turn this checkbox off to force DaVinci Resolve to process all media as it’s being rendered, writing at the maximum quality you’re outputting to.

- **Enable flat pass:** Three options let you choose whether or not to render each clip with its grade applied.
  - **Off:** DaVinci Resolve always applies each clip’s grade when rendering.
  - **With clip settings:** For each version of a clip, the system will check that version’s pass flat flag. If it’s turned on, the system disables color correction for that version of the clip. Otherwise, that version will be rendered with its grade intact. Versions can be individually flagged by right-clicking a clip’s thumbnail in the Timeline, choosing the submenu of the version you want to flag, and choosing Enable Flat Pass.
  - **Always On:** When checked, DaVinci Resolve disables the grade of every clip being rendered.

- **Disable sizing and blanking output:** When turned off, Output Blanking to create letterboxing or pillarboxing is “baked” into the output, as are all sizing adjustments made on the Cut, Edit, and Color pages, including Image stabilization.

  When turned on, Output Blanking, Cut and Edit page sizing adjustments, Color page Input and Output Sizing, and Image Stabilization are disabled. Rendered media is rendered either at the source resolution if “Render at source resolution” is enabled in individual clips mode, or to the currently specified resolution of the Timeline or project. If you’re outputting via Final Cut Pro or Premiere Pro XML, or Avid AAF, sizing adjustments are output to the XML or AAF files that are created for purposes of round-tripping these adjustments as editable metadata back to an NLE.

  Be aware that “Disable sizing and blanking output” does not disable any transform operations that happen within the Fusion page, nor does it disable transforms happening as a result of an OpenFX or ResolveFX plugin applied to one or more clips in the Cut, Edit, or Color pages. All of these effects will continue to be rendered into the final output.

- **Force sizing to highest quality:** If you’ve been working with the “When resizing and scaling” option set to Bilinear to improve performance when working on slower workstations, turning this checkbox on automatically renders all clips using the “Uses Sharper filter” setting of the Image Scaling panel in the Project Settings. For more information, see Chapter 3, “System and User Preferences.”

- **Force debayer res to highest quality:** When rendering camera raw media formats that allow variable quality debayering, it’s common to lower the debayering quality to improve real time performance while grading. Turning this checkbox on guarantees that media will always be rendered at the highest available quality, saving you from forgetting to manually change the debayer setting back when setting up a render at 3am.
• **Add X frame handles**: (When rendering Individual Clips) Lets you specify front and rear handles to be output in frames. This is particularly useful in round trips, when the finishing editor might want additional handles with which to roll edit points or add transitions while fine-tuning the graded edit.

• **Tone Mapping**: (Available in Single clip mode if Dolby Vision or HDR10+ is enabled in Project Settings) When set to None, the timeline is output using the current color management settings. When set to either Dolby Vision or HDR10+, you can choose to output the timeline at a specific peak nit level, color space, gamma, and Data Level using either the Dolby Vision or HDR10+ metadata available to guide the tone mapping operation you've selected. This makes it easy to set up multiple jobs to output HDR outputs at varying levels, as necessary.

• **Bypass re-encode when possible**: (Single Clip mode only) Turning this checkbox on makes it possible to do a direct copy of the video essence of video items in the Timeline, directly from the source media to the file being output, when the selected Format, Codec, and Type matches the source. This also preserves alpha channel data for compatible formats.

Bypass re-encode eliminates the need to re-encode video media, preserves quality, and speeds up the output process dramatically, but it only works for clips in the Timeline to which no additional effects have been added. Doing any grading, adding a ResolveFX plug-in, adding any overlapping effects or compositing to clips in the Timeline, resizing or stabilizing clips or altering the output sizing of the Timeline, and adding Fusion effects will all necessitate re-encoding the entire clip in order to process these effects. Transitions will require processing, but only for the duration of each transition.

There are many situations where this is valuable:

- **Fast output of simple edits**: You've edited a simple cuts-only promo using footage cut from a previously rendered program using QuickTime ProResHQ 422 media, and you're exporting to the exact same format. You can output all of the media very quickly using Bypass re-encode when possible.

- **Fast output of previously output timelines with small changes**: You need to replace a few shots in an effects-intensive program that's already been output. You can import the media file that was output into a new timeline, replace only the required shots with new media. DaVinci Resolve will do a direct copy of all previously rendered media, while re-encoding only the new clips with whatever effects and grading they contain. This lets you quickly re-output a high-quality master file, while preventing you from needing to re-render the entire program.

- **Fast output of previously output timelines with new audio mixes**: You've placed a previously rendered Video+Audio clip onto a timeline and edited a new audio mix clip to replace the old audio mix. In this situation, a new Video+Audio file will be quickly written with the new audio, but the video component of that file won't be re-encoded, again resulting in a fast export at the highest quality.

**TIP**: For a list of which video formats are compatible with Bypass Re-encode on macOS, Windows, and Linux, as well as which formats are compatible with alpha channels, see the “Supported Codec List” at the DaVinci Resolve Support page, located at https://www.blackmagicdesign.com/support/family/davinci-resolve-and-fusion.
DCP and IMF Composition Settings
If you’ve selected either DCP or IMF from the Format, a Composition Settings group appears with the following parameters when you click the disclosure control, which let you populate standard DCP and IMF composition metadata:

- **Composition name**: The name of the exported composition.
- **Issuer**: The organization providing the composition.
- **Use current date**: A checkbox that lets the current date be used as the Issue date automatically.
- **Issue date**: The date the composition is issued.
- **Content kind**: A drop-down provides a list of acceptable choices for defining the content.
- **Content version label**: Meant to identify the version of the content being provided.
- **Annotate xml using composition name**: Auto-populates Asset Map, Composition Playlist, and Packing List with data from the project. Otherwise these three fields are manually editable.
- **Annotate reel index as suffix (DCP only)**: Auto-populates Reel Annotation with data from the project. Otherwise this is manually editable.
- **Annotate media using filename**: Auto-populates Main Video Track and Audio Track 1 with data from the project. Otherwise these three fields are manually editable.

Subtitle Controls
The Subtitle Settings group exposes controls governing how to export subtitles in your program:

- **Export Subtitle**: This checkbox determines whether or not subtitles will be output or ignored.
- **Format**: Lets you choose how you want subtitles to be output, if present.
  - **As a separate file**: Exports all subtitles in the current timeline as a separate file of the format selected in the Export As drop-down.
  - **Burn into video**: Renders the current timeline with all subtitles appearing within the picture. When Burn into video is selected, the Export As drop-down is hidden.
- **Export As**: This drop-down is only adjustable if Format has been set to “As a separate file.” The two available formats are SRT and WebVTT.

Audio Panel
This panel contains all audio-oriented parameters.

- **Export audio**: Turn this checkbox on to render the source audio, or audio that you’ve synchronized in DaVinci Resolve, along with the media being output by DaVinci Resolve.
- **Format**: You can choose which format of audio you want to render. Depending on which format you choose, different audio codec options will appear below.
  - **MXF OP-Atom**: Generates media files that conform to the SMPTE 390M format of MXF media for file exchange.
  - **QuickTime**: Exposes all available formats of audio compatible with QuickTime.
- **WAVE**: Generates media in the WAVE format.
- **MP4**: Generates media in the MPEG-4 file format.

- **Codec**: Lets you choose between Linear PCM (the default), AAC audio, and IEEE Float (Wave only). AAC audio encoding is only available on macOS.
- **Bit Rate Strategy**: (Available for AAC encoding) You can choose among Constant Bit Rate, Average Bit Rate, Variable Bit Rate Constrained, and Variable Bit Rate.
- **Quality**: (Available for AAC encoding when Bit Rate Strategy is set to Variable Bit Rate) Five settings you trade between speed and quality when encoding AAC audio.
- **Data Rate**: (Available for AAC encoding when Bit Rate Strategy is set to Constant, Variable, or Variable Constrained) Lets you choose the maximum data rate for AAC encoding.
- **Bit Depth**: Lets you specify the bit depth at which to output the source audio.
- **Render one track per channel checkbox**: This checkbox lets you specify whether you want to export each channel as an individual track in the structure of the exported file.
- **Output Track #**: This drop-down menu lets you choose which Main or Submix bus you want to output. A Plus button to the right lets you add additional tracks you want to export in this job, so if you want to export multiple Mains or multiple Subs, you can add more Track pop-ups.
  - When you choose a track with multiple channels of audio, a field appears showing how many channels will be output; you have the option of using a virtual slider to change how many channels are output.
  - In Single Clip Mode, when you choose “All Timeline Tracks, each audio track in the current timeline will be rendered as an individual track in the rendered media file you’re outputting. Multi-channel tracks containing multi-channel clips will output audio tracks containing the same number of channels in the output media, which means you can output mixed combinations of mono, stereo, 5.1 or 7.1, and adaptive audio tracks, and each separately rendered audio track will reflect identical channel mappings.
- **Language**: (Only available when outputting to the IMF format) This drop-down menu lets you choose the language of a particular output track when you’re outputting to IMF. Since IMF files can accommodate multiple audio tracks containing different mixes for different regions, it’s important to identify each output track you’re outputting by language.
- **Content**: (Only available when outputting to the IMF format) This drop-down menu lets you choose the content of a particular output track when you’re outputting to IMF. Since IMF files can accommodate multiple audio tracks containing different mixes and content, it’s important to identify each output track you’re outputting by content.

### File

This panel contains all other parameters.

- **Filename Uses**: Three options let you automatically name the media file(s) that are output automatically.
  - **Use Custom Filename**: Lets you enter your own name in the Custom name/File prefix field.
- **Use Timeline Name:** (When rendering a Single Clip) When this option is selected, the name of the Timeline is used.

- **Use Source Filename:** (When rendering Individual Clips) When this option is selected, the filename of each clip’s corresponding source media file is cloned, and used as the filename of media being output by DaVinci Resolve. This is preferred when you’re generating offline media for use by an editor that you later want to reconform to the originating DaVinci Resolve project. When this checkbox is turned off, you can customize filenames using the other options in this section of settings.

- **Custom name:** Lets you use custom text to name all rendered files. If you’re not using the source filename, and not rendering to a file format that uses timecode, you can enter a filename here. When editing the Custom Name or File Prefix (or File Suffix), you can use “metadata variables” that you can add as graphical tags that let you display clip metadata. This is especially useful when rendering Individual Source Clips. For example, you could add the corresponding metadata variable tags `%scene_%shot_%take` and the File Prefix would be written as “12_A_3” if “scene 12,” “shot A,” “take 3” were in the source clip’s metadata. For more information on the use of variables, as well as a list of all variables that are available in DaVinci Resolve, see Chapter 173, “Using Variables and Keywords.”

- **File suffix:** Lets you add custom text and/or metadata variables (described previously) to the end of all rendered files.

- **Use unique filenames:** (When rendering Individual Clips, and only when Filename uses is set to Custom name) When enabled, additional characters are added to every rendered media file to guarantee that each rendered media file has a completely independent name. This prevents multiple rendered clips from the same source media file from overwriting one another when saved to the same directory. “Uniquely” named clips append the clip name with the track and clip number identifying a clip’s position in the currently selected session. For example, a clip that’s linked to a media file named “DropThatThingCU.mov,” and edited as the twenty-fifth clip on track V2, will be named “DropThatThingCU_V2-0025.mov” when rendered. When enabled, two other options are revealed.

  - **Use unique filename prefix/Use unique filename suffix:** (When Use Unique Filenames is on) Radio buttons let you choose whether to add the unique identifier at the beginning or end of a clip. Choosing Prefix would result in “V2-0025 _DropThatThingCU.mov,” whereas choosing Suffix would result in “DropThatThingCU_V2-0025.mov” when rendered.

  - **Add source frame count to filename:** (When Use Unique Filenames is on) Adds the number of frames in the source to the unique filename being created.

- **Add source frame count to filename:** (When rendering Individual Clips, and only when Filename uses is set to Custom name) When enabled, a number equal to the number of frames in each clip is appended to the end of the rendered file name. This is another way to make sure that multiple rendered clips with custom names don’t overwrite one another.

- **Use filename digits:** Lets you specify how many digits to use when rendering an image sequence, although the specified digits will also be used for any media format. This is particularly useful if you’re outputting media to be used by an application that has strict requirements for image sequence numbering. Defaults to eight digits.

- **Each clips starts at frame:** (When rendering Individual Clips) This permits timecode to be written to the header, and frame count to be written to the filename of the image sequences, which is ideal for VFX workflows.
• **Start timeline timecode at:** (When rendering Single Clip) This option is only available when rendering clips in Single clip order. Specifies the timecode that will be written to the media being output by DaVinci Resolve. For DPX files, timecode is written into the header data, and is simultaneously converted to a frame count that’s inserted into the filename of each frame file, which provides a logical count of the frame numbers. For other media formats, timecode is written to the appropriate metadata container. You may find it useful to use custom start times, for example starting each reel of a project at a particular value, depending on the standards employed at your shop.

• **Place clips in separate folders:** (When rendering Individual Clips) Useful if you need to preserve the filenames of files you’re outputting when the filenames of clips coming from the same source media file may cause them to overwrite one another. This option is also commonly used when rendering VFX shots for additional post-production work, allowing the VFX department to identify clips quickly and distribute the work accordingly.

• **Preserve Source directory levels:** (When rendering Individual Clips) Retains a user-specified depth of the original directory structure used by a clip’s corresponding source media file, recreating it when rendering new files for output. The number you select determines how many levels of subdirectories DaVinci Resolve will automatically create within the currently specified “Render job to” directory to match the path used by the source files. Defaults to 0, which creates no matching subdirectories.
  
  – **After Head/From Tail:** When setting how many directory levels of each clip’s file path to preserve (using the “Preserve x levels” parameter), click one of these buttons to specify whether that number of path levels is defined relative to the head or the tail of each media file path.

  – **Preserved Path:** Shows you a preview of the preserved path you’ve set up so you know you’ve gotten it right.

• **File Subfolder:** (Only appears in Additional Output panels) Lets you specify a subdirectory into which to render the media files being output. If the specified subdirectory doesn’t exist, a new one with that name will be created within the currently specified “Render job to” directory.

• **Use commercial workflow:** (When rendering Individual Clips) Automatically renders every version that’s applied to each clip in the session, except for versions that have been flagged using the “Render Disabled” flag, found in the Version submenu for each clip in the Timeline. This option is typically used when you’ve graded multiple versions of a clip to be used for VFX work, and you want to deliver each grade as a separate media file. This is also used when rendering programs for commercial broadcast where you have two or more versions of a grade for each scene. When using this option, alternate methods of outputting each rendered media file are used, and four additional settings are revealed.

  – **Alternative pass offset:** Lets you separate the timecode values written into each version of a clip with an offset. For example, if the default version timecode is 01:00:20:00, and you select a 10 minute offset in the Alternative Pass Offset timecode entry, then the second graded version of that clip will start at 01:10:20:00, the third version will start at 01:20:20:00, and so on until every version is rendered. You can offset the clips by whatever value you like, but the idea is to make it easy for editors and VFX artists to find the versions of each grade. If the clips are shared with a finishing artist, and they know that each alternate pass is 10 minutes apart, then it’s easy for the finisher to change the clip version just by adding 10 minutes to the referenced timecode. To simplify the workflow further, you can put separate source reels in separate folders using the next three options.
– **Place reels in separate folders:** Automatically places all media that’s output using a particular reel name into corresponding folders.

– **Place clips in separate folders:** Automatically places alternate grades of clips into separate folders.

– **Use version name for folders:** Labels each folder with the name of the version when using the Commercial Workflow option.

- **Render speed:** A drop-down menu lets you throttle the speed at which media is rendered. Ordinarily you’ll leave this set to the default of Maximum. However, some storage systems that are shared by multiple rooms in a facility use storage area networks (SANs) with insufficient bandwidth for multiple real-time image streams. DaVinci Resolve’s incredibly fast rendering speeds can cause playback problems with other users accessing the SAN if available bandwidth is insufficient. In this case, you can throttle the render speed to limit SAN bandwidth usage to between 1 to 50 percent of full rendering speed.

- **Disk space currently used:** Shows the amount of disk space available on the target volume.

- **Disk space used after render:** Shows the new disk usage based on the specified range of the current session that you’re rendering.

### Additional Outputs

Each job you create in the Render Settings defaults to a single output. However, you can create multiple outputs when you need to deliver multiple versions of media, with individual video formats and codecs and different data burn-in settings, to be rendered into individually named subfolders (optional).

This can be useful for setting up multiple rendered passes when your client requires two sets of media, for example QuickTime ProRes 422 (HQ) media along with MXF DNxHD media. This is also useful when you need to output two sets of media where one has window burns, and the other is clean.

**To add additional outputs in the Render Settings:**

Choose Create Additional Output from the Render Settings Option menu. A row of numbers below the Filename and Location controls let you open each output you create and adjust its settings. You can have as many outputs as you require.
To remove an additional output:
Open the additional output panel you want to remove, and click the Delete button at the bottom.

How to Avoid Overwriting Clips When Rendering Output Media

Three of the options described previously, “Use unique filenames,” “Place clips in separate folders,” and “Use commercial workflow,” are all ways of organizing your rendered media to avoid overwriting rendered clips that happen to share the same file name. These options are necessary because each clip has one logical range of timecode, and because multiple clips often refer to a single source media file with one name.

When rendering a clip, DaVinci Resolve automatically overwrites any other media files that have the same name. So, in instances where you're trying to preserve the previous filename of the source media file, or where you're rendering out multiple versions of the same clip, it's entirely likely that the clips you're trying to output will overwrite one another, leaving you with the last clip you rendered. The three options mentioned previously prevent this in different ways.

Defining a Range of Clips and Versions to Render

Once you’ve defined the Render Settings, now you need to decide how much of the Timeline you need to render. A Mini-Timeline and Thumbnail timeline are available to help you navigate your project’s clips in order to choose which ones you want to render. Track controls let you enable and disable whole tracks from being output; for example if you need to render a textless version of a timeline in which all the title clips are on track V4, you can disable track V4. Furthermore, you can also use these controls to choose which clip versions you want to render.

To render the entire Timeline:
Choose Entire Timeline from the Render drop-down in the Deliver page timeline. This option only appears if clips are not filtered.

To disable a video or audio track to exclude those clips from being rendered:
Click the Video or Audio Disable Track button for the tracks you want to exclude.

To render a filtered subset of clips in the Timeline:
1. Open the Color timeline, if it’s not already shown, and choose an option from the Timeline Filter drop-down to the right of the Clips button in the Interface toolbar.

   The contents of the Thumbnail timeline are restricted to show only the clips matching the selected criteria. For example, if you've already rendered a session, but you've since made some changes, you can use one of the “Show Modified Clips” options to display only the clips that have changed within a particular timeframe. Another possibility is to choose the “Show Unrendered Clips” option to show all clips that have not yet been rendered.

2. Choose “All Filtered Clips” from the Render drop-down in the Timeline toolbar.
To clear clip filtering:
Choose All Clips from the Timeline Filter drop-down to the right of the Clips button in the Interface toolbar.

To define a continuous range of clips to render:
1. To define the first clip in the range you want to render, do one of the following:
   - Right-click a clip thumbnail in the Thumbnail timeline and choose Mark In.
   - Position the playhead in the Timeline or the Viewer, and press the I key, or right-click the Timeline ruler and choose Mark In.

2. To define the last clip in the range you want to render, do one of the following:
   - Right-click a clip thumbnail (in the Color timeline) or a clip (in the Edit timeline) in the Thumbnail timeline and choose Mark Out.
   - Position the playhead in the Timeline or the Viewer, and press the O key, or right-click the Timeline ruler and choose Mark Out.

In and Out points appear within the Timeline ruler, and an orange bar shows the range you’ve selected to render. The In and Out fields update with the first and last frame numbers, in timecode and frame count, and the Duration field updates with the total number of frames you’ll be rendering.

IMPORTANT If you’re in Individual Clips mode, In and Out points automatically snap to the nearest clip In or Out point in the Timeline. You cannot render partial clips in Individual Clips mode, but you may do so in Single Clip mode.

To render a single clip:
• Open the Thumbnail timeline if it’s not open already, Right-click any clip thumbnail, and choose Render This Clip.
• An orange bar in the Timeline ruler shows that clip is selected for rendering. If you need to render several clips individually, you can select each clip one at a time to add as individual jobs to the Render Queue.

Choosing Which Versions to Render for Each Clip
By default, the currently selected version that was set in the Color page is rendered for each clip. If you want to render a different version, the easiest thing to do is to make sure they’re selected on the Color page Timeline before you open the Deliver page.

However, a Versions submenu, within the Thumbnail timeline’s contextual menu for each thumbnail, also provides options to manage grade versions. These commands are duplicates of options that are available from the Thumbnail timeline of the Color page.

To choose which version to render:
Right-click any clip thumbnail in the Thumbnail timeline, and choose a version from the Versions submenu.

TIP: You can right-click a clip in the Thumbnail timeline of the Color or Render screen and rename any version of a grade. This can assist a facility’s workflow when sharing material between suites and applications.
Using the Render Queue

Once you’ve defined the settings necessary to render the type of media you require, and the range of the current session you want to render, you need to add all that information as a job to the Render Queue. You can add as many jobs to the Render Queue as you need, depending on what files you need to output.

Each job can have individually specified ranges of clips and individual clip settings, which can include different render directories, different formats, resolutions, data levels, burn-in settings, and so on. As a result, you can use the Render Queue to queue up the render of multiple sections of the current session, or multiple versions of the same media. Furthermore, you can queue up multiple sessions, if you have several differently graded sessions.

To add a job to the Render Queue:

1. Select a timeline.
2. Choose the settings you require in the Render Settings, using one of the Presets, or by choosing your own custom settings.
3. Choose a range of clips to render using the Deliver page Timeline using the procedures described in the previous section.
4. Click the Add to Render Queue button at the bottom of the Render Settings.
5. If you haven’t chosen a location for the render yet, you’ll be prompted to do so now via a File Destination dialog, so choose a location and click Ok. If there’s already media in the render location you’ve specified, you may also see a dialog telling you “This render may overwrite existing clips in this folder.” If you want to continue, click Yes, otherwise click No.

That render setup is now added as a job to the Render Queue, showing the project and timeline name, and location path where the render will be written to.

To show more details about jobs in the Render Queue:

Click the Render Queue Option menu (at the upper right-hand corner) and choose Show Job Details. Each job now lists the frame size, format, frame rate, audio channels and sample rate, and duration below the name and location path.
To rename a job:
Jobs can be given custom names simply by clicking on the default job name (Job 1, Job 2, and so on) and typing a new name of your own. This can be useful for setting up jobs that you may be re-rendering over and over as you work on a project.

To start rendering:
1. If you want to restrict rendering to only selected jobs in the Render Queue, then select one or more jobs by clicking on one, and then Command-clicking on others to choose discontinuous jobs, or Shift-clicking on another to select an entire range of jobs. When you select one or more jobs, only the selected jobs will be rendered. If no jobs are selected, then all jobs in the queue will be rendered.
2. Click the Start Render button, underneath the Viewer to the right of the interface.
3. If there are jobs in the Render Queue that have already been rendered, a dialog will appear asking “Selected items contain already rendered items. Do you want to re-render them?” Clicking Yes will re-render all jobs in the Render Queue. Clicking No only renders the jobs that have not yet been rendered. Clicking Cancel cancels the entire rendering operation.

Rendering begins, starting with the highest job in the list. The Overall Progress bar starts to fill up, from right to left, indicating how much of what’s been queued up has been rendered so far. While rendering is in progress, the Start Render button changes to the Stop Render button, which can be clicked at any time to halt rendering.

To remove jobs from the Render Queue, do one of the following:
- **To clear a specific job:** Click the X at the upper right-hand corner of a job’s entry in the Render Queue.
- **To clear all previously rendered jobs:** Click the Render Queue Option menu (at the upper right-hand corner) and choose Clear Rendered.
- **To clear all jobs:** Click the Render Queue Option menu (at the upper right-hand corner) and choose Clear All.

To change a job that has been rendered to appear unrendered again:
Right-click any rendered job, and choose Clear Render Status. You can also select multiple jobs to change their rendered status all at once. This makes it easy to re-render the exact same job.

To edit a job that has or has not been rendered:
1. Click the Pencil button in the Render Queue to select it.

The selected Render Queue’s settings repopulate the Render Settings list, and resets the selected range of the Timeline corresponding to that job.
2. Change whichever settings you need to.

3. When you’re finished editing the job, click the Update Job button that appears at the bottom of the Render Settings, or you can click Add New Job to create a new job with the changes you’ve made, leaving the previous job untouched.

**NOTE:** If you click the Pencil button again without clicking Update Job, you’ll be prompted to Save, Cancel, or Don’t Save.

---

**To review clips that correspond to rendered jobs:**

- **To show a rendered clip in the Media Storage browser:** Right-click any rendered job, and choose Reveal in Media Storage.
- **To show a rendered clip in your computer’s file system (Mac OS only):** Right-click any rendered job, and choose Reveal in Finder.

---

### Rendering Jobs from Multiple Projects at Once

You can also add multiple projects from the currently open PostgreSQL or Disk database to the render queue all at once. This can be exceptionally useful in situations where you’ve broken a program into multiple reels, with each reel being a different project.

**To render output from multiple projects at once:**

1. Open each project, set up whatever jobs you want to render in the Render Queue, and save that project without rendering.

2. When you’ve set up the last project, click the Render Queue Option menu (at the upper right-hand corner) and choose Show All Projects.

   All queued items in projects belonging to the currently selected user (if using a PostgreSQL database) or in the currently specified disk location (if using a disk database) now appear in the Render Queue.

3. Click Start Render to begin rendering every job from every project in the queue.

4. When you’re finished, turn Show All Projects off to go back to displaying only the current project’s render queue items.

---

### Remote Rendering

If you have multiple DaVinci Resolve workstations on the same network, you can send a job in the Render Queue from the workstation you’re using (referred to as the “artist workstation”) to one of the “remote workstations” on the network using remote rendering. This lets you use any one of your currently unused secondary workstations to render your jobs, while you continue working on your main workstation.
In order to use remote rendering, you must adhere to the following three criteria:

- Both the artist workstation and the remote workstation must have DaVinci Resolve Studio installed. Remote rendering does not work with the free version of DaVinci Resolve.
- Both the artist workstation and the remote workstation must be using the same Postgres shared database, either on one of the machines, or on a dedicated Remote Database Server. For more information on setting up and using a shared databases, see Chapter 177, “Managing Databases and Project Servers.”
- Both the artist workstation and the remote workstation must have access to the same media files on either the same storage volumes, or identically named storage volumes.

Sharing Storage

It’s important that both the artist and remote workstations have access to the same media on the same named storage volume for remote rendering to work properly. This can be done via some manner of shared storage, such as a SAN. However, it can also be done by mounting the same volume over your network. This will be slower, but it will work.

If you’re mixing Mac OS X, Windows, and Linux workstations for remote rendering, you’ll need to use the Mapped Mount column of the Media Storage Locations list in the Media Storage panel of the System Preferences to add each volume’s path as it’s understood on the workstation it’s attached to. For example, on a Windows workstation that’s accessing volumes from a Linux workstation, type in the Linux-style file paths in the Mapped Mount column for each scratch disk that’s listed.

Setting Up and Using Remote Rendering

Using remote rendering is easy, but it does require a bit of preparation.

1. Make sure the storage volume containing the media being referenced by the project you want to render is mounted on both the artist and remote workstations.

2. Open DaVinci Resolve on the remote workstation, and do one of the following:
   - When the Project Browser opens, right-click anywhere and choose Remote Rendering.
   - If you’ve already opened a project in DaVinci Resolve, you can also choose Workspace > Remote Rendering.

DaVinci Resolve will automatically open to the Deliver page, awaiting jobs to be assigned for automatic rendering.

3. On the artist workstation, add a job to the render queue as you normally would.

4. Click the Remote Rendering button for that job in the Render Queue and one of the options from the list that appears:
   - **Any**: Automatically assigns that job to the next workstation that isn’t currently rendering anything. If all remote rendering workstations are rendering, assigns it as the next job in line.
   - **YourComputer.local**: The artist workstation with the name “YourComputer.” Choose this if you want to render the job locally, and not remotely.
   - **Other Workstations on Network**: All other remote rendering workstations are listed below, so you can choose which specific workstation you want to assign a job to.
Clicking the Remote Render button to remotely render a job

5 Click Start Render. The job is sent to the remote workstation you selected and is rendered, while you’re free to continue working on your artist workstation.

When You’re Finished Remote Rendering

Once you’re done using a particular DaVinci Resolve workstation in Remote Rendering mode and you want to go back to using it as an artist workstation, choose Workspace > Remote Rendering to exit remote rendering and return to the Project Manager.

Setting Up a “Headless” Remote Rendering Workstation

DaVinci Resolve allows remote rendering clients to operate in a so-called “headless” mode, with no GUI. This can be accomplished from the command line, by opening the directory where the app is located and then running DaVinci Resolve in Remote Rendering (-rr) mode using the correct command line syntax for your operating system. Once run in this way, DaVinci Resolve silently and invisibly waits on that system for remote rendering jobs to be sent to that workstation.

On macOS

- Open Terminal.
- Change the directory to:

  cd /Applications//DaVinci\ Resolve/DaVinci\ Resolve.app/Contents/MacOS/

- Run the following command:

  ./Resolve -rr

On Windows

- Open the Command Prompt.
- Change the directory to:

  C:\Program Files\Blackmagic Design\DaVinci Resolve\ 

- Run the following command:

  Resolve.exe -rr
On a Linux CentOS 6.8 system
  - Open Terminal.
  - Change the directory to:
    \[ cd \text{ /home/resolve/Cyclone/ } \]
  - Run the following command:
    \[ ./\text{script.start -rr} \]

On a Linux CentOS 7.x system
  - Open Terminal.
  - Change the directory to:
    \[ cd \text{ /opt/resolve/bin} \]
  - Run the following command:
    \[ ./\text{resolve -rr} \]
For projects requiring Digital Cinema Package (DCP) or Interoperable Master Format (IMF) mastering for digital cinema or broadcast distribution, DaVinci Resolve allows native DCP and IMF encoding and decoding for the creation and playback of unencrypted DCP and IMF deliverables, or it can be integrated with Fraunhofer’s easyDCP application in order to master fully encrypted DCP files, play them back for testing, and generate Key Delivery Messages (KDMs) for theatrical distribution, all directly within DaVinci Resolve.

This means you can encode a DCP or IMF master straight from your program’s source media, all within the 32-bit floating point image processing pipeline of DaVinci Resolve, for the highest possible quality result.

Native IMF Encoding and Decoding

Available in DaVinci Resolve Studio Only

The Format drop-down in the Video panel of the Render Settings now has a native IMF option that lets you export to the SMPTE ST.2067 Interoperable Master Format (IMF) for tapeless deliverables to networks and distributors. No additional licenses or plug-ins are required to output to IMF.

The IMF format supports multiple tracks of video, multiple tracks of audio, and multiple subtitle and closed caption tracks, all of which are meant to accommodate multiple output formats and languages from a single deliverable. As of DaVinci Resolve 16, IMF export also supports exporting IMF packages that use ST.2098 and Dolby immersive audio via selected Main busses. All of this is done by wrapping a timeline’s different video and audio tracks (media essences) and subtitle tracks (data essences) into a “composition” within the Material eXchange Format (MXF).

Additionally, a drop-down menu to the right of this preset provides options for Generic, 20th Century Fox, and Netflix versions of this preset.

When IMF is selected from the Format drop-down, the Codec drop-down menu presents options for Kakadu or EasyDCP encoding, with Kakadu being the method that’s included with DaVinci Resolve Studio. A Type drop-down lets you choose what kind of JPEG2000 output you want, with options including RGB, YUV, and Dolby Vision. Additional parameters include:

- **Package Type:** Defaults to App2 Extended (App2e), for encoding JPEG 2000 up to 4K.
- **Bit Depth:** The bit depth of the encoded IMF video.
- **Encoding Profile:** A drop-down that lets you choose among Auto, IMF, and Broadcast.
- **Encoding Level:** Provides different choices based on what is selected in Encoding Profile.
- **Maximum bit rate:** Lets you choose how much to compress the result.
- **Lossless Compression:** Lets you choose to encode using lossless compression.
- **Slope-Rate Control:** A checkbox lets you specify lossless compression.
- **QStep:** (DCP, IMF) Lets you choose either automatic or manually specified DCP quantization levels at which to compress the video signal when using the Kakadu JPEG 2000 encoder.
Render settings in the Export Video section for the IMF format

A separate group of parameters named Composition Settings, underneath the Advanced Settings, lets you add metadata to your IMF package, including:

- **Composition name**: The name of the exported composition.
- **Issuer**: The organization providing the composition.
- **Use current date**: A checkbox that lets the current date be used as the Issue date automatically.
- **Issue date**: The date the composition is issued.
- **Content kind**: A drop-down provides a list of acceptable choices for defining the content.
- **Content version label**: Meant to identify the version of the content being provided.
- **Annotate xml using composition name**: Auto-populates Asset Map, Composition Playlist, and Packing List with data from the project. Otherwise these three fields are manually editable.
- **Annotate media using filename**: Auto-populates Main Video Track and Audio Track 1 with data from the project. Otherwise these three fields are manually editable.
Native Unencoded DCP Encoding and Decoding

(Available in DaVinci Resolve Studio Only)

DaVinci Resolve also has native DCP encoding and decoding support built-in, for unencoded DCP files only. That means that you can output and import (for test playback) unencoded DCP files without needing to purchase a license of EasyDCP. If you have a license, a setting in the Configuration panel of the System Preferences enables you to choose whether to use EasyDCP (for creating encrypted DCP output), or the native DaVinci Resolve encoding.

Native DCP Encoding Parameters

When you choose DCP from the Format drop-down menu, the following additional parameters are exposed:

- **Use interop packaging**: (DCP only, located under Type parameter) Lets you create an Interop DCP package, based on an earlier standard of DCP delivery that is not forward compatible with SMPTE DCP packages.
- **Maximum bit rate**: (DCP, IMF) Lets you choose how much to compress the result.
- **Lossless Compression**: (IMF) Lets you choose to encode using lossless compression.
- **Slope-Rate Control**: (DCP, IMF) A checkbox lets you specify lossless compression.
- **QStep**: (DCP, IMF) Lets you choose either automatic or manually specified DCP quantization levels at which to compress the video signal when using the Kakadu JPEG 2000 encoder.

![Native DCP settings in DaVinci Resolve](image)

Native DCP settings in DaVinci Resolve
If you’ve selected DCP from the Format drop-down menu, a Composition Settings group appears with the following parameters when you click the disclosure control, which let you populate standard DCP composition metadata:

- **Composition name**: The name of the exported composition. DCPs use specific naming conventions for the composition name that include metadata about the file itself for DCP projectors and playback equipment. DaVinci Resolve has a tool called the Composition Name Generator to generate these names properly for you; it is accessed by pressing the “Edit” button next to this field. Simply fill out the fields and press OK, and DaVinci Resolve will rename your composition in line with these standards.

  The Composition Name Generator will pass a standards compliant name for you to the Composition Name field.

- **Issuer**: The organization providing the composition.

- **Use current date**: A checkbox that lets the current date be used as the Issue date automatically.

- **Issue date**: The date the composition is issued.

- **Content kind**: A drop-down provides a list of acceptable choices for defining the content.

- **Content version label**: Meant to identify the version of the content being provided.

- **Annotate xml using composition name**: Auto-populates Asset Map, Composition Playlist, and Packing List with data from the project. Otherwise these three fields are manually editable.

- **Annotate reel index as suffix**: Auto-populates Reel Annotation with data from the project. Otherwise this is manually editable.

- **Annotate media using filename**: Auto-populates Main Video Track and Audio Track 1 with data from the project. Otherwise these three fields are manually editable.
Parameters for adding composition metadata

Creating DCP/IMF Supplemental Packages

Once created, DaVinci Resolve has the ability to reimport a DCP or IMF so that you can overwrite parts that need to be updated with new media, in order to export a “Supplemental Package,” which is effectively a new version of the program that combines the new overwritten parts of the program with the old version, such that you can deliver just the changes.

**NOTE:** Supplemental packages are only supported using the Kakadu encoder and decoder; this is not compatible with DCP or IMF packages created using EasyDCP. To avoid issues, disable “Use easyDCP decoder” in the Decode Options panel of the DaVinci Resolve System Preferences.

Importing a DCP or IMF Into a Timeline

1. Using the Media Storage browser in the Media page, find and select the DCP or IMF, and check the header of the Metadata Editor to verify that your media is suitable for creating a supplemental package. Supported IMF profiles will be displayed in the Metadata Viewer.
2 Create a new project and add the DCP/IMF package you need to modify to the Media Pool. If a dialog appears asking if you want to change your timeline frame rate to match the incoming media, click Change to make your project match the media.

3 Create a timeline from the composition playlist (XML) within the imported DCP or IMF by right clicking the imported package in the media pool and choosing “Create New Timeline Using Composition Playlist” from the contextual menu.

Right-clicking an imported IMF or DCP clip in the Media Pool reveals a command to make a new timeline using the composition playlist in the contextual menu.

4 The New Timeline dialog has an “Import Dolby Vision Project Settings” checkbox. When it's turned on, clicking Create will do the following:
   a. Dolby Vision will be enabled in the Color Management panel of the Project Settings, and the Mastering Display menu will be set to match that of the IMF package.
   b. If Resolve Color Management (RCM) is not active, the Timeline Color Space will be set to match the Dolby Vision metadata. However, if RCM is already enabled, the user must manually set this by turning on “Use Separate Color Space and Gamma,” and changing the Timeline settings to P3-D65” and “ST.2084” respectively.

5 Creating the Timeline will import Dolby Vision metadata (if applicable). This will allow a Tone Mapping preview to be seen on the Color page that uses the original metadata.

Once import is complete, all video and audio clips from the DCP or IMF appear within a new bin with the name of the package. The resulting timeline will be identified via its icon as a DCP/IMF timeline.
**Editing the Resulting Timeline**

At this point, you can edit the program in the Timeline as necessary.

- You can overwrite sections of the Timeline with new clips. All modifications will be automatically included into the supplemental package.
- You can use the Blade tool or Insert Edit command to cut sections of the existing program to which you want to add Fusion effects, audio grading, or color correction. When you do this, you must right click that section and choose "Include in Supplemental Package" to make sure it exports correctly.

![Include in Supplemental Package](image)

Right-clicking a section of the program and choosing Include In Supplemental Package

For IMF Dolby Vision packages, please ensure all modifications are on the first video track (V1).

**NOTE:** If RCM is being used, please ensure the input color space and gamma of the inserts are correct.

**Dolby Vision Metadata**

The Dolby Vision metadata from the imported DCP/IMF file can be reused by selecting "Original Metadata" from the Tone Map Using drop-down menu of the Dolby Vision palette in the Color Page

![Original Metadata](image)

Setting a clip to Original Metadata in the Color Page

Alternatively, this metadata can be imported separately from an existing XML via the "Import Metadata from XML" command in the option menu of the Dolby Vision palette in the Color page. When successful, "Imported Metadata" will be enabled.
Exporting

You can export a supplemental package by turning on "Supplemental Package" in the video panel of the Deliver page Render Settings list.

The codec type and profile will be automatically selected to match the original version of the DCP/IMF package, and the audio tracks are set to match the Timeline tracks. Please ensure the rest of these audio settings are matched to the original version, since they start out set to the default values.
Photon Validation of IMF Packages

Photon is Netflix’s validation software for IMF App2/App2e packages. The option for using Photon validation will only be shown on Resolve Studio with JDK/JRE version 1.8 and above installed, which is available at https://github.com/Netflix/photon.

**NOTE:** Please disable “Use easyDCP decoder” from “Preference” as there can be issues decoding IMF packages without an easyDCP license.

Validating in the Media Pool

An existing IMF package can be validated with Photon by importing it into the Media Pool, then right-clicking it and choosing “Perform Photon Validation” from the context menu.

A report dialog will be shown when the validation is completed.

Validating on Export

Photon validation can be enabled in the File panel of the Deliver page Render Settings; choosing the “IMF Netflix” preset will also enable this option. When enabled, DaVinci Resolve will perform Photon validation after the IMF package is exported. The validation report will be saved to a text file in the IMF package folder, and a report dialog will be shown if there is any error.
Enabling Photon validation on export

Using and Licensing EasyDCP

Both DaVinci Resolve and DaVinci Resolve Studio include a demo version of easyDCP. Details of operation and restrictions of the demo version can be found later in this chapter. The fully functional version of easyDCP operates via licensing modules purchased from http://www.easyDCP.com (info@easyDCP.com) and every new DaVinci Resolve system (server) needs its own license and specific certificates for DCP and KDM generation and for playback of DCPs.

Requesting Your Server Certificate Set

For your DaVinci Resolve system to generate DCPs and KDMs you need to request a specific set of configuration files called the Server Certificate Set. To begin, first purchase your encoding, encryption, decoding, and decryption modules from easyDCP. They will provide a password to access your easyDCP account.

Then, from the DaVinci Resolve File menu, select easyDCP > Request Server Certificate Set. Fill in the detail listed on the request form and save the form to your desktop or somewhere it can be easily found. This html file can be emailed to info@easyDCP.com. After sending the html, a customized Server Certificate Set for your installation will be generated and made available for download in your easyDCP Website User Account.
The Server Certificate Set generated for your DaVinci Resolve will contain files based on your purchased modules and your specific DaVinci Resolve server hardware. The table below shows the modules and the licenses and certificates generated, followed by a brief description of each item.

<table>
<thead>
<tr>
<th>Module</th>
<th>License</th>
<th>Server Certificate</th>
<th>Signer Certificate</th>
</tr>

</tr>
<tr>
<td>DCP Player with Encryption</td>
<td>X</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- **License**: The License is used to activate the purchased modules on a specific hardware server.
- **Server Certificate**: Each DCP render (referred in the industry as an “Instance”) using encryption or decryption has an individual server certificate. This certificate is required to be able to receive Key Delivery Messages (KDMs), which unlock encrypted DCPs.
- **Signer Certificate**: A Signer Certificate is used to sign certain files within a DCP package and/or Key Delivery Message (KDM) to verify which authority generated the DCP instance.

### Importing Your Server Certificate Set

Once generated and downloaded to your DaVinci Resolve server, the Server Certificate Set needs to be imported into DaVinci Resolve.

**To import your server certificate:**

1. Choose File > easyDCP > Import License and Certificates.
2. Use the Import Server Certificate dialog to select the file, enter your Certificate Set password, then click Import.
3. To verify your easyDCP license and the Server Certificates, choose easyDCP > About easyDCP.

From this point onward, you can use the controls from within the Settings window, the Deliver page, and the File menu to master and play DCPs.

### Limitations of the Demo Version of easyDCP

The demo version of the DCP encoder embeds visible DaVinci Resolve and easyDCP logo watermarks in the rendered Digital Cinema Package (DCP) images. The demo version does not include encryption so these DCPs can be used for screening in a digital equipped cinema. The demo version of the DCP playback module will play 15 seconds in full quality. After that playback quality reduces drastically. Furthermore, audio won’t be rendered after 15 seconds of playback.
Switching Between Native DCP and EasyDCP Encoding

A checkbox in the Configuration panel of the System Preferences, “Use EasyDCP Encoder,” lets you choose whether to use the native DCP/IMF encoding in DaVinci Resolve, or your licensed EasyDCP software. In either case, all set up happens from within the Deliver page of DaVinci Resolve.

EasyDCP Color Management

The Color Management panel of the Project Settings has a Timeline Colorspace drop-down menu that is enabled for EasyDCP encoding regardless of whether or not DaVinci Resolve Color Management is used for the current project (the same setting is used for both color management tasks). You should set this to the color space used by your current DaVinci Resolve timeline. If, for example, you are grading using a Rec. 709 monitor for television deliverables but also wish to make a DCP, select Rec. 709 Gamma 2.4 and DaVinci Resolve will render the DCP with the correct Rec. 709 to XYZ matrix.

EasyDCP Output in the Deliver Page

To master to a DCP in the Deliver page, use the following procedure, which walks you through all of the easyDCP settings that are available in the Render Settings list.

To master a DCP or IMF:

1. Set “Render timeline as” to Single clip.
2. Choose easyDCP from the Video Format drop-down.
3. Choose the appropriate option from the Codec drop-down that corresponds to the type (DCP or IMF) resolution (2K or 4K), and aspect ratio (native, scope, or flat) of your intended output.
4. Set the Composition Name. This field is intended to hold a standardized name for the DCP being encoded. You can either type a name into this field directly, or you can press the “...” button to open the easyDCP Composition Name Generator window. An editable Film Title field appears, along with a number of drop-down menus that let you select various DCP attributes such as content type, aspect ratio, language of audio and subtitles, and so forth. As you populate each attribute, the name being generated appears at the top of the window, and clicking OK copies the resulting Composition Name into the Composition Name field of the Render Settings.
5. If necessary, set the desired “Maximum DCP bit rate” by either typing or dragging within the field (the range is 50 to 250 Mbit/sec). If you’re not sure what data rate to use, consult the client or distributor to whom you’re delivering the DCP.
There are two DCP package types you can output, determined by the “Use Interop packaging” checkbox:

- The standard package conforms to the “Interop” specifications for DCPs, which is turned on by default. With “Use Interop packaging” turned on, however, the frame rate of your output is limited to either 24fps or 48fps, so you need to make sure that your timeline conforms to these frame rates.

- If you want to generate DCP packages with other frame rates to match your timeline, you need to turn “Use Interop packaging” off to generate a SMPTE-standard DCP. This supports additional frame rates including 25, 30, 50, and 60 fps. However, SMPTE-Standard-DCPs are not supported on all JPEG2000-based playback systems so it’s generally recommended to use the Interop standard unless you know the player supports the SMPTE-Standard DCPs.

Turn on the “Encrypt package” checkbox to encode an encrypted DCP. This sets the encoder to generate a Digest containing the keys used during encryption. This Digest will allow you to play the resulting DCP on your system, and to generate KDMs to allow that DCP to be played on other servers.

**NOTE:** If you do not encrypt the DCP it can be played on any DCP player/decoder without restriction.

Set the Subtitles Path. If you have a properly formatted subtitle file, click the Browse button to link to it.

If you’re including an audio mix in the DCP, go to the Audio section, turn on the Render audio checkbox, and choose the number of channels in the “Render channels of audio” drop-down menu that corresponds to the number of Audio Mixer output channels defined in the Edit page.

Click the Browse button under the “Render to” field, and choose a location for the resulting DCP. Make sure you pick a drive with enough room for the estimated size of the final DCP.

Choose all necessary options from the Output Options to ensure the quality you need.

Click the Add Job to Render Queue button, and then click Start Render to create your DCP. A DCP will be created and placed at the location you chose, ready for playback or delivery.

### KDM Generation and Management

Key Delivery Messages (KDMs) are required to allow an encrypted DCP play on a designated projector at a particular theater at a specified time. DaVinci Resolve is capable of creating KDMs, which is convenient for exporting KDMs for select screenings, but commercial distributors may require thousands of KDMs. Fortunately, easyDCP allows you to use external Distribution KDM (DKDM) utilities to generate KDMs for your clients, so you don’t have to tie up your DaVinci Resolve workstation with this task.
Publishing Your Encrypted Digital Cinema Package

While you can play your encrypted DCP on the same DaVinci Resolve system that generated it, if you wish to publish the DCP so other players can decode and play you need to generate a KDM to send to the player. The user of the other player, or players, will need to generate a Server Certificate for each of their players and send this to you so when you generate the KDM it will be just for those players.

Select the DCP in the Media page Library. Right-click and select Generate KDMs. From the drop-down select the location of the Server Certificate file if the KDM is for one player, or folder for multiple players. Set the start and end dates that the KDM will be valid for, an output folder to place the KDM, and then select Generate.

You can now send your DCP and the KDMs to the player you authorized. The user there will import the KDM and the DCP will play between the start and end dates.

Playing Your Digital Cinema Package

To play a DCP you’ve output from DaVinci Resolve, use the Media page to add it to the Media Pool and edit it into a timeline like any other clip.

Decoding the JPEG2000 images embedded within the DCP in real time is computationally intensive. If your system is underpowered you can reduce the decoded resolution of the files by selecting Half or Quarter Resolution Decode from the File > easyDCP menu. A smaller, less bandwidth-intensive version of the JPEG2000 files will be decoded by discarding some levels of the wavelet stage inside the decoder, which will directly increase the playback performance.

Playing Third-Party Digital Cinema Packages

To play a non-encrypted DCP simply select the DCP in the Media page like any other clip. To play an encrypted DCP from a third party you first must publish your Server Certificate. They use the certificate to generate KDMs for their DCP to play on your DaVinci Resolve system. From the File menu choose easyDCP > Export Server Certificate, and on the drop-down menu choose a location to save the file. Send this to the third party for KDM generation.

When you receive a KDM or a Digest for an encrypted DCP you must first import the file into your DaVinci Resolve system. Choose File > easyDCP menu > Import KDM/Digest, and then select the file. Then simply select the encrypted DCP in the Media Page Library to play.
Chapter 168

Delivering to Tape

This section covers how to use the Deliver page to output a timeline, either in whole or in part, to a device-controllable VTR connected to a compatible Blackmagic Design video interface. For whichever output interface you use, you need to make sure that the RS-422 interface is connected to that of the VTR, and that device control has been established.

The Tape Output Interface

Tape output is accomplished on the Deliver page, which has to be placed in the Tape mode before you can proceed.

To switch to tape output in the Deliver page:
Click the Tape button, which is the third button from the left on the Interface toolbar at the top of DaVinci Resolve. The Deliver page updates to reflect the relevant controls for editing to tape.

While in Edit to Tape mode, the Deliver page is used to control the VTR, in order to establish In and Out points for insert or assemble editing of the selected portion of the current Timeline to tape.

- **Capture and Playout:** The Render Settings panel turns into the Capture and Playout panel, with controls and settings governing how DaVinci Resolve will output your program to tape.
- **Edit to Tape Queue:** The Render Queue turns into the Edit to Tape Queue, which lets you set up a batch of either previously rendered media files, or In and Out point-defined segments of the current Timeline for simultaneous output to tape.
- **Transport controls:** The transport controls, while similar in appearance to those used while in Render mode, now control the VTR. While in Edit to Tape mode, the transport controls of the DaVinci control panel also control the deck, rather than your program.
- **Shuttle control:** A shuttle control appears in what was formerly the jog or scrubber bar, which lets you shuttle through the range of reverse and forward speeds compatible with that deck.
- **In and Out controls:** In Edit to Tape mode, the In and Out buttons to the right of the transport controls define a range of the tape to Insert or Assemble edit to, within the current Timeline. While in Edit to Tape mode, you can still define In and Out points to define a specific range of the Timeline by right-clicking a clip in the Thumbnail or Mini-Timeline, and choosing Mark In or Mark Out. You can only add In or Out points to the beginning and end of clips.
- **Cue In and Cue Out controls:** Buttons next to the timecode In and Out fields cue the tape to those frames on tape.

Gang Timecode to Tape

When the Deliver page is in Tape mode, you can right-click the ruler running along the top of the Timeline and choose “Gang Timecode to Tape,” which puts DaVinci Resolve into a mode where every time you set an In point on the Deliver page Timeline, a corresponding In point is automatically set on the tape deck. Setting both In and Out points on the Deliver page Timeline results in the In and Out points on the tape deck being set at the same timecode, making it easy to set up insert edits to tape on top of a previously output program.
The Gang Timecode to Tape option

Insert/Assemble Drop-down Menu

A drop-down menu under the In and Out buttons lets you choose how to edit the selected part of the Timeline to tape. There are two options:

- **Insert**: Performs an insert edit to tape, in which selected tape tracks are seamlessly and frame-accurately overwritten without interrupting the timecode or control track. You must be outputting to either a blacked tape, or a prerecorded tape to make an insert edit.

- **Assemble**: Performs an assemble edit, in which every track of tape is overwritten, including the video, audio, timecode, and control tracks.

- **Crash**: (Only appears if “Output Source Timecode” has been enabled in the Playout section of the Capture and Playback panel of the Project Settings) Similar to an assemble edit, except there is no pre-roll period to let the VTR get up to speed. A crash edit also overwrites every track of the tape, including the video, audio, timecode, and control tracks, and may result in a more visible jump at the resulting edit point. However, in some instances crash edits may be the only option for a particular operation.

**NOTE:** When DaVinci Resolve is performing a Batch Output operation, you can only output clips using assemble editing or crash recording.

Start Record Button

Once you’ve set In and Out points to define how much of the tape to record to, the Start Record button initiates device-controlled tape output.
Setting Up for Tape Output

Before you perform an edit to tape, the Capture and Playback panel of the Project Settings has a number of options that you should set to match the format and type of tape output you’re doing.

General Options

The Output LTC checkbox, when turned on, directs DaVinci Resolve to output LTC timecode.

Capture and Playout Settings

These settings affect both capture and playback when using the Tape Ingest options of the Media page, or the Tape Output options of the Deliver page.

- **Video capture and playback**: You can choose the video format (frame size and frame rate) with which to output to tape from this drop-down menu. HD timelines can be downconverted to SD, and SD timelines can be upconverted to HD using the format conversion of your DeckLink card.

- **Use left and right eye SDI**: A checkbox that enables supported video interfaces to ingest and output muxed stereoscopic video when used with supported VTRs, such as HDCAM SR decks with 4:2:2 x 2 mode. (When muxed stereoscopic signals are ingested, each eye is separated into individual left-eye and right-eye image files.) This parameter only appears when your hardware is set up appropriately.

- **Video connection operates as**: Selects between the available signal options: Use 4:4:4 SDI, and enable Single Link. Which options are available depend on which video capture card you are using.

- **Data Levels**: Lets you specify the data range (normally scaled or full range) that’s used when ingesting from or outputting to tape. This option switches the data range of the signal output by your video capture card, but only during capture from tape in the Media page, or output to tape in the Deliver page. When capture or output is not currently occurring, your video capture card goes back to using the identically named data range setting in the Master Settings panel of the Project Settings, which governs how you monitor the signal being output on an external broadcast display or projector.

- **Video bit depth**: Choose the bit depth that corresponds to the capability of your deck. You can choose between 8-bit and 10-bit. Outputting to 10-bit is more processor intensive, but higher quality for compatible devices, and is the default setting.

- **Use deck autoedit**: If supported by your video deck, this is the best method to record video to the deck, as it enables the deck to roll the edit using the specified preroll, and control the edits via serial device control. If this checkbox is turned off, a basic edit On/Off mode is used by the deck, with the potential for frame inaccuracies if the “Non auto edit timing” setting is not properly adjusted.

- **Non auto edit timing**: Adjusts the edit synchronization of the connected deck when auto edit is turned off.

- **Deck preroll**: Sets the number of seconds for preroll. How much is appropriate depends on the performance of your deck.

- **Video output sync source**: When using a DeckLink card this is set to Auto. Other capture cards may require you to set the sync source to “Reference” for playout and “Input” for ingest. This setting is only available if you have a DVS card installed on your system.

- **Add 3:2 pulldown**: Inserts or removes the 3:2 pulldown required to record or play 23.98 fps media to or from a 29.97 tape format.
Capture

These settings are used when you use the Capture mode in the Media page to capture clips from tape into the Media Pool. Media is captured as DPX image sequences.

- **Capture**: Lets you choose whether to capture both Video and Audio, or Video Only.
- **Video Format**: The format that scanned film frames are saved as. When capturing from tape, the available options are DPX and QuickTime. When capturing from the Cintel film scanner, this is restricted to Cintel Raw Image (CRI), which is a raw data format that DaVinci Resolve automatically debayers as a Cineon log-encoded image for grading.
- **Codec**: The codec used to write captured media. When capturing from tape, these include the various type of Apple ProRes, 8- and 10-bit YUV 422, 10-bit RGB, and the various types of DNxHD. Cintel Raw Image files default to RGB.
- **Save clips to**: A field that displays the directory path to which media files captured from tape are written. You want to choose a volume that’s fast enough to accommodate the data rate of the media format you’re capturing.
- **Browse**: Click this button to choose a directory to write captured media to. The directory you choose appears in the field above.
- **Save in this folder path**: A series of checkboxes let you specify what other information to use to define the directory hierarchy that will hold the captured media. Every checkbox you turn on adds an additional directory with a name defined by that checkbox’s metadata. You can choose any or all of the following: Program name, Clip number, Reel number, and Roll/Card.
- **Apply reel number to**: Lets you choose how to write the reel name. Two checkboxes let you write the reel number to the file’s name, and/or to the Header data.
- **Use prefix**: A field lets you type in a prefix to be used in the media file’s name. This lets you add text identification that will make the media more easily identifiable and searchable.
- **Apply prefix to**: Two checkboxes let you choose to use the prefix you typed in the file name, and/or in the folder name.
- **Use frame number with**: When capturing to image sequences, you can choose how many digits to use when writing the frame number into the name of each frame file.
- **Set batch ingest handles to**: When capturing to image sequences from a batch list, defines how many frames of additional handles to ingest along with each logged clip.
- **Enable audio input**: Turn this checkbox on to capture audio along with the video. If you’re capturing QuickTime or MXF files, the audio will be written as additional tracks inside each file. If you’re capturing to a DPX image sequence, then a broadcast .wav file is recorded separately.
- **Input**: Lets you choose how many tracks of audio to capture, from 2 to 16.

Playout Settings

These settings only affect the video signal that’s output when you use the Edit to Tape mode of the Deliver page.

- **Output**: Lets you choose whether to output both Video and Audio, Video Only, or Audio Only if you’re doing an audio layback.
- **Output Source Timecode**: Turn this checkbox on to output each individual clip’s source timecode. This option is only applicable when assemble editing to tape.
• **Output LTC**: With a Blackmagic Design DeckLink or UltraStudio device using HD-SDI, longitudinal timecode (LTC) is available on track 16 of the HD-SDI video signal, making it easy to use a Mini Converter de-embedder to extract this analog timecode audio signal and feed it directly to a recording device. This is particularly helpful if you have outboard video processing equipment such as a noise reducer or format converter that does not pass through the VITC timecode.

• **Delay LTC by x frames**: When outputting LTC to bypass outboard processing gear, such as a noise reducer or format converter, you can compensate for the processing delay by delaying the timecode by a matter of frames to ensure that the processed image and timecode reach the deck at the same time. With a DVS card there is a separate timecode output.

• **Enable audio output**: When this checkbox is enabled, DaVinci Resolve will play all available timeline audio along with the video being output, so both can be recorded to tape.

• **Offset audio by x frames**: Lets you specify an offset between the audio track and video to achieve proper A/V sync in cases where the video is being delayed by outboard processing hardware.

• **Output x channels of audio**: Choose the number of audio tracks to output to tape.

• **Set batch playout head handle to x seconds**: When batch outputting multiple clips, you can specify a number of frames before the In point of each clip to be output as well.

• **Set batch playout tail handle to x seconds**: When batch outputting multiple clips, you can specify a number of frames after the Out point of each clip to be output as well.

• **Apply gaps between clips**: This checkbox lets you add a black gap, of the specified duration in frames, between every two clips being output when outputting in batch mode.

---

**Edit to Tape Queue Option Menu Settings**

The following settings and options are available in the Option menu found at the top right-hand corner of the Edit to Tape Queue.

• **Show Job Details**: Lets you see more information about each job listed in the Render Queue.

• **Clear Recorded**: Clears all queue items that have already been output to tape.

• **Clear All**: Clears every queue item.

• **Sort by Reel & Timecode**: Does a multi-criteria sort by reel and timecode, reel first, then timecode.

• **Sort by Timecode**: Sorts by timecode only.

• **Output Source Timecode**: Sets tape output to write source timecode to tape (each clip’s individual timecode), rather than record timecode (from the Timeline).

• **Use Preview for Tape Output**: Enables Preview mode when outputting to tape. Preview mode lets you test how an edit to tape operation will work before actually recording it.
Tape Output Procedures

There are a few different ways you can output media to tape, depending on what you need to accomplish, and on how intensive your grades are relative to the processing capabilities of your workstation.

Power Mastering

Power Mastering allows you to select either a range of clips, or an entire timeline, to be output to tape in real time, without rendering. This can save you from a time-consuming render, and it also saves disk space. Power Mastering is a no-compromise procedure, since your program is still output at full quality.

If there are a handful of clips with grades that you know are too processor-intensive to be Power Mastered, you can use the Render Cache controls to cache the problem clips before output. For more information, see Chapter 6, “Improving Performance, Proxies, and the Render Cache.”

Outputting a Program From the Timeline

The simplest method of outputting to tape is to output a single Timeline, either in its entirety, or in part if you’re insert editing a small section that has been revised.

To Power Master to tape:

1. Use the Render Cache, if necessary, to cache any clips that are too processor-intensive to output in real time.
2. Click the Edit to Tape mode button to the left of the transport controls to switch to tape output.
3. Define how much of the current Timeline to output by moving the playhead throughout the program, and then right-clicking clips that define the beginning and end of the range you need to output and using the Mark In and Mark Out commands.
4. Use the transport controls to find the In point on tape at which you want to start recording, and click the In button.
5. Choose Insert from the drop-down menu at the upper right-hand side of the Viewer, if you’re either outputting to a striped and blacked tape, or inserting over an existing program on tape.
6. Click the Power Mastering (lightning bolt) button at the bottom of the tape settings to add the job you’ve just set up to the Edit to Tape Queue.
7. Click Start Record to begin the process of outputting to tape. Device control is used to record to the designated section of tape; a progress bar appears at the bottom of the Render Queue to show how long this will take.

If you don’t want to Power Master, you can render the section of the Timeline you need to output as a single clip first, as a self-contained media file, and then add that clip directly to the Edit to Tape Queue. This might be an easier solution if you’re outputting an extremely processor-intensive timeline.
To output a pre-rendered media file to tape:

1. Click the Add Clips button at the bottom of the tape settings, and use the VTR Record dialog to select the media file you rendered in step 1, and click Add Clip(s) to Queue. The media file you selected is added to the Edit to Tape Queue as a Power Mastering job, and will be output in its entirety.

2. Use the transport controls to find the In point on the tape at which you want to start recording, and click the In button.

3. Choose Insert from the drop-down menu at the upper right-hand side of the Viewer, if you’re either outputting to a striped and blacked tape, or inserting over an existing program on tape.

4. To preview what the edit will look like before actually writing it to tape, choose “Use Preview for Tape Output” from the Edit to Tape queue option-menu, and then click Start Record to watch DaVinci Resolve run through the edit using the deck. After previewing the edit, turn this setting off.

5. Click Start Record to begin the process of outputting to tape. Device control is used to record to the designated section of tape; a progress bar appears at the bottom of the Render Queue to show how long this will take.

Batch Outputting Multiple Clips

You also have the option of outputting a number of clips to tape in a batch operation, as opposed to outputting from the Timeline. When you set up a batch of multiple clips in the Edit to Tape Queue, then DaVinci Resolve will automatically record them sequentially to tape.

How the timecode is generated during batch output depends on the “Output Source Timecode” setting in the Capture and Playback panel of the Project Settings. If this is turned off, then a continuous timecode track will be written to cover everything being output to tape. If this is turned on, then each clip’s source timecode will be written to tape discontinuously.

When batch outputting to tape, you can add black handles to each of the clips to space them out, making later ingest easier, using the “Set batch playout head/tail handle” settings in the Capture and Playback panel of the Project Settings.

To make a Batch Record multiple clips to tape:

1. Use the transport controls to find the In point on tape at which you want to start recording, and click the In button.

2. Do one of the following to add items to output to the Edit to Tape Queue:
   - Click the Add Clips button at the bottom of the tape settings, and choose one or more media files from the VTR Record browser, and click Add Clip(s) to Queue.
   - Right-click any clip in the Timeline, choose Render This Clip, and then click the Power Mastering button at the bottom of the tape settings to add that clip to the Queue.

3. Choose either Assemble or Crash from the drop-down menu at the upper right-hand side of the Viewer. Because you’re outputting clips with discontinuous timecode, you cannot insert edit when batch outputting.

4. Once you’ve added all the clips you want to output to the queue, click Start Record to begin outputting to tape. Device control is used to record to the designated section of tape, a progress bar appears at the bottom of the Render Queue to show how long this will take.
Chapter 169

Exporting Timelines and Metadata

Once you’ve completed editing and grading a program, you may need to export your final graded timeline as EDL, AAF, or XML files in order to send it to another application for further finishing, effects work, or to complete a round trip from an NLE.

To send a graded project to another application, you need to render the graded clips first using the controls on the Deliver page to render the Timeline as individual source clips. In this mode, the reel name and timecode metadata of each rendered clip is mirrored by the exported project file, to maintain the correlation between exported EDL, XML, or AAF data and the rendered media. For detailed information about rendering in the Deliver page, see Chapter 166, “Rendering Media.”

If you render using the Easy Setups that correspond to Final Cut Pro XML or Avid AAF round trips, then an XML or AAF will be exported to the same directory you’ve rendered to. However, you can still export an XML, AAF, or EDL file separately should the need arise.

Alternately, if you’ve edited a project from scratch in DaVinci Resolve and need to move a timeline to another application, you can export any timeline to any format for purposes of project exchange, without the need to render new media (depending on your workflow).

Even in situations where you’ve imported a timeline from another application, the robust project compatibility of DaVinci Resolve makes it possible to import one type of project exchange file, such as XML, and then export a completely different kind, such as AAF or EDL. This lets you use DaVinci Resolve as a project exchange utility.

Exporting to AAF/XML

Whether you’ve edited your project from scratch inside of DaVinci Resolve, or you’re doing a round trip with an application that uses AAF, Final Cut Pro 7 XML, or Final Cut X XML project exchange formats, you can export any DaVinci Resolve timeline in the Edit page to any project format DaVinci Resolve supports. Whatever your workflow, keep the following in mind:

- **Timelines are automatically exported when you render a timeline in the Deliver page:** When you use the “Final Cut Pro Round-Trip” or “Avid AAF Round-Trip” render setting presets, or a preset created from one of them, a corresponding XML or AAF file is automatically exported along with the media you render.

- **Even if you’ve imported a project from another application, you can re-edit imported projects before export:** If necessary, you can freely re-edit projects you’re planning to export. When you export an AAF or XML file, the Timeline will be sent back to the originating NLE, or onward to the finishing application of choice.

- **Unsupported effects are sometimes preserved in Round Trip workflows:** If there were effects or clip constructs in the original sequence that were not compatible with DaVinci Resolve, how those effects will be handled depends on the project format you’re exporting to, and whether or not you’ve edited the project. For XML projects, unsupported effects are saved internally by DaVinci Resolve, and are exported with the XML file that you output no matter what. Consequently, they should reappear when you reopen the exported file in the originating NLE. For AAF projects, you can export unsupported effects as long as you don’t re-edit the project. However, if you do re-edit the project, then you can only export an AAF file that’s been stripped of all unsupported effects.

- **Project formats can be converted to other formats:** Using DaVinci’s Export commands, compatible project formats can be converted from one format to another. For example, an imported EDL can be output as Final Cut Pro X XML. For that matter, Final Cut Pro 7 XML can be imported and then exported as Final Cut X XML. Or, an AAF file from Media Composer can be imported and then exported as a Final Cut Pro XML file to be opened in any NLE or finishing application compatible with that format, such as Premiere Pro or Smoke.

**To export an AAF or XML file after you’ve rendered the graded clips:**

Do one of the following:

1. **To export the current Timeline, choose File > Export AAF, XML, or press Shift-Command-O.**
   - Open the Edit page, right-click the Timeline you want to export in the Media Pool, and choose Timelines > Export > AAF/XML.
   - When the Export XML dialog appears, type a name for the file and choose a location for the exported XML file, then click Save.

2. **An XML version of that timeline is saved, complete with references to the graded media you rendered, and is ready for import into an NLE or finishing application.**
More About Exporting to AAF

When you export to AAF, there are actually two options that are available to you, depending on whether you made editorial changes to the Timeline in the Edit page:

- **If you didn’t make any editing changes to the Timeline you imported:** You can choose File > Export AAF, XML, and choose “AAF Files” from the Format drop-down menu. This exports all audio and effects using data from the original AAF file that was exported from Media Composer, regardless of whether or not they’re supported in DaVinci Resolve. When you export an unedited AAF, DaVinci Resolve uses the Avid AAF file that you originally imported to create an updated one; make sure it’s still in the same location as it was when you first imported it into DaVinci Resolve.

- **If you made editing changes to the Timeline you imported, or you’re exporting a project that wasn’t AAF to begin with:** Then you need to right-click the Timeline you want to export in the Media Pool and choose Timelines > Export > Generate New AAF. This option creates a brand new AAF file, but audio and effects that are not supported in DaVinci Resolve in an AAF import are discarded.

Exporting an EDL

DaVinci Resolve is also capable of exporting EDLs that can be reimported into other applications. For more information about EDL workflows, see Chapter 16, “Ingesting From Tape,” Chapter 47, “Conforming and Relinking Clips,” and Chapter 51, “Conforming EDL Files.”

**To export an EDL:**

1. Open the Edit page and select the Timeline you want to export an EDL from in the Media Pool.
2. Exported EDLs only have a single video track. For timelines with multiple tracks, only the events on the video track with the destination control assigned to it will be exported (the destination control is the first control at the left in the track header). If you want to export a track other than Video 1, you can assign the destination control to the specific track you need to export.
3. Right-click the Timeline in the Media Pool, and choose Timelines > Export > AAF/XML/EDL from the contextual menu.
4. When the Export Timeline dialog appears, type a name, choose a location for the exported EDL, and choose EDL Files from the drop-down menu at the bottom, then click Save. An EDL is exported.
Exporting a Missing Clips EDL

This command lets you export a quick report listing all clips that are offline in the currently selected track of the Timeline in the Edit page. This report is in EDL format, with one event for each clip that’s offline, which describes the reel number and source timecode of the missing media, as well as the record timecode of the missing media’s position on the Timeline.

Here’s an example of an exported Missing Clips EDL:

```
TITLE: ( no title )
1  A001_C002_0820GA_001  V  C  10:28:27:03  10:28:28:00  01:00:00:00  01:00:00:21
2  A004_C012_0820MC_001  V  C  14:07:31:21  14:07:35:13  01:00:12:13  01:00:16:05
3  A017_C001_0820CV_001  V  C  21:16:14:22  21:16:15:00  01:00:16:05  01:00:16:07
```

Once you’ve exported this information, you can hand it off to whomever can help you track down the missing media.

To export a Missing Clips EDL:

1. Open the Edit page and open the Timeline you want to export a Missing Clips EDL for in the Timeline browser.
2. For timelines with multiple tracks, only the events on the video track with the destination control assigned to it will be examined for missing clips. If you want to examine a track other than Video 1, you can assign the destination control to the specific track you need to examine for missing clips.
3. Right-click the Timeline in the Media Pool, and choose Timelines > Export > Missing Clips EDL from the contextual menu.
4. When the Save Missing Clips EDL dialog appears, type a name and choose a location for the exported EDL, then click Save.

Exporting Timeline Markers to EDL

If you keep notes about a project within the notes field of Timeline markers, found in the Timeline ruler, then it’s possible to export those notes as an EDL.

To export timeline markers as an EDL:

1. Right-click that timeline in the Media Pool, and choose Timelines > Export > Timeline Markers to EDL.
2. Choose a location and export format from the Export Edit Index dialog, and click Save. Each Timeline marker is listed in the resulting EDL, with any notes included along with a duration, where applicable.
Exporting to CDL

DaVinci Resolve can export and import basic grading data to and from other applications via a Color Decision List (CDL). CDLs are an industry-standard file format originally developed by the American Society of Cinematographers’ technology committee. DaVinci Resolve supports the 1.2 CDL standard that defines the slope, offset, and power for each of the red, green, and blue channels, as well as the overall saturation of each clip in a program.

CDL files are formatted similarly to EDLs, with SOP (Slope/Offset/Power), and SAT (Saturation) values embedded as metadata in much the same way as comments are in a more typical EDL.

Here’s an example of a single CDL event:

```
020 001 V C 03:02:49:13 03:02:53:00 01:01:28:11 01:01:31:22
*ASC_SOP (1.109563 1.717648 0.866061)(-0.238880 -0.390357 0.353743)
(0.672948 1.384022 0.889876)
*ASC_SAT 1.000000
```

Because the CDL definition of a grade is so narrow, projects you’re planning to export to other applications via a CDL must be constrained to only those operations the CDL mathematically defines. Here are some things to keep in mind:

- Only primary corrections in the first node of each clip are exported.
- Restrict yourself to using the Lift/Gamma/Gain, Offset, and Saturation controls.
- Keyframes are never exported. If keyframes are present in a grade, only the parameter values at the first frame of the clip are used.
- The track grade and group grades are completely ignored.
- If there is an HSL Qualifier or a Power Window in the first node, it is ignored and the corrections in that node are exported as if it were a primary correction.
- Do not make Y’ only adjustments; they’re not compatible with CDLs. To ensure that your exported CDL is accurate, set the Lum Mix parameter in the Primary Controls palette for each grade to 0. For workflows involving frequent CDL export, you can turn on the “Luminance Mixer defaults to zero” option in the Color section of the General Options panel of the Project Settings to guarantee this parameter is always set to 0.

If your timeline conforms to all of these restrictions, then you’re ready to export a CDL.

To export a CDL:

1. Open the Edit page, right-click the Timeline you want to export in the Media Pool, and choose Timelines > Export > CDL from the contextual menu.

2. Enter a name for the CDL, choose a location to save it to, and click OK.

For more information on importing a CDL to add grades to your project, see Chapter 123, “Copying and Importing Grades Using ColorTrace.”
Exporting the Edit Index as a CSV or TXT File

You can export the current contents of the Edit Index, in the Edit page, as a self-contained file to use for reference in a variety of ways.

To export the Edit Index:

1. Open the Edit Index, and choose one of the Edit Index filters from the Edit Index option menu, if necessary. For example, you could filter the edit index by Offline Clips Only if you wanted to export a list of all offline clips in the current timeline.

2. Right-click that timeline in the Media Pool, and choose Timelines > Export > Edit Index, then choose a location and export format from the Export Edit Index dialog, and click Save.

Exporting to ALE

DaVinci Resolve is also capable of exporting ALE (Avid Log Exchange) files. ALE is a tab-delimited, ASCII text-based clip logging list format that enables the exchange of clip metadata that can't be embedded inside MXF files. ALE files are designed to let you export a log of all clips that are used in a particular timeline with all of the metadata that's associated with those clips in DaVinci Resolve, so this metadata can be imported into and associated with clips inside Media Composer or Symphony.

ALE files are divided into three sections, labeled Heading, Column, and Data:

- The Heading provides information about the clips being logged, including the picture and audio format, and the frame rate.
- The Column line defines each of the columns of metadata being exported in the list. There's an automatic minimum of metadata columns that are automatically included, regardless of whether they're populated or not. However, additional metadata columns are automatically added to this list by DaVinci Resolve when any corresponding metadata field in the Metadata Editor is populated. For example, if you enter information into the Camera, Keyword, and Shot fields of the Metadata Editor, then those columns will be added to the exported ALE. There are no user settings that control this.
- The Data section contains multiple lines, one for each event being referenced in the list, that contain all the data corresponding to that clip.

If you're exporting stereoscopic clips from stereoscopic timelines, the following additional columns of metadata are automatically included in the two ALE files that are generated:

- Pan (relative to timeline resolution)
- Tilt (relative to timeline resolution)
- Zoom
- Rotate
- Convergence (relative to timeline resolution)
- HFlip (0 or 1)
- VFlip (0 or 1)
If you’re exporting ALE files from projects using ARRIRAW clips, the following additional columns of metadata can be included:

- Temperature
- Tint

**To export an ALE file:**

1. Open the Edit page, right-click the Timeline you want to export in the Media Pool, and choose Timelines > Export > ALE from the contextual menu.

2. Enter a name for the ALE file, choose a location to save it to, and click OK.

The ALE file is saved, and a dialog appears reminding you of the file path to which it was saved (click OK to dismiss it).

**Here’s an example of a short ALE export:**

<table>

</tr>
</tbody>
</table>

**NOTE:** The commas shown above are not normally in the ALE but shown here for field clarity.
To export an ALE file:
1. Open the Edit page, right-click the Timeline you want to export in the Media Pool, and choose Timelines > Export > ALE from the contextual menu.
2. Enter a name for the ALE, choose a location to save it to, and click OK.

Exporting to ALE with CDL

Avid Media Composer and Symphony also support the import of ALE files with additional CDL metadata columns with which to associate SOP (Slope/Offset/Power) and SAT (Saturation) adjustment metadata to each clip that’s logged in the ALE.

When you import an ALE with CDL file into Media Composer, the SOP and SAT data populate metadata columns for preservation and export in various Avid workflows. Here’s an example of the Heading, Column, and Data sections of a sample ALE with CDL, with one line of clip and CDL data.

To export an ALE with CDL file:
1. Open the Edit page, right-click the Timeline you want to export in the Media Pool, and choose Timelines > Export > ALE and CDL from the contextual menu.
2. Enter a name for the ALE file, choose a location to save it to, and click OK.

The ALE file is saved, and a dialog appears reminding you of the file path to which it was saved (click OK to dismiss it).

Here’s an example of a short ALE with CDL export:

<table>
<thead>
<tr>
<th>Heading</th>
</tr>
</thead>
<tbody>
<tr>
<td>FIELD_DELIM</td>

</tr>
</tbody>
</table>

NOTE: The commas shown above are not normally in the ALE but shown here for field clarity.
Exporting Timeline Markers to EDL

This command lets you export a quick report listing the text of all markers that have been added to the Timeline as notes in an EDL. Clip markers are ignored. This report is in EDL format, with one event for each Timeline marker, with a placeholder reel number (001 by default), and source and record timecodes that correspond to each marker’s position in the Timeline (with a duration of one frame). An EDL note for each event lists the Marker note, if there is one. There is no note available for the color of the markers.

Here’s an example of an exported Timeline Marker EDL:

```
TITLE:  ( no title )
001  001 V C 01:00:09:09 01:00:09:10 01:00:09:09 01:00:09:10
Replace with another car door sound effect
002  001 V C 01:00:20:12 01:00:20:13 01:00:20:12 01:00:20:13
Trim this clip shorter
003  001 V C 01:00:30:12 01:00:30:13 01:00:30:12 01:00:30:13
Find another stock footage clip of the bridge
004  001 V C 01:00:30:13 01:00:30:14 01:00:30:13 01:00:30:14
Trim this montage three seconds shorter
```

Exporting and Importing Media Pool Metadata

DaVinci Resolve makes it possible to export metadata from the Media Pool of one project for import into the clips of another project, for instances where you need to move metadata around. This process exports all metadata from the Media Pool as a .csv file.

For example, a DIT might have entered a lot of metadata to the DaVinci Resolve project used for generating dailies, but then an impatient editor might have created a separate project to begin editing those dailies. Instead of requiring the editor to enter each clip’s metadata all over again, you can export the metadata from the DIT’s project and import it into the editor’s new project, automatically matching the relevant metadata to each corresponding clip.

To export Media Pool metadata:

1. Open a project containing Media Pool metadata you want to export.
2. Optionally, select which clips in the Media Pool you want to export metadata for.
3. Choose File > Export Metadata From > Media Pool to export metadata from every clip in the Media Pool, or choose File > Export Metadata From > Selected Clips to only export metadata from clips you selected in step 2.
4. When the Export Metadata dialog appears, enter a name and choose a location for the file to be written, then click Save. All metadata is exported into a .csv file that can be viewed and/or edited in any spreadsheet application.
To import Media Pool metadata:

1. Open a project containing clips you want to populate with imported metadata.
2. Optionally, select which clips in the Media Pool you want to import metadata to.
3. Choose File > Import Metadata To > Media Pool to import metadata to potentially every clip in the Media Pool, or choose File > Import Metadata To > Selected Clips to only import metadata to clips you selected in step 2.
4. When the Import Metadata dialog appears, choose a metadata .csv file to import, and click Open.
5. When the Metadata Import dialog appears, choose the Import Options you want to use to match the .csv file’s metadata to the correct clips in the currently open project. By default, DaVinci Resolve tries to use “Match using filename” and “Match using clip start and end Timecode” to match each line of metadata in the .csv file with a clip in the Media Pool, but there are other options you can use such as ignoring file extensions, using Reel Name, and using source file paths.
6. Next, choose which Merge Option you want to use in the Metadata Import dialog. There are three options:
   - **Only update metadata items with entries in the source file:** The default setting. Only updates a clip’s metadata if there’s a valid entry in the imported .csv file. Other clip metadata fields are left as they were before the import.
   - **Update all metadata fields available in the source file:** For each clip that corresponds to a line of metadata in the imported .csv file, every single metadata field referenced by the .csv file is overwritten, regardless of whether or not there’s a valid entry for that field.
   - **Update all metadata fields available in the source file and clear others:** For each clip that corresponds to a line of metadata in the imported .csv file, every single metadata field referenced by the .csv file is overwritten, regardless of whether or not there’s a valid entry for that field. Furthermore, metadata fields that aren’t referenced by the imported .csv file are cleared of whatever metadata was there before.
7. The Metadata Import dialog that lets you choose options for how to match and merge imported metadata
8. When you’re finished choosing options, click Ok and all available metadata from the source .csv file will be imported.
PART 14
Advanced Workflows
Chapter 170

Frame.io Integration

DaVinci Resolve has sophisticated integration with Frame.io, a video review and collaboration service designed specifically for the postproduction industry. This integration consists of the ability to render and upload directly to Frame.io, maintain sync between Frame.io comments and timeline markers, and import media from Frame.io directly into the Media Pool.
Contents

Enabling Frame.io Integration in Preferences 3495
Deliver and Upload to Frame.io 3495
Frame.io Comments Sync with Timeline Markers 3496
Importing Media from Frame.io 3498
Linking Media Pool Clips and Timelines with Frame.io Clips 3498
Enabling Frame.io Integration in Preferences

An Internet Accounts panel in the System tab of the DaVinci Resolve Preferences lets you sign into your Frame.io account and specify a local cache location for media being synced with Frame.io. You’ll need to enter your login name and password to enable Frame.io integration, but once entered, DaVinci Resolve will sign in automatically when DaVinci Resolve opens.

The local cache location is used to store clips you import into a DaVinci Resolve project from the Frame.io volume in the Media Storage panel of the Media page.

Deliver and Upload to Frame.io

A Frame.io preset at the top of the Deliver page’s Render Settings panel lets you render and upload a program for review. All options in the Render Settings panel update to present suitable controls for this process.
When you choose the Frame.io preset, the Location field turns into an Upload To field, and the Browse button lets you choose a project and folder path to which to upload the exported result.

Choosing a Frame.io account to deliver a program to

When you export to Frame.io, the available choices in the Resolution, Format, Video Codec, and Type pop-up menus are limited to those that are most suitable for Frame.io file sharing. Choose the desired export options, then click the Add to Render Queue button to add this job to the Render Queue as you would with any other export. When that job is rendered, it automatically proceeds to upload to Frame.io, and an upload percentage indicator appears in the job listing to show how far along this upload is. When it's finished, the job displays the text “Upload completed.”

This upload is done in the background, so you can continue working on other things in DaVinci Resolve while the file uploads. If you want to see how long the upload will take on any other page, you can choose Workspace > Background Activity to see the Background Activity window.

Frame.io Comments Sync with Timeline Markers

When you render a timeline directly to Frame.io, that timeline is automatically linked to the movie that's been uploaded to Frame.io, and all comments, "Likes," and graphical annotations (drawings and arrows) from reviewers that are added online via the Frame.io interface are automatically synced to Frame.io markers on your timeline (so long as your computer has an active internet connection). Frame.io markers are distinct from all other markers and can be independently shown and hidden, or deleted.
Drawings and arrows from Frame.io are converted into their equivalent DaVinci Resolve annotation graphics for visibility in DaVinci Resolve.

Comments and graphical annotations from Frame.io appear as markers with their corresponding overlays in your DaVinci Resolve Timeline.

**Working With Frame.io Markers**

Double-clicking any Frame.io marker in the Timeline opens a dialog that lets you send replies to comments that appear on Frame.io, enabling editors to respond directly to commenters.

You can also place Frame.io markers on the Timeline to have them automatically sync back to Frame.io, giving you the ability to send your own comments back to commenters (be kind).

If you delete one or more Frame.io markers on the DaVinci Resolve timeline, those markers will also be deleted in Frame.io. This includes the Mark > Delete All Markers > Frame.io command. This is not undoable.
Importing Media from Frame.io

A Frame.io volume appears in the Media Storage panel of the Media page that lets you access the media available from your Frame.io account. Within this Frame.io volume, a top-level directory represents your account directory, and within that each project you've created in Frame.io appears as a sub-directory.

Any media files that can be accessed in Media Storage can be imported into the Media Pool via the usual methods. Once added to the Media Pool, that media file downloads in the background to the specified local cache location, but it's immediately available via your internet link until the download is complete, so you can begin working immediately. If you want to see how long the download will take, you can choose Workspace > Background Activity to see the Background Activity window.

Linking Media Pool Clips and Timelines with Frame.io Clips

You can also use Frame.io accessibility in the Media Storage panel of the Media page to link clips or timelines with media that's already uploaded to your Frame.io account. Just locate and select a Frame.io clip in Media Storage, then right-click the clip or timeline you want to link it to in the Media Pool and choose Link to Frame.io Media from the contextual menu.

If you've linked a Frame.io clip to a timeline, comments made on that Frame.io clip appear on the linked timeline as Frame.io markers, just as if you'd exported that timeline directly to Frame.io.
The Color page has another mode available to aid you in using DaVinci Resolve in on-set grading workflows. Turning the Resolve Live option on puts DaVinci Resolve into a live grading mode, in which an incoming video signal from a camera can be monitored and graded during a shoot.

More About Resolve Live

Resolve Live has been designed to let you use all of the features of DaVinci Resolve to grade these on-set video previews, in the process saving video snapshots that contain a captured image, your grade, and reference timecode from the camera. The idea is that, using Resolve Live, you can work with the cinematographer to develop looks and test lighting schemes on the footage being captured during the shoot, and then later you can use those looks to build dailies, and as a starting point for the final grade once the edit has been completed.

Additionally, you can use Resolve Live in conjunction with other Color page features such as the Alpha output to build test composites to check green screen shots, comparing them against imported background images in order to aid camera positioning and lighting adjustments. The built-in video scopes can also be used to monitor the signal levels of incoming video. Finally, you can use 1D and 3D LUTs to monitor and grade log-encoded media coming off the camera.

Configuring Your System for Resolve Live

Setting up Resolve Live is straightforward. Whether you’re using a tower workstation or a laptop, any of the Blackmagic Design DeckLink or UltraStudio video interfaces can be used to connect your DaVinci Resolve workstation to a camera and external video display. The important thing to keep in mind is that, if you want to connect to a live incoming signal and output that signal for monitoring at the same time, you need to either use two separate DeckLink PCIe cards or UltraStudio Thunderbolt interfaces, or a single DeckLink Duo or DeckLink Studio card with multiple separate inputs and outputs on a single PCIe card.

The Video and Audio I/O panel of the System Preferences provides two sets of options for configuring video interfaces connected to your computer, one for capture and playback, and one for Resolve Live input. If you only have a single video interface, you can only do one or the other. If you have two interfaces, then you can use these options to use one interface for playback, and the other interface for Resolve Live.

During the shoot, the digital cinema camera in use needs to be connected to your DaVinci Resolve workstation via HD-SDI, which must be configured to carry both the video image and timecode that mirrors the timecode being written to each recorded clip. Most cameras allow timecode output over HD-SDI, and both DeckLink and UltraStudio interfaces can pass this timecode to DaVinci Resolve. Without a proper timecode reference, you won’t be able to take the shortcut of automatically syncing your saved Snapshots to recorded camera original media using ColorTrace, although you can always apply grades manually.
Grading Live

Once your camera and computer are appropriately connected and configured, using Resolve Live is straightforward. This section describes the live grading workflow as it was designed to be used. Once you’re familiar with the capabilities of Resolve Live, you may find your own ways of working that are more in tune to the needs of your particular project.

Getting Started

When working with Resolve Live on a new shoot, you should begin with an empty project and a new empty timeline, since the live grading workflow involves capturing live graded snapshots to an otherwise unoccupied timeline. One recommended way of organizing the live grades of a shoot is to create one new project per day of shooting. This way, snapshots captured during shoots using all 24 hours of time-of-day timecode won’t conflict with one another. Also, separate projects can make it easier to use ColorTrace to copy grades from your live grade snapshots to the camera original media you’ll be creating dailies from, eventually.

TIP: Having an empty Media Pool and timeline doesn’t mean you can’t install useful LUTs and pre-import reference stills and saved grades to the Gallery, as these can be valuable tools for expediting your on-set grading.

Once you’ve created your new project, you also need to choose the disk where all snapshots you take will be saved. By default, snapshots are saved on the scratch disk at the top of the Scratch Disks list in the Media Storage panel of the System Preferences. They’re automatically saved in a folder named identically to the current project.

Going Live

Once you’ve created your day’s project, you need to turn on Resolve Live to begin work.

To turn on Resolve Live:

1. Open the Color page.
2. Choose Color > Resolve Live (Command-R).

A red Resolve Live badge at the top of the Viewer indicates that Resolve Live is turned on, and the transport controls are replaced by the Freeze and Snapshot buttons.
At this point, the video from the connected camera should become visible within the Viewer, the camera timecode should be displayed in the Viewer’s timecode window, and you can begin using all of the capabilities of the Color page to begin grading whatever is onscreen, including Gallery split-screens for matching and comparing. The current color adjustments in all palettes are automatically applied to both the image in the Viewer and the video output to an external display (if there is one).

While Resolve Live is on, much of DaVinci Resolve’s non-grading functionality is disabled, so when you’re finished, be sure to turn Resolve Live off.

To turn off Resolve Live, do one of the following:
- Click the Exit button at the bottom left-hand corner of the Viewer.
- Choose Color > Resolve Live (Command-R).

Using Freeze

In Resolve Live mode, the Freeze button (it looks like a snowflake) freezes the current incoming video frame, so you can grade it without being distracted by motion occurring during the shoot. When you’ve made the adjustment you need, you can unfreeze playback in preparation for grabbing a snapshot.

To freeze incoming video:
- Click the Freeze button (that looks like a snowflake).
- Choose Color > Resolve Live Freeze (Shift-Command-R).

Using Snapshot

Once you’re happy with a grade, clicking the Snapshot button saves a snapshot of the current still in the Viewer, the incoming timecode value, and your grade into the Timeline. Snapshots are simply one-frame clips. They use grades and versions just like any other clip. In fact, ultimately there’s no difference between the timeline created by a Resolve Live session and any other timeline, other than that the Resolve Live timeline only has a series of one frame clips, which appear in the Timeline of the Edit page as a series of 1-frame stills.

To save a snapshot, do one of the following:
- Click the snapshot button (with a camera icon).
- Choose Color > Resolve Live Snapshot (Command-Option-R).
For example, you may begin the process of building and refining a grade for a particular scene during an unrecorded run-through. Then, once shooting starts, you may take snapshots of each shot’s slate, and then of significant takes that follow, tweaking where necessary and in conjunction with the DP’s feedback once things get going. New camera setups may require further tweaks, which you’ll save as snapshots for those shots, and as you work in this way you’ll find yourself building up a timeline of snapshots that correspond to that day’s shoot.

As you work, keep in mind that you must temporarily turn Resolve Live off in order to open a grade from a previous snapshot in the Timeline, in order to use it as a starting point for another shot. You can also save grades into the Gallery.

Using Resolve Live Grades Later

Since each Snapshot you capture during a Resolve Live session contains timecode that was captured from the camera, grades from snapshots with timecode that overlaps recorded camera original media can be synced using ColorTrace when the time comes to start making dailies.

Keep in mind that snapshot grades correspond to the monitored output of the camera during the shoot. If you shot using a raw format, you’ll need to use whatever in-camera debayering settings were used for monitoring during the shoot if you want the grades from your snapshots to produce the same result.

For more information on using ColorTrace, see Chapter 129, “Copying and Importing Grades Using ColorTrace.”

Using LUTs in Resolve Live Workflows

Many on-set workflows use Lookup Tables (LUTs) to calibrate displays, normalize log-encoded media for monitoring, and preview looks in the video village to test how the current lighting scheme will work with the intended grade. You can apply LUTs using the Lookup Tables section of the Project Setting’s Color Management panel, or within a grade as part of a node tree.

However, you can also export LUTs, if necessary for monitor previewing, that you can apply by loading them into a compatible LUT box of some kind, connected in-between the camera’s video output and a display, or using a display capable of loading LUTs internally.

If you’re exporting LUTs using the Generate 3D LUT command of the Thumbnail timeline’s contextual menu, you should limit yourself to using only Primaries palette and Custom Curves palette controls within a single node. These are the only grading controls that can be mathematically converted into a LUT.

When exporting a LUT, any nodes that use Windows or OpenFX will be ignored along with all corrections made within these nodes. All other nodes with Primaries palette and Custom Curves palette adjustments that can be translated into a LUT will have their combined result translated into a LUT. For any nodes that mix supported and unsupported adjustments for LUT export (such as sharpening or blur filtering operations), the unsupported adjustments will simply be ignored. For more information on exporting LUTs, see “Exporting Grades and LUTs” in Chapter 123, “Grade Management.”

NOTE: DaVinci Resolve exports LUTs in the .cube format, which is a DaVinci-developed LUT format, with no relation to the Adobe SpeedGrade.cube format.
Chapter 172

Stereoscopic Workflows

DaVinci Resolve has robust support for a wide variety of stereoscopic workflows. Using the built-in tools of the Studio version of DaVinci Resolve, you can edit using stereoscopic clips, grade the resulting program, adjust each clip’s stereo-specific properties such as convergence and floating windows, and master stereoscopic output, all within DaVinci Resolve.

Stereoscopic Workflows

Creating a stereo 3D project is a multi-step process that benefits from careful media organization. This chapter covers how to set up for working on stereoscopic projects, how to import stereoscopic projects, and how to export stereoscopic media.

First, stereoscopic pairs of clips, i.e., the individual left- and right-eye media files, are imported into the Media Pool, organized, and then linked together using the “Stereo 3D Sync” command to create a new set of linked stereo clips. Then, these clips stereo clips can be either edited or conformed to imported project data using a single Timeline. DaVinci Resolve lets you manage left- and right-eye grades and sizing in the Color page using the controls found in the shortcut menu of the Thumbnail timeline, and in the Stereo 3D palette.

If you’re using stereoscopic CineForm media, which contains muxed left-eye and right-eye image data that can be decoded by DaVinci Resolve, you still need to go through this process, although you’ll be using duplicate clips to populate Left and Right folders with matching sets of clips.

Hardware Requirements for Working in Stereo 3D

With DaVinci Resolve on Mac systems, dual 4:2:2 Y’CbCr stereoscopic video streams are output via SDI from a compatible Blackmagic Design video interface. You can select either Side-by-Side or Line Mesh output to be fed to your stereo 3D-capable display, depending on its compatibility. Alternately, if you turn on the “Enable Dual SDI 3D Monitoring” checkbox in the Video Monitoring group of the Master Settings panel of the Project Settings, your compatible Blackmagic Design video interface outputs full resolution 4:2:2 Y’CbCr for each eye to compatible displays.

When setting up a 3D-capable DaVinci Resolve workstation, keep in mind that the dual video streams of 3D projects make greater demands on disk bandwidth, media decoding via your workstation’s CPU, and effects processing via your workstation’s available GPU cards.

Setting Up to Display Stereo 3D via SDI

All DaVinci Resolve systems can output a side-by-side frame-compatible signal that can be viewed on a stereo 3D-capable display via a single SDI connection, output from a DeckLink HD Extreme card or better. For higher-quality monitoring, two SDI signals can be used to output the left-eye and right-eye images separately at full resolution using one of the following Blackmagic Design video interfaces:

- DeckLink HD Extreme 3D+
- DeckLink 4K Extreme
- DeckLink 4K Extreme 12G
- DeckLink 8K Pro
- UltraStudio 4K
- UltraStudio 4K Extreme
- UltraStudio 4K Extreme 3

Very old legacy systems accomplish this via NVIDIA dual SDI monitoring outputs.
The following procedures describe how to set up stereo 3D monitoring in two different ways.

**Monitoring via dual SDI to dual SDI:**
1. Open the Master Settings panel of the Project Settings, then do the following:
   - Make sure the Use 4:4:4 SDI checkbox is unchecked.
   - Turn on the "Use dual outputs on SDI" checkbox.
2. Open the Stereo 3D palette in the Color page, and do the following:
   - Set Vision to Stereo.
   - Set the Out pop-up menu to None.

**NOTE:** When "Enable dual SDI 3D monitoring" is turned on, split-screen wipes and cursors will not be visible on the grading monitor, nor will you be able to view image resizing.

**Setting Up to Display Stereo 3D via HDMI**
If your stereo-capable display only has HDMI input, you'll need to use the HDMI output of a compatible Blackmagic Design video interface that has HDMI 1.4 or better to output stereo 3D signals; see the documentation accompanying your video interface for more information.

**Supported Stereo 3D Media**
When importing stereo 3D media from other applications, there are two types of media that are compatible with DaVinci Resolve stereoscopic workflows.

**Using Dual Sets of Media in Any Supported Format**
When originally shot, the media corresponding to stereo 3D workflows consists of two directories, one for the left-eye media, and one for the right-eye media. For the most automated workflow possible, this media must be tightly organized. Each pair of left-eye and right-eye media files in both directories should have matching timecode, and reel numbers that clearly indicate which are the left-eye shots, and which are the right-eye shots. When organized in this way, it's relatively easy to use DaVinci Resolve to convert each matching pair of clips into the stereo 3D clips that you'll need to work in DaVinci Resolve. This process is covered in detail in a subsequent section.
Using Stereoscopic OpenEXR Media

DaVinci Resolve is compatible with stereo OpenEXR files to accommodate professional cinema and specialty workflows. Stereo OpenEXR clips include the media for both eyes stored as separate parts so that a single OpenEXR file may output either a single image or stereo 3D images when used with an application that supports it, such as DaVinci Resolve. This means you can edit stereo OpenEXR media, grade it, and make all of the stereoscopic adjustments that the Stereo palette of the Color page supports.

If you import stereo OpenEXR clips to the Media Pool, they will at first appear to be regular non-stereo clips that output a single image. However, these can easily be converted to stereo 3D clips using the following procedure.

To set stereo OpenEXR clips to be usable as stereo clips:
1. Import the OpenEXR media to the Media Pool as you would any other clips.
2. Select one or more OpenEXR clips, then right-click the selection and choose “Convert to Stereo” from the contextual menu. Those clips will now appear with a stereo 3D badge to indicate that they’re stereo.

Using Stereoscopic CineForm Media

DaVinci Resolve is also compatible with CineForm stereo QuickTime files. CineForm clips encode the media corresponding to both eyes and mux (multiplex) it together in such a way so that CineForm files may output either a single frame of image data, if used in an application that is not capable of stereoscopic processing, or stereo 3D media when used with an application that is, such as DaVinci Resolve. This means that you can edit CineForm media using nearly any NLE, export a project via whatever workflow is convenient, and end up with a stereoscopic project that can be graded in DaVinci Resolve.

There are two ways of creating CineForm files. One is by using a camera or recording system that processes dual synchronized video signals to create a single set of CineForm media. The other is to use the CineForm conversion tools that come with GoPro CineForm Studio to reprocess dual sets of stereo 3D assets into the CineForm format.

The CineForm codec itself encodes full-frame image data using wavelet compression, at any resolution, at up to 12-bits, in a choice of RGB, Y’CbCr, or RAW color spaces. DaVinci Resolve is compatible with CineForm in a QuickTime wrapper using any supported color space, allowing access to the dual streams of image data that are provided.

When the time comes to output your program, keep in mind that while DaVinci Resolve can read CineForm files, CineForm files cannot be rendered out of DaVinci Resolve unless you’ve purchased an encoding license for OS X or Windows from GoPro. Furthermore, DaVinci Resolve cannot render Stereoscopic CineForm files.

If you import stereo CineForm clips to the Media Pool, they will at first appear to be regular non-stereo clips that output a single image. However, these can easily be converted to stereo 3D clips using the following procedure.

To set stereo CineForm clips to be usable as stereo clips:
1. Import the CineForm media to the Media Pool as you would any other clips.
2. Select the CineForm media you need to convert, then right-click the selection and choose “Convert to Stereo” from the contextual menu. Those clips will now appear with a stereo 3D badge to indicate that they’re stereo.
Creating Stereo 3D Clips From Separate Files

If you’re working with stereo media that was either captured or created as individual left- and right-eye files, then you need to convert each matching pair of clips into the stereo 3D clips that you’ll need to work in DaVinci Resolve. This is a two-step procedure.

Step 1—Import and Organize Your Media

You need to import all of the left-eye and right-eye media into separate bins.

1. Open the Media page, and create three Media Pool bins named “Left,” “Right,” and “Stereo Clips.” The exact names are not important, but the way the media is organized is.

2. Import all left-eye media into the “Left” bin, and all right-eye media into the “Right” bin. If you’re importing stereoscopic Cineform media, you still need to create this kind of organization, which requires you to place duplicates of each clip into each of the “Left” and “Right” bins.

Step 2—Generate 3D Stereo Clips

Once you’ve organized your media appropriately, you’re set up to synchronize the left- and right-eye clips using timecode.

1. Create a new bin in the Media Pool, and name it “Stereo Clips.” This is the bin that will eventually contain the linked stereo clips you’re about to create.

2. Right-click anywhere within the Media Pool and choose Stereo 3D Sync.

The Stereo 3D Sync dialog appears, with buttons for choosing the left-eye folder, choosing the right-eye folder, choosing the output folder, and checkboxes for specifying whether to match reel names and file names, and additional fields for entering characters that identify left- and right-eye clips.
3. Click the Browse button corresponding to “Choose left eye folder” and then use the hierarchical list of bins that appears to choose the bin you named “Left.” Follow the same procedure to choose the right-eye media.

4. Click the Browse button corresponding to “Output folder” and then use the hierarchical list of bins that appears to choose the bin you named “Stereo Clips.”

5. Choose which matching criteria to use. Ideally, you only need to use whichever one of the three criteria that apply. The three options are:
   - **Match Reel Name:** If the reel names of the left- and right-eye media match, turn this checkbox on.
   - **Match File Name checkbox:** If the file names of the left- and right-eye media match, turn this checkbox on.
   - **Left Identifiers and Right Identifiers fields:** If the left- and right-eye clips are identified by a special subset of characters within the file name (for example, “3D_R” and “3D_L”), then you can type each into the appropriate field, and these characters will be used to match the left and right eyes together.

6. Click Sync.

The original clips in the Left and Right bins disappear, and a full set of Stereo 3D clips appear in the output bin you selected in step four.

---

**Step 3—(Optional) Create Optimized Media**

If your stereo media is excessively large, you can create optimized media.

1. Select the stereo clips you’ve created.

2. Right-click one of the selected clips, and choose Generate Optimized Media from the contextual menu. A window appears showing you how long it will take to finish creating optimized media.

---

**Converting Clips Between Stereo and Mono**

You also have the option of converting clips between mono and stereo 3D using a pair of commands in the Media Pool.

**Converting Stereo Clips Back to Mono**

If necessary, you can split one or more stereo clips into mono clips using a single command.
To convert stereo clips into mono clips:

1. Select one or more stereo clips in the Media Pool.
2. Right-click one of the selected clips and choose Split Stereo 3D Clips from the contextual menu.

Afterwards, two new bins are created named Left and Right, containing the individual left- and right-eye clips that you've split apart.

Converting Mono Clips or an Entire Timeline to Stereo

Non-stereo clips (for which there are not separate left- and right-eye media files) can be converted into stereo clips either individually or throughout an entire timeline for one of two different reasons:

- You can convert non-stereo clips into stereo for use in a stereo project, so they output properly along with the rest of a stereo timeline, albeit without adjustable convergence or depth effects.
- If you want to grade an HDR and non-HDR version of your program at the same time, converting non-stereo clips to stereo makes it possible for you to a) manage two separate SDR and HDR grades for each clip in a timeline using the left- and right-eye channels, and b) output the SDR and HDR signals separately via your compatible Blackmagic Design interface's left- and right-eye SDI outputs when you turn on the "Use dual outputs on SDI" checkbox in the Video Monitoring section of the Master Settings panel of the Project Settings.

To convert mono clips into stereo clips:

1. Select one or more non-stereo clips in the Media Pool.
2. Right-click one of the selected clips and choose Convert to Stereo from the contextual menu.

Afterwards, that clip appears in the Media Pool as a Stereo 3D clip, and when edited into a timeline, can expose its controls in the 3D Stereo palette in the Color page.

If you have a timeline full of clips that you've just converted into stereo using the above procedure, you need to take the additional step of setting the Timeline to stereo in order to create stereo grades for each clip.

To convert a timeline to have stereo grades for simultaneous HDR/SDR output while grading:

Right-click a timeline in the Media Pool and choose Timelines > Set Timeline to Stereo.

For more information about using stereo timeline workflows for simultaneous HDR and SDR grading, see Chapter 7, “Data Levels, Color Management, and ACES.”
Attaching Mattes to Stereo 3D Clips

If you have left- and right-eye mattes that need to be attached to stereo clips, the process works identically to importing mattes for regular clips, except that when you’ve selected a stereo 3D clip in the Media Pool, you have two matte import commands, “Add As Left Eye Matte,” and “Add As Right Eye Matte.”

Organizing and Grading
Stereo 3D Dailies

A common workflow is the creation of digital dailies within DaVinci Resolve before editing in an NLE. This provides the editors, director, and producers with the advantage of having more attractive media to work with, that’s also more comfortable to view if handled with the automatic geometry and color-matching functions that match the media of each pair of shots together for a preliminary left- and right-eye balance. The resulting Timelines can then be output to whichever media format is most convenient to use.

Step 1—Create 3D Stereo Clips

The very first step in the process of creating dailies is to import all of the left-eye and right-eye media into individually organized bins, and to then link them together to create stereo 3D clips, as described in the previous section.

Step 2—Edit the New Stereo Clips Into One or More Timelines for Grading

Now that you’ve created a set of Stereo 3D clips, you’re ready to edit them into one or more Timelines for grading. You can do this by simply creating a new Timeline and deselect the Empty Timeline checkbox. A new Timeline will be created with the stereo 3D clips you created.

Step 3—Align Your Media

For the stereoscopic effect to work without causing headaches, it’s critical that both eyes are aligned. This can be tricky to adjust using manual controls, but is something that can be automatically analyzed. You can perform stereo 3D alignment to a single clip using the Stereo 3D Palette controls, or you can select a range of clips to align all of them automatically at once. There are two methods of alignment; which is more appropriate depends on the type of geometry issues you have to address.

- **Transform Alignment**: Analyzes the image and makes vertical and rotational adjustments to line up the left- and right-eye images as closely as possible.
- **Vertical Skew**: Analyzes the images and makes a vertical-only adjustment to line up the left- and right-eye images.
Step 4—Grading Stereo Media

Grade the clips in the Timeline as you would any other digital dailies, with the sole addition of using the controls in the Stereo 3D palette to control monitoring and manage the adjustments made to each eye as necessary. As when creating any other kind of dailies, you can use LUTs, the Timeline Grade, and individual clip grading to make whatever adjustments are necessary to create useful media for editing.

Grading Windows

If you’re using windows, The Color group of the General Options panel of the Project Settings has a checkbox called “Apply stereoscopic convergence to windows and effects” that correctly maintains the position of a window that’s been properly placed over each eye when convergence is adjusted.

When this option is enabled, the Window palette displays an additional Transform parameter, “Convergence,” that lets you create properly aligned convergence for a window placed onto a stereoscopic 3D clip.

After placing a window over a feature within the image while monitoring one eye, you can enable Stereo output in the Stereo 3D palette and use the Pan and Convergence controls to make sure that window is properly stereo-aligned over the same feature in both eyes. At that point, adjusting the Convergence control in the Stereo 3D palette correctly maintains the position of the window within the grade of each eye.
Matching Media From Left and Right Eyes

To help you manage the visual differences between left- and right-eye clips, there are also three automatic color matching commands that can be used to batch process as many clips as you need to adjust at once.

- **Stereo Color Match (Primary Controls):** Uses the Lift/Gamma/Gain controls to match one eye to the other. The result is a simple adjustment that’s easy to customize, but may not work as well as Custom Curves in some instances.

- **Stereo Color Match (Custom Curves):** Uses the Custom Curves to create a multipoint adjustment to match one eye to the other. Can be more effective with challenging shots.

- **Stereo Color Match (Dense Color Match):** Performs a pixel by pixel, frame by frame color match that is incredibly accurate. This operation is processor intensive, so if you’re going to batch process many clips, or if you’re matching long clips, you’ll want to make sure you have adequate time. Because this is such a precise match, it’s recommended to use Dense Color Match after you’ve used one of the stereo alignment commands.

![](controls_matching.png)

Controls for matching the grade of the left and right eye media

Step 5—Output Offline or Online Media for Editing

When you’re done applying whatever grading is necessary to make the media suitable for editing, you’ll need to export each clip as separate left- and right-eye clips using the controls of the Deliver page.

1. Open the Deliver page, and set up your render to output the format of media you require. Be sure to do the following:
   - Set Render Timeline As to Individual source clips.
   - Turn on the “Filename uses Source Name” checkbox.
   - To render both eyes’ worth of media, choose “Both eyes as” from the Render Stereoscopic 3D option, and choose Separate Files from the accompanying pop-up menu. Optionally, you could also choose to render only the left-eye or right-eye media.

2. Choose how much of the Timeline to render from the Render pop-up menu in the Timeline toolbar; to render everything, choose Entire Timeline.

3. Click “Add Job to Render Queue.”

4. Click Start Render.

DaVinci Resolve will now render either two sets of left- and right-eye clips, or one set of media corresponding to the eye you chose.

To make sure that the resulting edited project conforms easily to the originating DaVinci Resolve project, it’s important to be sure that you render individual source clips, and that you turn on the “Filename user Source Name” checkbox, in order to clone the timecode, reel numbers, and file names of the source media.
Conforming Projects to Stereo 3D Media

Since DaVinci Resolve manages stereo via a single set of specially created stereo 3D clips, you can use the same project import methods to import stereo 3D projects as you would for any other project. Only a single imported timeline is necessary.

This also means that you can edit stereo projects in NLEs that aren’t otherwise stereo-aware, and finish them in full stereo 3D in DaVinci Resolve. To do this, you need to make sure that you edit the left-eye media in your NLE, and then export either an EDL or XML file to conform in DaVinci Resolve.

**To conform an EDL to stereo 3D media:**

1. Open the Media page, and create the necessary set of stereo 3D clips that will correspond to the project you’re going to import, as described previously.

2. Open the Edit page, and then use the Import AAF/EDL/XML command to import your edit.

When the Load EDL/XML dialog appears, do the following:

- If importing an EDL, verify that the frame rate is correct, and click OK.
- If importing XML, make sure you turn off the “Automatically import source clips into Media Pool” checkbox, since you want to relink the imported project to the stereo 3D clips you created in step one.

The left-eye media timecode and reel information that’s embedded within each stereo 3D clip will be used to conform the stereo 3D clips with the imported EDL, and you should be ready to work.

Grading Mastered Stereoscopic Media From Tape

If you’ve been handed a stereo 3D muxed tape with a mastered program that needs to be graded, but you haven’t been given a project file or EDL, you can ingest it as individual left- and right-eye media files with a supported VTR, such as HDCAM SR with 4:2:2 x 2 mode, by turning on the “Use left and right eye SDI” checkbox in the Capture and Playback panel of the Project Settings. When muxed stereoscopic signals are ingested, each eye is separated into individual left-eye and right-eye image files.

Once ingested, you can use Scene Detection to split the left-eye media in one bin, and to create an EDL, you can use to split the right-eye media in the same way in another bin, so that you can create a sequential set of stereo clips for grading.
Adjusting Clips using the Stereo 3D Palette

Once you’ve either created or imported a stereoscopic 3D-identified timeline, you’re ready to begin grading. The left eye will be displayed in the Edit and Color pages by default; however, you can right-click on the Timeline and select Stereo 3D Mode to view the other eye. Most colorists work by grading one eye first (typically the left), and rippling their grades to the other eye, making separate adjustments to each eye’s clips when necessary to match undesirable variation between cameras. DaVinci Resolve lets you do this automatically.

Setting up stereo 3D media enables the Stereo 3D palette on the Color page. This palette contains all the controls necessary for working on stereoscopic projects. It provides controls for choosing which eye to grade, adjusting convergence, swapping and copying grades and media between matching left- and right-eye clips, auto-processing the color and geometry of left- and right-eye clips to match, stereo 3D monitoring setup, and controls for floating windows.

Your project must contain stereo 3D clips in order to open this palette. For more information on setting up a stereo 3D project, see the “Creating Stereo 3D Clips” section of this chapter.

Stereo Eye Selection

Most colorists work by grading one eye first (typically the left), and rippling their grades to the other eye, making separate adjustments to each eye’s clips when necessary to match undesirable variation between cameras.

The first three buttons in the Stereo 3D palette let you choose which eye to grade while you’re working, as well as whether or not to ripple each clip’s grade to the matching opposite-eye clip. Whenever you switch eyes, the 3D badge above each clip’s thumbnail changes color (blue for right, red for left) and the thumbnails themselves update to show that eye’s media.

- **Left button:** Displays the left-eye image and grade.
- **Ripple Link button:** When enabled (orange), all changes you make to the grade of the currently selected eye are automatically copied to the correspondingly opposite eye. When disabled (gray), grades made to the currently selected eye are made independently.
- **Right button:** Displays the right-eye image and grade.
You can also choose which eye you’re viewing and grading by right-clicking a clip’s thumbnail and choosing Stereo 3D > Switch Eye or by choosing View > Switch Eye To > Left Eye or Right Eye.

**Using Ripple Link When Grading Stereo 3D Clips**

You would turn Ripple Link off to suspend rippling when you want to make an individual adjustment to the grade of one eye to obtain a better match between the two. When you’re finished matching the two clips, you can turn it back on to resume automatic grade rippling.

Stereo 3D grade rippling is always relative, so differences between the grades that are applied to the left- and right-eye clips are preserved. In fact, when you add or remove nodes to or from one eye, the same nodes are automatically added to or removed from the corresponding clip it’s paired with, regardless of whether or not Ripple Linked is enabled.

**IMPORTANT** Regardless of whether or not Ripple Link is enabled, local versions created for one stereo 3D-identified clip are automatically available to the paired timeline.

**Stereo 3D Geometry Controls**

The next group of parameters lets you adjust the geometry of stereo 3D clips. The Pan, Tilt, and Zoom controls are provided as a convenience, and simply mirror the same parameters found in the Transform palette’s Input mode, but made specific to the geometry of the left- and right-eye media. Convergence, Pitch, and Yaw are the three parameters that are unique to the Stereo 3D palette.

![Stereoscopic 3D Geometry controls](image)

- **Convergence**: Adjusts the disparity between the left and right eyes, to define the point of convergence (POC), or the region within the image where the left- and right-eye features are in perfect alignment. If necessary, Convergence can be animated using the Stereo Format parameter group in the Sizing track of the Keyframe Editor. If you want to adjust convergence in pixels, open the Stereo 3D palette option menu, and turn on “Show convergence in pixels.”

Features that overlap perfectly in both right- and left-eye clips are at zero parallax, putting that feature’s depth at the screen plane. Matching features that are divergent in the left- and right-eye clips have increasingly positive parallax, and appear to be farther away from the audience. Matching features that are divergent and reversed in the left- and right-eye clips have increasingly negative parallax, and appear to be closer to the audience than the screen plane.
• **Linked Zoom button**: When enabled (white), both the left- and right-eye clips are automatically zoomed whenever Convergence is adjusted so that both eyes always fill the screen. When disabled (gray), changes to Convergence will cause the opposing left and right edges of each eye’s clip to have blanking intrude.

• **Pitch**: Pivots the image around the horizontal center plane of the frame.

• **Yaw**: Pivots the image around the vertical center plane of the frame.

### Sizing Repositioning in Stereo 3D

Generally, you’ll want to reposition stereo 3D clips with Ripple Link turned on, but you may occasionally find yourself needing to make a manual adjustment to one eye in particular with Ripple Link disabled. As with color adjustments, Sizing adjustments made with Ripple Link disabled are only applied to the clip in the current Timeline. When Ripple Link is turned on, all Sizing adjustments are automatically copied to the correspondingly numbered shot of the other stereo 3D timeline.

**WARNING** It is not advisable to use the Rotate parameter when transforming stereo 3D clips. Geometrically, rotation tilts a stereo pair of clips inappropriately, and ruins the “side-by-side” convergence that’s necessary to create the stereoscopic illusion.

### Protecting Stereo Adjustments When Copying Grades

Each version of a grade has independent stereo adjustments stored along with the Sizing settings. To prevent accidental overwrite of convergence and alignment data when copying grades from one clip to another, you can right-click within the Gallery and choose one of the following options to turn them on:

- **Copy Grade**: Preserve Convergence
- **Copy Grade**: Preserve Floating Windows
- **Copy Grade**: Preserve Auto Align

When enabled, these options let you overwrite a clip’s grade without overwriting specific Stereo 3D parameters.

**TIP**: Stereo 3D and Sizing settings are processed before node-based corrections in the DaVinci Resolve image processing pipeline.

### Swap and Copy Controls

Another set of controls at the right of the Stereo 3D palette lets you swap and copy grades, and swap clips, in situations where you need to reverse what’s applied to a pair of left- and right-eye clips.
• **Swap Grade**: Exchanges the grades that are applied to the left- and right-eye clips.

• **Swap Shot**: A checkbox that, when enabled, switches the actual media used by two corresponding left- and right-eye clips. Useful in situations where the eyes of a stereo 3D clip were mislabeled, and you want to switch the clips without rebuilding both EDLs.

• **Copy Right to Left**: Copies the right-clip grade to the corresponding left-eye clip.

• **Copy Left to Right**: Copies the left-clip grade to the corresponding right-eye clip.

### Batch Grade Management for Stereo 3D Projects
There are also a series of batch-processing commands that are useful for stereoscopic grading that are available when you right-click one or more selected clips in the Thumbnail timeline:

• **Stereo 3D Batch Copy**: Copies every grade from the left-eye clips to the right-eye clips.

• **Stereo 3D Batch Sync**: Copies grades from one eye to the other only when their node graphs have the same number of nodes. This prevents you from accidentally overwriting a custom grade with a different node structure that was necessary to match two eyes for a problem shot.

The Copy Grade, Swap Grade, Swap Shots, Ripple Link, and Switch Eye commands are also available from the Stereo submenu of the Timeline contextual menu.

### Automatic Image Processing for Stereo 3D
It’s common during stereoscopic shoots for minor divergences in geometry and color to appear in the source footage. To make the process of grading stereo 3D media less onerous, DaVinci Resolve provides a set of auto-adjustment controls at the right of the Stereo 3D palette that gives you a starting point for matching left- and right-eye clips together.

![Auto align and color match buttons](image)

#### Options for Auto Processing
You can choose which frame should be used to automatically analyze and process stereo clips using the Alignment and Matching controls from the Stereo 3D palette option menu. You can choose Auto Process > First or Middle, depending on what works best for your media.

#### Auto Process—Stereo Alignment
For the stereoscopic effect to work without causing headaches, it’s critical that both eyes are aligned. This can be tricky to adjust using manual controls, but is something that can be automatically analyzed. You can perform stereo 3D alignment to a single clip, or you can select a range of clips to align all of them automatically at once. There are two options. Which is more appropriate depends on the type of geometry issues you’re needing to address.

• **Transform Alignment**: Analyzes the image and makes vertical and rotational adjustments to line up the left- and right-eye images as closely as possible.

• **Vertical Skew**: Analyzes the images and makes a vertical-only adjustment to line up the left- and right-eye images.
To align one or more clips automatically:

1. Select one or more stereo clips in the Thumbnail timeline of the Color page.
2. Choose which frame of each clip you want to use for the analysis by opening the Stereo 3D palette, clicking the Option menu, and choosing Auto Process > First or Auto Process > Middle.
3. Click either of the Stereo Alignment buttons. The button to the left is for Automatic Transform, while the button to the right is for Automatic Vertical Skew.

   If you selected multiple clips, then the Stereo Alignment window appears, and a progress bar shows the remaining time this operation will take.

Auto Process—Color Matching

Due to the design of different stereo 3D rigs, sometimes the color and contrast of one eye’s media doesn’t precisely match that of the corresponding eye. DaVinci Resolve provides two commands for quickly and automatically matching two eyes together.

- **Stereo Color Match (Primary Controls):** Uses the Lift/Gamma/Gain controls to match one eye to the other. The result is a simple adjustment that’s easy to customize, but may not work as well as Custom Curves in some instances.

- **Stereo Color Match (Custom Curves):** Uses the Custom Curves to create a multipoint adjustment to match one eye to the other. The result can be more effective with challenging shots.

- **Stereo Color Match (Dense Color Match):** Performs a pixel by pixel, frame by frame color match that is incredibly accurate. This operation is processor intensive, so if you’re going to batch process many clips, or if you’re matching long clips, you’ll want to make sure you have adequate time. Because this is so precise a match, it’s recommended to use Dense Color Match after you’ve used one of the stereo alignment commands.

TIP: For the best results, it’s recommended to use automatic color matching in a separate node, independent of other corrections.

Stereo 3D color match works differently depending on whether or not one of the stereo 3D-paired clips has already been graded. The following procedure shows how to match a pair of left- and right-eye clips before you make any manual adjustments of any kind.

To match a pair of left- and right-eye clips automatically:

1. Select one or more clips in the Thumbnail timeline of the Color page.
2. Open the Stereo 3D palette, and click one of the three Color Match controls.

   The Color Matching window appears, and a progress bar shows the remaining time this operation will take. You can also use automatic color matching to match an ungraded clip to a paired clip that’s already been graded. This only works for grades consisting of one or more primary corrections; secondary corrections cannot be auto-matched.
To match an ungraded clip automatically to a paired stereo clip that’s graded:

1. To suspend stereo grade linking temporarily:
   - Open the Stereo 3D palette, and turn off the Ripple Link button.
   - Right-click the Thumbnail timeline, and choose Stereo 3D > Ripple Link > Solo.

2. Make a primary adjustment to a clip in the left-eye timeline to create a simple base grade. The left-eye clip now has a grade, and the right-eye clip does not.

3. Do one of the following to switch eyes:
   - In the Stereo 3D palette, click Right.
   - Right-click the Thumbnail timeline again, and choose Stereo 3D > Switch Eye.

   This procedure only works when you use the Stereo Color Match commands on the ungraded clip of a left- and right-eye stereo pair, to match it to the graded clip.

4. To make the match, do the following:
   - In the Stereo 3D palette, click one of the three color match controls.

   Both clips should match one another very closely.

Stereo 3D Monitoring Controls

To output both eyes to a stereo 3D display, you need to click the Vision: Mono or Stereo button, and then choose a display mode from the Out pop-up menu.

- **Vision**: Click a button to choose between Stereo, where both eyes can be displayed in the Viewer and output to video in a variety of different formats, and Mono, where only one eye is monitored in the Viewer and your video output interface.
- **Out**: A pop-up menu that provides different stereo viewing options for previewing stereo 3D signals in different ways. By default, this option is also linked to the Viewer display Internal Video Scope options. For detailed descriptions of each stereo 3D viewing mode, see the following section, “Stereo 3D Output Options.”
- **Link button**: When enabled, the Viewer and internal video scopes both use the Out pop-up menu’s option for stereo 3D viewing. When disabled, you can choose different stereo 3D viewing options for the Viewer and internal video scopes.
- **Viewer**: Lets you choose a stereo 3D viewing option for the Viewer.
- **WFM**: Lets you choose a stereo 3D viewing option for the internal video scopes.
- **Cbd Size**: If any stereo 3D viewing options are set to Checkerboard, this parameter becomes enabled, and lets you define the size of the checkerboard boxes, in pixels.
Dual 4:2:2 Y'CbCr stereoscopic video streams are output via HD-SDI on selected Blackmagic I/O devices when you turn on the "Use left and right eye SDI output" checkbox on the Master Settings panel of the Project Settings. You can select either Side-by-Side or Line-by-Line output to be fed to your stereo-capable display, depending on your display’s compatibility.

Stereo 3D Output Options
Additionally, the Viewer and video scopes can be set to display both "eyes" in one of a variety of different modes.

- **Side by Side**: Displays both images side by side. Each eye is squeezed anamorphically to fit both eyes into the same resolution as the GUI viewer.
- **Top and Bottom**: Displays both images one over the other. Each eye is squeezed vertically to fit both eyes into the same resolution as the GUI viewer.
- **Line by Line (Even/Odd)**: An interlaced mode where each eye is displayed on alternating lines. The thickness of the lines as seen in the Viewer depends on how zoomed in you are.
- **Checkerboard**: Displays both eyes via an alternating checkerboard pattern. This is an excellent mode for identifying regions of the image where there’s variation in color or geometry between the two eyes.
- **Anaglyph (B/W)**: Each eye is desaturated and superimposed via Red/Cyan anaglyph to show the disparity between both eyes in different regions of the image. Left-eye divergence is red, and right-eye divergence is cyan. Regions of alignment between both eyes appear grayscale.

Anaglyph modes are useful for evaluating the geometric differences between both eyes, as well as for identifying the point of convergence (where both eyes align most perfectly) that places a region of the image at the screen plane.

Red/cyan color coding also identifies the direction of parallax. For any given feature, disparity such that red is to the right and cyan is to the left indicates positive parallax (backward projection away from the audience). Red to the left and cyan to the right indicates negative parallax (forward projection towards the audience).

- **Anaglyph (Color)**: Similar to Anaglyph (B/W), except that regions of close alignment are shown in full color. Incidentally, both anaglyph modes can be previewed on ordinary displays using old-fashioned red/cyan anaglyph glasses, enabling stereo 3D monitoring on non-stereo 3D-capable displays.
- **Difference**: Superimposes grayscale versions of both eyes using the difference composite mode. Corresponding left/right-eye pixels that are perfectly aligned appear black, while pixels with disparity appear white. This mode is extremely useful for evaluating geometric differences between both eyes, as well as for identifying the point of convergence, without the distraction of color that the anaglyph modes present.

**NOTE**: Only displays the eye corresponding to the currently selected timeline in the Viewer. However, this option also works in conjunction with the “Use Dual Outputs on SDI” checkbox in the Master Settings of the Project Settings which, when turned on, outputs each eye to an individual HD-SDI output of your Blackmagic I/O card.
Floating Windows

Floating Windows are meant to correct for “Window violations,” where elements of the image with negative parallax, that project forward from the screen plane towards the audience, are cut off by the edge of the frame. In these instances, differences between the images being shown to the left and right eyes can result in a visual paradox that’s difficult for viewers to reconcile. Specifically, when a forward-projecting element is cut off by the left or right edge of the frame, one eye sees things that the other eye does not.

If the subject is moving quickly, this may not be an issue, but if the cut off (or occluded) element lingers onscreen, it causes problems for viewers that defeat the stereo 3D illusion. The viewer’s binocular vision (or stereopsis) is providing one depth cue, while occlusion is providing a completely different depth cue.

To fix this, you can use Floating Windows to crop the cut off object from the eye on the side of the object that’s cut off, thus eliminating the portion of the stereo image that is unseen to the other eye that causes the problem.

The objective of using Floating Windows is to manipulate the illusion of the viewer’s “window into the scene.” In addition to fixing Window violations, it has been proposed that Floating Windows can be used as a creative tool by manipulating the geometry of this Window to alter subtly the viewer’s perception of the screen orientation.

- By cropping the right-hand side of the right-eye frame, you also create the illusion that the right edge of the “window into the image” is tilted farther forward toward the viewer.
- By cropping the left-hand side of the left-eye frame, you create the illusion that the left edge of the Window is tilted toward the viewer.
- If you crop both the left-hand side of the left-eye frame and the right-hand side of the right-eye frame, you create the illusion that the entire plane of the “virtual screen” is coming toward you.
- If you apply opposite-angled Windows to the left- and right-eye clips at one or both of the edges of the frame, it appears to “tilt” the screen toward or away from the viewer.
Animating Floating Windows

Floating Windows can be animated using the Float Window keyframing track, found within the Sizing track of the Keyframe Editor, to push the edge of the frame in as needed, and then pull it back out when the partially occluded subject has moved fully into the frame. For more information about animating keyframing tracks, see Chapter 128, “Keyframing in the Color Page.”

Floating Windows have the following controls and parameters.

- **L/R/T/B buttons**: Lets you choose an edge to which to apply a Floating Window. Click the button corresponding to the edge you want to adjust. Each edge has its own position, rotate, and softness settings.
- **Position**: Adds masking to the currently selected edge.
- **Rotate**: Rotates the currently selected edge, letting you create an angled Window.
- **Softness**: Feathers the edge of the currently selected edge, letting you create a soft Window that can be less noticeable to viewers.

To add a Floating Window to fix a Window violation:

1. Choose to which eye you want to add the Floating Window.
   - To apply a Floating Window to eliminate a Window violation on the right-hand side of the screen, click the right eye view.
   - To apply a Floating Window to eliminate a Window violation on the left-hand side of the screen, click the left eye view.

2. Choose which edge you want to adjust by clicking the L or R buttons.
   - To eliminate a Window violation on the right-hand side, click R.
   - To eliminate a Window violation on the left-hand side, click L.

3. Adjust the Position parameter as necessary to crop the portion along the edge of the selected eye that’s not visible in the other.

4. Optionally, if you feel that the Window adjustment you’ve just made is too obvious, increase the Softness parameter to make that edge less noticeable.

Stereo Controls on the DaVinci Control Panel

If you’re doing convergence adjustments and stereographic work throughout a program, you can use many of the controls described in this section from the DaVinci control panel.

To show the Stereo transform controls page on the Transport panel:

1. Press the 3D soft key. The Transport panel’s knobs and soft keys are remapped with all available Stereoscopic commands.

2. When you’re finished, press MAIN.

To show the Floating Windows controls on the Center panel:

1. From the main page of the Center panel, press the 3D soft key. The Floating Windows, Auto Match, and Auto Align controls appear on the Center panel.

2. Press the 3D OVERLAY soft key to expose the Stereoscopic sizing controls on the Transport panel. Press 3D OVERLAY again to return to the ordinary sizing controls.

3. When you’re finished, press the MAIN soft key to exit the 3D control page.
Outputting Stereo 3D Media in the Deliver Page

To render full frame media, you’ll need to render each stereo 3D eye separately using the controls of the Deliver page, outputting whatever media format is required by the client.

Rendering Frame-Compatible Media

Frame-compatible media has both the left- and right-eye images squeezed anamorphically into a single media file. To create frame-compatible media, choose the “Both eyes as” option from the Render Stereoscopic 3D controls at the bottom of the File output options of the Deliver page, and then choose a method of output from the Mesh Options pop-up menu.

![Stereoscopic 3D mesh render options on the Deliver page](image)

You can choose Side-by-Side, Line-by-Line, or Top-Bottom. You can also choose Anaglyph if you want to output a traditional anaglyph red/cyan stereo 3D image for viewing on any display.

Rendering Individual Left- and Right-Eye Clips

If your workflow requires you to deliver separate sets of left- and right-eye media, this is easily accomplished by either setting up a render job with “Render Stereoscopic 3D” set to either “Right eye” or “Left eye,” or selecting “Both eyes as” and choosing the “Separate files” option.
Chapter 173

Using Variables and Keywords

This chapter describes how to use metadata variables and keywords to help you manage your clips.
Contents

Using Metadata Variables 3529

Available Variables in DaVinci Resolve 3530
Using Keywords 3532
Using Metadata Variables

If you’re an enthusiastic user of clip metadata (and you should be), you can use “metadata variables” that you can add into supported text fields that let you reference other metadata for that clip. For example, you could add the combination of variables and text seen in the following screenshot. Variables, once they’ve been entered, are represented as graphical tags shown with a background, while regular text characters that you enter appear before and after these tags.

![Variables and text characters entered to create a display name based on a clip's metadata](image)

As a result, that clip would display “12_A_3” as its name if scene “12,” shot “A,” and take “3” were its metadata. When you do this, you can freely mix metadata variables with other characters (the underscore, as in the example above) to help format the metadata to make it even more readable.

Be aware that, for clips where a referenced metadata field is empty, no characters appear for that corresponding metadata variable’s tag wherever it happens to be used.

Where Variables Can Be Used

Metadata variables are extremely flexible, and can be used to procedurally add metadata to several functions in DaVinci Resolve. Here’s a partial list of where you can use variables:

- **Clip names**: You can use variables in the Clip Name column of the Media Pool in List view, or in the Clip Name field of the Clip Attributes window’s Name panel, to use each clip’s metadata to generate a more readable and useful display name.

- **Other metadata fields in the Metadata Editor**: You can use variables to reference metadata in other fields.

- **Automatic labeling of stills in the Gallery**: You can choose an option from the Color group in the General Options panel of the Project Settings to “Automatically label Gallery stills” in the Gallery, and you can use variables to do so.

- **Custom text in the Data Burn palette**: You can use variables to automatically populate metadata in different combinations as a window burn.

- **The Filename field of the Render Settings in the Deliver page**: Using variables, you can automatically set the name of rendered clips to follow any metadata that’s associated with a timeline or individual clip. This is especially useful when you want to generate specific file names when rendering individual source clips.

How to Edit Metadata Variables

Every single item of metadata that’s available in the Metadata Editor can be used as a variable, and several other clip and timeline properties such as the version name of a clip’s grade, a clip’s EDL event number, and that clip’s timeline index number can be also referenced via variables.
To add a variable to a text field that supports the use of variables:

1. Type the percentage sign (%) and a scrolling list appears showing all variables that are available.
2. To find a specific variable quickly, start typing that variable's name and this list automatically filters itself to show only variables that contain the characters you've just typed.
3. Choose which variable you want to use using the Up and Down Arrow keys, and press Return to choose that variable to add.

As soon as you add one or more metadata variables to a field and press Return, the string is replaced by its corresponding text. To re-edit the metadata string, simply click within that field to edit it, and the metadata variables will reappear as the graphical tags that they are.

To remove a metadata variable:
Click within a field using variables to begin editing it, click a variable to select it, and press Delete.

Available Variables in DaVinci Resolve
The following list describes what metadata variables are available to add.

Clip Metadata
- File Name
- Clip Directory
- Video Codec
- Data Level
- KeyKode

Metadata Editor Metadata
- All Shot Scene metadata
- All Clip Details metadata (see Metadata Editor for more information)
- All Camera metadata (see Metadata Editor for more information)
- All Tech Details metadata (see Metadata Editor for more information)
- All Stereo 3D VFX metadata (see Metadata Editor for more information)
- All Audio metadata (see Metadata Editor for more information)
- All Audio Tracks metadata (see Metadata Editor for more information)
- All Production metadata (see Metadata Editor for more information)
- All Production Crew metadata (see Metadata Editor for more information)
- All Reviewed By metadata (see Metadata Editor for more information)
Media Pool Metadata
  - File name
  - Reel name
  - File path
  - Video Codec
  - IDT
  - Input LUT
  - PAR
  - Data Level
  - Description
  - Comments
  - Keyword
  - Shot
  - Scene
  - Take
  - Roll/Card #
  - Input Color Space
  - Input Sizing Preset
  - Start TC
  - End TC
  - Optimized Media

Timeline and Project Metadata
  - Group
  - Timeline Name
  - Project Name
  - Track Number
  - Track Name

Legacy Metadata
  - **EDL Tape Number**: Tape number extracted from imported EDL
  - **Render Resolution**: Resolution of the rendered file
  - **EDL Event Number**: DaVinci Resolve-generated index number of the clip in the timeline
  - **Version**: Version Name of the rendered file
  - **Eye**: Stereo session, “Left” or “Right”
  - **Reel Number**: Reel Name extracted by DaVinci Resolve from source filename or clip name
  - **Timeline Index**: Event number from imported EDL
Using Keywords

While most metadata in the Metadata Editor is edited via text fields, checkboxes, or multiple button selections (such as Flags and Clip Color), the Keyword field is unique in that it uses a graphical “tag” based method of data entry. The purpose of this is to facilitate consistency with keyword spelling by making it easy to reference both a built-in list of standardized keywords, as well as other keywords that you’ve already entered to other clips.

Once added, keywords are incredibly useful for facilitating searching and sorting in the Media Pool, for creating Smart Bins in the Media and Edit pages, and for use in Smart Filters on the Color page. Reaping these benefits by adding and editing keywords is simple and works similarly to the method of entering metadata variables that’s described above.

**To add a keyword:**

1. Select one or more clips, then click in the Keyword field of the Metadata Editor, and begin typing the keyword you want to use. As you begin typing, a scrolling list appears showing all keywords that are available using the string of characters you’ve just typed.

2. To find a specific keyword in the list, start typing that keyword’s name and this list automatically filters itself to show only keywords that contain the characters you’ve just typed. Choose which keyword you want to use in the list using the Up and Down Arrow keys, and press Return to choose that keyword to add.

3. If you selected multiple clips, don’t forget to click Save or you’ll lose your changes. If you only selected a single clip, your changes will be saved automatically.

As soon as you add one or more keywords, they appear as a graphical tag. To re-edit any keyword, simply click anywhere within the Keyword field to edit it.

**To edit a keyword:**

Double-click any keyword to make it editable, then edit it as you would any other piece of text, and press Return to make it a graphical keyword tag again.

**To remove a keyword:**

Click any keyword to select it, and press Delete.
Chapter 174

Creating DCTL LUTs

This chapter describes how to create DCTL LUTs to perform your own custom mathematical transformations in DaVinci Resolve.

About DCTL

DCTL files are actually color transformation scripts that DaVinci Resolve sees and applies just like any other LUT. Unlike other LUTs, which are 1D or 3D lookup tables of values that approximate image transformations using interpolation, DCTL files are actually comprised of computer code that directly transforms images using combinations of math functions that you devise. Additionally, DCTL files run natively on the GPU of your workstation, so they can be fast.

Anyone with the mathematical know-how can make and install a DCTL. Simply enter your transformation code, using a syntax that’s similar to C (described in more detail below), into any text editor capable of saving a plain ASCII text file, and make sure its name ends with the “.dctl” (DaVinci Color Transform Language) file extension. Once that’s done, move the file to the LUT directory of your workstation. Where that is depends on which OS you’re using:

- **On Mac OS X:** Library/Application Support/Blackmagic Design/DaVinci Resolve/LUT/
- **On Windows:** C:\ProgramData\Blackmagic Design\DaVinci Resolve\Support\LUT
- **On Linux:** /home/resolve/LUT

When DaVinci Resolve starts up, assuming the syntax of your .dctl is correct, they appear in the Color page Node contextual menu within the DaVinci CTL submenu.

DCTL Syntax

Users need to put __DEVICE__ in front of each function they write. For example:

```c
__DEVICE__ float2 DoSomething()
```

The main entry function (transform) should come after all other functions, with the following format argument:

```c
__DEVICE__ float3 transform(float p_R, float p_G, float p_B)
```

The main entry function must also have a float3 return value.

For the following floating point math functions, please use the described syntax:

- `float _fabs(float)` // Absolute Value
- `float _powf(float x, float y)` // Compute x to the power of y
- `float _logf(float)` // Natural logarithm
- `float _log2f(float)` // Base 2 logarithm
- `float _log10f(float)` // Base 10 logarithm
- `float _exp2f(float)` // Exponential base 2
- `float _expf(float)` // Exponential base E
- `float _copysignf(float x, float y)` // Return x with sign changed to sign y
- `float _fmaxf(float x, float y)` // Return y if x < y
- `float _fminf(float x, float y)` // Return y if x > y
- `float _saturatef(float x, float minVal, float maxVal)` // Return min(max(x, minVal), maxVal)
float _sqrtf(float) // Square root
int _ceil(float) // Round to integer toward + infinity
int _floor(float) // Round to integer toward - infinity
float _fmod(float x, float y) // Modulus. Returns x – y * trunc(x / y)
float _fremainder(float x, float y) // Floating point remainder
int _round(float x) // Integral value nearest to x rounding
float _hypotf(float x, float y) // Square root of (x^2 + y^2)
float _atan2f(float x) // Arc tangent of (y / x)
float _sinf(float x) // Sine
float _cosf(float x) // Cosine
float _acosf(float x) // Arc cosine
float _asinf(float x) // Arc sine
float _fdivide(float x, float y) // Return (x / y)
float _frecip(float x) // Return (1 / x)

The following functions support integer type:
  min, max, abs, rotate

Other supported C Math functions include:
  acosh, acospi, asinh, asinpi, atan, atan2, atan2pi, cbrt, cos, cospi,
  exp10, expm1, trunc, fdiv, fma, lgamma, log1p, logb, rint, round, rsqrt,
  sincos, sinh, sinpi, tan, tanh, tanpi, tgamma

Vector types float2, float3, and float4 are supported. The data fields are:
float x
float y
float z
float w
To generate a vector value, use make_floatN() where N = 2, 3, or 4.

Users can define their own structure using "typedef struct." For example:
typedef struct
{
    float c00, c01, c02;
    float c10, c11, c12;
} Matrix;

To declare constant memory, use __CONSTANT__. For example:
__CONSTANT__ float NORM[] = {1.0f / 3.0f, 1.0f / 3.0f, 1.0f / 3.0f};

To pass the constant memory as a function argument, use the __CONSTANTREF__
qualifier, e.g.:
DEVICE float DoSomething(__CONSTANTREF__ float* p_Params)

A float value must have the 'f' character at the end (e.g. 1.2f).
A Simple DCT LUT Example

The following code shows an example of how to create a simple color gain transformation using the DCT LUT syntax.

```c
// Example to demonstrate simple color gain transformation
__DEVICE__ float3 transform(float p_R, float p_G, float p_B)
{
    const float r = p_R * 1.2f;
    const float g = p_G * 1.1f;
    const float b = p_B * 1.2f;
    return make_float3(r, g, b);
}
```

A Matrix DCT LUT Example

The following code shows an example of creating a matrix transform using the DCT LUT syntax.

```c
// Example to demonstrate the usage of user defined matrix type to transform RGB to YUV in Rec. 709

__CONSTANT__ float RGBtoYUVMat[9] = { 0.2126f , 0.7152f , 0.0722f,
                                      -0.09991f, -0.33609f, 0.436f,
                                      0.615f  , -0.55861f, -0.05639f }; 

__DEVICE__ float3 transform(int p_Width, int p_Height, int p_X, int p_Y,
                                    float p_R, float p_G, float p_B)
{
    float3 result;

    result.x = RGBtoYUVMat[0] * p_R + RGBtoYUVMat[1] * p_G + RGBtoYUVMat[2] * p_B;

    return result;
}
```
A More Complex DCT LUT Example

The following code shows an example of creating a mirror effect, illustrating how you can access pixels spatially.

```c
// Example of spatial access for mirror effect

__DEVICE__ float3 transform(int p_Width, int p_Height, int p_X, int p_Y, __
TEXTURE__ p_TexR, __TEXTURE__ p_TexG, __TEXTURE__ p_TexB)
{
    const bool isMirror = (p_X < (p_Width / 2));
    const float r = (isMirror) ? _tex2D(p_TexR, p_X, p_Y) : _tex2D(p_TexR, p_
        Width - 1 - p_X, p_Y);
    const float g = (isMirror) ? _tex2D(p_TexG, p_X, p_Y) : _tex2D(p_TexG, p_
        Width - 1 - p_X, p_Y);
    const float b = (isMirror) ? _tex2D(p_TexB, p_X, p_Y) : _tex2D(p_TexB, p_
        Width - 1 - p_X, p_Y);
    return make_float3(r, g, b);
}
```
Chapter 175

TCP Protocol for DaVinci Resolve Transport Control

This chapter describes how to create third-party utilities that use Transport Control with DaVinci Resolve.

About the TCP Protocol Version 1.2

This protocol defines the communication standard between third-party applications ("Client") and DaVinci Resolve ("Server") using the TCP protocol.

Port number 9060 will be used by the server. SSL will not be used in this protocol. Communication takes the form of request-response messages, where the Client initiates a command, and the Server responds appropriately.

To use this protocol, you must first type the following string into the Advanced panel of the DaVinci Resolve System Preferences:

```
System.Remote.Control = 1
```

Data Types

The following data types are used in this protocol:

- **float (f):** A 4-byte IEEE 754 single precision float
- **int (i):** A 4-bytes signed int
- **unsigned char (uc):** A 1-byte unsigned char (0–255)
- **string (s):** A UTF-8 encoded string. No terminator is specified. The string is a composite type, transmitted as a single int (i) specifying the number of characters in the string (N), followed by N unsigned chars (uc) containing the letters of the string.

**NOTE:** The bytes of the float and int types are transmitted in little endian order.

Command Format

Commands are transmitted as a single string (using characters a–z (0x61 – 0x7A) only), followed by any additional payload required by the command in the definition.

Response Format

The response to any command is composed of a status byte (unsigned char), followed by any additional payload required by the response.

Communication Delays

Once the first byte of the command string is sent, the rest of the command string and the payload data must follow without delay. At the end of COMMAND, the server must respond immediately. If there is a delay of more than 5 seconds during this process, the party waiting for data may drop the connection assuming that the peer has become unresponsive.

There is currently no limit on the delay between two consecutive commands. (NOTE: Alternatively, a maximum allowable delay may be defined, in which case, the client may issue periodic “connect” commands to keep the connection alive.)

Status Response Values

The meaning of the status values are as follows:

- **0x00:** Command was executed successfully. Any additional payload is sent as expected.
- **0xFF:** Command could not be executed successfully. No additional payload will follow.
TCP Protocol Stream

The following commands can be sent over the protocol stream.

**connect**

The client initiates the stream by sending a connect command string. There is no payload. The server responds with a status value of 0x00.

**goto**

The client sends a goto command string followed by four unsigned chars representing the hour, minute, second, and frame of the timecode.

The server responds with an appropriate status byte based on the execution of the command.

**play**

The client sends a play command string followed by a floating point value. Play in real-time is 1.0, stop is 0.0, reverse is -1.0, 2x is 2.0, etc.

The server responds with an appropriate status byte based on the execution of the command.

**gettc**

The client sends a gettc command string.

The server responds with an appropriate status byte (status byte may be 0xFF if no timeline exists, for instance). If the status byte is 0x00, it is followed by four unsigned chars representing the hour, minute, second, and frame of the timecode.

**getframerate**

The client sends a getframerate command string.

The server responds with an appropriate status byte. If the status byte is 0x00, it is followed by a floating point value for the frame rate.

**Sample Code**

The following C sample program sets up the connection to Resolve, and returns the timeline timecode to the client:

```c
#include <stdio.h>
#include <sys/socket.h>
#include <arpa/inet.h>
#include <unistd.h>
#include <string.h>

#define PORT 9060

int main(int argc, char const *argv[]) {
    int sock = 0, valread;
    struct sockaddr_in serv_addr;
    if ((sock = socket(AF_INET, SOCK_STREAM, 0)) < 0) {
        // Socket creation failed.
    }
    serv_addr.sin_family = AF_INET;
    serv_addr.sin_addr.s_addr = inet_addr("127.0.0.1");
    serv_addr.sin_port = htons(PORT);
    if (connect(sock, (struct sockaddr *)&serv_addr, sizeof(serv_addr)) < 0) {
        // Connection failed.
    }
    // Continue with the program logic...
}
```
Socket creation error
return -1;

serv_addr.sin_family = AF_INET;
serv_addr.sin_port = htons(PORT);

// Convert IPv4 and IPv6 addresses from text to binary form
if(inet_pton(AF_INET, "127.0.0.1", &serv_addr.sin_addr)<=0)
{
    printf("Invalid address/ Address not supported \n");
    return -1;
}

if (connect(sock, (struct sockaddr *)&serv_addr, sizeof(serv_addr)) < 0)
{
    printf("Connection Failed \n");
    return -1;
}

char* connectStr = "connect";
int length = strlen(connectStr);

send(sock, &length, sizeof(int), 0);
send(sock, connectStr, strlen(connectStr), 0);

char responseBuffer[1024] = {0};
valread = read(sock, responseBuffer, 1024);
printf(" sent, response = %x
", responseBuffer[0]);

char* gettcStr = "gettc"
length = strlen(gettcStr);
send(sock, &length, sizeof(int), 0);
send(sock, gettcStr, strlen(gettcStr), 0);

valread = read(sock, responseBuffer, 1024);
printf(" sent, response = %x timecode(%d:%d:%d:%d)\n", gettcStr, responseBuffer[0], responseBuffer[1], responseBuffer[2], responseBuffer[3], responseBuffer[4]);

return 0;
}
Chapter 176

Immersive Audio Workflows

DaVinci Resolve 16 introduced support for additional object and channel-based surround or immersive audio formats. This chapter describes how to set up and mix with these formats when mixing in the Fairlight page.

About Immersive Audio Formats

Immersive audio formats use multiple channels of audio to position audio around an audience, to add a specially creative dimension to sound design. At their simplest, formats such as 5.1 and 7.1 surround allow the mixer to send varying amounts of any given track to the combination of speakers that makes audio sound centered in front, ambient from the rear, or weighted towards the left or right of an auditorium or living room. More sophisticated “object-based” formats such as Dolby Atmos define a virtual soundstage on which you can actually position tracks in 3D space, and the resulting positional audio is rendered by specialized encoder/decoders to however many speakers in whichever configuration a venue happens to have.

Immersive Format Configuration

You can enable these audio surround formats in the Fairlight panel of the Project Settings. Once enabled, all supported channel configurations of each format become available for timeline track mappings, clip attributes channel mappings, Fairlight bus mappings, and output settings.

Object-Based Format Support (Studio Only)

Dolby Atmos with support for 7.1.2 and 7.1.4
MPEG-H with support for 5.1.4, 7.1.4, and 7.2.3
SMPTE ST.2098 with support for 9.1 OH, 9.1 HT, 11.1 HT, 13.1 HT, and 15.1 HT

Auro-3D Support (Studio Only)

Auro-3D with support for 9.1, 10.1, 11.1 (7+4), 13.1
Dolby Atmos Configuration Controls

The Video and Audio I/O panel of the Resolve System Preferences lets you enable and configure the use of a Dolby RMU for doing Dolby Atmos mixing. You can enter the IP address of the RMU, and choose the base audio output.

MPEG-H Authoring

DaVinci Resolve enables MPEG-H authoring. This includes Native MPEG-H track and bus formats and monitoring, including the ability to define basic track-level meta-data for export into an MPEG-H scene, and export of a MPEG-H Master file. Once enabled, the formats become available for selection as a bus, track, or monitoring format, in the Bus Format window.

These formats also become available for multi-channel track assignment.
Tracks are mixed natively in a similar manner to most immersive content, with the creation of a bed mix consisting of a set of immersive object tracks that use dynamic panning. These are combined onto the main bus to form the immersive mix.

**Track Configuration**

In addition to this process, once the format is enabled, a set of MPEG-H meta-data columns become enabled in the DaVinci Resolve Track index, including Track Type, Kind, Language, SW Group, and Preset. For more information about these columns and how to configure them, see Chapter 149, “Using the Fairlight Page.”

Export

Once everything is configured, and your project is mixed, you export a master file. In order to do this, you must select a range In and Out point on the Timeline to define an export range. Additionally, you must define whichever busses are designated for rendering by defining their Kind, and you can select tracks you want to export additionally.

**NOTE:** An MPEG-H master file can only contain a maximum of fifteen channels total. If the selected track and bus stems exceeds this, then the export will fail, issuing a warning. The same will occur if a range is not selected.
To export an MPEG-H mix:

2. Choose a save location and name, and click Save.

At this point, all defined busses are rendered. Then, track loudness is measured for compliance. Lastly, the source audio is exported and the metadata embedded into the deliverable MPEG-H wav file.

There are several error conditions, which are deleted during the export process, that will all cause the export to fail. For example, all tracks must contain audio. Audio within switch groups must be within a specific loudness tolerance of one another. If any of these conditions occur, a dialog will appear.

**Quality Control**

You can do a quality control check of the final audio export using a Fraunhofer MHAPI tool which can open up the exported content. This includes compliancy tests, and visualization of the contained metadata. It can also render and monitor the content, but this aspect of the tool is basic, and only works with external audio that’s linked to the metadata. In other words, you must manually link the components back to the source audio files.
B-Chain Support for Audio Monitoring
(Studio Only)

Choosing Fairlight > Immersive > B-Chain Control opens the B-Chain Control window. Using traditional cinema audio postproduction terminology, the “A-Chain” is all of the bussing and signal processing that happens within the mix (in our case using the Fairlight page) and the “B-Chain” is the signal processing, amplification and speaker system that takes the sound from your workstation’s output and gets it “into your ears.” This typically includes all necessary signal decoding or pre-processing hardware, amplification systems, and speaker setups for most professional and commercial listening environments, especially for immersive audio or surround sound formats. These options are complex and have many variables in terms of speaker configuration, selection, and placement, output channel timing, attenuation, and phase, and a host of other considerations.

In DaVinci Resolve, these B-Chain controls affect how the channels of audio being output by the Main you’re mixing is mapped to the actual audio signals being output from your workstation into the amplification and speaker system of the current viewing environment. The extensive level of control the B-Chain presets offer is most useful in situations such as surround-sound configured grading and mixing theaters, to define how the immersive audio standard you’re mixing is mapped to the speaker setup of your particular application, and to fine-tune the channels being output to each speaker specifically for your environment. In simpler monitoring situations, the B-Chain controls can be useful for configuring the standard you’re mixing with to play out of a non-standard speaker setup in your room.

Ultimately, the B-Chain controls are designed and intended for users who need to create custom, fine-tuned settings for their specific monitoring situation. For this reason, pretty much every real-world use of these B-Chain controls will require custom configuration for your unique environment.

Overview of Setting Up a B-Chain Configuration

Setting up a B-Chain configuration takes some doing, but once set up, you have a preset that’s easy to reopen at any time. In the following example, a B-Chain preset will be configured to convert a 5.1 surround output to a 3-channel left-center-right room speaker setup.

To set up a B-Chain:

1. Choose Fairlight > Immersive > B-Chain Control to open the B-Chain Control dialog. This exposes the monitoring controls but not the configuration controls.
2. Click the Option menu in this window and choose Setup B-Chain Presets. The B-Chain Setup window appears.
3. Click the New button to create a new B-Chain preset, then enter a name in the dialog and click OK. In this example we’ll use the name “5.1 to LCR.” The Name you enter here is the name of the saved setting data.

Additional buttons let you Delete, Rename, or Duplicate presets that you’ve already created once you choose them from the Setting pop-up.
4. Enter a label in the Name field (this is the name that appears in the preset menu). The name you enter here is the name that appears in whatever pop-up menus you select these options from.
Choose Input Mode > Fixed Format, and Input > 5.1 from the pop-up menus. These define the signal coming out of your mix. (Input Mode > Monitor Feed sets the B-Chain to listen to the selected monitor source, while Input Mode > Custom Format lets you choose an arbitrary number of channels.)

Choose an Output Mode > Fixed Format, and Output > LCR from the next set of pop-up menus. These define the speaker setup you’ll be playing the mix out of. In this example, we’ve chosen LCR, which stands for Left, Center, Right.

At this point, you can see that once you’ve defined the Input and Output channels, the “Inputs/Outputs” table of cells becomes populated:

- At the left of this table, each channel of your selected Input occupies a vertical column. In this example, the Input columns are labeled L, R, C, LFE, Ls, Rs, corresponding to the 5.1 channels you’ve selected to be output. It’s possible to specify setups with many more channels, in which case the left half of the table becomes scrollable.

- At the right of this table, each channel of your selected Output occupies a horizontal row that intersects the Input columns. In this example, the rows are labeled Left, Center, Right.

In this way, every Input column intersects with each Output row, making it possible for you to assign how much of each Input is fed to each Output by entering values into each intersecting cell.

To assign Input channels to Output channels, double-click the field where the desired Input intersects the desired Output, and type a value to set how much level from the Input to assign to the Output. Typing 0 assigns Input to Output at “unity” gain (0dB). Numbers you type here specify tenths of a dB. Typing -3 assigns half of the level from Input to Output. Typing -100 mutes that Input to that Output completely. Blank cells with no value make no assignment. In this example, we’re typing:

- **a.** 0 into cell L-1 to assign all of the Left source to the Left output
- **b.** 0 into R-3 to assign all of the Right source to the Right output
- **c.** 0 into C-2 to assign all of the Center source to the Center output
- **d.** -6 into Ls-1 to assign a fraction of Left surround to the Left output
- **e.** -6 into Rs-3 to assign a fraction of Right surround to the Right output
- **f.** -8 into LFE-1 to assign a smaller fraction of LFE to the Left output (LFE is not directional)
- **g.** -8 into LFE-3 to assign a smaller fraction of LFE to the Right output as well (LFE is not directional)
At this point, we've fully defined how much of which Input channels go to which Output channels. In the process, you can see that this table interface makes it possible to assign the full levels of Input channels to Output channels, to assign partial levels of Input channels to Output channels, and to assign fractions of Input channels to multiple Output channels.

The Inputs/Outputs Table of the B-Chain preset window fully populated to assign inputs to outputs

8 At this point, you should notice there are additional columns to the right of the Output channels that provide various options that let you fine-tune each channel’s output in order to optimize the acoustics and layout of your room:
   – Trim each channel (in tenths of a dB)
   – Add a Delay (in milliseconds)
   – Add specific EQ (None, LFE Only, Surr Mode)
   – Mute or Solo groups.

9 The last thing you need to do is to right-click each Output channel row’s right-most Output column, and choose the hardware output of your audio or video+audio interface that you want that channel to go to. See one of the following I/O Setup procedure for how to rename these options to make this easier.

Assigning I/O channels to output to

10 Once you've finished setting up your B-Chain preset, click OK, and that preset will be saved and available for use.

To choose a B-Chain preset to use and enable B-Chain:
   1 Choose Fairlight > Immersive > B-Chain Control to open the B-Chain Control dialog.
   2 Turn on the toggle at the upper left-hand corner of the window to enable B-Chain, and choose a preset from the pop-up menu.
   3 Choose the Input you want to assign that B-Chain preset to.
   4 A set of Solo and Mute buttons lets you selectively choose sets of channels you want to listen to in isolation, or mute from the whole, in order to better evaluate selected portions of your mix.
   5 A Fixed Level button lets you fix the output level in the DaVinci Resolve UI to a single value. With this enabled, you cannot drag the level slider to change the monitoring volume.
   6 When you're finished using B-Chain for monitoring, turn off the toggle at the upper left-hand corner.
NOTE: While the B-Chain is enabled, the Speaker Setup controls in the Video and Audio I/O panel of the Resolve System Preferences is disabled.

To name the various outputs of your system’s channels for easy assignment:

1. Choose Fairlight > Immersive > B-Chain Control to open the B-Chain Control dialog.

2. Click the Option menu in this window and choose Setup I/O Names. The I/O setup window appears, showing every single audio input and output on every audio interface that’s connected to and recognized by your system.

   The I/O Setup window lets you rename the Inputs and Outputs associated with your workstation setup, to make it easier to configure Fairlight when you’re managing hundreds of channels. The names you choose here are shown everywhere in DaVinci Resolve where channels are selectable and/or exposed.

3. To rename a channel, double-click that channel’s field in the Name column, type a new name, and press Return.

4. To protect a channel, click the checkbox in the Protect column. Protected channels are prevented from being patched to. This is intended for potentially high-volume speaker outputs, to which it would be hazardous to accidentally connect the wrong input. Protected channels can be seen everywhere patches can be made, but they’re grayed out. Protected channels can only be used in the Speaker Setup controls in the Video and Audio I/O panel of the Resolve System Preferences, and in the B-Chain Setup window.

5. When you’re finished, close the window. The names and protected status of channels are a system-wide setup.
Space View Channel Monitoring

Once you’ve configured your DaVinci Resolve workstation to mix audio via an Immersive format, you can use the Space View to facilitate surround sound mixing. Choose Fairlight > Immersive > Space View Scope to open the Space View window, which is a virtual representation of your control room with all defined source channels positioned in space according to the speaker that channel is intended to play out of. This view makes it easy to see which audio channels on which timeline tracks are playing out each speaker.

The Space View window gives you a spatial representation of what levels are playing where; this example show the various stems of a 5.1 mix

Each channel shows a label and a meter that lets you see, at any given part of the mix, what audio levels are playing where, spatially. However, you only see channels that are unmuted and with a fader level of more than -70dB. A checkbox lets you choose whether to see labels for all track channels in your mix, or to only show labels for track channels with active levels that are currently playing. The Space View is also aware of the state of all Solo controls, allowing you to quickly focus on just what you hear.
PART 15
Project Databases, Collaborative, and Remote Workflows
Chapter 177

Managing Databases and Project Servers

This chapter describes how to set up and use databases in greater detail, giving you more control over how projects are saved and organized, including how to set up project servers you can use to administer DaVinci Resolve projects that are available to multiple DaVinci Resolve workstations on the same network.

Why Use a Project Server?

Multiple DaVinci Resolve workstations can access the same project when you set up a Project Server that shares one or more PostgreSQL databases over a local network. Once you’ve set this up, there are two ways of using a shared database.

Multiple Users Sharing Projects

The simplest case is for users to simply open up a project on the Project Server and work on it. Working this way, if you ever have to change rooms, or switch workstations, you can easily open that same project from any machine that’s connected to the server on the same network without needing to export and import it first. For example, an assistant could be working with a colorist to prepare files for the next reel by conforming shots, managing VFX replacements, doing dust busting repairs, and so on in an unsupervised editing suite anywhere in the building, before saving their work and closing the project so the colorist can immediately open that same project in the grading theater across the hall.

Another way of taking advantage of shared Project Servers is to split large projects into sections, so multiple artists can work in parallel on different pieces of the whole in different suites, handing them off when necessary. For example, a feature film may be split into reels, or a film can be separated from the trailer and electronic press kit projects that it shares media with. In this case, each project can be edited, mixed, and graded by different people accessing the Project Server.

When a shared project is opened by someone else after it’s already been opened, a dialog informs you that it’s being opened in Read-only mode to prevent multiple users from accessing the project at the same time. If you load a Read-only project and decide you want to make changes anyway, you’ll need to use the Save As command to create a duplicate project file using a new name in order to preserve your work.

Using Collaborative Workflow

Alternately, you can use the Collaborative Workflow features in DaVinci Resolve to enable multiple collaborators on multiple workstations in multiple rooms to open and work on the very same project at the same time. For example, an editor can be editing a project’s main timeline in one room, while an assistant organizes media and adds metadata within the same project in another room, and a colorist grades dailies in that same project in yet another room, all accessing the same Project Server which allows them to work together in parallel. For more information, see Chapter 178, “Collaborative Workflow.”

All participants in a Collaborative Workflow must have the Studio version of DaVinci Resolve, and they must be using a PostgreSQL database on a Project Server that’s properly set up.
Know Which Version of PostgreSQL You’re Using

Starting with DaVinci Resolve 12.5.4 on macOS, DaVinci Resolve requires PostgreSQL 9.5, which is necessary for compatibility with macOS versions above 10.12 Sierra. All previous versions of DaVinci Resolve on macOS use PostgreSQL 8.4, and you must upgrade PostgreSQL before upgrading to macOS 10.12 Sierra or later.

**IMPORTANT** If you’re upgrading from a previous version of DaVinci Resolve that uses 8.4 to a new version of DaVinci Resolve that uses 9.5, it’s vital you read the instructions located in /Library/Application Support/Blackmagic Design/DaVinci Resolve/Upgrade PostgreSQL/ before you upgrade.

If you’re unsure what version of PostgreSQL you’re using, check to see what versions appear in the /Library/PostgreSQL/ directory.

The /Library/PostgreSQL/ directory on macOS systems shows which versions of PostgreSQL you’re using.

Using the DaVinci Resolve Project Server Application

When you install DaVinci Resolve, an additional application is installed in the DaVinci Resolve application directory on macOS and Windows, called DaVinci Resolve Project Server. This is a stand-alone application that lets you create, manage, backup, restore, and most importantly share project databases on any workstation. Using this application, it’s not necessary to launch DaVinci Resolve just to manage your databases, and it’s no longer necessary to use Terminal to set up database sharing as before (although you still can if you want to).
The DaVinci Resolve Project Server Interface

The DaVinci Resolve Project Server interface greatly resembles the DaVinci Resolve Project Manager with the Databases sidebar open. However, a toolbar at the top exposes all of the database management tools that are available for creating and managing databases, including controls for sharing databases and creating access keys that are essential for quickly and easily creating and connecting to Project Servers.

The DaVinci Resolve Project Server window

This window has three main UI areas:

- **Databases list:** Unlike the Databases sidebar in the Project Browser of DaVinci Resolve, in which you can disconnect databases you no longer want to use, the Databases list in the Project Server application shows every single DaVinci Resolve PostgreSQL database on your machine. This makes it easy to find databases you’ve disconnected that you want to reconnect.

- **Projects browser:** Shows all projects and folders within the currently selected database.

- **Toolbar:** A toolbar at the top of the window shows you all of the functions that are available for managing DaVinci Resolve databases on your workstation.
  - **Enable Sharing:** Selecting a database and clicking this button lets you turn the workstation you’re on into a Project Server. When you select a database that’s already shared, this button changes to Disconnect Database. This process is described in greater detail in the next section.
  - **New Database:** Lets you create new databases without needing to open Resolve.
  - **Optimize:** Only available for PostgreSQL databases. Sometimes, databases in DaVinci Resolve can become so large that the size affects performance. In these cases you may need to optimize it to improve access speed by “vacuuming” the database of unnecessary spaces and reindexing it. You can now also access the
Optimize Project command directly from the Project Manager window. Simply hover the mouse over your project in the Project Manager, hold down the Option key, and right-click. Then select Optimize Project in the menu.

- **Backup:** You can back up databases just like any other file. This provides added protection should your system drive fail, but a database backup can also be used to move multiple projects between systems (particularly if you’re using PostgreSQL). Clicking this button exports the currently selected database, with all enclosed projects, to a self-contained .resolve.backup file.

- **Restore:** Imports .resolve.backup files to restore a backed up database.

- **Add Folder:** Creates a project folder inside whatever database is currently selected.

- **Create Access Key:** Selecting a database and clicking this button exports an access key file that you can send to other users to quickly connect their workstation to a shared Project Server. This process is described in greater detail in the next section.

Using the Project Server Application to Manage Databases

The DaVinci Resolve Project Server utility is useful for accomplishing all kinds of administrative tasks.

Creating New PostgreSQL Databases

If necessary, you can create new PostgreSQL databases right within this utility.

**To create a new PostgreSQL project database:**

1. Click the New Database button in the toolbar.

2. When the New Database window appears, type a name for the new database into the Name field. Because all projects in a PostgreSQL database are saved internally within the PostgreSQL database, no other changes are necessary.

3. Click Create, and the new disk database will appear in the Databases list.

Backing Up and Restoring Databases

You can also back up and restore databases without needing to open Resolve. Furthermore, you can back up databases even if they’re out of date, making it easy to back up databases for safety before you upgrade them.

**To back up a database for safekeeping:**

1. Select the database you want to back up in the Databases list.

2. Click the Backup button in the toolbar.

   ![Backup button](Backup.png)

   The Backup Database button in the toolbar

3. Choose a location to which to save the backup in the Backup Database dialog, and click Save.
To restore a database you've backed up previously:

1. Click the Restore button in the toolbar.

2. Find the database you need to import using the file import dialog, and click Open. The database you've restored should now appear in the Databases list.

Upgrading Databases

From time to time, new versions of DaVinci Resolve require changes to the way projects are created, which requires databases created with older versions of DaVinci Resolve to be upgraded before you can access the projects within. Fortunately, this is a simple process.

To upgrade a database made or used with an older version of DaVinci Resolve:

Right-click any database with an upgrade badge to the right of the database name, and choose Upgrade from the contextual menu.

Reconnecting Databases You PreviouslyDisconnected

Unlike the Project Manager in DaVinci Resolve, the DaVinci Resolve Project Server application shows you every single DaVinci Resolve database on your computer, whether it's connected to Resolve or not. For this reason, it's a good way to find the names of databases that have been disconnected, either deliberately or accidentally, in order to reconnect them.

To reconnect any database on your workstation:

1. Open the DaVinci Resolve Project Server application.
2. Find the database you want to reconnect in the Databases list at the left.
3. Open DaVinci Resolve.
4. When the Project Manager window appears, open the Databases sidebar, and then drag the database you want to reconnect from the DaVinci Resolve Project Server window to the Database list of the Project Manager. That database is reconnected and appears in the Database list.

Sharing Databases to
Create a Project Server

You can also use the DaVinci Resolve Project Server to easily set up a shared Project Server on your local network. However, for this to work, you need to adhere to the following requirements:

- All workstations need to be connected to the Project Server on a local network.
- All network connections should be reasonably fast (preferably Gigabit Ethernet or faster).
- The computer functioning as the Project Server should be reasonably fast, but it doesn’t need fast GPU processing.
- The Project Server should have DaVinci Resolve installed, but it doesn’t need a dongle or serial number, nor need it be the Studio version.
The following procedures describe how to set up a shared Project Server, and how to export an access key with which to easily set up other workstations to connect to it.

To set up a workstation as a DaVinci Resolve Project Server:

1. Open the DaVinci Resolve Project Server application, found in the DaVinci Resolve application folder.
2. Select or create a DaVinci Resolve project database you want to share, and click the Enable Sharing button.
3. When a dialog appears asking if you want to authorize the configuration of your PostgreSQL server. Click Authorize. That database can now be shared among other Resolve workstations on the same network.

Once you've set up a Project Server, it's easy to connect other machines to that server using access keys that you can create using the DaVinci Resolve Project Server application.

To create an access key to enable easy connection to a Project Server:

1. With the DaVinci Resolve Project Server application open, select a database that you've set up to share, and click the Create Access Key button to the right in the toolbar.
2. Choose a location via the Create Access Key dialog, and click Save. An access key file is saved to the location you chose with the file extension .resolvedbkey.
3. Copy the .resolvedbkey file to the workstation you want to connect to the shared database.
4. Open Resolve, and when the Project Manager appears, open the Databases sidebar, and then drag the .resolvedbkey file and drop it anywhere within the Project Manager. The shared database should now appear in the Databases sidebar, and if you select it, you'll see all of the projects that are located in that database on the Project Server.

If necessary, you can also disable sharing for any database, preventing remote access to it from other workstations on the network.

To disable sharing:

1. With the DaVinci Resolve Project Server application open, select a database you enabled sharing for, and click the Disable Sharing button to the left in the toolbar.
2. When a dialog appears asking if you want to authorize the configuration of your PostgreSQL server. Click Authorize. That database will no longer be shared.

IMPORTANT: If you enable sharing on a computer that is later moved to another network (for example, if you set up Project Server sharing on a laptop), you'll need to disable sharing and then re-enable it before you create access key files that will successfully connect to the new network location.
Manually Setting Up a Linux Project Server

These instructions are only appropriate for systems created with the DaVinci Resolve CentOS 6.x/7.3 build image ISO. The default PostgreSQL install is set up to only allow connections to the database from the local host IP address. Remote systems will not be able to access the database. To change this, you need to modify the “pg_hba.conf” file as detailed below.

Open a shell on the desktop and type:

```
su<ENTER>
```

You’ll be prompted for the password. The password will be “DaVinci” for DaVinci Resolve Legacy CentOS 6.x installs. For CentOS 7.3 installs, the password is whatever root password you chose.

Based on which install you have, type either of the following:

For legacy DaVinci Resolve installs:

```
cd /db/PostgreSQL/8.4/data<ENTER>
```

For CentOS 7.3 standalone DaVinci Resolve installs:

```
cd /db/PostgreSQL/9.2/data<ENTER>
```

This puts you into the directory with the “pg_hba.conf” file.

Next, type:

```
ls<ENTER>
```

This lists the files in the directory. Make sure you see the pg_hba.conf file. If you do not, type `pwd<ENTER>` to make sure you are really in the proper directory.

Next, type:

```
cp pg_hba.conf pg_hba.conf.bk<ENTER>
```

This makes a backup copy of “pg_hba.conf” in case something goes wrong.

Next, use a text editor such as vi or nano to edit the “pg_hba.conf” file. Once you have the file open in a suitable editor, go to the bottom of the file and add the following line:

```
host all all 192.168.1.88/24 md5
```

Use the tab key to format the text to match the line above, just to keep things tidy. More importantly, the “192.168.1.88” IP address used above should be replaced by the IP address of your actual server; this will allow any other computer on the 192.168.1.x subnet (or whatever YOUR actual subnet is) to access the database. Note that there is no space after the 88 and before the /24.

Once you have added the line above, save the changes and exit the editor. As a sanity check, you can type:

```
cat pg_hba.conf<ENTER>
```

This shows the contents of the file and verifies that your change at the end of the file is correct.

Lastly, enter the following:

```
service postgresql restart<ENTER>
```

This restarts the PostgreSQL server, which will now use the new “pg_hba.conf” information. After the restart, other DaVinci Resolve systems on the same network subnet should be able to create and connect to databases on this server.
Multi-user collaborative workflow has been significantly altered after DaVinci Resolve 14, using “bin locking” to manage who has access to what when multiple collaborators open the same project. However, collaborative workflow also allows multiple artists to do simultaneous editing, compositing, grading, and metadata entry to clips on the same timeline within a single project for which Collaboration has been enabled. Multiple users can simultaneously access the same timeline within the same project to edit, composite, and grade at the same time, while other editors and assistants can open different bins containing different timelines within the same project to do editorial and media management. This chapter describes how to set up multiple DaVinci Resolve workstations to collaborate, and how to use bin locking to work together.
Introduction to Collaborative Workflow

Multi-user collaborative workflow allows simultaneous editing, compositing, grading, and Media Pool clip management by multiple people within a single project that has been enabled for collaboration. Collaboration takes three different forms:

- Using bin locking, multiple editors can simultaneously edit different timelines in different bins of the same project, while assistant editors can reorganize clips and edit the metadata in other bins within the same project. Bins are automatically locked when selected by a particular user and unlocked when deselected by that same user, or they can be manually set to be either locked or unlocked as circumstances require.

- Using clip locking, multiple colorists and compositing artists can work together in the same timeline, in either the Color page or Fusion page, without fear of overwriting one another’s work. A clip is locked automatically when a user selects that clip to work on, and is unlocked (with the work checked in) when that same user selects a different clip. Clip locking in the Fusion page is maintained separately from clip locking on the Color page, so a compositing artist and colorist can work together on the same shot.

- One editor, one compositing artist, and one colorist can work together on the same clip in the same Timeline of the same project without conflict.

Overall, working in DaVinci Resolve in Collaborative Workflow mode is identical to working in non-collaborative mode. However, there are a few collaborative capabilities that are worth knowing about.

Collaborative Render Cache Support

Each collaborator on a project can have individualized render cache settings on their machine, enabling everyone to cache to a format that their workstation can best handle and that meets their needs.

Collaborative Support for Individual Monitoring

If necessary, each collaborator on a project can override the output and monitoring settings of a project on their particular workstation. When a project is set to use Collaborative Workflow, a “Use Local Overrides” checkbox appears in the Video Monitoring group of the Project Settings that lets you choose how to monitor on your particular workstation.

Collaborative Marker, Flag, and Clip Color Support

Collaborative workflow supports the modification of markers, flags, clip metadata, and clip color from the Color page. Additionally, FrameIO comment markers are supported by collaborative workflow.

Read Only Mode

Users can load collaborative projects in Read Only Mode.

Collaborative Support for HDR

Starting with DaVinci Resolve 16, there is support for Dolby Vision and HDR10+ in collaborative workflows.
Requirements for Collaboration

In order to use collaborative workflow:

- All users must be using the paid Studio version of DaVinci Resolve.
- All users must be working on a project that's been saved on a properly configured Remote Database Server. This Remote Database Server can be on one of the actively used DaVinci Resolve workstations, or it can be another computer on your network that simply hosts shared projects, but it should be on a computer that is never shut down or put to sleep, to prevent projects suddenly becoming unavailable.
- All machines participating in a collaborative workflow must be networked. They can be on the same local area network (LAN), but you can also connect computers on different subnets.
- Shared projects should ideally use media on some type of fast storage area network (SAN), with each collaborator connected to that SAN so that every workstation that's connected to the project being collaborated on has direct access to the same media. In a pinch, shared volumes over a network will work, but proper SANs will provide significant performance benefits. Facilities using multiple computer platforms (macOS, Windows, and Linux) together can use the Mapped Mount option of the Media Storage Locations list, found in the DaVinci Resolve System Preferences, to facilitate cross platform drive connection.

For more information on setting up a Database Server, see Chapter 177, “Managing Databases and Project Servers.”

Enabling Project Collaboration

Starting with DaVinci Resolve 14, the process of initiating a collaborative workflow has been vastly simplified over previous versions.

To open a project and initiate a collaborative workflow:

1. Open DaVinci Resolve on a computer that’s connected to a Remote Database Server.
2. Open any project on the remote database DaVinci Resolve is connected to using the Project Manager.
3. When the project is open, choose File > Enable Collaboration.

Once collaboration is enabled, two additional buttons appear at the lower right-hand corner of the DaVinci Resolve interface, next to the Project Manager and Project Setting buttons. These are the Collaboration Chat and Collaboration buttons.

NOTE: When you enable collaboration, the “Auto conform missing clips as media is added to Media Pool” option in the General Options panel of the Project Settings is automatically disabled, as it interferes with collaborative workflow. Also, Live Save is automatically turned on in the Auto Save panel of the User Preferences, to ensure that all collaborators’ work is saved regularly to avoid conflicts between collaborators.
Opening Projects to Collaborate

Projects that have Collaboration enabled appear with a badge below their thumbnail in the Project Manager to let you know that project is available for collaboration.

At this point, anyone else who has access to this Remote Database Server can simply open this project up and work collaboratively with you. Whenever a collaborator opens the same project you’re working in, the Collaboration Chat button at the bottom of the DaVinci Resolve UI highlights to let you know you have a message.

Opening the Collaboration Chat window shows who’s collaborating with you.

Customizing Your Collaborator Identification

Once you’ve set up a project for collaboration, you want to make sure it’s easy to tell all your collaborators apart. Clicking the Collaboration button opens a list of all collaborators, or project members, working in that project.
Opening the Collaboration list shows all the current project members. The top member is you, and you can change the name you use by editing the text field. Additionally, you can click the icon to the left and choose a new color for yourself from the icons in the pop-up menu below. All the badges that indicate who has a lock on which folders, timelines, and shots are color-coded, so it’s a good idea for everyone to choose their own custom color so you can tell who’s doing what.

How Collaboration Works

At its simplest, collaborative workflow uses a “first come, first served” model to manage who has can make changes to what. Essentially, the first collaborator to select a bin in the Media Pool, open a timeline, or select a clip in the Fusion page or Color page gets a “lock” on that item. Once an item is locked (indicated by a colored collaborator badge), other collaborators can look at it, but they cannot make changes. This prevents versioning conflicts from occurring.

Bin and clip locks are released when a collaborator selects a different bin or timeline in the Media or Edit pages, or a different clip in the Fusion page or Color page. At that point, the changes that have been made to the previously locked item are “checked in” and made available to all collaborators once they refresh their project (by clicking a circular refresh icon that appears to the right of bins in the Media Pool or in the corner of the Edit page Viewer).

All changes that collaborators make are automatically saved to the project as they’re made, via Live Save (which is always on in Collaborative mode), so no work will ever be lost as you collaborate with your team. However, each collaborator gets to decide when they want to update the bin, timeline, or clip they’re currently working on to see the changes made by everyone else, in order to prevent a kaleidoscope of constant alterations to compositions and grades from being a distraction while you’re working.

The following sections describe Bin and Timeline locking and Clip locking in more detail.
Automatic Bin and Timeline Locking

Whenever a collaborator opens a particular bin, that bin and its contents are locked, preventing any other collaborators who open that project from making alterations to anything inside that same bin. This prevents versioning conflicts while work is in progress. When a bin is locked, you can still view its contents, if for instance you just need to figure out where a particular clip has been put, but you can’t make changes.

Furthermore, when a collaborator opens a timeline in either the Edit or Fairlight pages, whatever bin that timeline is in is locked as well, along with any other timelines or clips in that bin. Collaborators can open locked bins and see the contents for reference, but they cannot make any organizational or editorial changes. The only things that can be changed once a bin and its contents are locked are the creation or alterations of clip compositions in the Fusion page, and alterations to clip grades in the Color page.

You can always tell when a collaborator has a lock on a bin and its contents because a badge appears to the right of the bin in the Bin list, and in the corner of timeline thumbnails that are visible in the Media Pool browser area. Hovering the mouse over that badge in the Bin list reveals a tooltip with that collaborator’s name.

An icon indicates that another collaborator has a lock on the Reel 2 bin, the Pool Shark (Trimming) timeline, and the Alternate bin.

Once a collaborator (someone other than you) makes changes to a bin’s contents or to a timeline, you’ll see a circular “refresh” badge appear by each affected bin in the Bin List of the Media Pool. Click these badges whenever you want to update your version of the shared project with all organizational and editorial changes made by others in that bin.

An icon indicates that another collaborator has made changes, clicking it refreshes your project to show those changes.

To release a bin or timeline, simply select another bin or timeline. It’s that simple.
Managing Bin Locks Manually

You can also manually control the locked state of bins, during instances where you want to keep bins locked for future use or prevent them from becoming locked when you only want to browse the contents.

Keeping Bins Locked

If you want to lock one or more bins that you know you’re going to be switching among to either prevent other collaborators from making changes or so that nobody else inadvertently prevents you from having access, you can right-click one or more selected bins and choose Lock Bins to lock them. Bins locked in this way remain locked, even when you deselect them, until you right-click them again and choose Unlock Bins.

![Manually locked bins stay locked even when they’re not selected](image)

Keeping Bins Unlocked

Additionally, you can choose to keep bins unlocked when selected. For example, you may just want to examine the contents of a bin without keeping someone else from editing its contents. In this case, simply Option-click any bin to open that bin in read-only mode, which is indicated by an eyeball badge to the left of that bin in the Bin list. In this mode, any other collaborator can still lock that bin while you’re examining its contents. Selecting any other bin will clear this read-only status.

![Selecting a bin in read only mode allows collaborators to lock that bin while you examine its contents](image)

**TIP:** While a bin is open but manually unlocked by you, you can still open clips into the Source Viewer and add markers to them, so long as another user doesn’t select that same bin and lock you out.

Manually Unlocking Timelines

You can also manually manage the locking of timelines. Ordinarily, opening a timeline automatically locks other collaborators out of making changes to that timeline, and also locks the bin that timeline appears within. However, if you’ve finished making changes to a timeline and you want to release it to other collaborators for immediate work, you can unlock the currently open timeline.
To unlock a timeline to let other collaborators work on it:

1. Right-click that timeline in the Media Pool and choose Timelines > Unlock Timeline from the contextual menu.

2. Your collaborator will then need to right-click the Media Pool bin the timeline is in to be able to edit it.

**Automatic Clip Locking**

Clip locking in the Fusion and Color pages works similarly. As multiple compositing artists work in the Fusion page, and multiple colorists work in the Color page, the first compositing artist or colorist to select any given clip has an automatic lock on that clip. Other compositing artists or colorists will see a badge on that clip in the Thumbnail timeline showing that it’s locked as well as letting them know who has the lock. In the following screenshot, a green badge at the corner of clip 12 in the Color page Thumbnail timeline indicates that clip is locked.

![Badges in the Thumbnail timeline indicate which clips are locked because a collaborator is grading them](image)

**Automatically Checking In Work When You Change Clips**

When you’re finished with the clip you’re working on, you need only select another clip for the changes you made to the previously selected clip to be automatically saved and pushed to all other colorists who are working on that timeline in the Color page. No refresh is needed. This is the main difference between clip locking in the Color page and bin locking.

**Compositing Artists and Colorists Can Work Together**

The Fusion page and Color page each maintain separate clip locks. This means that for any given pool of compositing artists, only one will be able to work on a given clip at a time, while in the Color page only a single colorist will be able to work on a clip at a time. However, because Fusion and Color page clip locking is maintained separately, that means that one compositing artist and one colorist can work on a single clip in the timeline simultaneously, even while an editor is working on that timeline.

**Receiving Changes Made by Collaborators**

As you work collaboratively, it will be common for groups of compositing artists to be executing multiple compositions at a time, while colorist and their assistants will be working on the grade, and an editor and their assistants will be refining the edit, all working together within the same project.
Receiving Changes On the Edit Page

While compositors are compositing and colorists are grading clips within the same timeline of the same project, each clip that’s adjusted in the Fusion or Color page triggers a Refresh badge to appear in three areas of the Edit page, so the collaborating editor(s) can decide when to update their timeline to see the changes that have been made.

- At the upper right corner of the Timeline Viewer. Clicking this badge refreshes the composites and grades of all clips in the currently open Timeline.

- At the right of the bin containing the modified timeline in the Media Pool’s bin list. Clicking this badge refreshes all clips in the Timeline within that bin.

- At the upper-right hand corner of each modified clip in the Timeline.
Receiving Changes On the Fusion and Color Pages

For collaborators working on the Fusion or Color pages, other badges indicate when editors have made changes to the Timeline, or when other compositing artists or colorists have made changes to other clips in that timeline.

- Timelines that you’re locked out of because another collaborator has a lock on them are indicated by a badge at the upper right corner of the Viewer, while changes made to the Timeline by editors on the Edit page are indicated by a refresh badge in the same location. Clicking this badge refreshes all clips in the Timeline.

- If you open up the Media Pool, then a badge appears at the right of any bin in the Bin List that’s been reorganized or that contains a modified timeline. Clicking this badge refreshes all clips in the Timeline within that bin.

- A badge appears at the upper-right hand corner of each clip in the Thumbnail timeline that’s been modified by a fellow compositing artist or colorist. Clicking a single clip’s badge updates that clip alone.

- A badge appears over clips in the Timeline with grades that have been updated. Clicking this badge refreshes just that clip.
Examples of Collaborators Working Together

The first collaborator that opens a timeline is the only person that can make editorial changes to that timeline in the Edit or Fairlight pages. Other collaborators who open that project are "locked out" of making changes to the Edit or Fairlight pages, but they can see the Timeline, and they can make grading changes in the Fusion or Color pages. This means in situations where you want multiple editors to be working on a project, it can be ideal to organize your program into separate "reels," where each reel of a project is a separate timeline in a separate bin.

Multiple Editors Working Together

The first collaborator that opens a timeline is the only person that can make editorial changes to that timeline in the Edit or Fairlight pages. Other collaborators who open that project are "locked out" of making changes to the Edit or Fairlight pages, but they can see the Timeline, and they can make grading changes in the Fusion or Color pages. This means in situations where you want multiple editors to be working on a project, it can be ideal to organize your program into separate "reels," where each reel of a project is a separate timeline in a separate bin.

On the other hand, if two or more editors must both work on the same timeline, this can be accomplished using duplicate timelines and then merging the changes back together later on. For example, collaborating editor Anne can do the following to make changes to a timeline that editor Erin is already working on:

- First, Anne can duplicate the locked timeline into a separate bin from the one Erin has a lock on. Alternately, Erin could be proactive and duplicate the timeline into a separate bin in advance.
- Second, Anne will re-edit the duplicate timeline to make whatever changes are necessary to a different scene than the one Erin is currently working on. Working on different scenes is the cleanest and easiest way of using this workflow.
- Third, Anne uses Collaborative Chat to notify Erin that the changes are finished.
- Fourth, Erin then refreshes the project to see Anne's updated duplicate timeline in the Media Pool, right-clicks it, and chooses Compare With Current Timeline from the contextual menu to show the Timeline Comparison window that makes it possible to merge the changed section of the duplicate timeline with the original timeline that Erin already has open.

In the following screenshot, Erin's highlighted changes (made while Anne was working) can be seen at the left, and Anne's highlighted changes can be seen at the right. Right-clicking within the right highlighted area reveals an Accept Change command that lets that scene's changes be merged from the duplicate timeline back to Erin's original timeline.
Using the Compare With Current Timeline command lets you see the differences between two differently edited versions of the same timeline, and merge a scene’s worth of changes that a collaborator has made (at right) back to the original timeline.

For more information on comparing timelines, see Chapter 26, “Creating and Working with Timelines.”

Editors and Assistant Editors Working Together

Collaborators can edit metadata, create new bins, and reorganize clips within unlocked bins only. This means that your project should be organized so that an editor can lock the contents of the bins they need to work with at a given point in time, while the assistants can work on additional timelines and media within other bins in that project.

However, in addition to being able to copy timelines from a locked bin to a bin that you control, you can also copy clips from one timeline to another. In this way, if you absolutely need to make changes to source clips while the original source clips are locked, you can make your changes to copies of these clips.

Editors and Compositing Artists Working Together

Editors and compositing artists can work together closely, since compositing artists can create compositions for one or more clips in a timeline while it’s being edited, even though that timeline and the bin it’s in are locked to other editors.

Here’s an example of an editor working on a commercial spot with a lot of greenscreen material working together with one or more compositing artists.

- First, the editor cuts together each foreground clip with actors performing as a rough cut, and once that rough cut is assembled, they edit in the background clips that accompany each greenscreen clips to create a series of stack of clips.
- Second, the editor selects each stack of clips, one by one, and uses the New Fusion Clip command to create Fusion clips that the compositing artists can work on. By making each of these clips into Fusion clips, the editor is making it easy for the compositing artists to have access to all the clips necessary for each composition from within the Fusion page, collaboratively.
- At this point, the editor uses collaborative chat to notify the compositing artists that there are composites ready for them to work on, and the editor can then turn their attention back to refining the edit.
- Upon being notified that they can begin work, one or more compositing artists start working through the Fusion clip compositions while the editor is working, to create each multi-layered composite that’s necessary. As each compositing artist finishes a clip and moves to a new clip to begin work, the editor sees a notification badge at the upper right corner of each clip in the Timeline that’s been composited, as well as notification badges in the Bin List of the Media Pool, and at the upper right corner of the Timeline viewer. Clicking any of these badges will refresh one or more of these clips, so the editor can see the changes.
Multiple Compositing Artists Working Together

To prevent versioning issues, only one compositing artist can work on a particular clip at a particular time in the Fusion page, and the first compositing artist to select a clip puts a lock on that clip. Other collaborators looking at the Thumbnail timeline in the Fusion page will see a small icon that shows it’s locked, letting them know they can’t make any changes to it until whoever is working on that composition moves to another clip.

This means that multiple compositing artists can’t work on the same composition at the same time. However, an assisting compositing artist can do preparatory work on one composition, such as doing rotoscoping, paint, particle system design, or any other time-consuming task, while a lead compositing artist works on another shot in the meantime. Once the assisting compositor is done, they can select another clip to work on and use collaborative chat to let the other compositor know they’re done and that clip is ready for more work.

In order to prevent half-finished work from being disseminated to other collaborators, a clip that’s in the process of being worked on in the Fusion page isn’t updated for anyone else who’s working on that same timeline until the compositing artist who’s working on it selects another clip. Immediately upon being deselected, all changes are automatically checked in and made available to all other collaborators, who see notification badges in the Fusion page and the Edit page to alert them that changes are available and that they can refresh their timeline to see the updates.

Editors and Colorists Working Together

Colorists and editors can work together very closely in DaVinci Resolve, as colorists can grade the shots of a timeline that an editor is currently working on, even though that timeline and the bin it’s in are locked to other editors.

From the colorist’s point of view, whenever the editor makes an alteration to the Timeline, a badge appears at the upper right hand corner of the Color page Viewer to indicate that a change has been made to the timeline being graded. Clicking this badge updates the timeline the Colorist is working on.

In order to prevent half-finished work from being disseminated to the editor (or worse, being seen by the client), clips that are in the process of being graded aren’t updated for other collaborators that are looking at that timeline until the colorist who’s working on it “checks in” their work by selecting another clip. So, from the editor’s point of view, whenever a colorist has finished grading a clip and has selected another clip to grade, a series of badges appear in the Edit page, one on the clip that’s been graded, one on the Timeline Viewer and one on the bin in the Bin List that contains the Timeline. Clicking any of these badges updates the Timeline with the latest grades.
Multiple Colorists Working Together

Only one colorist can work on a particular clip at a particular time, and the first colorist to select a clip puts a lock on that clip. Other collaborators looking at the Thumbnail timeline in the Color page will see a small icon that shows it’s locked, letting them know they can’t make any changes to it until whoever is grading that clip moves to another clip.

A small icon indicates that you’re locked out because another colorist is grading that clip

In order to prevent half-finished work from being disseminated to other colorists or editors, a clip that’s in the process of being graded isn’t updated for other collaborators that are looking at that timeline until the colorist who’s working on it selects another clip. These changes are then automatically made available to all other collaborators working in the Color page, who see badges appear in the Edit and Color pages to indicate which clips have updates available.

This makes it easy for multiple colorists to work together. For example, an assistant colorist can be notified via Collaborative Chat to draw a custom window that a senior colorist needs for a grade. The assistant opens that timeline in another suite, selects the appropriate clip, and draws the window. Once finished, the assistant simply selects a different clip, and the changes they’ve made are immediately available to the senior colorist, who sees a badge on that clip in the Thumbnail timeline and can click to update it.

Managing Notes Among Collaborators

If an editor wants to send a note to colorists or compositing artists, they can do one of the following:

- They can add a marker with note text to the Timeline ruler (the marker appears in the marker submenu in the Color page Viewer option menu)
- They can add a marker with note text to a clip (that marker appears in the mini-timeline of the Color page)
- They can color code clips in different ways to get the colorist’s attention (clip color coding appears as a dot in the Thumbnail timeline).
- Of course, the editor and colorist can always interact via the collaborative chat window, as well.
Collaboration Chat

To facilitate communication among collaborators, DaVinci Resolve has built-in text chat, called Collaboration Chat. Simply click the Collaboration Chat button to open the chat window, and chat away.

The Collaboration Chat window for communication among collaborators

The Collaboration Chat button at the bottom of the DaVinci Resolve interface highlights whenever someone texts while this window is closed, letting you know you have messages that are waiting.

Chapter 179

Remote Grading

This chapter describes how to set up and use two separate DaVinci Resolve systems in different locations via the internet, to have one system remotely control the other for color grading.

Introduction to Remote Grading

To enable colorists to work interactively with clients across the globe, DaVinci Resolve offers a remote grading option. It allows two matching DaVinci Resolve systems to be synchronized via an Internet connection such that changes made on the colorist’s workstation are immediately applied on the remote client’s workstation.

Cue commands are also synchronized to ensure that both systems are always on the same frame in the Timeline. Starting or stopping playback on the colorist’s DaVinci Resolve also starts and stops the remote client system. While a remote grading session is in progress, input from the user at the remote client’s DaVinci Resolve workstation is ignored.

Currently, the remote grading feature supports only color correction and does not allow editing or conforming during a session. The two colorist and remote DaVinci Resolve systems must have matching timelines and the number of clips, clip durations, and system resolutions must match. The requirements and limitations of a remote grading session are summarized below.

Requirements for Remote Grading

- The same version of DaVinci Resolve must be installed on both systems.
- The Timeline to be graded must be conformed on both machines prior to the start of the remote grading session.
- The number of clips on the Timeline and the duration of each clip must be identical.
- While grading, the active Timeline and versions on the remote client system are constantly updated. Creating, deleting, or switching the Timeline on the client’s DaVinci Resolve is not allowed. Doing so will terminate the remote grading session immediately.
- You cannot make any grading adjustments on the remote client’s DaVinci Resolve workstation until the remote grading session has ended.

NOTE: Remote grading does not require a shared database.
Setting Up for Remote Grading

To start a remote grading session, the client’s DaVinci Resolve must be able to connect to the colorist’s system using TCP/IP.

1. Open DaVinci Resolve on the remote client’s workstation (the one that’s being remotely controlled), log in, and open the project that will be remotely graded.

2. Choose Workspace > Remote Grading (Ctrl-G) on the remote client’s workstation. A window is displayed with text fields to enter the IP address and port number of the colorist’s system.

3. Set the IP address field to the IP of the colorist’s DaVinci Resolve workstation. If the colorist’s system already has a public IP address, the port number can be left at its default value (15000). If the colorist’s system is on a private network, the colorist or their network administrator should set the port number to one on the public IP router that is internally routed to port 15000 of the colorist’s DaVinci Resolve.

4. Once the remote client clicks Connect, the client’s DaVinci Resolve system will attempt to establish a connection with the remote colorist’s workstation.

5. Once the connection is established, a pop-up appears on the colorist’s screen asking for permission to accept a Remote Grading connection.

6. Click OK to accept, minimize the size of this dialog window, and continue grading normally.

The Remote Grading session will remain active until one of the users chooses to disconnect or an error occurs causing DaVinci Resolve to automatically terminate the session.

Remote Grading Restrictions

To allow operation over low bandwidth and a potentially long latency Internet connection there are some restrictions to remote operation.

• When playback is started, the playback speeds on the two DaVinci Resolve systems may differ. The frame positions are only guaranteed to be synchronized when playback is stopped.

• Input/output/display LUTs applied from the Config page on the colorist’s DaVinci Resolve will not have any effect on the client system. LUTs selected on the client’s DaVinci Resolve will be applied instead.

• Presets applied from the Config/Color pages on the colorist’s system will not have any effect on the client’s system. Presets selected on the client’s DaVinci Resolve will be applied instead.

Regulatory Notices

**Disposal of waste of electrical and electronic equipment within the European union.**
The symbol on the product indicates that this equipment must not be disposed of with other waste materials. In order to dispose of your waste equipment, it must be handed over to a designated collection point for recycling. The separate collection and recycling of your waste equipment at the time of disposal will help conserve natural resources and ensure that it is recycled in a manner that protects human health and the environment. For more information about where you can drop off your waste equipment for recycling, please contact your local city recycling office or the dealer from whom you purchased the product.

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. Operation of this product in a residential area is likely to cause harmful interference, in which case the user will be required to correct the interference at personal expense.

Operation is subject to the following two conditions:

1. This device may not cause harmful interference.
2. This device must accept any interference received, including interference that may cause undesired operation.

**ISED Canada Statement**
This device complies with Canadian standards for Class A digital apparatus. Any modifications or use of this product outside its intended use could void compliance to these standards.

Connection to HDMI interfaces must be made with high quality shielded HDMI cables.

This equipment has been tested for compliance with the intended use in a commercial environment. If the equipment is used in a domestic environment, it may cause radio interference.
Safety Information

Weight Warning
The Fairlight Console has considerable weight even when empty. For example, a 3 Bay console weighs up to 110 kg empty, and 157 kg fully assembled. You should always move a Fairlight console with at least 4 people using safe lifting procedures, such as keeping the back straight, bending the knees and lifting with careful, controlled movements.

Electrical Warning Notice and Disclaimer
For installations involving the fitting of more than five Fairlight modules, additional earthing requirements must be fitted before connecting the supply. This requirement does not apply if each group of five Fairlight modules can be connected to separate wall or floor socket outlets.

Earth posts are welded internally at both ends of the console frame for connecting earth wires from the console frame to the building earth point. Either of these posts can be used and they are marked with the following label.

Blackmagic Design recommends appointing a qualified and licenced electrician to install, test and commission this wiring system.

Blackmagic Design does not accept responsibility for the safety, reliability, damage or personal injury caused to, or by, any third-party equipment fitted into the console.

To reduce the risk of electric shock, do not expose this equipment to dripping or splashing.
Ensure that adequate ventilation is provided around the product and is not restricted.

Use only at altitudes not more than 2000m above sea level.
No operator serviceable parts inside. Refer servicing to your local Blackmagic Design service centre.

State of California statement
This product can expose you to chemicals such as trace amounts of polybrominated biphenyls within plastic parts, which is known to the state of California to cause cancer and birth defects or other reproductive harm.
For more information go to www.P65Warnings.ca.gov.
Warranty

12 Months Limited Warranty

Blackmagic Design warrants that DaVinci Resolve control surface will be free from defects in materials and workmanship for a period of 12 months from the date of purchase. If a product proves to be defective during this warranty period, Blackmagic Design, at its option, either will repair the defective product without charge for parts and labor, or will provide a replacement in exchange for the defective product. Periodical updates to the operational software are not included under this warranty.

In order to obtain service under this warranty, you the Customer, must notify Blackmagic Design of the defect before the expiration of the warranty period and make suitable arrangements for the performance of service. The Customer shall be responsible for packaging and shipping the defective product to a designated service center nominated by Blackmagic Design, with shipping charges pre paid. Customer shall be responsible for paying all shipping charges, insurance, duties, taxes, and any other charges for products returned to us for any reason.

This warranty shall not apply to any defect, failure or damage caused by improper use or improper or inadequate maintenance and care. Blackmagic Design shall not be obligated to furnish service under this warranty: a) to repair damage resulting from attempts by personnel other than Blackmagic Design representatives to install, repair or service the product, b) to repair damage resulting from improper use or connection to incompatible equipment, c) to repair any damage or malfunction caused by the use of non Blackmagic Design parts or supplies, or d) to service a product that has been modified or integrated with other products when the effect of such a modification or integration increases the time or difficulty of servicing the product.

THIS WARRANTY IS GIVEN BY BLACKMAGIC DESIGN IN LIEU OF ANY OTHER WARRANTIES, EXPRESS OR IMPLIED. BLACKMAGIC DESIGN AND ITS VENDORS DISCLAIM ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. BLACKMAGIC DESIGN’S RESPONSIBILITY TO REPAIR OR REPLACE DEFECTIVE PRODUCTS IS THE WHOLE AND EXCLUSIVE REMEDY PROVIDED TO THE CUSTOMER FOR ANY INDIRECT, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES IRRESPECTIVE OF WHETHER BLACKMAGIC DESIGN OR THE VENDOR HAS ADVANCE NOTICE OF THE POSSIBILITY OF SUCH DAMAGES. BLACKMAGIC DESIGN IS NOT LIABLE FOR ANY ILLEGAL USE OF EQUIPMENT BY CUSTOMER. BLACKMAGIC IS NOT LIABLE FOR ANY DAMAGES RESULTING FROM USE OF THIS PRODUCT. USER OPERATES THIS PRODUCT AT OWN RISK.
